PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE,
171, FLEET STREET.

TO OUR READERS.

THE following are extracts from letters received during the last month of 1874:—

“At the gable-end of a gardener's house not far from my own is the tallest and widest-spreading Elder tree I have ever noticed. He told me yesterday that he calls that tree ‘The Cottage Gardener,’ for he and his sons rest under it; his fowls roost in it and eat its berries; and his bees visit its flowers.’ ‘We have wine from it,’ he added in conclusion, ‘all the year; and those little neighbouring dwarf Elders with leaves like it, but never growing or bearing fruit, we say are ‘The Cottage Gardener's’ opponents.”

One of the first members of our staff, in partly retiring, but to be succeeded by his son, says—

“I lose none of my interest in the old paper, and if I can be useful shall be its humble servant. I shall always look with pleasure, and something akin to gratitude, to my association with you in its columns, and have every good and hearty wish for the success of the ‘Journal,’ and kindest feelings for its Editors.”

We are proud of such communications, for they testify that we have true and able contributors, that you, our Readers, appreciate them, and that neither contributors nor readers think unkindly of

THE EDITORS.

INDEX.

- AARON'S BEARD, 171
 Aelia uniflora, and culture, 276
 Abelmoechos esculentus, 234
 Aherystwith, in and out of, 93, 116, 141, 161
 Achillea, ageratifolia, 319; Millefolium on lawn, 164
 Achimenes, culture, 37; insects on, 284
 Adelaide Botanic Garden, 254

From observations taken near London during forty-three years, the average day temperature of the week is 71.5°; and its night temperature 50.5°. The greatest heat was 97°, on the 3th, 1852; and the lowest cold 35°, on the 7th, 1861. The greatest fall of rain was 0.78 inch.

MUSCAT GRAPES.

MATEURS generally seem to think there is something difficult or mysterious about growing Muscat Grapes, and the same feeling is not altogether absent from professional gardeners. The poor appearance of this class of Grapes, too, at many establishments where other sorts are well grown, tends to confirm the idea that there is some mystery about their culture. Once get rid of these wrong notions, and the culture of the Muscat of

Alexandria becomes as simple as that of the Black Hamburgh. It is necessary, however, to bear in mind two or three facts concerning it: It does not flower so early as the Black Hamburgh; it takes a longer period than that variety to ripen to perfection, for instance, supposing the Black Hamburgh takes five months and a half, the Muscat of Alexandria and its varieties will take seven months; it wants more light than black Grapes do, for the latter will colour perfectly under the thickest foliage. Muscats must have space between the leaves for the light to reach the fruit. Excepting in the hottest part of summer, they will bear the sun shining directly on the fruit. They are also grosser feeders than the Black Hamburgh.

Muscat Grapes can be grown with a certain amount of success in a Black Hamburgh house, but owing to their flowering and ripening at a later season than the Hamburghs, they cannot be expected to grow to perfection there. If Grapes with a Muscat flavour are required from a Hamburgh house it is better to depend on some of the early Frontignan varieties, which flower and ripen about the same time as the Hamburghs, and can be grown perfectly with them.

Where a house cannot be devoted specially to Muscats they can be grown to great perfection in a house with such sorts as Lady Downe's, Alicante, and Mrs. Pince, taking care to afford them more room than the black varieties, for the reason I have already given—that they require more light. The best place to grow them, where a large quantity is required, is a good-sized span-roofed house, with the ends running north and south; they there get the benefit of the sun all day long; it shines most directly on them in the morning and evening, and they are partially shaded at midday by the rafters. The Vines should not be planted nearer together than 5 or 6 feet if they are intended to be kept to one main rod; if they are not intended to be restricted to one rod, they should then be allotted a similar space for each main stem that is allowed to grow. The weight of fruit will be as great as if the Vines were crowded, and the quality, of course, will be infinitely superior.

It is altogether a mistake to suppose that Muscats require more fire heat than other Vines. I never attempt to keep them higher than 55° during cold nights in the spring, and they are often as low as 50°, even when in flower. As for setting, I can assure my readers that I have had as much difficulty to thin Muscats this season as I have had to thin Hamburghs. I believe the prin-

cipal cause of bad setting is too much fire heat and too little air and water.

Muscats should not be kept stopped too closely while the fruit is swelling. Stop them at first three or four leaves beyond the bunch, then allow them while they are flowering to make another leaf or two, and also during the second swelling. Till the fruit is nearly full grown, they should be allowed to make as much foliage as there is room for without obstructing the light from the fruit. When the fruit is fully grown, some of the immature shoots may be cut off, which will hasten the ripening of the principal eyes for the coming season.

Such plants as Azaleas, Fuchsias, Gardenias, Geraniums, &c., can be grown perfectly well in the same house up to the middle or end of May; after which time only such things as grow best in the shade can be accommodated.—WILLIAM TAYLOR.

ANTHURIUM SCHERZERIANUM CULTURE.

YOUR correspondent "T. J. H." asks me to say a few words respecting the culture of this now well-known and much-valued plant, and truly they must perforce be few, for I really know of nothing requiring less care and trouble than the plant in question. I have often thought it a nice subject for discussion and a puzzle for the judges when I have seen this plant staged as one in a collection of stove and greenhouse plants in flower, when really it often has not had a single flower open upon the spadix. I have known people assert that the spathe was really and truly the bloom, but few of my readers will have fallen into this error. For matter of argument we might say Anthurium Scherzerianum cannot be classed as a first-rate ornamental-leaved plant, because the foliage is not sufficiently attractive to allow of its admission to this section. Then, again, it is not a plant remarkable for the beauty of its flowers, for these are extremely small and unattractive; but the beauty and brilliancy of its spathe or floral leaf is such that it at once carries the day against all competition, and lands it quite in the front rank, in spite of the immense number of exotic gems which now serve to enchant our eyes in the gardens of horticulturists throughout the length and breadth of the three kingdoms. I have heard the question raised as to whether it should take rank as a stove or greenhouse plant, but I think there cannot be a shadow of reason on the side of those who argue for the latter. True, during some four months of summer it thrives admirably in the greenhouse or conservatory, but it is too frequently forgotten that in such structures the thermometer ranges very high during summer, but that if the plant were left in the same position all the winter it would present a woe-begone appearance, if, indeed, life existed in it at all.

There are many varieties of this plant now to be found in our plant houses, some of which have been imported direct, but the greater number of our plants are home seedlings. However, amongst the thousands which I have seen I could not say I have met with even one which

could be called worthless. The large-spathed form is truly the most magnificent, and as an exhibition plant is by far the most valuable; but for home use, and for the decoration of apartments, the somewhat smaller variety with a rounder spathe in my opinion is much the best; it has the advantage of being more compact in growth, and, moreover, produces a larger amount of spathes in proportion to the size of the plant. Another striking form, which has obtained the name of longispatha, is also very desirable, as being thoroughly distinct and brilliant in colour. It is not, however, my intention in this place to enter into a detailed account of all the various forms; suffice it to say much depends upon the style of treatment the plants receive. None in a young state produce large spathes, these only come with age and vigour. At the same time I do not wish my readers to imagine that one form can be grown into the other by skilful management.

In many instances a great mistake is made in potting this plant. It not unfrequently happens during my peregrinations that I find it growing slowly, or in fact badly—the result of being potted too firmly, and that, too, in close binding soil. This I consider is a shoal my readers should steer clear of, for I have never upon a single occasion found anyone excel whilst practising this system. In potting Anthurium Scherzerianum the first thing to secure must be good drainage; for although it enjoys copious supplies of water, everything that would stagnate and become sour must be kept from coming into contact with its roots. The soil with which I have obtained the greatest success is a mixture consisting of about two parts good fibrous peat broken up rough, one part light turfy loam, and one part sphagnum moss; to this I add sufficient silver sand to make the whole feel gritty when taken in the hand. Let it be well mixed together, but keep the sieve out of sight. When the soil is ready proceed to repot the plant, and in doing so it is the fashion to elevate the soil into the shape of a small cone, after the style or system adopted in potting Orchids. To this I have no objection, because it provides the roots with more surface room, and at the same time adds somewhat to the appearance of the plant, otherwise I know of no reason for the adoption of the system. In potting, press the soil down firmly, but not hard, and finish up the surface with a layer of living sphagnum; this latter is more for appearance sake than a necessity, but still the roots do love to creep through the growing moss.

As before remarked, this Anthurium enjoys an abundant supply of water, both from can and syringe, but that from the latter should be withheld to a considerable extent during the dull days of winter. In the growing season the plant will not object to any amount of heat, but the atmosphere must be well charged with moisture, and the lowest temperature to which it should be subjected at this time is about 65°. If the specimen is strong and in good health, the grower may calculate upon having a spathe produced from the base of every new leaf the plants make, which will continue in their full blaze of beauty between three and four months. If the plant has already become large enough to fill a pot of goodly dimensions, there is no necessity to repot annually; it will be found sufficient to remove the surface soil with a potting stick, and replace with a compost prepared as previously directed.

If the above simple directions be followed, no difficulty will be experienced in the culture of this showy and beautiful Anthurium, which has not inaptly been called the "Flamingo Plant."—EXPERTO CREDE.

JUDGING MELONS—READ'S SCARLET-FLESHED MELON.

I AM always on the look-out for first-class Melons. They are more difficult to grow and finish satisfactorily than the Pine Apple—the acknowledged "king of fruits." At the late show at South Kensington (June 4th and 5th), though there were eighteen fruits exhibited, there was a great want of finish throughout. They were not fully swelled, and scarcely netted. I looked in vain for Read's in the Scarlet-fleshed class, to see what it was ripened three hundred miles south of where I live. Scarlet Gem, the type of Read's, carried off the first and second honours, which led me to conclude that flavour is all our judges care about in Melons. Fruit of handsome shape—spherical, elliptical or oval—plump, well swelled, without ribs, netted all over, and finely coloured, go for nothing; if an ill-grown, misshapen, ribbed, smooth-rinded, and small Melon has flavour it takes the first rank. I know fruits are

grown to be eaten, not looked at; but you may contend that the leg of a mountain sheep is far sweeter mutton than that of a Leicester, the former weighing 6 lbs., and the latter twice as much. Some would be content with the small fruit, but for appearance—and I hold it is all-important on festive occasions, when the dessert is required to be noble—there is no question that the large one is the more appetising. The great aim of the cultivator is the same as that of the cattle-breeder and feeder—viz., to diminish the coarse parts and increase the "flesh." The lean beast need not enter the lists with the thoroughly-conditioned animal; but with Melons it matters not how small and mean-looking they may be so long as they have flavour.

It is well known that in some kinds of fruits, and I may say generally all descriptions, the smallest examples, not the consequence of overcropping, have the highest flavour; no Pine Apples compare with the Queen in summer, or the Jamaica or Montserrat in winter. Muscat of Alexandria is far before all other Grapes in the crackling flesh, just as the Hamburg is in the sugary juice. The Royal George is the sweetest of all Peaches; the Green Gage of Plums; the May Duke of Cherries; Winter Nelis of Pears; and Ribston of Apples. I admit this; but ought it to follow that because a known kind is the best in flavour, it should upon an exhibition table be honoured to the exclusion of superior qualities for consumption in others? Could not quality advance with size? A Melon of 4 lbs. can surely be grown as high-flavoured as one of 2 lbs. or under. Quality requires to be taken relatively, for in many cases it is only a question of culture. The large fruit may be wanting in flavour from being grown under conditions favourable only to size, the weightier conditions of quality-giving not being considered. It is possible to give fruits immense proportions by feeding, but this, unless accompanied by increased facilities for the elaboration of the juices, tends to inferiority of flavour. On this account only can I account for Melons being judged by flavour, which results from good cultivation—as giving the plants the needful heat, moisture, air, light, and root-support. There is, too, a flavour inherent in certain kinds of fruit. Grow one such under similar circumstances to another, and it will ever be superior-flavoured, and if the judging go by flavour will always be first. It is evident, therefore, that judging Melons is only a question of tasting; and as taste differs so greatly, I do not perceive how any satisfactory inference can be drawn by an on-looker. A novice could see why the first or second prize is given for Pine Apples, Grapes, or Peaches; but no one, except an adept at Melon-cutting, could tell why that small Melon should be first, when there are others far nobler and handsomer in appearance.

Now, I do not consider that flavour should be the sole test in judging Melons; I do not think any person has at all times the same sense of good and ill flavour. I confess to not liking a small Melon, for in such there is a greater proportionate waste than in a large one. Then there is the mutilation, in fact destruction, of the fruit consequent on tasting. If Melons cannot be judged by their external appearance, how is it most other fruits can be so judged? Under the rich yellow skin of a Muscat Grape everybody concludes—in fact it is never questioned—that the flavour is high. With black Grapes it is the same: if the bunches are compact, the berries large, black as jet, and well furnished with bloom, flavour is presumed. It is the same with Peaches: if they are well-swelled, well-coloured, the flavour is not called in question. The consequence is the fruit after exhibition can be used for their owner's dessert; whereas in Melon competition the fruit, whether successful or not, is lost for that purpose. The cutting also spoils their appearance on the exhibition table.

There are some facts in connection with the flavour of Melons which lead me to conclude that they may be judged satisfactorily without cutting, and to these I will briefly allude, observing first, that Melons are of two types—spherical and elliptical. The former are round, flattened at each apex like an Orange, original representatives of which are the Egyptian in Green-flesh, and the Cantaloup among Scarlet-fleshed. Melons of the second type are oval, as the Persian and Cabool, originally white, yellow, or green-fleshed, but now having scarlet-fleshed varieties. The Beechwood was originally from Persia, and oval, but the best fruit are now spherical, the original form having been altered considerably by cross-breeding.

The very circumstance that Melons are always cut shows that flavour has advanced very little, and the advance is always

open to question. True, we have varieties annually certificated, described as the finest yet tasted, and these soon pass away, giving place to others; but the broad fact is the first honours at exhibitions continue to be taken by older sorts, or slight removes from these, under the designation of hybrids or seedlings.

The best Melons are those which are not ribbed, but are perfect in evenness, whether the form is round or oval. Examples in the spherical form are Scarlet Gem, Malvern Hall, and Read's Scarlet-flesh, in the Scarlet-fleshed class; Golden Gem, Beechwood Improved, Bromham Hall, slightly ribbed; and varieties of the Victory of Bath race, as Gilbert's and Royal Horticultural Prize. Of elliptical forms the best are Moreton Hall in Scarlet-fleshed, and the Persian, Trentham Hybrid, and Gilbert's and Meredith's Cashmere. Melons which have no ribs, or but slight ones, and have thick short footstalks, and hard shell-like skins or rinds, are subject in ripening to part from and crack round the junction of the footstalk with the fruit if the soil or atmosphere is at all moist, and which do not give off a powerful aroma, are invariably the highest in flavour. Fruits with these characteristics are mostly solid, not hollow in the centre; the seeds disposed in the central flesh, and few, not occupying more than one-third the fruit, the remaining two-thirds being eatable flesh, with a skin of about an eighth of an inch thick. Very few Melons unless netted at the end of the fruit next the footstalk are good in flavour, and as a rule the more netted and hard the exterior the more concentrated are the juices and the flavour high. High colour is no criterion of flavour; and powerful aroma is equally uncertain as indicating high flavour. Deep-ribbed Melons, the skin spotted or dappled green, yellow, and white, as some are very prettily, roughly netted, warted, or earbunneled, and with powerful aroma, are usually hard-fleshed and hollow—not melting, juicy, and rich-flavoured, but very poor in flavour, and having thick rinds or skins.

Judged by qualities externally observable, characteristic of a high-flavoured Melon, we should have—Rotundity, perfect freedom from ribs, 6; netting, if finely netted all over or at the stem end, 3; colour, 1; size, 1; and aroma, 1; or twelve points. New kinds to be scrutinised by the foregoing standard, and compared for flavour with some standard kind of known high flavour. The staging of "seedlings" and "hybrids," which latter are properly cross-breeds, along with older kinds, causes the cutting of all to glean the simple fact whether the new are superior to the old in flavour.

These remarks are offered as suggestions, and I should be glad to hear the views of others. I would fix the lowest weight at 2 lbs., it would not rise above 4 lbs., if the fruit were up in all the other points. The weight might be ascertained by the circumference. A Melon 1 lb. in weight is 1 foot in girth; 1½ lb., 1 foot 2 inches; 2 lbs., 1 foot 4 inches; 3 lbs., 1 foot 6 inches; and 4 lbs., 1 foot 8 inches. The weight of elliptical-shaped Melons may be ascertained by taking the circumference round the middle and that lengthwise of the fruit, adding both together and taking the mean; for instance, a Melon of oval form 1 foot 10 inches round lengthwise, and 1 foot 6 inches round the middle, will have a mean circumference of 1 foot 8 inches, and weigh 4 lbs.

To return to Read's Scarlet-fleshed. I had a two-light frame, and a plant was put out under the centre of each light. It progressed famously, setting its fruit freely, and so many setting numbers were cut off, six fruit being left on each plant. I had an idea from its free-setting that it was a small kind, like Scarlet Gem, Wills's Oulton Park, and some others of this type, and only regret the fruit were not reduced to three, or at most four, on a plant. They ripened the second and third week in June. The heaviest weighed 3 lbs., and the others downwards to 1 lb. The plants have been cut-back, and will apparently soon be in bearing again. I have no experience of it in pits or houses heated by hot water. The fruits were quite round, beautifully and closely netted all over, and to the touch hard as a cricket-ball. It cracked, or rather the footstalk showed signs of parting from the fruit when ripening. The aroma was not remarkable. I thought it faint, but no cracked fruits occurred, all being cut off as soon as ripe, which they are when cracking or parting from the footstalk, and Melons are best kept in fruit-rooms to ripen if full flavour be wanted. The flesh is thick, fully two-thirds that of the diameter; the seeds not numerous, and very few sound in the one tested; the rind very thin, a mere hard thin shell; flesh scarlet, firm, but melting, rich, and most excellent. It is the best in flavour of any scarlet-fleshed Melon I have tasted,

whilst in appearance it is the handsomest, not being in the least ribbed.—G. ABBEY.

NOVELTIES IN THE ROYAL GARDENS, KEW.

In the stove are two new *Eranthemums* from the South Sea Islands, introduced by the Royal Gardens. They have coloured foliage, and are likely to be cultivated on that account; they are not yet named. No. 1 is of erect habit, with broadly ovate leaves about 9 inches long and of a uniform colour, similar to that of a Copper Beech or Hazel. It is distinct in habit from all other plants with dark foliage. No. 2 has a freely-branched habit; the leaves are lanceolate, with bright yellow reticulation, sometimes with scarcely a trace of green. It is very distinct, and is likely to be valuable. Plants newly propagated do not always show the golden character. It was exhibited by Messrs. Veitch a short time ago in fine condition. Besides these, another new variety was imported at the same time, but which was already introduced. It is on the Continent, and at least two London nurserymen have a good stock. It is a handsome plant when in its best condition, has ample foliage variously variegated with creamy white. All the above are of free growth and easy propagation. They require an intermediate house or stove; the treatment for other members of the genus will suit them well. The first two, if not already, will soon be obtainable from the leading nurserymen. Here also *Ataccia cristata* is in flower. The long, sterile, drooping pedicels, which are the most attractive feature, with the queer flowers and leafy involucre, compose a most grotesque inflorescence. A close ally is in fruit, the new *Tacca artocarpifolia*, from Madagascar. It is, perhaps, more curious and ornamental than the preceding. It has divided leaves more than 2½ feet across, and sends up a scape over 5 feet in height; the sterile pedicels are about 1 foot long, and still remain, though in withered condition.

The most beautiful flowers newly open among the Orchids are *Disa grandiflora*, a healthy plant; *Trichopilia Galeottiana*, two varieties, concolor and picta, in the same pot—the latter has the lip slightly spotted with pale red; *Aërides Lobbi*, and the curious *Cirrhaea saccata*. *Dendrobium Pierardi* is very beautiful, so also is a variety of *Lælia purpurata*, white, with the exception of the lip. *Oncidium luridum* has a fine spike of bloom 7 feet long.

At the Rockwork is an interesting and beautiful hybrid *Saxifraga*, *S. autumnalis* × *S. mutata*. It is best described as being intermediate between the parents. It has a branching habit, and is easily cultivated. There is also a splendid Orchid, the name of which has not yet been given. It is 2½ feet in height, and has a dense spike of purple flowers. It grows freely planted in peat, and is very ornamental.

In the Herbaceous Ground, *Aphyllanthes monspeliensis* is nicely in flower. *Centaurea* (*Rhaponticum*) *pulchra* is ornamental from its neat foliage and numerous pink-flowered capitula. *Antirrhinum numidicum* has been described among the "novelties of the present season," and from two sources it proves to be *Linaria triphylla*. *Campanula Medium* var. *calycanthema*, from its petaloid calyx, presents a more conspicuous mass of colour than the species. *Carex pendula* is very ornamental; it has long drooping spikelets, and is worth planting for effect in suitable places. *Penedanum officinale* (in the Economic Ground) is one of the most ornamental of the fine-foliaged Umbelliferae. It produces a round mass of finely-divided foliage, which is more evenly disposed, and is not so stiff-looking as the *Ferulas*; the height of this specimen is about 3½ feet. The yellow foetid juice was formerly used against hysterics. *Athamanta Matthioli* is a good plant of similar character, but smaller dimensions; it is now conspicuous from its numerous umbels of white flowers. The double varieties of *Papaver orientale*, of which there are many colours, are very ornamental, and are useful for sowing in rough corners, where they often make a display without trouble.

In the old Victoria house, where the Victoria regia has this year been planted, *Batatas paniculata* is commencing to flower freely. If I mistake not, the writer of an article in a continental paper recommended its being planted out of doors on a wall. *Euryale ferox* is in flower; as an aquatic it must rank next the Victoria for nobility of appearance. It is grown for the sake of its seeds in China, which, after being baked, are eaten. The deliciously fragrant and beautiful flowers of *Nelumbium speciosum*, the "Sacred Bean," are being produced freely. "The seeds and stem, which contain much starch, are used as food in India and China" (*Museum Guide*).

Chlorocodon Whitei is in flower in the Palm house, "the aromatic roots of which are extensively collected and sold by the native tribes as 'Mundi' or 'Mind,' and used by them as a stomachic" (Dr. Hooker, "Bot. Mag."). It is a curious *Asclepiad*, a native of Natal. It has large evergreen foliage, and would be useful where a climber of that character is required. Pieces of the root grow freely, and it requires a warm greenhouse or stove. It was figured in the "Botanical Magazine" of 1871, when the above name was given. *Pavetta caffra* is very pretty; it is covered with white flowers, and from the protrusion of so many styles it has a light appearance.

In the Temperate house the beautiful *Spiraea palmata* is very attractive. It does not seem to be much grown for conservatory decoration, though eminently suited for the purpose. "By far the handsomest species of the genus hitherto imported, and certainly one of the most beautiful hardy plants in cultivation; the deep purple red of the stems and branches passing into the crimson purple of the glorious broad corymbs of flowers, contrasts most exquisitely with the foliage, which in autumn assumes beautiful tints of brown and golden yellow" (Dr. Hooker, "Bot. Mag.," 1868). *Cyphomandra betacea* is very ornamental in one of the beds; now coming into flower, it still retains a number of the fruits of last year; they are the shape and size of a hen's egg, reddish yellow in colour, and hang by slender stalks from the rigid branches; they remain on the tree altogether about fourteen months. The plant is cultivated in South America for the sake of the fruit, where they are used in a similar way to the Tomato.

In the Succulent house are the three plants supposed to be lost to cultivation at page 514 last week—*Kleinia* or *Cacalia articulata*, the Candle Plant; *Crassula imbricata*, under the preferable name *C. lycopodioides*, which, according to the laws of botanical nomenclature, is the one that should be upheld; and *Monanthes polyphylla*, which should be replanted in pans at least every year, otherwise it is liable to lose vigour and at last to die.

MIDLAND COUNTIES GRAND HORTICULTURAL EXHIBITION,

AT ASTON PARK, BIRMINGHAM.

THE arrangements for this great Exhibition, which may be said to take the place of the large provincial Show of the Royal Horticultural Society, which will not be held during the present year, are in a very forward state, and are being worked-out with spirit. The large tent occupied by the Royal Horticultural Society in 1872 has been roofed over, and formed into two longitudinal divisions. The northern division is wholly covered-in with glass. One half of this is fitted-up with a hot-water apparatus, and is used by Mr. Quilter for the growth of the large specimen Palms, tree Ferns, and other tender-foliaged plants. These will still continue to occupy the centre of the house, and will be an imposing feature; but all round there is a staging which will accommodate the Orchids, new plants, tender specimens, &c. The other half, which is used as a winter promenade, will be fitted-up to contain table-decorations, of which a large number of elaborate designs are expected, bouquets, button-holes, &c. The structure is airy and lofty, and the necessary means have been taken to mitigate the effects of the sun's rays, and make it pleasant for the visitors. The other longitudinal division is planted with *Rhododendrons*, *Clematises*, &c., with a broad winding path down the centre; and in addition it will afford accommodation for miscellaneous collections of plants tastefully arranged.

An immense tent, lofty, airy, and of great strength, will contain all the large collections of plants, with ample space at the side for smaller groups. Another long tent will be occupied by the cut Roses, cut flowers, &c.; and another by the fruit and vegetables. They will be so arranged as to afford as far as possible a continuous promenade. Every facility will be afforded exhibitors to secure a proper staging of their plants; notices containing a list of the classes to be staged within will be posted at the entrance to each tent, and attendants will be found in each to indicate the proper position for the plants, and otherwise assist exhibitors; and, in fact, every precaution will be adopted to secure the rapid staging of the plants, a comprehensive arrangement, and such a prompt clearing of the tents, that the judging may be got through quickly and uninterruptedly, and the tents thrown open to the public at the announced time. The disposition and arrangement of the plants will be under the superintendence of Mr. Thomas Baines, of Southgate, and Mr. William Spinks, Mr.

Quilter's foreman, and formerly of Chiswick. As soon as possible after the work of judging shall have been completed, lists of awards will be posted at the entrances to all the tents.

The comfort and convenience of the exhibitors will be carefully looked after by Mr. Quilter. One room will be set apart as a meeting-place for horticulturists, where appointments can be made, and friends meet together. Another will be fitted-up as a temporary reading and writing room—a want always felt at large gatherings. A cold collation will be provided every day from twelve to four, at a moderate charge, and the tariff of refreshments supplied on the grounds will be arranged in a like spirit.

On Wednesday, July 8th, the judging of the implements and the trial of lawn-mowers will take place. This is a most important and extensive feature of the Show, and the great desire of Mr. Quilter is to afford opportunities for displaying all the newest improvements in garden appliances. The lawn-mowing contest is so arranged as to afford every exhibitor an opportunity for fully testing the capabilities of his machine. Mr. Charles Quilter will have the supervision of this part of the Exhibition.

A horticultural dinner will take place in the afternoon of the second day, when the Mayor of Birmingham will take the chair, and the cost of the dinner has been fixed at a price that will bring it within the reach of all.

AMONG THE NORTH-FOLK.—No. 1.

THAT is Camden's name for the county, and far superior is it to our curt corruption, Norfolk, or, as our base pronunciation still further mangles it, Norfuk. However, the North-folk have no right to complain, for they and other East-Anglians are the worst corrupters of names that ever bewildered me. I have found out and am well housed at Hunstanton, but I had to inquire for it as Hunston. No countryman knew Eye, but Ay was about a mile off; and Botsdale was unknown, but they knew Busdel. The cottagers in some of the outlying villages still call Gooseberries "Thebes," and yeast "God's-good;" but they have one form of expression which deserves general adoption: in speaking of a recent occurrence they say, "It was near now."

As aforesaid here I am at Hunstanton, which, being interpreted, means Hanna's Dwelling, and though the Normans won his and the broad acres of many other Anglo-Saxons, they did not extirpate their place-names; all are still of Anglo-Saxon origin, even the ruined chapel on the headland here is "St. Edmund's." Camden says that both it and the village were built by Edmund, last titular King of East-Anglia. He was A.D. 903 killed by the Danes, and buried at "Breada-worth," known now as St. Edmund's Bury. As he had been a great benefactor of monastic establishments he was canonised, and St. Edmund's day is November 20th.

The district, I think, would repay the attention which might be bestowed upon it by archaeologists; more than one tunnel would probably repay them for opening. They must not wait for an invitation, inasmuch as such researches do not seem to be appreciated. The ruins of St. Edmund's chapel and of Ringstead St. Peter's church I found, the one in the middle of a Barley field, and the other in a field of Clover, without the possibility of reaching the ruins without trampling through the crops. Those crops, and of Wheat, are excellent—above an average—and the last-named is safely in bloom during continued fine weather.

In the cottage gardens—and these, happily, are general and well cultivated—the Potatoes are vigorous, and the early varieties yielding abundantly. Of the flowers around the cottages I will only mention that the Roses, even the standards, are marvellously vigorous, and free from both mildew and green fly. Their flowers and those of Valerian, which is much patronised, are intensely crimson. The sea air and the sea manures accomplish these results. I speak of the manure in the plural, because not only is seaweed largely used as a fertiliser but fish also. I saw a twenty-acre field of Mangold Wurtzel that had been manured just previously to the last ploughing with mussels. Apples are a total failure, the frosts in early June cut off the blossoms. Pears and Plums are abundant. Cherries I cannot speak of, for I never saw a district where there are fewer Cherry trees. Strawberries and small bush fruits are above an average crop.

In Hunstanton churchyard is a square plot with a low rail, and borders of flowers around it. In the centre of the plot are two tombs of the Le Stranges. I have more than once advo-

cated the floral decoration of churchyards, but this plot, without intending a pun, looks strange. It seems to say that those who rest in that plot are still superior to those who are buried outside it, for the rest of the churchyard is a wilderness of long grass. Although I shrink from punning the family referred to did not, for over one of them, who died in 1654, is inscribed—

"In heaven at home, O blessed change!
Who while I was on earth was Strange."

That worthy, jovial in death, lived more than threescore years and ten, being one of the many evidences of the salubrity of the district. In churches and churchyards are inscriptions recording that those they commemorate had lived more than eighty years; and they were not unvigorous years, for one epitaph in Holme-on-the-Sea church tells that one Stone and his wife each lived to be eighty-seven, and to see seventy-two of their descendants. That the district is healthful is proved by better testimony than that of these epitaphs, for official returns show that the death-rate is the lowest in England, being only 13.9 per 1000 annually. The healthfulness is explained by its thorough drainage by the chalk subsoil, the bracing coolness and dryness of the air, and the purity of its water. The same promoters of health prevail at Sandringham, and they aided in warding off death from the Prince of Wales in 1871—G.

BURNING CLAY.

WE reprint the following from a back volume in answer to "A SUBSCRIBER" and another querist, merely adding that it was the practice adopted by Mr. D. Thomson, when at Archerfield:—

As soon as a quarter in the garden became vacant, a fire or two was started, according to the size of the quarter. When only one fire was required, it was, of course, started in the middle of the quarter. The site for the fire was first trenched to the depth of 2 feet 9 inches, turning the top spit (which had through a long course of years been improved a little by liming, the addition of ashes, road-scrappings, &c.), into the bottom of the trench, taking out the two bottom spits for burning. So thoroughly clayey was the greater part of the soil moved, that the men had to dip their tools in a pail of water at every lift, to make the next spadeful slip off the metal. On this site the fire was commenced. Wood which was only fit for charring or firewood, and which is generally plentiful enough about most gentlemen's places, was used. In that locality coal was costly, and not so effective in this case as wood; the latter also affording in burning a desirable quantity of potash. The site for the fire being ready, a little stack of wood was formed 5 feet in diameter at the base, tapering cone-like to the height of 5 feet, beginning with a few dried faggots in the middle, and finishing with stronger junks of wood round the outside. All round this stack of wood a coating of the clay was laid to the depth of about a foot. It was found best to pack it on in lumps as it was turned out of the trench. When this was done the wood was set fire to at the centre, and long ere the wood was all consumed the clay caught fire and burned freely. As soon as the first layer was nearly burned through another layer was added all round, which in its turn soon burned through also. The fire was then broken down with a strong iron-handled hoe, for the double purpose of adding more wood to quicken the fire, and enlarging the basis of operations. After the fire was thus set agoing the wood was of necessity laid horizontally over the burning heap, putting the strongest pieces of wood next the burning mass, and finishing-off the layer with the smallest, to prevent the clay from lying too closely to the wood and obstructing the draught necessary to combustion.

In the meantime trenches were opened at the extremities of the quarter, and the clay taken out, as already described in making the site for the fire, and forwarded to the fire, there being the solid undisturbed surface to wheel it over, and the distance lessened as the fire became larger and required more feeding.

But to return to the fire. When it was again found necessary to break it down for the purpose of extending the base, and increasing its capacity for consuming the clay, another layer of wood was added, and then a layer of clay over the surface, and all round the outside of the heap. After this, as the layer of clay was burned through, another was packed on all over and round without any wood, and so on with two or three layers, till it became necessary to enlarge the base of the fire, by drawing it down from the top, then more wood was

added; and from the great power which the fire attains it is necessary to have plenty of clay and men at hand to cover over the wood quickly, or it would be consumed without doing much good; and so this process was continued till the necessary quantity was burned. I have frequently had three great fires going at a time, on to the tops of which I have wheeled layers of clay to the thickness of 3 feet and more at a time. When the fire became powerful it formed a solid pile of fire, which very soon worked its way through thick and successive layers of clay, transforming what was once an insoluble, wet, tenacious paste, into a heap of material greatly altered in its mechanical properties, and with a great capacity for the absorption of ammonia, besides being mixed with charred wood and potash.

As soon as the heap was sufficiently cool to be moved, it was wheeled back over the surface of the quarter and regularly spread, and the large lumps broken-up. On the surface of all was wheeled a garden rubbish heap, rotten leaves, road scrapings, dung, and other decayed vegetable matter that could be obtained. A trench was then opened at the end of the quarter, and the whole was turned over and mixed the same as is done with a compost heap, to the depth of the original clay, which was forked-up as well as it would allow at the bottom of each trench. This formed a staple, on which almost any crop that could be put on it in the way of vegetables grew with such a luxuriance as I have never seen equalled either before or since. I have seen Brussels Sprouts over 4 feet in height, studded with hard sprouts more like a rope of Onions than anything else. Peas, Canliflowers, &c., were amazingly fine crops. One quarter which I burned in 1854 had the finest crop of Carrots that could be desired, and to have attempted such a crop on it previous to its being passed through the fiery ordeal would have been in vain.

ORCHIDS IN BLOOM

AT THE VICTORIA NURSERY, UPPER HOLLOWAY—JUNE 27th.

<i>Acridos crispum</i>	<i>Masdevallia coriacea</i>
<i>Lindleyanum odoratum</i>	<i>Harryana ochracea</i>
<i>purpurascens majus</i>	<i>Cypripedium Hookeri</i>
<i>virens Ellisii</i>	<i>barbatum bierum grandiflorum</i>
<i>affine superbum</i>	<i>superbiens</i>
<i>Larperetii</i>	<i>Parishii</i>
<i>Lobbii</i>	<i>Stonei</i>
<i>Schroderi</i>	<i>Roezii</i>
<i>Dendrobium Devonianum</i>	<i>spectabilis</i>
<i>infundibulum chrysanthum</i>	<i>Cyrtorchilus stellatum</i>
<i>transparens</i>	<i>Vanda tricolor</i> (many varieties)
<i>McCarthyi</i>	<i>insignis</i> (many varieties)
<i>Pierardi latifolia</i>	<i>snayis</i>
<i>Angoloea Clowesii</i>	<i>linbata</i> (new species)
<i>Ruckeri</i>	<i>Saccolabium retusum</i>
<i>eburnea</i>	<i>Bumel</i>
<i>Dend. cinilum filiforme</i>	<i>Phalaenopsis grandiflora</i>
<i>Tichoplia crispa</i>	<i>Cattleya Mossie</i> (many varieties, and in great quantities)
<i>Oncidium flexuosum</i>	<i>Mendeli</i>
<i>uccellatum</i>	<i>Warneri</i>
<i>bifidum majus</i>	<i>Lelia purpurata</i>
<i>Batemanii</i>	<i>Epidendrum vitellinum majus</i>
<i>Barleria spectabilis</i>	<i>cinabarinum</i>
<i>Odontoglossum Pescatorei</i>	<i>Maxillaria venusta</i>
<i>Alexandree rubescens</i>	<i>Lycaste Skinnerii</i>
<i>Uro-Skinneri</i>	<i>Duppei</i>
<i>Masdevallia Lindenii</i>	<i>Mesospidium sanguineum</i>
—EXPERTO CREDE.	<i>Disa grandiflora</i>

ODONTOGLOSSUM VEXILLARIUM.

I HAVE seen this beautiful *Odontoglossum* exhibited on two or three occasions, but all previous examples come far short of the extreme beauty of two handsome small specimens at present in flower in the hothouses of S. Rucker, Esq., of Wandsworth, under the care of Mr. Pilcher. There are two varieties, the one lighter in colour and more delicate in its markings than the other. The lighter-coloured of the two has produced four spikes from one bulb, and fifteen flowers. The other variety has thirteen flowers on four spikes. Mr. Pilcher grows this species in his cool house, and treats it in the same way as *O. crispum* (Alexandree). Although Mr. Pilcher is not the first to flower *O. vexillarium*, I fancy nothing has yet been seen in England to approach his plants in beauty.—J. DOUGLAS.

ARAUCARIA IMBRICATA FRUITING.—Mr. Barham, gardener to Lord Ormathwaite at Warfield Park, Bracknell, informs us that

there is a tree of *Araucaria imbricata* 16 to 17 feet high at that place showing fruit. There are other instances which have come under our knowledge, as at Bieton and Stratfieldsaye. At the latter place the tree has fruited for two or three years, producing ripe seed, from which Mr. Bell has raised a large quantity of seedlings.

ROYAL HORTICULTURAL SOCIETY.

JULY 1ST.

It is now some years since the National and Royal Horticultural Society's Rose Shows were blended together, and for some years, too, it has not been our lot to see so small a display at this annual meeting, so much looked forward to by rosarians. The season has been most untoward, and every allowance must be made on that account; and even now we hardly know what allowances should be made, so varying has been the weather within the last few days—thunder showers in many places, not a drop of rain in others. The Show, held on this occasion in the western conservatory corridor, was small compared to those of former years, and the blooms were far from equal, either in number or quality, to those usually exhibited at this meeting.

In Class 1, for seventy-two single trusses (nurserymen), Mr. G. Prince, Market Place, Oxford, was placed first with stands containing good examples of Maurice Bernardin, Baroness Rothschild, Exposition de Brie, L'Abbé Brammerel, Madame Hippolyte Jamain, Paul Neron, Alfred Colomb, Edouard Morren, Marquise de Castellane, Madame Laurent, and Marie Van Houtte. Second, and very closely, came Mr. C. Turner, of Slough, with fine trusses of La France, Napoleon III., Rubens, Général Jacqueminot, Jules Margottin, Maurice Bernardin, Duke of Edinburgh, Céline Forestier, Ferdinand de Lesseps, Dr. André, and Prince Camille de Rohan. The third prize went to Messrs. Paul, of Cheshunt, the fourth to Messrs. Mitchell, of Piltown.

In the class for forty-eight triples, which in point of display is always highly effective, Mr. Turner was first with Maréchal Niel, Paul Verdier, Souvenir de Malmaison, Duke of Edinburgh, Prince Camille de Rohan, Camille Bernardin, Victor Verdier, Général Jacqueminot, Louis Van Houtte, and Baroness Rothschild. Messrs. Paul & Son were a good second.

In the next class, for twenty-four triples, Mr. Cranston was first with La France, Victor Verdier, Marie Baumann, Marquise de Castellane, Prince Camille de Rohan, &c. Second came Mr. Fraser, Leyton, and third Mr. Prince.

In twenty-four single trusses Mr. Cranston was first with Edouard Morren, La France, Paul Verdier, Maréchal Niel, Gloire de Dijon, Victor Verdier, Maréchal Vaillant, &c. Mr. C. Turner was a good second; and Mr. G. Cooling, Bath, was third.

In the amateurs' class for forty-eight single trusses, Rev. G. Arkwright, Pencombe Rectory, Hereford, stood first with a very fine stand, in which we especially noticed La France, Sémateur Vaisse, Duchesse de Caylus, Ferdinand de Lesseps, Baroness Rothschild, Maurice Bernardin, Pierre Notting, Leopold I. and several more very fine. Rev. J. M. B. Camm, Moulton Wyld, Chalmouth, was second with excellent trusses; third Mr. Farren, Crescent, Cambridge; and fourth Mr. Ingle, gardener to Mrs. Round, Colchester.

In the remaining amateurs' classes there was also a generally good competition, Mr. Farren, Cambridge, taking the lead for twenty-four single trusses, Mr. T. Gould the second place, and Mr. Ingle the third. For twelve, Mr. J. Mayo, of Oxford, was a very good first; Mr. D. Chapman, of the same city, an excellent second; and Mr. T. H. Gould third; Capt. Christy, of Westeham, being fourth.

For twelve single trusses of Roses of 1871, 1872, or 1873, Mr. Cranston, of Hereford, took the first place with a collection, of which the best were Reynolds Hole, Madame Thérèse Parriou, Lyonais, Bessie Johnson, Annie Laxton, Cheshunt Hybrid, and Etienne Levet. Second came Mr. Turner, of Slough, with Bessie Johnson, Baron de Bonstetten, Mrs. Baker, Miss Hassard, promising, and John Stuart Mill; third, Messrs. Paul & Son. For six trusses of any new Rose of the same years, Mr. Turner was first with Etienne Levet, very fine. Messrs. Paul second with Annie Laxton; and Mr. Prince third with Elie Morel.

In Tea-scented and Noisette Roses, Messrs. Paul & Son took the lead, Mr. Prince being second. In the amateurs' class the Rev. G. Arkwright, Mr. Ingle, and Mr. Farren carried off all the prizes. Gloire de Dijon, Cheshunt Hybrid, Madame Willemoz, Rubens, Souvenir d'Elise, and Triomphe de Rennes were well represented.

For twelve single blooms of different varieties the first prize was deservedly awarded to Mr. Turner, of Slough, who had remarkably good examples of Etienne Levet, La France, Ferdinand de Lesseps, Louis Van Houtte, Baroness Rothschild, and Duke of Edinburgh.

For twelve trusses of Alfred Colomb, the principal awards went to Rev. J. B. M. Camm, and Mr. Chard, gardener to Sir F. Bathurst, Bart.; for twelve of Duke of Edinburgh, to the richly-coloured blooms of Messrs. Paul & Son, and those scarcely

inferior of Mr. Turner, the latter taking first for Baroness Rothschild, and Mr. Camm second. For La France, Rev. G. Arkwright was first, and the Rev. J. B. M. Camm second, whilst of Marie Baumann the only twelve considered worthy of an award was that of Mr. Prince, of Oxford.

No vases of cut Roses were exhibited, though usually there is an abundance of these; but from Messrs. Paul & Son and Mr. Turner came excellent groups of Roses in pots. A large and very ornamental group of plants was furnished by Mr. Williams, of Holloway, a smaller one by Mr. Aldous, of South Kensington, whilst Mr. Turner contributed stands of Pinka and Verbenas of the highest merit.

In competition for the prizes offered by James Carter & Co. for Peas, there were about a dozen exhibitors. For six dishes Mr. Pragnell, gardener to G. W. Digby, Esq., was first with capital examples of Hundredfold, G. F. Wilson, Champion of England, Superlative, Wonderful, and James's Prolific Marrow. Mr. Elbot, gardener to J. Hibbert, Esq., Maidenhead, was second with similar kinds, although there were several exhibitors of creditable dishes, such as those of Mr. Chaff, gardener to C. H. Goschen, Esq., Croydon; Mr. Cross, of Sidmouth; Mr. Brown, Henley-on-Thames; and Mr. Chard, gardener to Sir F. Bathurst, Salisbury. These latter looked to be a fine lot, but were much too old. In the class for four varieties Mr. Bailey, gardener to T. T. Drake, Esq., of Amersham, was first with Laxton's Filbasket, Superlative, William J., and Laxton's No. 1. The second best came from Mr. Miles, gardener to Lord Carington, Wycombe Abbey; his sorts were exactly the same as the preceding. In this class there was a third prize awarded to Mr. Gilbert, gardener to the Marquis of Exeter, Burghley. Mr. Burnett, gardener to Mrs. Hope, The Deepdene, Dorking; Mr. Moorman, Kingston-on-Thames; Messrs. Dobson & Son, Isleworth; and Mr. J. Smith, of Romford, also showed good dishes.

In the miscellaneous class there were two magnificent Smooth Cayenne Pines, shown by Mr. J. Tonkin, gardener to T. Keke-wich, Esq., to which a bronze medal was awarded.

FRUIT COMMITTEE.—Alfred Smea, Esq., F.R.S., in the chair. Mr. Dean, of Bedford, sent samples of the old White Dutch Cabbage Lettuce under the name of Leyden White Dutch. He also showed a Pea called Robert Fenn, which was referred to be grown in the garden; and Dean's Dwarf Marrow, which was passed. Mr. J. Cotton, Kingate Lodge, Kilburn, sent a Cucumber called Queen Park Gem, which was passed. Mr. Richards, gardener to Baron Rothschild, Gunnersbury, sent a Queen Pine weighing 5 lbs. 6 ozs.; and Mr. Perkins, gardener to Charles Keyser, Esq., Stanmore Priory, sent a Ripley Queen, weighing 5 lbs. 13 ozs., produced from a rooted sucker planted in August, 1873. The latter was a very handsome fruit, and received a cultural commendation. Mr. Bennet, gardener to the Marquis of Salisbury, Hatfield, sent fruit of Read's Scarlet-flesh Melon, which was gone to decay and of bad flavour. Mr. J. Read, The Gardens, Aisle Hall, Northwich, sent two fruit of Read's Perfection Melon. It is a Scarlet-fleshed variety, too much like Scarlet Gem in the condition in which it was exhibited to be considered distinct. Mr. Cooling, nurseryman, Bath, sent a handsome large Strawberry called Lord Lyons, which was so deficient in flavour as to be passed, with a request that it may be tried at Chiswick. Thomas Laxton, Esq., of Stamford, sent a seedling Strawberry of remarkable firmness of flesh, and good flavour. It was recommended to be grown at Chiswick.

Mr. Woodbridge, gardener to the Duke of Northumberland at Syon, sent thirteen dishes of distinct varieties of Cherries, which were so highly appreciated as to receive the unanimous thanks of the Committee, with a recommendation to the Council to award the collection a bronze medal. Mr. McLaren, of Ash, Surrey, sent a plant of McLaren's Prolific Raspberry, which received a certificate a few years ago. It is a prolific variety about 3 feet high, and producing an abundance of fine large fruit.

FLORAL COMMITTEE.—Dr. Denny in the chair. From Mr. Bester, manager to the Pine Apple Nursery Company, came *Lobelia pumila magnifica*, fine deep blue with a small white eye; this received a first-class certificate. A similar award was made to Mr. Croucher, gardener to J. Peacock, Esq., Hammersmith, for *Escheveria Peacockii*, a very ornamental kind, resembling *E. secunda* in shape, but whiter. Harrison Weir, Esq., Weirleigh, Brenchley, sent yellow Foxgloves; and Messrs. E. G. Henderson groups of Begonias, Delphiniums, Lobelias, and zonal Pelargoniums, of which last Dr. Masters, a splendidly coloured Tricolor, received a first certificate, as did Iris *Kempferii* Edward George Henderson, with large, richly-coloured, velvety purple flowers feathered with gold. Sir Garnet Wolseley Rose from Mr. J. Cranston, of Hereford, a fine deep crimson, seedling from Prince Camille de Rohan, likewise had a first-class certificate. Mr. R. Dean sent a good collection of Antirrhinums, also a double variety of the pink *Silene pendula*, which had a first-class certificate.

From G. F. Wilson, Esq., Weybridge, came beautiful pans of the interesting and ornamental little *Nertera depressa*, as well as correctly-named cut specimens of *Lilium Washingtonianum*, *Humboldtii*, *puberulum*, *philadelphicum*, *californicum*, *longiflorum*, and varieties of *canadense*, &c. Mr. R. Barr, jun., also sent a large collection of cut flowers of Lilies. From Messrs. Backhouse, of York, came *Oncidium stelligerum*, of Reichenbach, with graceful wreaths of flowers. This was awarded a certificate.

STRATFORD HORTICULTURAL SHOW.

A GRAND horticultural Exhibition is held in West Ham Park, in connection with the Essex Agricultural Society's Exhibition. It opened on June 30th, and closes to-day. We have attended many of these annual gatherings, but none of them with which we have been acquainted on previous occasions has been at all equal to that held this year. A series of large tents is devoted to the different horticultural productions. A very large circular tent in the centre of the grounds contains the flowering and fine-foliaged plants. In the former, for twelve specimens, Mr. J. Ward is first, a long way ahead of the other competitors; he has *Erica Parmentieriana rosea*, *Statice profusa*, *Bougainvillea glabra*, and a gorgeous *Anthurium Scherzerianum*. Mr. J. Wheeler, gardener to J. Phillpott, Esq., Stamford Hill, is second with nice plants. *Erica Cavendishii* is well flowered. Mr. D. Donald, gardener to J. G. Barclay, Esq., Leyton, is third. For six Mr. Ward is again first, Mr. Wheeler second, and Mr. Donald third.

The fine-foliaged plants in the amateurs' classes are not quite so good as we have seen them in London this year; the specimens are smaller, though in other respects they are well grown and very effectively disposed. Mr. Donald has the first prize, Mr. Ward the second, and Mr. Douglas, gardener to F. Whitbourn, Esq., Loxford Hall, Ilford, the third. Before leaving this tent a word of praise must be accorded to the magnificent group of ornamental-foliaged and flowering plants sent by Mr. B. S. Williams, of Upper Holloway, London. In the centre is a splendid *Cycas revoluta* and *Gleichenia spelonca*. These are flanked by magnificent tree Ferns, *Croton*, and the graceful *Cocos Weddelliana*. Mr. Williams also takes the first prize for twelve stove and greenhouse plants in flower. *Ericas* come from Mr. J. Ward; he has twelve matchless plants, and takes two first prizes for them.

Orchids are also sent by Mr. Ward, such as he usually exhibits, *Epidendrum vitellinum majus*, *Dendrobium Bensoniae*.

Exceedingly good groups of stove and greenhouse Ferns are exhibited in quantity from Mr. Donald, first; Mr. Simmonds, gardener to Alderman Finnis, Waustead, second; Mr. Douglas third. Mr. Lane, gardener to Major-General Pytche, Romford; Mr. Wheeler, and others.

Fuchsias were not nearly so good as we have seen them at country shows. Mr. G. Wheeler, gardener to Sir F. H. Goldsmid, Regent's Park; and Mr. D. Donald are exhibitors. Mr. J. Ward sent six very good Show Pelargoniums, and Mr. D. Donald six Fancies. Mr. G. Wheeler, Mr. Simmonds, and Mr. Donald have *Colens*. Some of these are pretty, others are coarse in appearance and far from effective. *Liliums* come from Mr. Douglas and Mr. C. Parker, Clay Hall Works, Old Ford. The first-named has five pots of *L. auratum*, and a fine pot of *L. Humboldtii*.

As we expected, cut Roses are very fine. Mr. W. Ingle, gardener to Mrs. Round, Colchester, is first with a fine stand of fresh blooms in twenty-fours. Mr. W. Harrington, Corbetskey, Romford, is second. Mr. Ingle is also first for twelve. There is a good competition in twelve trebles. Here Mr. Ingle had to give way to Mr. J. C. Quennell, Brentwood, who was first.

Mr. W. Paul, of Waltham Cross, sends a very fine group of variegated Zonal Pelargoniums, and cut blooms of the plain-leaved sorts.

Table decorations are in a tent by themselves, and are disposed on a double row of tables, plenty of space being allotted for each exhibitor. For three vases, Mr. Burley, nurseryman, Brentwood, and Mr. Soder arranged their vases much in the same way, and very well finished they are. Mr. Soder's is rather heavy, although Mr. Burley, who obtained the first prize, would have improved his if less materials had been used. The third-prize three are much too heavy. The prize went to Miss Hill, Bow Road. *Briza gracilis* and some of the finer Grasses, *Adiantum cuneatum*, *Rhodanthe*, pink *Geranium*, and Water Lilies form the make-up of the prize vases. Mr. Soder is first with a single vase, Mr. Burley second, and Miss Hill third. What are termed the March vases are used in all the prize stands.

In fruit the Pines are very poor; but Grapes are very fine indeed, especially Black Hamburg. Mr. Douglas is first with very fine bunches, large in berry, and beautifully coloured; Mr. W. Bones, gardener to D. McIntosh, Esq., Romford, is second; and Mr. Lane third. Excellent Buckland Sweetwater was sent by Mr. Douglas; Muscats by Mr. Bones. The best Peaches

come from Mr. J. Stevenson, gardener to F. C. Barker, Esq., Leigh Hill, Essex; who also sends the best Nectarines.

Mr. Chambers, gardener to H. Fowler, Esq., of Woodford, has the best black Cherries; and Mr. Douglas the best red. Currants of sorts, and Gooseberries are also exhibited in quantity. The best Green-fleshed Melon was sent by G. E. Wythes, Esq., Capt Hall, Epping, the variety being Trentham Hybrid; Mr. Lane is second with Ickfield Hybrid.

Vegetables are an important and special feature; some excellent collections are shown, neatly set up in baskets, and disposed round the sides of the fruit tent. The best collections of ten sorts is sent by Mr. Wythes, Mr. Douglas, and Mr. Bones. They contain excellent Hathaway's Excelsior Tomatoes; G. F. Wilson and Hundredfold Peas. Dwarf Kidney Beans are also very fine. An excellent brace of Tender and True Cucumber shown by Mr. Douglas took the first prize.

FLOWER GARDENS IN WINTER AND SPRING.

No. 1.

THE principal defect of the bedding-out system is the short time that the masses of colour continue in full beauty, cold ungenial springs and early autumnal frosts curtailing the display so much, that we cannot calculate with any degree of certainty upon its duration for more than four months. In most large places this is immaterial, owing to the absence of the family in spring and early summer; but where this is not the case it becomes extremely desirable to render the flower beds as ornamental as may be throughout the year, and to this end, when the summer plants succumb to the adverse influences of autumn, they should immediately be replaced with some hardy ornamental plants, of which we have now so rich a collection.

The summer occupants of the flower garden being now fairly established in the beds, the present time appears to me to be very suitable for the consideration of future measures, in order that a clear decision as to our actual requirements may be arrived at before the rapidly approaching season for the propagation of spring-flowering plants is upon us, as well as for showing with what ease, simplicity, and economy spring and winter gardening may be executed. We do not now hear so much about the use of broken brick, spar, coal ashes, and chalk in the formation of fanciful designs upon the surfaces of the beds in winter; and I am glad of it, for with such a profusion of hardy shrubs and plants ready to our hands, one can hardly understand how the blindest followers of "fashion" could be induced to turn from the use of living forms to that of "dead" materials. It is only in large flower gardens that spring and winter gardening can attain its fullest development, the very term implying a combination of shrubs and hardy flowers, such as necessarily requires considerable space to do full justice to it. Fine and desirable as such extensive displays undoubtedly are, the very numerous modifications of them which may be adapted to the requirements of smaller gardens, are equally beautiful in their way, and it is to one or two of such, as being more generally useful, that I desire first of all to call attention.

In all gardens of moderate extent it invariably answers best to confine the arrangements to the simple combination of a few choice spring flowers that are tolerably similar in habit of growth and in the duration of their flowers, which may readily be raised and prepared for the beds in large quantities. Pre-eminent among pink flowers in this class is the lovely Italian Soapwort (*Saponaria calabrica*), perfectly hardy, of a dwarf, dense, yet spreading growth, producing its flowers in rich profusion. Beds of it may be compared to a soft fleecy cloud rather than a mass of pink, for there is nothing heavy in its appearance, the pretty flowers being so gracefully disposed upon the slender branchlets that they look like so many pink gems sprinkled over a delicate network of green. To these valuable properties may be added the length of time which it continues in flower; commencing in March with the bright Catchfly of Sicily (*Silene pendula*), it continues in full beauty late in June, long after the *Silene* is "faded and gone." The seed should be sown the first or second week of August, transplanting into a rich open soil a few inches apart as soon as the plants are large enough, giving careful attention to all the necessary weeding, watering, and stirring of the soil, so as to have the plants in a thoroughly sturdy and vigorous condition by the time they are required for the beds. If this is not well done, and they become crowded in the nursery, a weakly attenuated growth ensues, so that when the plants are removed to the beds, instead of being so neat and compact as to be even then ornamental in a certain degree, they present a

ragged and forlorn appearance, many of them sooner or later perishing, and thus the negligence which was apparently of so trifling a character in the first instance does eventually seriously affect the appearance of an entire design.

Thus much, and certainly not more than it deserves, of the high rank of the *Saponaria* amongst the notable flowers of spring; but I cannot turn from it without a parting word concerning its value as a decorative plant in summer and autumn, a couple of sowings in March and April affording a supply of plants that, with ordinary care, will form beds of as attractive and ornamental an appearance as any which are filled with the

choicest *Geraniums*. It is also well adapted for planting in vases, its trailing growth drooping over and concealing parts of the sides in a most picturesque manner.

Silene pendula is an old and general favourite, ranking next in importance to the *Saponaria*. It, too, has a nice spreading habit of growth, reaching barely a foot in height, and if planted in a poor soil it may be kept as low as 3 or 4 inches from the surface. It is altogether of a bolder type than *Saponaria*, beds of it forming striking masses of deep pink. The seed should be sown about the last week in July. There are white varieties both of *Saponaria* and *Silene* that are equally

Fig. 1.—DESIGN FOR A SMALL SPRING GARDEN ON TURF.

1. *Saponaria calabrica*, pink.
2. *Myosotis sylvatica* alba, white.
3. *Nemophila insignis grandiflora*, blue.
4. *Limnanthes Douglasii*, pale yellow.
5. *Saponaria calabrica*, pink.

6. *Saponaria calabrica* alba, white.
7. *Myosotis sylvatica*, blue.

The central bed may be *Silene pendula*, pink, with an edging of *Nemophila insignis*, blue.

valuable and effective, and which, with *Myosotis sylvatica* alba, form a capital trio, each of which possesses such distinctive features as to render all three indispensable in all colour-combinations of any extent.

Of plants having blue flowers we may take one of the loveliest of Californian annuals, *Nemophila insignis grandiflora*, too well known to need description, sowing the seed the last week of August, and the graceful *Myosotis sylvatica*, which requires to be sown quite two months sooner than the *Nemophila*. The *Nemophila* should have a light, rich, porous soil raised well above the surrounding level, as it suffers very much from excessive moisture. I have had whole beds of it die outright in winter when the soil has been of a close adhesive texture. *Myosotis sylvatica*, which may often be found in its wild state in Scotland and the north of England, ought perhaps to have had the first place, for while the *Nemophila* is occasionally somewhat uncertain, this fine plant is invari-

ably good, forming most attractive masses of blue. The slender yet sturdy growth of the stems, surmounted by the well-proportioned clusters of pretty blue flowers, gives an air of lightness and grace, which has, doubtless, contributed very materially to its present popularity. To these may be added the pretty blue *Collinsia verna grandiflora*, sown early in August; and if yellow is required, *Lasthenia californica*, sown about the end of August, makes a fine bed of rich golden yellow, and it continues in full beauty from April till late in June. It is of a somewhat tall straggling growth, and therefore should be planted thickly. *Limnanthes Douglasii*, of a pale yellow or straw colour, is also a useful plant. Its seed should be sown the first week of September.

With the exception of the different periods of time at which it is necessary to sow the various seeds in order to produce a uniform display of flowers, the whole of this small but very choice selection of spring-flowering annuals are amenable to

one simple cultural process, consisting of the careful watering and transplanting of the young seedlings into rich nursery borders, to be removed from thence into the flower beds in autumn, when the beds are cleared and dressed with manure or rich soil. The ten kinds which I have selected embrace three shades of blue, two of pink, two of yellow, and three white kinds of distinct form and growth. Sufficient seed to afford a large supply of plants may be procured for three or four shillings, so that it is evident the expenditure of either time or labour need not deter anyone from carpeting the beds with green foliage during winter, and rendering them bright with gay flowers throughout the spring and early summer.

My aim in contributing these notes is to induce those who have not hitherto seen or understood much of the real beauty of spring flowers to take up their culture in earnest. For the further assistance of such I append a few hints concerning the arrangement of the plants in the beds. If a ribbon border were required I would proceed thus:—Beginning in front, white, pink, blue, yellow; or blue, white, pink, yellow, keeping the yellow *Lasthenia* at the back because of its tall growth; but if a deep yellow were specially required for a front row, then we must call in our invaluable ally Golden Feather *Pyrethrum*, of which a stock of plants is raised by sowing seed any time in August. Following Golden Feather in front with blue *Nemophila*, pink *Saponaria*, white *Silene*, and with blue *Myosotis* behind, we have a combination that few summer flowers can equal, and which certainly none can surpass.

Small beds, each containing one distinct colour, as shown in the plan (fig. 1), have a pleasing effect, and solitary beds may be filled in a variety of ways. A bed near a house would be very beautiful if planted with pink *Saponaria*, surrounded by a broad band of its white variety, and with an edging of blue *Nemophila*; or, if the bed were large enough, the *Nemophila* might form a band as wide as *Saponaria calabrica alba*, adding an edging of Golden Feather *Pyrethrum*. The same arrangement would be equally effective at a distance by substituting *Silene* of both kinds for the *Saponaria*. Another striking bed might be composed of golden *Lasthenia* for a centre, with concentric rings of *Collinsia verna*, white *Myosotis*, pink *Silene*, and blue *Nemophila*, proceeding outwards from the *Lasthenia* in the order named; and for beds of two colours we may surround *Saponaria calabrica* with various appropriate edgings, such as *S. alba*, *Nemophila insignis*, and Golden Feather *Pyrethrum*.—EDWARD LUCKHURST.

PACKING CUT FLOWERS.

IN answer to "A. S. L. M." it is no doubt true that great quantities of flowers are spoilt through careless packing; at the same time far more are spoilt through neglect after they arrive at their destination. The box will be opened, and perhaps the contents placed in a warm dry room, a few put in water, and the rest left exposed to the dry atmosphere of the room for an hour or two, or until an opportunity occurs for setting them in water. This is no fancy picture. I have often known such to be the case.

I will first give a few hints as to how the flowers should be packed, and afterwards state how they should be treated when they arrive from the country. Tin boxes made with moveable trays are always to be preferred. They should be made of good strong tin, as they are very liable to be knocked about in travelling. They can be made of any size required, but with large boxes there should be divisions, so as not to have great quantities of flowers placed together. The great evil in packing is having too many crowded together without any division of a substantial nature between them. Packing in thin layers with a little cotton wool between such choice flowers as *Gardenias*, *Stephanotis*, &c., is always better than damp moss, which is sometimes used. The moss is heavy, and is liable to do more harm than good owing to its shifting about when travelling. Roses may be packed in a box with the stems in damp moss. If trays with holes in them are used the stems can be put through the holes into the damp moss, so that there can be no danger of its injuring the petals.

A very important matter is the cutting of flowers. They should always be cut in the morning or late in the evening. Morning is better. If gathered in the middle of the day, with a hot sun, they will never last fresh any length of time.

Flowers should be unpacked immediately they arrive, and if possible in a cool damp room or cellar, and at once placed in cold water. Many kinds of Ferns will not last fresh for

more than a few hours after they are cut; and in rooms where gas is used they are almost certain to wither up in one night, unless they are removed to a cool damp cellar, or even to the open air for the night. Plants of Ferns and many other plants growing in pots, and carefully attended to as regards watering, will seldom look fresh for many days if kept in rooms where gas is used—a sufficient proof of its injurious effects on vegetable life. Cut flowers should always be placed as far as possible from the gas-burners, and near a window where they can have fresh air. The water used should be changed often, and a small lamp of charcoal placed in it, which will keep the water pure, and help to prevent the flowers from fading.—J. S.

READ'S SCARLET-FLESHED MELON.

I HAVE found this Melon a shy setter, but with a little care in fertilising the flowers, and keeping the air of the pit or frame drier than usual until the fruit shows signs of swelling off, I have secured an abundant crop. I have at present two dozen fruits under two lights of a pit, and half of them are larger than an Orange and swelling quickly. I will cut off all the small ones in a day or two to an average crop, when I find I am safe. I grow my Melons on manure in a pit which can be heated with hot water as soon as the heat is found to decline. I quite agree that the habit of the plant is ample and good, but I think it will be found to succeed in and require a high temperature.—W. L., *Lisburn, Co. Antrim*.

ROSE CLAUDE LEVET.—Mr. Cant is right in saying that *Pierre Seletzky* is a capital Rose. It is of much the same colour as *Claude Levet*, but it is full to the centre, which *Claude Levet* is not. Its formation, disposition of, and quality of the petals, together with circular outline, are excellent. It will be one of the best of its year. I have pleasure in recommending it. It is, moreover, on the *Manetti* a good grower.—W. F. RADCLIFFE.

THE TIGER FLOWER, ODONTOGLOSSUM GRANDE.

THIS is just the plant for an amateur to commence the cultivation of Orchids with, because its constitution is so robust that it will live under very trying conditions, and, as a rule, plants of any description have to suffer some rough and un-congenial usage during the earlier days of a young beginner's practice; and whilst it undoubtedly is one of the gayest of its class, it is so reasonable in price that a first failure does not entail a sufficiently heavy loss to deter those with even a small income from making a second venture, and those who possess only a *Wardian case* to indulge their fancies may hope with ordinary care to be entirely successful in its culture.

Odontoglossum grande (fig. 2) has now been an inhabitant of our plant houses for some thirty-five years. For its introduction we are indebted to the late Mr. Skinner, who did so much during his visits to South America to familiarise us with the Orchid flora of Guatemala. It is a sturdy bold-growing species, characterised by its dark blue-green pseudobulbs, bearing a pair of ample dark green leaves, which are, when healthy, thick and leathery in texture; the scape is erect, and produced from the base of the pseudobulb, coming away almost simultaneously with the young growth, and the flowers open during early autumn, and last a very long time in full beauty if not sprinkled with water from the syringe. The individual blooms usually measure some 5 or 6 inches across, but extra fine varieties are sometimes to be met with which considerably exceed that size. The sepals and petals are rich orange yellow, having the appearance of being varnished; the basal portions are ornamented with broad transverse bands of rich brown. The lip varies in size considerably in different specimens, and is creamy white in colour, being dotted and streaked rather sparingly with bright purplish brown. Each spike bears usually from three to five or six flowers, and I have had a not-very-large plant produce as many as forty blooms, in which state it is truly a gorgeous spectacle. This, taken in conjunction with the fact that it is sufficiently robust to allow of its being used for the decoration of apartments, or, indeed, in any situation where gay and festive flowers are desiderata, renders it a favourite with all who know it, and should be a sufficient recommendation to all those who have not that pleasure to at once add it to their collections.

I have before observed that *Odontoglossum grande* blooms during autumn, but within the last few years we have had a

variety introduced which is in full beauty about Christmas; so with a plant of each variety an amateur may maintain a succession of these brilliant flowers during the dullest of the winter months.

This species is a great lover of shade and moisture, and when provided with these it will not fail to thrive. For soil use good rough fibrous peat, from which the small gritty particles have been beaten, and mix with it some living sphagnum

Fig. 2.—*ODONTOGLOSSUM GRANDE*.

moss. The pots should be drained well, and, although a less supply of water (as a matter of course) during the dull dark days of an English winter is absolutely necessary, this element, however, must not be entirely withheld, for they will not suffer to be dried off. During summer the temperature should be about 70°, or, indeed, whatever the atmosphere of the house can be kept down to, but no fire heat should be applied; in

winter, however, I have had the plant thriving admirably in a night temperature of 48° to 50°, and these are conditions which no amateur, I am of opinion, would find any difficulty in providing it with.

One word of advice more and I have done, and that is, bear in mind that during the season of growth care must be taken to prevent water resting in the large imbricating sheaths which

envelope the young growth. Neglect of this results in the decay of the shoot, thus not only depriving the possessor of the beauty of its blooms, but, by destroying the leading growth, permanently injuring the plant.—EXPERTO CREDE.

THE CEDAR OF LEBANON.

It was some time during the latter part of the reign of Charles II. that the Cedar of Lebanon was introduced to this country. Many of the early-planted specimens still exist, but many also have disappeared within a few years. It was evidently a great favourite at the time of its introduction, and was much planted in the villa gardens round London, where, in the neighbourhoods of Hammersmith, Chiswick, Sion, Twickenham, Whifton, Richmond, Walthamstow, and similar localities, original specimens are still to be found; but the

encroaching builder has no compunction in removing whatever stands in his way, and many of the finest trees of Cedar of Lebanon which were frequent in the neighbourhood of the metropolis, have in these latter days disappeared. Some there are that still remain. At Chiswick House, for instance, there is still an avenue of these trees, which is, perhaps, unsurpassed anywhere else by the beauty of their forms, feathered as they are to the ground, and sweeping the turf to immense distances. At Stratfieldsaye, where a grove of them had been planted at an early period, the trunks rise sheer-up like columns 80 or 90 feet high, the spreading branches meeting overhead and forming as it were a temple of vegetation. [See vol. xxiv., page 245.]

"There is," says Figuier, "no nobler object than the Cedar. 'The Lebanon,' say the Arabian poets, 'bears winter on his head, spring on his shoulders, and autumn in his bosom,'

Fig. 3.—LARGE CEDAR AT NORMANTON PARK.

while summer sleeps at his feet,' and in confirmation of the truth of the sentiment a few venerable Cedars still remain; they form a beautiful grove on the line of route from Baalbec to the coast. They are large and massy, rearing their heads to an enormous height, and spreading their branches afar; but they have a strangely wild aspect, travellers say, as if wrestling with some invisible person bent on their destruction while life is still strong in them; but they are gradually disappearing. In 1575 there were found twenty-four standing in a circle; in 1630 Fermanil counted twenty-two; there are now seven standing near each other, and a few more almost in a line with them."

The subject of our illustration is a fine specimen of Cedar of Lebanon at Normanton Park, Rutlandshire, growing in the pleasure grounds near to the kitchen garden. About 3 feet from the ground it branches off into a great number of limbs, every one of which would form an ordinary-sized tree. At this height from the ground it is 28 feet in circumference; the spread of branches is about 90 feet in diameter, and the height from 90 to 100 feet. It is supposed to be two hundred years old.

CANDLE PLANT.—*Cacalia articulata* is still in cultivation, a small plant having been kindly sent to me by Mr. Maule, of the Nurseries, Bristol. Could you tell me where *Pachyphy-*

tum roseum is from, and when introduced?—JOHN GRUMMITT, *Sheffield*.

Mr. JAMES FLINT, a well-known collector in this district, has a specimen of *Cacalia articulata*—Candle Plant, and I have no doubt if Mr. Grummitt were to make application a cutting would be forwarded to him. Mr. Flint, who is a most enthusiastic amateur, is always glad to encourage the cultivation of specialties.—W. F., *Airdrie, N.B.*

NOTES ON VILLA AND SUBURBAN GARDENING.

Flower Shows.—When the cultivator of flowers has been successful in raising his favourites, and his parterres begin to develop their beauties, he is conscious of a very natural desire to show his productions to others. The wish that our friends should admire the same objects as we do is an inseparable accompaniment to the amateur gardener, and has sometimes made him a mark for the merriment or ridicule of those who are destitute of his tastes. Often have I seen an inhabitant of the suburbs of London, who is happy in the possession of about two poles of ground at the back of his dwelling, drag an unwilling visitor round and round his flower beds, and din his ears with the praises of his *Cauliflowers* or his *Sweet Williams*. In such cases the grower has links of fancy and of feeling which bind him to those products of his labour and skill of which the spectator is unconscious, and the unwilling manner in which the

latter follows his guide reminds one of a bear in the Zoological Gardens, who walks about indeed and looks around him enough, but would evidently get away if he could from the chain which confines him.

But if the grower has to complain of undiscerning and tasteless mortals who wonder at what they call his useless enthusiasm, he can always find devotees like himself in the nearest horticultural society, and there in the presence of a company, though few, there will be no danger of his beauties wasting their sweetness on the desert air. The tendency will rather be the other way, for the visitors may be so critical and keen in their conceptions of floral excellence, that your productions may be blamed for not having been grown with sufficient care, or prepared for the show with the proper degree of art. But do not be discouraged at this, but join the society at once. Get the principal lists of articles to be competed for as early as you can, and then select those in the growth of which you are most likely to be successful. But I shall presume you have done this, and are now prepared to contest the reward of excellence or superiority with your neighbours. A few hints derived from my own observations and experience in connection with a society of amateurs may not be useless in reference to the general subject of flower shows. In employing Art for the purposes of successful competition, let Art always be the handmaid of Nature, to wait upon and follow her rules, and to confer upon her a higher beauty. This principle should regulate the choice of articles to be exhibited, for some will bend much and others little to the care of the gardener. Those called florists' flowers are always desirable objects, as they are so amazingly affected by skillful growth. But the rule is adverse to the practice of what is called dressing flowers, that being an operation which more often alters than improves the subject of its manipulation. If by art a Carnation may present a form in a show-pan which it never had or could have when grown on its stems in a bed, the triumph may be allowed in a technical point of view, but ought not to be admitted by a rational horticulturist. A Carnation-grower should seek the improvement of the growth of the flower, and not to be satisfied with trussing-up and patching the disordered petals with string and cardboard. The object is to make art so as to bear on vegetable growth, that bad habits may be corrected, and symmetry and beauty more uniformly obtained. A visitor at a floral exhibition not initiated in the mysteries of flower-craft, who would see a stand of Carnations, and purchase of the exhibitor on the faith of their being so compact and regular, would have a right to complain if he found the following year that these qualities were conferred by dressing. Skill in growing is in my opinion the object to be aimed at in horticultural societies, and artificial trimming should be discouraged. It is on the same principle that the system of sticking and propping-up is objectionable, and is disused at the higher shows. Some *Pelargoniums* present an immense front of flowers, while the back is a miserable scaffolding of sticks; others throw off all their branches from one stem, and dispose foliage and bloom equally round their pots. The first may be more attractive, merely as presenting a mass of bloom, but there can be no doubt that the latter deserve the prize, as developing most the subserviency of Art to Nature.

A real love of science should be always made to repress a mere spirit of gambling at flower shows. No one can have been long acquainted with the operations of such societies without having seen a dangerous tendency in some minds to look for prizes for their own sake. Persons have been known to withhold their patronage from these institutions because sufficient prominence has not been given to some productions which they happen to fancy, or perhaps have in abundance in their garden. The veriest rubbish has in this manner found its way to the exhibition; and when the folly of such a system has compelled its continuance, the guinea has been withheld and the patronage withdrawn. Unequivocal marks of disappointment and vexation may also be seen sometimes displayed by some unsuccessful candidate, although the superiority of the winning article is unquestionable. All such feelings and tempers will be best conquered by loving floriculture for its own sake. Those who do this will feel compensated for the loss of a prize by the superior method of growth which they now have exhibited for their imitation, and they will go and count their deficiencies by the higher examples brought under their notice.

The greatest triumph which gardeners have achieved in the management of plants is that by which almost innumerable and very beautiful varieties of flowers have been raised from the weeds of our fields, as in the Heartsease and Tulip, and to what in exotics are comparatively little better, the single *Dahlia*, the *Dianthus*, *Pelargonium*, and several other genera. This is effected by what is technically designated hybridising and cross-breeding, by which process the proportions of dissimilar but allied species, and in some cases genera, are so intermixed that the seedling produce will partake of the character of both parents, and the flowers be frequently superior to those of either.

Nature unaided by Art has accomplished much, and has produced the Golden Pippin Apple from the wild Crab, and the

Damson and other Plums from the common Sloe, yet it must be confessed that Art properly directed has effected and will effect more in a few years than Nature, dependant upon accidental circumstances, would do in a long lifetime. As an operation to fill up the leisure hours of the lady gardener and amateur I do not know anything more pleasing, for there is something akin to creative power in it, as we are bringing new forms into existence, and though all the offspring may not be equally interesting, some may be very pretty, and others superlatively beautiful. "No one but a parent can have a parent's feeling" is a trite saying, and certainly the pleasure of an enthusiastic florist in viewing a first-rate flower of his own raising, amounts in some cases to a species of idolatry. To explain the method of artificial fertilisation it will be necessary to make a few remarks on the formation of flowers. In all flowers when divested of the petals or corolla there will be found standing in the centre and attached to the flower-stalk, of a *Fuchsia* for illustration, a small pin-like substance which is called the pistil or female organ, and surrounding it a number of shorter pins of various lengths with rather large heads, which are called stamens or male organs. A slight examination of various flowers will show how beautifully Nature has provided for the multiplication of the different species of plants, as in some cases the farina falls from the anther upon the stigma, while in others it is deposited there by an elastic force in the filament, as is exemplified in the *Kalmia*. The pistil consists of three parts—viz., the ovary, the style, and the stigma, and has been likened to a column, as the first will represent the pedestal, the second the shaft, the third the capital. The stamen also consists of three parts, which are called the filament, anther, and pollen or farina—a sort of mealy powder which the anther throws out, which, when it falls upon the stigma or top of the pistillum, fructifies it, and a production of seed is the consequence.

Now, when gardeners wish to produce hybrid or cross-bred plants they divest the flowers which it is intended to produce seed from of their stamens, and proceed to fertilise the stigma with the farina taken from some other plant; and thus, if I wished for a family of plants between *Fuchsia globosa* and *F. Venus* *Victrix*, I should take the stamens from the flowers of the latter directly the flowers were open, and fertilise the stigma with farina taken from *F. globosa*, and the result would probably be plants resembling *F. globosa* in habit, and partaking of the colour of *Venus* *Victrix* in the flower. The habit of the plant generally resembles the male parent, and the flowers those of the female, and for this reason particular attention should be paid to the choice of parents if we wish to make decided improvements in the habits of our plants. After the stigma is fertilised it should be guarded from the contact of honey-sucking insects by a muslin bag placed over the flower, or by keeping the plants in a pit or frame covered with strong gauze or fine canvas. The best instrument to convey farina from one plant to another is a camel-hair pencil, and the best time to apply it is early in the morning when the flower is full grown and the stigma is covered with its own mucus; but to make assurance doubly sure, it is well to apply the pollen several days successively.—W. KEANE.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

WE are truly grateful for the rain we have had; during the last week 0.75 inch fell, making the total for the month 1.98 inch. The want of rain seems to have been felt in many parts of England, and also in Scotland this year. Whenever a dry period occurs in Scotland, the old people make a comparison with the memorable year of drought—1826, when the cereal crops did not grow more than a few inches in height. It has been stated that since then no season so dry as the present has occurred. In our own garden water has been short, but owing to our system of culture, which has been previously detailed, the crops have suffered but little. The rain has also given us an opportunity to plant-out all green crops—Brussels Sprouts, Savoys, Breccoli, &c. The above may be planted in the driest weather if plentiful supplies of water can be given, and the plants will not suffer much.

The earliest crop of Peas has been cleared off the ground, and the sticks used for successional crops. We have generally made a sowing of Peas at this time. Last year nearly all the most approved early sorts were tried, but none of them gave satisfaction. In moderately heavy, or what would be called medium soils, Peas do well late in the autumn, and furnish dishes of Green Peas until the frosts destroy them. We have tried them here many years in succession, but have not been very successful with them. The weeds have also been picked out of the walks. This is best done after rain; they come out more readily when the ground is wet, and moreover they are more conspicuous. Gooseberry or other bushes growing near the Box edging have a tendency during the growing season to hang over and destroy the Box; we went over ours and propped up the branches with forked sticks, and in other cases cut away

the superfluous wood. Scarcely anything looks worse in a garden than imperfect Box edgings, with gaps at irregular intervals the whole length of the path. Unsuitable soil is often blamed for this, when the primary cause is to be found in crops overhanging the edgings during the summer months.

FRUIT AND FORCING HOUSES.

Pinerias.—There are plenty of good suckers on the Queens, and as soon as we have the opportunity we shall have them taken off and potted, using 6 inch pots for the smaller plants, and 7-inch for those of a larger size. We have under the force of circumstances been obliged to use different sorts of soil for Pines, but the best seems to be medium clay, using only the surface turf of an old pasture; added to this are one-sixth part of rotted manure and some crushed bones. This compost is recommended for fruiting plants; a lighter compost may be used for potting the suckers. Orange trees grown at the back of the Pine house are progressing well. A great difficulty with them is to keep the leaves clean; even with frequent syringing an accumulation of a black substance takes place upon the leaves. This is removed with a sponge and soapy water; it proceeds from scale on the wood, which must also be washed off. A surface-dressing of pounded charcoal, bone meal, and guano in equal proportions is very beneficial to them.

Figs in pots have also supplied us with a few fine-flavoured fruit. Not every variety of Fig is adapted for pot culture, although those that have failed here may not do so in other gardens. The best that we have tried are White and Grizzly Bourjassotte. Gros Verte is also a dwarf-growing variety producing fine-flavoured fruit.

Orchard House.—There is a considerable drawback in the cultivation of any fruit or flower when two or more varieties requiring diverse treatment are grown in the same house. This is always the case when Strawberries and Peaches are grown together; syringe the Strawberries effectually night and morning until the fruit colour, even then red spider is sure to appear before all the fruit is gathered. The atmospheric conditions necessary to produce good flavour in Strawberries are the very opposite of those required for Peach trees making rapid growth, and having fruit in the earlier stages of development. Now that all the Strawberries in pots are cleared out, the house is shut-up early and the trees thoroughly syringed night and morning. The trees were surface-dressed for the first time last week, and after this dressing they start into a much more vigorous growth. If the trees are large enough, as they are in our case, they must be closely stopped-back. Abundant supplies of water are now essential, and the watering should always be done by the same man, who will, if he is attentive, get to know the quantity required by each tree, and will act accordingly. A close scrutiny must be made for aphids, as this must be destroyed by fumigation or washing on its first appearance. If this pest is allowed to have much license given to it, the trees will be permanently injured.

GREENHOUSE.

At this season the display of flowers in the greenhouse is kept-up by what is called in gardening phraseology softwooded plants, and if the house is to be kept tidy very much more work is required—removing petals that have dropped, or decayed and withered flowers. The stage Pelargoniums are now past their best, but Zonal kinds, Fuchsias, and other plants are very useful. A very distinct plant, though one not often seen, is *Lisianthus Russellianus*. If properly treated this is easily grown and lasts a long time in beauty. The seeds should be sown in light peaty soil in a hothouse; in a young state the plants are very easily killed if great care is not taken with them. The pot must be placed on a shelf near the glass, and shaded from sunshine. When large enough to handle place each plant separately in a very small pot, always keeping the pots on a shelf near the glass, and shading from sun during their growth. Our plants which have just come into flower were grown in the Melon houses, where the temperature has ranged from 60° to 65° at night since January. The potting material throughout has been Orchid peat with a small portion of leaf mould added to it, and the plants have flowered in pots 8½ inches diameter, inside measure. The Orchid peat is very porous, and the plants on that account should not suffer for lack of water at the roots. Probably this would be very injurious if not fatal to them.

We are now potting the Azaleas, and removing them to a house where they can have a good heat—70° or more at night; this should have been done two or three weeks ago, but to do all our work just when it ought to be done is more than we have yet been able to accomplish. The potting material for Azaleas is very simple, and is composed of turfy peat; the pots are also well drained. This is a matter that ought not to be done carelessly under any circumstances; but in the case of all hard-wooded plants that must remain three or four years in the same pots, the results of bad drainage must be obvious to any intelligent cultivator. The Azalea is very subject to the attacks of red spider, but when the plants are making their growth they require plenty of water at the roots; they must also be syringed

two or three times a-day, and they delight in a moisture-laden atmosphere.

We cannot grow *Carnations* and *Picotees* in beds in the open ground in the soil to be obtained here, but they succeed tolerably well in pots. Another advantage to be derived from this mode of culture is that the pots can be removed under glass when the flowers open, where they can be protected from the weather. Ours were removed indoors this week. Potting young plants of Tree or Perpetual-flowering *Carnations*. The plants intended to flower in November and December should be of large size by this time, and should be potted into their flowering pots by the end of this month or early in August.

Lilium auratum is now in full beauty, and when well grown has a magnificent effect in the greenhouse or conservatory. One or two others of the new species of recent introduction are very distinct and good. Messrs. Veitch, of Chelsea, exhibited one of the newest of the Californian species—*L. purpureum*, which gained a first-class certificate at Kensington; it is of small growth, densely spotted, and very sweet. We have *L. Washingtonianum*, *L. puberulum*, and *L. Humboldtii* now in flower; the first-named had only two flowers on a spike, but these were delicate in their colouring and very elegant. *L. Humboldtii* seems to be allied to the Tiger Lily in the formation of its flowers. One bulb threw up two spikes, and had more than a dozen flowers on one, and this bulb was so weak in its growth last year that it did not flower; the petals are turned back and meet at the points, they are of a bright orange colour, and densely spotted with brown and black.—J. DOUGLAS.

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

MARSHAL NIEL ROSE INFESTED WITH SCALE (F. E.).—Your plant is terribly infested with the brown mussel scale, which if not removed will destroy it. Take a hard brush, an old plate-brush or some such thing, and remove as much of the scale as you can with that. Then wash the shoots with a solution of Gishurst compound made by dissolving 8 ozs. in a gallon of water. Apply this carefully to the hard branches only, and avoid touching the foliage or tender shoots. Repeat this from time to time, and you may succeed in cleaning the plant. Winter is the best time to apply so strong a solution, when the tender growth is past, but as the case is a desperate one you may run the risk now. If this do not succeed, cut the plant down, and watch carefully the new growth.

NOTTINGHAM NETTING, &c. (Fifteen-years Subscriber).—You can get the netting of any of the seedsmen who advertise in our columns. It is not at all uncommon.

POPPIES AND CAMOMILE (C. C.).—We do not know of any manual that treats on the culture of these plants. We presume you mean field culture for medicinal purposes.

VINE ROOTS IN LEAF SOIL ON BORDER—POT VINES (R. S. M.).—If the soil is not more than a few inches thick leave it on, and apply the same depth to the other part of the border; but if it must be removed it will not be safe to do so until the present crop of fruit is ripe, and it will act injuriously to cut away and expose the roots to cold; therefore, you will need to apply a covering of leaves or litter when the leaf soil is removed. Stop the Vines in pots when they have canes 8 or 9 feet long, allowing the laterals to make two or three leaves before stopping, and when the wood is brown place against the wall or fence out of doors to harden. Prune to the length required when the leaves fall, removing to a cool dry house until required for forcing. The best compost for pot Strawberries is three-fourths turfy rather strong loam, one-fourth well-rotted manure, and one-sixth of old mortar rubbish.

BED OF CLEMATIS JACKMANI (C. R.).—We should not only well raise the bed in the centre, but also have the edge above the surrounding level. The soil should be sandy loam enriched with leaf soil, well-rotted manure, or decayed vegetable refuse. The stones may be placed on the surface, but not close together, leaving some openings between them for putting in pegs to secure the shoots to, and for top-dressings. We should have one plant in the centre of the bed, and others round the edge at 1 foot from it, the plants 4 feet apart. You will thus require six plants. Put in pots or stakes so as to be not more than 6 inches above ground, and to these secure the shoots. The slugs may be kept under by frequently dusting the bed with quicklime.

MUSHROOM SPAWN NOT RUNNING (T. W.).—There are various reasons why your Mushroom bed has not produced. The spawn may not have been good, and heat may not have been generated. Did you cover the bed with litter? Without knowing exactly your treatment we cannot tell the reason of your failure, but the probability is the fault was in the spawn.

CELINE FORESHIER ROSE (J. J. Cartwright).—We would recommend you to remove your Rose tree from the shaded eastern position in which it is now growing, as it evidently does not suit it. Let it have an open but sheltered situation. You need give yourself no trouble about *Spinex* (*Hoteia*) japonica. If you were to leave it in the ground it would bloom freely next year without

any winter protection. If, however, you wish to bloom a few plants in pots, take them up in autumn, pot them, and place them in your large cool frame.

DOUBLE PYRETHRUMS (*Old Subscriber*).—Annoire, Delicata, Duchesse de Brabant, Emile Lemoine, Gloire de Nancy, Hermann Stenger, Haage et Schmidt, Imbricaria plenum, Imperatrice Charlotte, Madame Boncharlat, Mons. Barral, Penn Ronce, Princess Charlotte, Progress, Rose Perfection, Solfatere, Striata plena, and Virginal.

CATERPILLARS AND APHIDES ON GOOSEBERRY BUSHES (*A. B.*).—To free them of caterpillars mix with a gallon of rain water 1 oz. of white hellebore powder, and keep close to the air. On a fine dry day shake well up, and with an old whitewash brush sprinkle the liquid on the trees infested by the caterpillars, repeating the application if necessary. Bear in mind that the hellebore is a poison. For the green aphid add six gallons of water to one of tobacco juice, and then 2 ozs. of soft soap to every gallon. Thoroughly dissolve and strain before use, applying to the bushes with a syringe, the ends of the shoots where practicable being dipped in the liquid. The aphides must be wetted with the solution. See answer to another correspondent in last week's Journal, page 516.

DEUTZIA GRACILIS AFTER FLOWERING (*Idem*).—Set them on and partially plunge in coal ashes in an open but sheltered situation out of doors, and keep them well supplied with water. When the leaves have fallen remove the plants to a cold pit or a sheltered spot, and plunge the pots to the rim in coal ashes. In January take them to the potting bench, reduce the ball a little, removing any loose soil, and picking out some with a pointed piece of wood, and after loosening the sides of the ball put in a size that will admit of some fresh soil all round. Afford good drainage. Sandy loam, with a little leaf soil is suitable. Place in a light airy position in the greenhouse, and keep moist, but watering carefully until the plants are in free growth, then supply moisture more freely.

BLACK HAMBURG GRAPES RUSTED (*E. W.*).—The probable cause of this is painting the hot-water pipes with flowers of sulphur, or the Grapes when in an early stage of their development were exposed to cutting winds. It cannot be called a disease, nor is it infectious.

ORANGE-TREE GRAFTING (*Mrs. Henderson*).—It is best done in spring when the stocks are commencing to grow. Place them in bottom heat to insure growth previous to the scions starting. Whip-grafting is the best mode for small plants, and for large stocks cleft or crown-grafting. They succeed best kept in rather close and moist. A little grafting-wax is better than clay; secure with cotton, and cover with a little fine moss so as to keep the graft moist and encourage the flow of the sap.

GLASS COPING OVER PEACH TREES (*Idem*).—It should not be removed. It is necessary to the ripening of the fruit and wood in summer and autumn, quite as much so as in spring for protecting the blossom and young tender growths. The trees would be better of thorough syringings in the evening, especially in dry weather and hot days, until the fruit change colour, with copious waterings at the roots in dry weather until the fruit swells for ripening. For the mildew dust with flowers of sulphur from a muslin bag, or the foot of a worsted stocking, and apply to the border a top-dressing of short manure after a thorough watering at the roots.

FRUIT TREES STOPPING (*Mrs. C.*).—Stop or shorten the shoots now—those required to form spurs to three leaves, if the shoots are not strong and the leaves distant, but more closely if vigorous, not leaving the shoots longer than an inch or two. These remarks apply to the shoots on the main branches, the leaders of which should be stopped at from 6 to 9 inches of growth, and at the third leaf afterwards. Your trees being young, you will require to leave shoots at about 1 foot apart every way, and treat them as main-branch leaders. The above observations apply to bushes and pyramids; if they are wall trees do not stop the shoot at the extremity of the branch, but lay it in at full length, and stop the other shoots at the third leaf. The leading or central shoot of the tree should be stopped when it has grown a foot, if it is vigorous; if weak, do not stop it, but shorten it in autumn to 12 inches. If the trees are fan-trained you will need at every 3 feet to originate a branch or shoot, and not stop it but lay it in at its full length, and so that at 3 feet it will for Plums be 9 inches from the branch below it. For Peaches the distance between the branches should be a foot. The side shoots ought to be pinched to one leaf after the first stopping.

CUTTING PEACH-TREE LEAVES (*E. A. Trichene*).—It is not beneficial to Peach trees in a forcing house to cut their leaves in two whilst fruiting. When the fruit is covered by the leaves it is desirable to admit light and air, in order to enable them to colour well and ripen perfectly, which they do not always when shaded by leaves. Shorten any leaves which overhang and crowd the fruit, but beyond this we do not recommend cutting or removing any of the leaves. The leaves are necessary to the thorough ripening of the buds, but if the shoots and leaves are much crowded it is better to thin-out the shoots so as to admit light and air, rather than seek to do so by the removal of the leaves.

RECENTLY PLANTED VINES NOT GROWING (*G. S.*).—The Vines have probably received a check from too much or too little water at the roots, or not applying it of the same temperature as the house. We should afford slight shade from bright sun, and maintain a moist atmosphere, watering only moderately until the Vines are growing freely, the soil, however, being kept moist, and when the growth is free water copiously. The laterals on the four side shoots we should stop at the first leaf, and remove all the laterals but the uppermost joint and the two lowest leaves, keeping those left closely stopped to one joint as growth is made. The laterals on the main cane we should not stop until six leaves were made for the first year of growth, to four for the second, two for the third, and afterwards stop the laterals at the first leaf, and after the first stopping keep to one leaf of each succeeding growth throughout the season. The Vines you have in pots we should plant out at once if the border is ready, and in planting spread-out the roots a little, but do not disturb the ball much, watering moderately, and shading for a few days until the Vines are re-established. The laterals may be stopped as described for the leaders of those planted out, and if kept in pots stop the laterals at the first joint, and stop the canes at 9 feet. They should be cut-back, after the leaves fall, to such a length as will allow of the cane reaching the trellis when planted out in spring.

MOTH (*Mrs. Carey*).—The moth is Sphinx Ligustri, the Privet Hawk Moth. Your letter has been sent to Mr. Johnson.

FUNGUS (*J. W. P.*).—The fungus on Mint is not the same with that on Hollyhocks, the spores are very different. It is Puccinia Anthrac.—M. J. B.

ROSES WITH INSECTS (*Miss Dennis*).—They are covered with aphides. The cause is the late cold east winds, which check the growth of the plants, curl the leaves, and allow the insects to get ahead. Wash your trees morn-

ing and evening with a strong jet of water from a garden engine or stout syringe. Or wash them with Gishurst compound, 2 ozs. dissolved in a gallon of water. Dissolve it and let it stand twelve hours before using it, and pour the clear liquid from the sediment.

INSECTS ATTACKING CINERARIA LEAVES (—).—The leaf sent shows the mines or channels formed within the substance of the leaf by minute larvae, which leave the upper and under surfaces entire. We believe they are caused by the larva of a very minute two-winged fly (Phytomyza sp.?), rather than by the caterpillars of a little moth, many of which have similar habits. Pick off and burn the attacked leaves.—I. O. W.

NAMES OF PLANTS (*Mrs. Henderson*).—We regret to say we cannot undertake to name Roses or other florists' flowers. Your other queries are in another place. (*R. Maries*).—Ad-antum reinfemore. (*Anna Liffey*).—It is like Beauty of Calderdale, but it is very difficult to name florists' flowers. (*S. B.*).—The Primula is verticillata var. sinensis, a native of Abyssinia. The bloom of Viola is a case of fasciation, or union of two. (*Subscriber*).—2, *Asclepias curassavica*. The Orchid was too shrivelled for determination. (*H. G.*).—*Cephalanthera grandiflora*. (*A. H. K.*).—1, *Thalictrum elatum*; 2, *Papaver pilosum*; 3, *Lunaria purpurea*. (*E. D. H.*).—*Astragalus glycyphyllos*. (*H. Etherington*).—1, *Oxyechium lucidum*; 2, *Nephrrolepis cordifolia*. (*H. Snodgrass*).—1, *Hypochaeris radicata*; 2, *Santolina* sp. (*S. G.*).—*Gloxinia tubiflora*, *Hook. f.* (*A. T.*).—*Sisyrinchium striatum*, *Sm.* (*B. T.*).—1, *Selaginella uncinata*; 2, *S. sp.*; 3, *S. Macdougalli*; 4, *S. Kraussiana* (?); 5, *Pteris serrulata cristata*; 6, *Lactaria* (too young). (*R. D. D.*).—1, *Saxifraga sarmentosa*; 2, *Lysimachia vulgaris*; 3, *Tanacetum vulgare*; 4, *Hypericum calycinum*.

POULTRY, BEE, AND PIGEON CHRONICLE.

HANTS AND BERKS SHOW AT READING.

It is always a trial to go from larger to smaller; the smaller should always by rights go before the larger, just as luncheon precedes dinner. Still, it is a badly-balanced mind that cannot enjoy smaller things as well as larger. I once sat by the side of a lady, a very young lady, at a concert in a county Town Hall, and on asking her if she enjoyed it she replied, "Oh! I was at a London concert last week. You should have heard Madame So-and-so sing." Now, the dear young girl positively did not enjoy her county concert because of having been at the one in London; though, perhaps, there was also a little vanity mixed with the affair. This, however, was wrong. Why not enjoy both? I have seen York Minster, but why should I not enjoy looking at Wells Cathedral? If you have seen the Lake of Geneva, good reader, don't go and turn up your nose at Lake Windermere; if you do, you are a bit of a goose, although I don't like slandering that sensible bird by comparing you to her. Fortifying myself with these reasonings I reach Reading, and mean to enjoy that Show, and not continually be turning up my nose because it is not so large as the Bath and West of England seen by me just a fortnight ago at Clifton. I remember the Hants and Berks at Reading eight years ago. I saw it then, and never before nor since, and well—it was not a large Show, certainly.

On reaching the station I lunch at the new refreshment-rooms, mindful of short commons perhaps, or bad fare, at the Show. I ask the waiter, just in an innocent way, what the church bells are ringing for. "Oh! sir, it's the Agricultural Show." "Many people in Reading?" "Never, sir, saw Reading so full. The Queen has sent a lot of stock, and so has the Prince." All this sounded promising; and it was evidently gala time—flags, streamers, bells, shops at their best, and all gaiety, and best of all, crowds of people. On my way to the Show-yard I saw unmistakable proofs of a large Show and not a small one. The great gathering outside, the nigger minstrels, the blind man reading, the large confectionary tents—in short, a sort of fair outside. Then the large number of carriages waiting, and the crowds pushing forward. The rumour that the Prince of Wales was to be present of course increased the multitude, especially of the many who gazed at the arrivals, but lacked the halfcrown for entrance.

I enter, and what a difference to the Show eight years ago! Hants and Berks is now just a rather smaller Bath and West of England, machinery in motion, implements, horse ring, and streets of bazaars included. No Fine Arts department, no horticultural tent, it is true, but a Dog show, which Bath and West of England lacks; and Sutton's seed pavilion in all its glory as at Clifton, and a whale to be seen for twopence!—rather a low affair this, surely! I mistake one of the dog tents for the poultry, not expecting two for dogs; but on entering I find I am wrong, for poultry do not bark or repose on velvet cushions.

At length I find the right tent, fair in size, yea sufficient, but shockingly hot and lacking ventilation. I find the numbers of the two Shows are as follows:—

BATH AND WEST OF ENGLAND.		HANTS AND BERKS.	
Poultry.....	431	Poultry.....	267
Pigeons.....	98	Pigeons.....	60
		Rabbits.....	23
		Extra Stock.....	4
	529		294

The Reading Show is now, as to pens, more than half the

size of the Bath and West of England. This was very different eight years ago. Dorkings begin the classes; this natural enough, as we are high the county whence they take their name. Spanish first at Bristol. Dorkings first at Hants and Berks, and among them first of all come Coloured Dorkings, cock and hen. I have myself no objection to this showing of pairs, and considering the pairs, the whole number of birds shown was 414, and at Clifton there were 262 single birds shown; so, counting single birds, and not pens, there was no such great difference between the two Shows. Counting bird and bird they stand thus—Clifton, 600 head of poultry; Reading, 414 head of poultry.

The Coloured *Dorkings* were good, but in the third-prize the hen was apparently half silver-grey, so light was her colour. Rev. G. F. Hodson also showed a very good pen. Of Silver-Greys proper there were very few, and those shown with the White; the first Whites a beautiful pair. All the varieties of *Cochins* were shown together. Among them, Balis first, White second, and Blacks commended; they might have been *h.c.* instead of *c.* Many of the *Game* were too small. Among Black Reds Mr. Matthews showed a beautiful pen, No. 35. The second-prize Brown Reds pleased me much. Mr. Matthews' first-prize Duckwings were beautiful; the second too light in colour; the next pen, No. 61, better in this respect according to my taste. The *Polands* were treated liberally, being separated into Golden and Silver. This, no doubt, was quite right. This arrangement brought three pens of Golden and five Silver; all were good. Mr. Hinton took first with a pair of Silvers, which he valued at only £22s., and nothing with a pair in his estimate worth £21! Of course the first-prize birds were sold at once, their price being only 10s. more than the prize they won. This singular difference of estimate in birds by a veteran fancier and veteran Judge was singular. My view was that the hen in the unnoticed pen was the better, particularly the marking of her topknot. Shall I congratulate or condole with Mr. Hinton on his luck? The *Spanish* were not much. The *Hamburgs*, unlike eight years ago, were numerous, but another show kept, it was said, Mr. Beldon's birds from Reading. In all the varieties there were many, and some good. In size the birds shown in the same varieties varied much, some to my mind being over large. *Brahmas* in both classes were strong, the Whites, even the prize birds, too yellow. Among the Dark was one pen, No. 141, that struck me more favourably than it did the Judge, for it was unnoticed; but then the Judge can handle birds, the reporter only can look at them, for I once tried, but was summarily stopped. The *Game Bantams* were too much Bantams. There was a pen which belonged to the same owner as the second-prize birds, and next to them, which contained a thoroughly good cock, wing well tucked-up, and tail without the suspicion of a squirrel turn. The Any other variety Bantams were not numerous—no Silver Sebrights (where were those shown at Clifton? they must have been first).

Passing the few French fowls of different varieties I reach one of the best classes in the whole Show—that for any description not in the former classes. First Malays. That noble bird of Mr. Hinton's, bred splendidly large—how did he manage to get him so fine? Second Black *Hamburgs*; rather too nearly related to Spanish. *h.c.s* were thickly scattered, a pair of Scotch *Dumplings* being thus noticed. The legs were short, but the fowls larger than I used to see in that class in Scotland. A pair of *Aedulians* were also present, a variety always grateful to the eye at a show from their unique colour; so also pleasant to see from their rarity was a pair of White Malays. If I were a committee, one man made into many, I should give more prizes to a Variety class than any other, for I am sure it is the class of all others that pleases the public. I would give four or five prizes, always withholding some unless the specimens were worthy. It must be borne in mind that other classes are for enthusiastic fanciers of their special varieties, but the Any variety is the people's class, and also the class in which a man exhibits his second and smaller hobby, or his wife's it may be; and "any variety" gives variety, and variety is always pleasing. Rouen *Ducks* good, Aylesburys not so good. Among other Ducks, good East *Indians* first; Mr. Sunsbury's *Shovellers*, shovel-like bills indeed, second. Two pens of *Muscovys*, formerly often seen in farmyards in the Fens. *Geese*, in pens, at least very few—only two. Mr. Ridley's *Turkeys* very fine.

PIGEONS.—The food is too often scattered on the floor, consequently the wattled birds were starving. I put this remark first, and I hope fanciers will demand that there should be pans for food or not send their birds. It is almost a case for the Society for the Prevention of Cruelty, and for an article in "The Animal World."

Carriers.—Second-prize better than the first if the cock had not been Roman-nosed. **Tumblers.**—Only two pairs: first good Kites, second fair Black Mottled. And tell it not at Glasgow, not a single *Pouter* in the Show, except a girl who was having a tiff with her lover in front of the pens, and she pouted so well I should like to have put her in a large pen, labelled "A good *Pouter*, but by no means to be commended." **Fantails.**—Blue first—first, no doubt, because of the rarity of this colour con-

sistent with fairness of shape and tail. Miss Milward won second with *Fantails* of the special *Fantail* colour—pore white. The *Trampeters* were much better than at Clifton. Blacks first, Mottled second. Almost all the eight pens had merit.

Homing Birds were very numerous indeed—the largest class in the Show. All but one pair belonged to Reading or its immediate neighbourhood. How these birds were to be managed was in this way: "The birds," said the catalogue, "will be liberated at two o'clock on the last day of the Show, having been previously stamped with a number which will be unknown to the owner. The prizes not to be paid to the winner unless the number which will be found on the birds on their return home be communicated to the Secretary by a letter posted on the day after the Show." This notice I own I cannot understand. First prize, according to ordinary judging in the tent, went to a pair of Silvers; second to a pair of Red Chequers, by no means of a rich colour.

The Any other distinct variety class—seventeen pens, three, however, empty—brought together a pair of Runts not matching; a pair of very old Barbs, which reminded me of the tale of a poor woman near me, who bought a second-hand dress of a material which had once been very good rather than a new dress of an inferior material, new and showy, but not good. Upon her being questioned by a neighbour as to her preferring the old dress to the new she answered, "I like the has-beens better than the never-wases." The second prize in this class went to a pair of *Isabels*—the cock a nice upright bird—or, as they did not show clearly the white bars, they might be called *Pigmy Pouters*. But the *Pigeons* that caught and attracted my attention most were entered as *Chequered Autwerps*. These, thus called probably by the printer's mistake, should surely be called *Chequered Archangels*, and exceedingly pretty birds they are—good, clear, blue-chequered wings and yellow necks, the colours contrasting admirably, and the form *Archangel*-like. I should like to know the history of these birds, and whether they breed true, for without doubt they are very pretty.

Such were the poultry and *Pigeons*. I strolled through the Dog tents, and shall not soon forget a lovely *Maltese* reposing on its blue velvet cushion, on which was embroidered its name, "Madge." I looked at the Rabbits, and was glad, as a fancier of *Lops* when I was a boy, that they held their own still. I walked from one part of the Show to another; had to pay 2d. for sitting two minutes in a chair, a very sharp boy pouncing on me, and a man of stern aspect coming up after and demanding a second 2d., and scarcely believing me when I told him I had already paid. Oh, Hants and Berks! this is scarcely a "royal" proceeding to charge for a rest on a chair. Why, Bath and West of England would scorn to do it, for around the band-stand were at Clifton plenty of seats, and the music was listened to without being disturbed by exacting man and boy. I noticed in my ramble a very pretty rustic pole-house for *Pigeons*. I notice it, not wishing anyone to buy or erect such a cruel abode for the poor birds, but simply to show that the fancy is attracting attention now, or such an ornamental work would scarcely have been exhibited. May the Hants and Berks prosper, and increase as much in the next eight years as in the eight years that have last passed.—WILTSHIRE RECTOR.

MORE SHOWS.

I was exceedingly pleased this week to hear that another town in Devonshire was about to hold an exhibition of poultry and *Pigeons* for the first time. It always gives me pleasure to hear such news, so I wrote and obtained the list of prizes that were to be offered; I found they were small to what we generally see, but I also found that the entry fees were small as well, and in proportion to the prizes. Taking into consideration that the town contains only a few inhabitants comparatively speaking, that there are only a small number of fanciers residing there, if any, and that this is the first effort—taking into account these drawbacks, I think the deficiency in the amount of the prizes cannot be wondered at. But my object in writing this is not so much about the South Molton Show, for that is the name of the place to which I refer, but to put it forth as an example to other places which have every opportunity to form a good show. There are scores of towns in England that have everything that is necessary to get up a really good exhibition, and yet with all their advantages they do not make a beginning. I feel certain that if some of these places were to make an effort by offering liberal prizes with low entry fees, were to adhere to the regulations that are formed, and were to have competent judges, they could not fail to make it a success. Let every town make the most of the advantages it already has; and should anybody be desirous of establishing a Show, let him take care that there is no other show to be held on the same day that will be likely to interfere with the arrangements. This can be avoided by advertising when the show will be held as soon as it is decided upon. Also let sufficient and qualified judges be appointed, and let the public know who they are to be by printing their names on the list of prizes, and in the poultry journals. I trust

shortly to see some more towns making an attempt to form poultry and Pigeon Shows, and I hope their exertions may not be in vain.—F. S. H.

THE STANDARD FOR PRIZE POULTRY, &c.

Upon reading the account of the formation of the National Ornithological Association at the last Crystal Palace Poultry Show, I was in hopes there was a possibility of something definite taking place in the matter of deciding upon a standard for judging poultry, &c., but up to the present time there seems to be no likelihood of anything being done in the matter; and the more I hear and see of the conflicting awards at the different shows, the more I am convinced of the necessity of some standard rules being laid down, to guide not only exhibitors but also the judges in making their awards. At the present time it is quite a lottery in prizetaking; each judge seems to have a standard of his own, frequently at variance with that of others; but I am of opinion the matter might easily be set at rest if our principal judges would take it in hand and agree amongst themselves what shall be the correct standard for prize poultry.—AN OLD FANCIER.

WHAT IS A "WHITE" BANTAM?

I RECENTLY received a prize-list of the Ipswich Show, and finding a class for "Black or White" Bantams, entered a pen of the former, on the supposition that those two varieties only would compete. The third prize was awarded to a "Japanese." Now, this might be a "White Bantam" (provided it was not one with a black tail) in a broad sense, but certainly is not what is generally understood to be such; and it was either a mistake to award the prize so, or the schedule was calculated to mislead. I, amongst many others, make it a rule never to show where more than the Black and White Bantams compete in one class, and I should not have entered for Ipswich had I known the class was open to other varieties.—E. CAMBRIDGE.

THE POULTRY-KEEPER.—No. 9.

LA FLECHE.

COCK—CHARACTERISTICS.

Body.—Well formed, firmly set on long and strong legs. The bird seems smaller than it is in reality, because the feathers are close-fitting. All the muscular part is well developed. Plumage black. Of all the French cocks the La Flèche (fig. 4)

Fig. 4.—La Flèche Cock.

is the one of most upright carriage. It is much like the Spanish, from which some believe it has been bred by crossings with the Crève-Cœur. Others think this variety is descended from the Breda, to which it has some points of resemblance. Skin white

fine, transparent, and elastic. Flesh tender, juicy, delicate, and readily fattened.

WEIGHT, SIZE, AND PECULIARITIES.

Weight.—At full age from 7½ lbs. to 8 lbs. 13 ozs. Flesh extremely fine and abundant. Bones light, about one-eighth of the weight.

Size.—From the upper part of the head to under the feet, 21½ inches. In an upright position, 25½ inches. From the back under the feet, 16½ inches.

Body.—Circumference taken in the middle under the wings, and where the thighs join it, 22½ inches.

Length of Body.—From the beginning of the neck to the end of the rump, 11 inches. Size of shoulders, 7½ inches.

Head (fig. 5).—Length, 3½ inches. Cheeks nearly naked from the beak to the ear.

Crest.—A little plume of feathers, sometimes short and straight, and sometimes long and drooping, is placed on the forehead, but behind the comb.

Fig. 5.—La Flèche Cock's Head.

Fig. 6.—La Flèche Cock's Comb.

Comb (fig. 6).—From 1½ inch to 2 inches, transversal, double, in the form of horns, bending forward, united at their base, usually far apart at their points, often united and pointed; sometimes having in the middle some branches. A small double comb which comes out of the upper part of the nostrils is placed about ¼ inch in front, and though hardly as big as a pea, this, which surmounts an elevation formed by the enlargement of the nostrils, gives a peculiar look to the head.

Wattles.—Hanging and very long, from 2½ inches to 3½ inches.

Ears.—Very large and folding under the neck, of a clear dull white, especially at the mating time. It is those which have the greatest white ears that most resemble the Spanish. The little bunch of feathers which covers the auditory organ is black.

Nostrils.—Very open, and of a peculiar shape. They are formed within the elevation that is in front of the small comb.

Beak.—Strong, slightly bent, of a grey sombre colour, becoming yellow at the point. Length, 1½ inch.

Iris of Eye.—Brilliant red, more or less deep.

Pupil.—Black.

Physiognomy of the Head.—The physiognomy is determined above all by the little elevation which comes out around the nostrils, surmounted by a little comb. This prominence of the comb seems to increase the characteristic depression of the beak, and gives some likeness to the rhinoceros. The comb and horns are like the Crève-Cœur, and the large white ear is like the Spanish.

Foot.—Sole of the foot very strong and very muscular. Circumference, 2½ inches.

Toes.—Strong, with long claws. Middle ones, 3½ inches; inside and outside, 2½ inches; hind one, 1½ inch.

Colour of the Foot.—Blue slate, more or less dark according to age, turning to dark grey in old age.

Weight of Chicken.—The chickens may be eaten when about five months old, but generally they are not fattened till seven or eight months old, the time when they have arrived at their last stage of growth. The male then takes the name of "a maiden cock," and when his fattening is ended, which should last a month or six weeks, he weighs 11 lbs. or more. A maiden cock not fattened at the age of eight months is from about 7½ lbs. to 8½ lbs., equal in weight to an adult cock in good condition. The weight of the flesh is variable, according to the stage of fattening, and if that of the bones is one-eighth in its normal condition, it is under that when the bird is fattened.

Plumage.—The plumage of La Flèche is entirely black, with the exception of some small white feathers, which may sometimes be seen in the small crest. The feathers of the neck are

long, fine, and thick; are iridescent with green and violet, and so are the feathers of the breast, the wings, the covert of the tail, the sickles, the extremities of the shoulders, the large feathers of the pinion, and the outside flight ones. The feathers of the thighs and the outside of the pinion are black. The feathers of the abdomen and of the side are greyish black. Amongst the large flight feathers are some of violet black with a green iridescence, and there are some white feathers before the first moulting.

DRIFFIELD POULTRY SHOW.

THE annual Show was held on June 21th, and but for a heavy thunder shower was a great success; but the rain was so heavy as to wet the birds to such an extent, that it was with great difficulty some of the awards were made.

Dorkings were of no great merit with the exception of the first-prize pen, which consisted of capital Dark Greys; but *Cochins*, on the contrary, were a fine collection, a splendid pen of Buffs winning the cup, and the same exhibitor also winning the second prize. *Brahmas* were poor in all respects, while the *Spanish* were but moderate, and only two pens were shown. In the three classes of *Hamburghs* there were only ten entries; the cup being won, however, by a good pen of Golden-pencilled, the first in Spangles being Silvers of fair merit. There were twenty-two entries in all of *Game*, the cup being awarded to a Black Red stag of promise, but which will improve with moulting; the second prize in the Red class going to Brown Reds of fair quality. The first-prize Duckwings were very good, but the rest poor, while the single cocks were a bad class. There was one class for *Game Bantams* and one for other varieties, all the birds in the latter being Blacks. The cup for Bantams was won in the single cock class, if we mistake not, by the Acering-two cup cock, which was shown in fine order; second coming a stylish Pile. Mr. Harvey's Golden Polands were awarded a cup in the Variety class, and well merited their position.

The **PIGEONS** were a good entry, and some of the winners will doubtless be heard of again, the cup for the best pen being awarded to a White Pouter cock such as we have not seen of late for style, girth, and carriage, the second being Black. The first-prize bird at Thorne was altogether out of show condition. Jacobins formed a capital class; the first a Red, very good in hood and chain. Fantails were very good, and the winners well placed. In the Tumblers awards were made more to head properties than colour, the first-prize bird failing much in the latter point. Nuns were very good, but the Dragons poor as a class; the first was, however, a good Blue. In Antwerps only two awards were made, and we considered this a stretch of privilege, the quality being very poor. In the Variety class a good Blue Owl stood first, with a Barb second.

A flying match from Scarborough to Driffeld excited some interest, the first being £1 by the Society, and second and third prizes given by tradesmen.

RABBITS.—The Lop-eared were a very good class, and many were noticed in the list, the first prize going to a Tortoiseshell doe of good length of ear and good colour, but not one of the largest, yet the award was correct. Second came a Black-and-white. In Himalayans both prizes were won with fair Rabbits, but there is room for improvement in this variety. A well-known doe won in Silver-Greys, but this is not in the best show condition, a fair buck being second.

DORKINGS.—1, W. Moritt, Goole. 2, R. W. Richardson, Beverley. c, D. White, Driffeld.

SPANISH.—1 and 2, J. W. Duggleby, Driffeld.

COCHINS.—Cup, 1, and 2, G. H. Proctor, Durham. *hc*, J. Allison, Driffeld; E. Winwood, Worcester; D. & J. Ibeson, Whitby. c, W. Harvey, Sheffield.

BRAHMAS.—1, F. Dobson, Kirbymoorside. 2, W. G. Purdon, Driffeld.

HAMBURGHS.—*Gold or Silver-spangled*.—1, J. W. Duggleby. 2 and *hc*, G. Holmes, Driffeld. *Gold or Silver-pencilled*.—Cup, 1, and 2, G. Holmes. *Cock*.—*Any variety*.—1, Master C. Holmes, Driffeld. 2, J. W. Duggleby.

GAME.—*Black-breasted or other Reds*.—Cup and 1, G. Akroyd, Sheffield. 2, H. M. Julian, Beverley. *hc*, Master T. Holmes; W. Adams, Ipswich. *Any other variety*.—1 and 2, A. & H. H. Staveley, Tibthorpe, Driffeld. *hc*, J. W. Duggleby. *Cock*.—*Any variety*.—1, H. M. Julian. 2, G. Sutton, Bootham, York. *hc*, M. Hunt, Bridlington.

BANTAMS.—*Game*.—1, F. Steel, Halifax. 2, E. Newbitt, Epworth. *hc*, R. J. Harley, Altrincham. c, W. Adams; Master C. Holmes. *Any other variety*.—1, W. Robinson, Driffeld. 2, Master Baron, Driffeld. *hc*, I. Dyson, Halifax; H. White, Norton, Malton; R. H. Ashton, Mottram. *Cock*.—*Any variety*.—Cup and 1, G. Anderson, Accrington. 2, E. Newbitt. *hc*, W. Adams. c, R. Stabler.

ANY OTHER VARIETY.—Cup and 1, W. Harvey, Sheffield. 2, G. Holmes.

FARMYARD CROSS.—1, G. Pounder, Kirbymoorside. 2, J. Ireland, North Fordingham. *hc*, G. Robinson, Fordingham.

SELLING CLASS.—1, G. Holmes. 2, T. Hope, Nantwich. *hc*, Miss E. Holland, Halifax; W. H. Young, Driffeld; G. Holmes, Driffeld. c, W. Hyde, Welham; R. Stabler.

TURNKEYS.—1, J. S. Jordan, Elmswell. 2, W. Taylor, Driffeld Wood.

GEES.—1, Mrs. A. O. Young, Driffeld.

DUCKS.—*Aylesbury*.—1, Mrs. Young. *Any other variety*.—1, C. Crowe, Bridlington. 2, Mrs. J. S. Jordan.

DISTINCT VARIETY.—*Six chickens*.—1, J. W. Duggleby (Spanish). 2, J. S. Jordan (Black Red Game). *hc*, G. Copley, Driffeld; Mrs. Hodgson, Driffeld; Mrs. Naylor, Driffeld.

PIGEONS.

CARRIERS.—1, J. E. Crofts, Blyth, Workop. 2, W. Harvey, Sheffield. c, J. A. J. Pickering, Mrs. Blanchard, Driffeld.

CROPPERS.—Cup and 1, Mrs. Blanchard. 2, J. E. Crofts. *hc*, J. Fawcett, Whitby. c, A. Spencer; J. Hainsme, Hull.

JACOBINS.—1, J. Blanchard, Driffeld. 2, J. E. Crofts. *hc*, J. Maynard, Driffeld; D. M. Garside, Manchester; J. Blanchard. c, W. W. Beerott, Hull; W. Harvey.

FANTAILS.—1, R. W. Richardson, Beverley. 2, C. Hall, Driffeld. c, J. Loveridge, Newark; C. N. Lythe, Gillingham, Hull.

TUMBLERS.—1, W. Adams. 2, W. Harvey.

NUNS.—1, R. W. Richardson. 2, J. A. Blanchard. *hc*, W. Leason, Driffeld.

TURNKEYS.—1, R. W. Richardson. 2, J. E. Crofts. *hc*, Master R. Maynard.

MASTER J. A. BLANCHARD.

TURNKEYS.—1, J. E. Crofts. 2, J. Marshall, Driffeld.

DRAGONS.—1, W. Harvey. 2, G. Blakey, Driffeld. *hc*, R. W. Richardson.

C. W. SMITH, LIVERPOOL; MISS N. MAYNARD, DRIFFELD; J. E. CROFTS; W. W. BEEROTT.

TURNKEYS.—1, J. W. Duggleby. 2, G. Blakey.

ANY OTHER VARIETY.—1, R. W. Richardson. 2, J. Aconley. *hc*, J. E. Crofts;

C. WROOT, HULL; W. HARVEY. c, R. W. RICHARDSON; J. BLANCHARD.

SELLING CLASS.—*Single or Pairs*.—1, Miss E. Maynard. 2, J. Aconley. *hc*, J. E. Crofts.

FLYING RACE.—1, W. Foster, Driffeld. 2, G. T. Foster, Driffeld. 3, T. Laycock, Driffeld.

RABBITS.

LOPS.—1, S. Myton, Fortes Noll, York. 2, J. Hume, York. *hc*, W. H. Raylor, Driffeld; S. Myton; J. Bowman, York; J. Wharton, York; J. Blakey. c, S. Myton; Master H. Hope, Driffeld.

HIMALAYAN.—1 and 2, W. Donkin, Driffeld. *hc*, J. Hudson, Driffeld.

SILVER-GREY.—1, J. H. Brand, Barton. 2, J. Mason, Hull. *hc*, J. Chappel, Dewsbury Moor.

ANY OTHER VARIETY.—1, W. Donkin. 2, A. Lund, York. *hc*, Master Topham.

BOSTON; J. MASON, c, J. MASON.

RABBIT.—Cup, W. Donkin.

CAT.—*Any variety*.—1, J. T. Foster, Little Driffeld. 2, W. Dale, Driffeld.

EXTRA STOCK.—1, Master Topham; Miss Robinson, Swaythorpe (Guinea Fowls). 2, G. Hawkins, Driffeld; Mrs. Rawlinson (Guinea Figs).

The Judges were Mr. W. Cannan, of Bradford, and Messrs. Maynard and Preston.

DONCASTER POULTRY SHOW.

THE good old town of Doncaster held its annual meeting on June 25th and 26th, when there was a good attendance of visitors.

Game were first, and in five classes had thirty-five entries, although taken altogether the entries were but scanty, at which we were surprised, for the prizes were good, though the classification was defective, as will be seen in the *Hamburghs*, where the Golden-pencilled were left out altogether. The cup for *Game* was awarded to a Brown Red cock, which though good was very deep in moult; the second, a Black Red very good, might have occupied that position, and in the following class the awards were considered to be bad, the second-prize pair being by far the best. In the next class a good pen of Brown Reds won; we think they were about the best pen in the Show, and the second prize we should have placed on pen 549. In Duckwings the hen in the winning pen was perfection. Messrs. Thornton and Chaloner also showed well. Of Silver-Grey *Dorkings* there was but one entry, but there were ten of Dark-Greys, the prizes being well placed. In *Spanish* the first-prize cock was very coarse, but the hen was excellent. The second-prize cock was fine, but the hen not equal to the first. The third-prize pen contained a good hen. In *Cochins* the first and third were Buffs, and the second White. In *Brahmas* the first-prize cock was perhaps one of the best that has been exhibited, but the hen was poor. We did not agree with the second and third awards, which ought to have been placed on Mr. Crabtree's pen. To know the quality of the *Hamburghs* we need only refer to the prize-list, where we find Mr. Beldon winning with every pen, as also in *Polands*. In *Game Bantams* we found them all Black Reds in the first class, Mr. Entwistle leading with the best coloured pair of Black Reds that has been seen for some time, securing the second prize also, and the third well deserved its position. In the following class Piles were first and second, no third being awarded. There was a class for Whites with only one entry, while no class was provided for Blacks, of which there is always a good muster, nor for any other colour. Of *Turkeys*, *Geese*, and *Ducks* the entries were few, but the winners generally good.

PIGEONS.—There were six classes with thirty-nine entries, Mr. Yardley winning three first prizes with good birds. In Carriers the first was a well-known Black cock, and second a Dun. In Jacobins, however, the awards were badly placed, Pen 701 being by far the best in the class, and unnoticed. In the Variety class the first were Black Barb, and second Ice Pigeons, and the awards were well made; but in Fantails the prizes ought by all means to have been reversed. The Selling class had six entries, the first White Turbitts, second poor Ice Pigeons, while a pair of Black Swallows ought in our opinion to have been in the list. Turner's pens were used, and the arrangements and attendance were very good.

GAME.—*Cock*.—Cup and 1, C. W. Brierley, Middleton, Manchester. 2, C. Chaloner, Whitwell, Chesterfield. 3, J. Fletcher, Stoneyhough, Manchester.

c, H. M. Julian, Hull; J. Jackson, East Markham, Tuxford.

GAME.—*Black-breasted Reds*.—1, J. Mason, St. John's, Worcester. 2, T. Woods, Sooton, Workop. 3 and *c*, C. Chadner, Whitwell, Chesterfield.

GAME.—*Brown and other Reds except Black-breasted*.—1, C. W. Brierley. 2, H. M. Julian, Hull. 3, Sales & Bentley, Whitwell, Chesterfield.

GAME.—*Duckwings and other Greys and Blues*.—1, Sales & Bentley. 2, J. W. Thornton. 3, C. Chaloner. c, W. HAWA, Tickhill, Rotherham; F. B. Frank.

GAME.—*Any other variety*.—1, R. Walker, Gomersal, Leeds. 2, C. W. Brierley.

3, H. C. & W. J. Mason, Bristol, Leeds.

DORKINGS.—*Silver-Grey*.—1, W. Roe, Newark. *Any variety*.—1, J. Walker, Rochdale. 2, J. White, Warley, Northampton. 3, W. Moritt, Goole.

SPANISH.—1, J. Thresh, Bradford. 2, H. Beldon, Gillingham, Bingley.

BURCH & BOUTLER, SHEFFIELD. c, J. POWELL, BRADFORD.

COCHINS.—1, W. H. Crabtree, Levenshulme, Manchester. 2, W. Whitworth, jnn., Longsight, Manchester. 3, J. White, Whitley, Netherthorn, Wakefield. c, H. Beldon.

BRAHMAS.—Cup and 1, W. Whiteley, Sheffield. 2, J. F. Smith, Sheffield. 3, T. F. Abndell, Cowley Mount, St. Helen's. c, W. H. Crabtree; G. Fox, Hanfield, Wilmslow, Cheshire.

HAMBURGS.—*Silver-spangled*.—1 and 2, H. Beldon. 3, Ashton & Booth, Broadbottom, Mottram. *Silver-pencilled*.—1 and 2, H. Beldon. 3, J. Clarke, Doncaster. *Golden-spangled*.—1 and 2, H. Beldon.

POLANDS.—1 and 2, H. Beldon. 3, A. Silvester, Sheffield.

BANTAMS.—*Black-breasted and other Bantams*.—Cup, 1, and 2, W. F. Eutwile, Westfield, Bradford. 3, J. K. Fletcher. c, Sales & Bentley. *White*.—1, Pickles and Whittaker, Greatfield, Edinfield, Eury.

GAME BANTAMS.—1, J. K. Fletcher. 2, F. Steel, Halifax.

FRENCH FOWLS.—Cup, W. H. Crabtree.

ANY VARIETY.—2, A. Cameron, Epworth; W. Mitchell, Birkenshaw, Leeds. c, W. Roe, Newrick; E. A. Johnson, Wath-upon-Deane.

GUINEA FOWLS.—1, W. H. Young, Driffield. 2, C. Stacey, Wilby, Doncaster.

TURKEYS.—1, J. Walker, Rochdale. 2, Miss Jordan, Eastburn, Driffield.

DUCKS.—*Aylesbury*.—1 and c, J. Walker, Rochdale. 2, W. Stonehouse, Whitley, Rouen. 3, W. Swann, Redington. c, J. Walker. c, G. Fentiss, Kirby Moorade; G. Fox, Hanfield, Wilmslow. *Any other variety*.—1, J. Walker. 2, Mrs. Arkwright, Sutton Scarsdale, Chesterfield. c, G. Liddle, Doncaster.

GESE.—1, J. White. 2, J. Walker.

SELLING CLASS.—1, Burch & Boulter, Sheffield (Spanish). 2, W. Whiteley, Sheffield. 3, J. B. Hepworth, Bears Wood Green (Game). c, F. B. Frank, Doncaster (Golden Sebright Bantams).

PIGEONS.

CARRIERS.—1, H. Yardley, Birmingham. 2, J. E. Crofts, Blyth, Worksop.

JACOBIANS.—1, H. Yardley. 2, S. Bamford, Conisborough. c, C. Anton, York.

ANTWERPS.—1, H. Yardley. 2, C. Anton.

ANY OTHER VARIETY.—1, C. Anton. 2, J. E. Crofts. c, J. Skilbeck, Coulton, Hovingham, York; H. Yardley.

FANTAILS.—1, W. W. Fowler, Pontefract. 2, J. F. Loversidge, Newark. c, H. Yardley, C. Anton.

SELLING CLASS.—1, W. W. Fowler. 2 and c, J. E. Crofts.

JUDGE.—Mr. J. Dixon, North Park, Bradford.

THIRSK POULTRY SHOW.

THE annual Show of the Agricultural Society was held at Thirsk on June 21th, in a large field very pleasantly situated, and with the exception of a drenching thunder-shower, which, though affecting the receipt of gate-money in a very serious manner, was not at all unwelcome in the parched-up state of the pastures in this neighbourhood, the day was a genial one. The pens used for poultry and Pigeons were those of the Society, made of wood on three sides, with a moveable front, and were both convenient and comfortable. Although the prizes were but small, and in Pigeons only one in a class, yet there were some very good birds; and the town being well situated for the transit of the birds, we strongly advise the Council to recommend an extended list, which will, without doubt, prove something like self-supporting.

Dorkings came first, two grand pairs of massive birds taking the prizes. *Spanish* cocks were poor, but the hens good; and in *Buff Cochins* were some very creditable specimens. Partridge were but poor; while only the winners in *Brahmas*, Dark and Light respectively, demand a note. *Golden-spangled Hamburgs* had three good pens, notably the first, which were as nearly correct as possible. *Silvers* were wretched; while the *Golden-pencilled* had a large entry, and some good ones; but in *Silvers* only one prize was awarded. In *Polands*, *Golden* won both prizes, and a fair pen of *Silvers* was shown. *Black Hamburgs* were poor as regards the cocks, but the hens were good. *Black Bantams* were a large class. There were many nice birds shown, though some were a little out of feather, the first being very neat; but they would have been beaten by the second had not the cock been in the wars. A third was awarded, and the hen in this pen was very small and pretty. *Game Bantams*, with the exception of the winners, were very shabby, and we recognised some recent winners in rather poor plight in that respect; the first being a stylish pair of *Duckwings*; and the second, though rather large, very fine in colour. In the *Variety* class, *Silver Sebrights* were first, and *White-booted* second.

Both *Rouen* and *Aylesbury Ducks* were very good; while a grand small pair of *Blacks* were shown in the next class. *Turkeys* and *Geese* were good in size, but few in number. In the *Variety* class were, first capital *Creve-Coeurs*; second *Houdans*, good and perfect in combs; while some good *Silbies* were highly commended.

A class was provided for chickens, but the show being a month earlier than heretofore they were not so well developed, but some promising birds were to the front; *Buff Cochins* being first, *Dark Dorkings* second, and two nice pairs of *Spanish* were very highly commended; no doubt these will be heard of again.

For *Pigeons* only one prize was offered, but the entries were pretty good, the quality of the winners being quite up to the mark. *Carriers* were a very equal lot, *Blacks* being first, and *Duns* highly commended. In *Pouters* a pair of smart stylish *White* stood first, and measured well; a good pen of *Red-pied* came unpleasantly close. *Tumblers* were poor; but the first-prize *Red Jacobins* very good; and *Fantails* a grand class in all respects. Of *Trumpeters* there was only one pen; and two of *Owls*, the first *White English*, and though good, showing a lot of the *Barb* cross. *Nuns* fair, but some trimmed; while the quality of *Barbs* was not high. Of *Dragoons* and *Turbits* there

was but one pen each. The *Variety* class was very interesting, a good handsome pair of *Black Swallows* winning first; *Plain-backed* Ice second; while two pairs of *Magpies* were noticed in the list. An able staff of attendants looked well to the comfort of the birds, in both food and water, and all were penned and repacked with the greatest promptness.

DORKINGS.—1 and 2, J. White, Warshaw, Northallerton. hc, T. P. Carver, Langthorpe, Boroughbridge.

GAME.—1 and 2, J. Watson, Knaresborough. 2, J. Robshaw, Whitley.

SPANISH.—*Black*.—1 and 2, Pallister & Hawkins, Tophelfe. 2, H. Dale, Northallerton.

COCHIN-CHINA.—*Buff*.—1, D. & J. Ibbeson, Whitley. 2, Lady Bolton, Bedale. hc, Wells & Sherwin, Ripon. c, Mrs. Brown, Easingwold. *Partridge*.—1 and 2, J. Bell, Kirkcaldie, Thirsk.

BRAMA-FOOTIA.—1, Mrs. Brown. 2, G. F. Umpleby, Boroughbridge. c, Mrs. Reed, Fotto, Yarm.

HAMBURGERS.—*Golden-spangled*.—1 and 2, G. Fentiss, Marton, Kirbymoorside. hc, T. P. Carver. *Silver-spangled*.—1, G. Waite, Swanton, Malton. 2, C. Holdsworth, Harrogate.

HAMBURGERS.—*Golden-pencilled*.—1, T. & G. Kidson, Norby, Thirsk. 2, J. Webster, Whitley. hc, G. Shipper, Kirbymoorside; D. Waller, Stokesley; C. Metcalfe, South Kilvington; J. Watson; Wells & Sherwin (2). c, J. Robshaw; J. Wetherill, Northallerton. *Silver-pencilled*.—1, J. Robshaw.

POLANDS.—1 and 2, J. Watson. 2, J. Clayton, Thirsk.

BANTAMS.—1 and 2, C. Walker, Boroughbridge. hc, T. Nuno, Thirsk.

BANTAMS.—*Black*.—1, Wells & Sherwin, Ripon. 2, R. H. Ashton, Mottram. vhc, T. P. Carver. hc, F. Steel, Stump Cross, Halifax; T. P. Carver. c, J. W. Corner, Whitley; Pallister & Hawkins; A. G. Mitchell, Bishop Auckland.

GAME BANTAMS.—1, F. Steel. 2, W. Gray, Towlaw, Darlington. hc, W. C. Dawson, Whitley (2). c, J. G. Bell, Ripon.

GUINEA FOWLS.—1, W. C. Dawson, Whitley. hc, T. P. Carver. 2, J. H. Cartwright, Wetherill, Northallerton. *Any other variety*.—1, T. P. Carver. hc, Wells & Sherwin.

DUCKS.—*Rouen*.—1, G. Fentiss. 2, T. P. Carver. hc, C. Graham, Aldborough, Boroughbridge; T. P. Carver. *Aylesbury*.—1 and 2, T. P. Carver. *Any other variety*.—1, T. P. Carver. 2, Mrs. Reed.

TURKEYS.—1, C. McC. Swarbrick, Sowerby.

GESE.—1 and c, J. Arrowsmith, South Kilvington. 2, Wells & Sherwin. hc, W. A. Speck, Thornborough, Thirsk.

GUINEA FOWLS.—1, Wells & Sherwin.

SELLING CLASS.—1, Pallister & Hawkins. 2, C. Holdsworth. hc, J. Cooper, Thirsk; T. P. Carver.

ANY OTHER VARIETY.—1, T. P. Carver. 2, Lady Bolton (Houdans). vhc, C. Holdsworth (Japanese). hc, Hon. W. O. Powlett, Bedale (Creve-Coeurs). c, J. Morton, Skipton-on-Swale (Mascary Ducks); C. Lickley, Ripon (Black Cochins-China); Miss Jaques, Richmond (Houdans).

ANY VARIETY.—*Chickens*.—1, Lady Bolton (Dark Brahmas). 2, J. White (Coloured Dorking). vhc, Pallister & Hawkins (2). Lady Bolton (Houdans). hc, Hon. W. O. Powlett (Light Brahmas); Lady Bolton (Buff Cochins); J. E. F. Fountier, Yarm (Black and Red Game). c, F. C. Taylor, Middlesbrough (Golden-pencilled Hamburgs).

PIGEONS.

CARRIERS.—1, J. Aconley. hc, D. M. Garside, Broughton; Wells & Sherwin; T. C. Taylor.

TUMBLERS.—*Almond*.—1, Wells & Sherwin. *Any other variety*.—1, Wells and Sherwin.

POUTERS.—1, J. Aconley. hc, Wells & Sherwin.

JACOBIANS.—1, J. Aconley. c, T. C. Taylor.

FANTAILS.—1, R. Wilson, Thirsk. vhc, T. C. Taylor; J. Wetherill, Northallerton. hc, Q. T. Blinn, Higher Broughton; Wells & Sherwin.

TRUMPETERS.—1, R. Wilson.

OWLS.—1, J. Aconley. hc, D. M. Garside.

NUNS.—1, Wells & Sherwin. hc, R. Wilson.

BARBS.—1, J. Aconley. hc, R. Wilson; Wells & Sherwin.

TURBITS.—1, R. Wilson.

DRAGONS.—1, Wells & Sherwin.

ANY NEW OR DISTINCT VARIETY.—1 and vhc, Wells & Sherwin (Swallows and Iech. hc, F. J. Kettlewell, Sowerby (Black and White Magpie); R. Wilson (Magpie).

The Judge was Mr. E. Hutton, Pudsey, Leeds.

IPSWICH POULTRY SHOW.

ALTHOUGH it must be admitted that prior shows at Ipswich have been much larger as to the number of entries, in almost every variety the competition this year outvied all preceding ones. The Show of last week was held, not as formerly in the Ipswich Corn Market, but under a couple of excellent tents in the grounds of the Lower Arboretum. This leads to a remark on an arrangement that is worthy of special note as not only adding most materially to the comforts of the birds, but also of everyone who viewed them. Thunder and excessive heat marked the weather, and Mr. Jeffries, the Manager, had very wisely provided an opening in the centre between the two tents, which, whilst acting as a shaft, insuring perfect ventilation and consequent comfort, provided as efficiently against any stress of weather from rain causing injury to the valuable collection on view. The only improvement the most fastidious could suggest was that had the pens been placed a little higher from the ground the general effect would have been improved. A very great change in the prize schedule was a matter of general congratulation. The conventional silver cups given as special prizes were superseded by lock-stitch sewing machines, lawn mowers, poultry coops, garden vases, and vases for table decoration. This change is certainly one that those who have obtained large collection of cups could not fail to appreciate, as we could refer to sideboards the owners of which, being absolutely overburdened with this description of plate, speak as lightly as truly of the utility of such prizes when secured by the score, or perchance the hundred.

The *Buff Cochins* of both sexes were unexceptionably good; so much so, that for general good quality they have rarely been exceeded. Lady Gwyder in the cock class took the first place with a bird truly grand in all points, and possessing the very bloom of high condition, the second and third prizes being also a very close run. Mr. Henry Lingwood's splendid *Buff* hen, however, was the recipient of the special prize in this division,

LAGG.—1, E. H. George, Stamford 2, Mrs. Deasley, Easton.

TRAUST—1, E. H. George. 2, T. Cox, Stamford.
BLACKBIRD—1, J. Griffin, Stamford. 2, C. Toon, Stamford.
ANY FANCY VARIETY.—1 and 2, E. H. George (Magpie and Jackdaw).

RABBITS.

LOP-EARED.—*Duck or Doe*.—1, S. S. Ward, Peterborough. 2, Rev. S. Walters, Stamford.

HIMALAYAN.—*Duck or Doe*.—1, S. Ward. 2, H. Mason.

SILVER-GRAY.—*Duck or Doe*.—1, R. Buffham, Spalding. 2, A. J. Roberts, Hereford.

ANGORA.—*Duck or Doe*.—1 and 2, M. Kew.

ANY OTHER DISTINCT VARIETY.—*Duck or Doe*.—1, R. Buffham. 2, M. Kew.

HEAVIEST (Any breed).—*Duck or Doe*.—1, R. Buffham. 2, Rev. S. Walters.

JUDGE.—Mr. John Douglas, The Aviaries, Clumber, Worksop.

BOSTON POULTRY SHOW.

- This was held on June 30th and July 1st. We must confine ourselves to giving the list of awards, deferring remarks on the classes till next week.

DORKING.—*Cock*.—1, W. Morfitt. 2, C. Wright, jun. *Hen*.—1, W. Morfitt. 2, No competition.

COCHIN (Buff).—*Cock*.—1, W. H. Crabtree. 2, No competition. *Hen*.—1, W. H. Crabtree. 2, R. L. Storey.

COCHIN (Any other variety).—*Cock*.—Plate and 1, W. H. Crabtree. 2, W. Whitworth, jun. *Hen*.—1, W. Whitworth, jun. 2, T. M. Derry.

he, C. Wilson; W. H. Crabtree; H. Beldon.

BRAMA (Light).—*Cock*.—1, P. Haines. 2, M. Leno. *Hen*.—1, W. H. Crabtree. 2, P. Haines.

BRAMA (Dark).—*Cock*.—1, J. F. Smith. 2, C. M. Walte. *Hen*.—1, W. H. Crabtree.

Hen.—1 and 2, W. H. Crabtree. *he*, J. F. Smith.

SPANISH (Black).—*Cock*.—1, H. Beldon. 2, K. Newbitt. *Hen*.—1, R. Newbitt.

2, H. Beldon.

FRENCH FOWLS (Any variety).—*Cock*.—1, R. H. Ashton (French Cochins). 2, R. A. Boissier (Houdans). *he*, W. H. Crabtree (Creve-Cœur); R. Coney (Houdans).

Hen.—1, R. A. Boissier (Houdans). 2, W. Cutlack, jun. (Creve-Cœur). *he*, W. Cutlack, jun. (Creve-Cœur); W. H. Crabtree (Creve-Cœur); R. H. Ashton.

ANY OTHER DISTINCT VARIETY.—*Cock*.—Plate, 1, and 2, H. Beldon. *he*, T. A. Wright (Black Hamburgs).

Hen.—1 and 2, H. Beldon. *he*, T. A. Wright (Black Hamburgs).

LOCAL CLAS (Any variety).—1, J. W. Riggall. 2, Miss Saddington (Golden-pencilled Hamburgs).

SELLING CLASS.—1, Mrs. M. A. Mason (Silver Poland). 2, J. T. Parker (Black Spanish).

DUCKS (Aylesbury).—1 and 2, W. Ball, jun.

DUCKS (Rouen).—1, W. Dudding. 2, Mrs. M. A. Mason.

DUCKS (Any other variety).—1, M. Leno. 2, J. E. Storr.

GESE.—1, T. M. Derry. 2, — Johnson.

TURKEYS.—1, M. Kew. 2, No competition.

PIGEON NOMENCLATURE.

I HAD almost forgotten the fact that I owed Mr. Lyell several answers relating to the above subject until looking through some back numbers lately. The questions, however, are in some cases unnecessary, as Mr. Lyell may find on referring to my last communication.

A blue Pigeon of a very light shade with black bars, if possessed of the slate shade on the head, flight, tail, &c., and a black tail bar, is a "grey" or "washed-out Blue," and a very ugly-coloured bird to boot. If, however, it have a drab shade over the above parts, and a dun-tail bar, it is a "black-barred Silver." I have seen many of these birds which sometimes possess the tail of an ordinary blue Pigeon, and are then simply a combination of both. That these black-barred Silvers are different all over from the dun-barred Silvers I readily admit, but if the mealy and buff birds were bred and crossed more, the same varieties would occur with them. Mr. Lyell no doubt calls a blue Pigeon, with a tendency to dun or brown in its bars, a "kite-barred Blue," and a properly black-barred Blue simply "blue." If he will therefore be consistent he will call the two varieties of Silver "black-barred Silver" and "Silver." Mr. Lyell can answer his next question for himself if he will take the trouble to inspect some Dun Carriers, that are clean and have their liberty, in the sunlight. He will soon find that the boasted whole colours are, if minutely examined, a myth, as the bar, though of course almost absent, is present, and that while some birds' shoulders are of a beautiful soft even tint throughout, others are chequered. Such birds, however, I willingly pass as "Duns," and dub these "Dun Silvers," which are of a somewhat lighter and dull shade, and have dun bars darker than their shoulders.

And now I wish to address Mr. Lyell on the subject of the Dragoon. The native and natural Persian and Turkish Carriers are described by Aldrovandus and Bechstein as "russet brown" (dun) and "black" respectively, "longish-faced and wattled." These birds having been brought to this country were in some instances bred for certain fancy points, and have gradually produced the Carrier of to-day. In others they were devoted to their proper calling, and when crossed with the blue Tumbler

and native Rock Pigeons, produced the three-quarter-bred Carrier called Horseman or Heavy Dragoon, the half-bred Carrier called Light Dragoon or Dragoon, and the quarter-bred Carrier called Skinnum. These three sub-varieties have gradually degenerated into a handsome Toy of various types, and the difference of opinion amongst the breeders of the fashionable Dragoon of to-day owes its origin to the variety of sources from which their pets have sprung. How any educated man can call the Dragoon "Dragon," simply because the Spitalfields weavers so denominated it, I am at a loss to understand. The slightest reflection will show Mr. Lyell that the name "Carrier," and the name of all the varieties descended from it, with the exception of the Skinnum or Skinner, which was bred by the weavers from the Dragoon, which in their hands was called "Dragon," imply the use of a horse, as witness Carrier, Horseman, Dragoon, Pouter Horseman, Ritter Taube, and Pigeon Cavalier. Whether the word Skinnum be a corruption of "Skinner" I do not know, and I shall be very pleased if anyone will enlighten me on the subject. Dr. Chapuis described the Pigeon Camus divided into two classes—les Camus grands and les petits Camus. These Pigeons, which are evidently the Heavy and Light Dragoon, were, he says, so called on account of the flatness of their wattle. The word "Camulet" would signify the last-named, and I feel certain that the name "Camulet," now applied to the white-eyed red-necked white Pigeon, whose home he designates as at Liège, is simply a corruption of "Camulet," and is altogether misapplied. Dr. Chapuis describes the Pigeon of Antwerp as Mr. Brent does, and states that the variety found at Liège, which I have described above, is called "the Swallow Pigeon" on account of its great powers of flight.

Le Pigeon Cravate Français (the Owl), le Pigeon Camus, and le Pigeon d'Anvers and de Liège produced the Smerle; and the fact that the Smerle is now giving place to birds which are in some instances nearly throughout Light Dragoons, speaks volumes for the powers of the old varieties of Horseman and Dragoon, which are in danger of being "improved off the face of the earth," through the indomitable desire of English fanciers to breed the really useful races of Pigeons as Toys. About ten or twelve years ago the Dragoons of both classes were very plentiful in this district (Cheshire and South Lancashire), and twenty, forty, and fifty miles (all their humble patrons required of them), or in some cases one hundred or even 180 miles were passed over by them. As to good looks they were quite as handsome as the Dragoons now shown. Now they are "few and far between, and the Belgians, varying from the Smerle and Antwerp to the nearly pure Dragoon, are all the rage. If, however, the Carrier were crossed with well-tested Skinnum-faced Belgian birds, and the produce (a tremendous proportion of which would of course be lost) trained, and after a few years again crossed with the Carrier; or if the heavy Belgians were crossed with the Carrier, and their produce treated in the same way as regards training, the Horseman and Dragoon might be reproduced without having recourse to the present pretty race of Toys. The fact that the Mealy-chequered Antwerps are called "red-chequered" in the new book does not prove it correct, any more than the fact of the birds being called "Antwerps" makes them so. They are derived from the Smerle and Barb, and I have seen some which, with a little more eye wattle, if the latter were red and the eyes pearl, would be splendid blue Barbs.—TURKEY QUILL.

WOOD PIGEON AND DOVECOTE PIGEON PAIRED.—My object in writing about this was to throw light on the meaning of the word "acar," and certainly not to impute untruthfulness or ignorance to "T. G.," and when I wrote I had "WILTSHIRE RECTOR's" letter only before me, as I had mislaid the number of the Journal containing the first communication on the subject, and, with "WILTSHIRE RECTOR," I was anxious to see the matter cleared up. I may add that "T. G." does not quote my concluding sentence correctly.—ALMOND TUMBLER.

RE-SWALLOWING HONEY.

WHETHER the nectar of flowers is chemically changed in the honey-bag or other laboratory of the bee previous to being deposited in cells, is a question on which different views have been and still are held. Hunter, Bonner, Polhill, Langstroth, and others expressed a belief that it underwent no change; but Kirby and Spence, Réaumur, &c., maintained that it did.

At the Entomological Society's meeting in February, 1873, a notice was communicated by Mr. F. Smith of recent researches made by Drs. Von Schneider and Von Siebold "on artificial honey obtained by feeding bees exclusively with malt. The question has been raised whether the substance thus obtained was real honey, and whether, consequently, the bee was able to change malt sugar into honey in its stomach." Dr. Von Schneider "arrived at the conclusion that the carbohydrates, sucrose and dextrose, contained in the malt are actually changed by the bee into honey sugar, and that malt honey differs only from ordinary honey in wanting the specific aroma given to the

latter by the flowers on which the bees had been gathering." Professor Von Siebold was also stated, when investigating the secreting organs of the bee, "to have discovered three entirely distinct and very complicated systems of salivary glands with separate excretory ducts."

In the face of such testimony, and without clear evidence to the contrary, it would be presumption to affirm nectar is deposited in combs in exactly the same condition as it is found when gathered. But although changed in some respects, this does not afford any ground for saying it requires to be "swallowed twice" or ten times, to be converted into honey proper. In wet unfavourable seasons honey is poor in quality, and if we take the crude-like product of one hive and feed another with it we shall find, on breaking up the fed hive, that the honey with which it was supplied is still crude, and has not been perceptibly altered by passing a second time through the receptacles of bees.

The experiment of getting supplies direct from the fields for inspection was tried yesterday (June 26th). A frame with empty comb was placed over the central aperture of a stock box during the forenoon, and removed at 2 P.M. As expected, the new honey brought in, when jerked from the cells into a glass vase, was found to be thin and crude, but it was the veritable article. It was almost identical with good honey when mixed with a third part of water. To try the effect of evaporation the new honey was placed under the fierce rays of a burning sun. At the end of two hours it became quite consistent, lacking in no property save aroma. It was sweet and thick, and all that could be desired, flavour excepted, and this admits of explanation.

But as bearing on the subject of "re-swallowing," I may mention that Monday, June 15th, was the first storing day in my district. At that date I had a unicomb observatory hive with stores just exhausted. Foragers went out and brought back loads, many of them going direct to the upper part of the comb, and putting what they had gathered into the empty cells there. These gatherings were carefully watched and scrutinised at intervals both by night and day. No attempt was made to remove them; they remained in the cells where they were first lodged, and as the weather proved favourable, had additions made to them daily. I remarked that sealing did not immediately follow the filling of the cells, and that it took place on the side of the comb exposed to the sun's rays two days sooner than on the side opposite. Whilst the cells remained open I also observed as a constant occurrence a bee dip its proboscis into half a dozen or more cells in succession, and apparently lick up the water which, being lighter than honey, had come to the surface or outside. The amount of water obtained in collecting honey is greater than I imagined, and the quantity doubtless explains why bees are not seen going in summer, as they do in spring, to pools and marshy places for a supply. I am therefore of opinion that "re-swallowing" is not needed for the manufacture of good honey; that proof of the alleged fact is wanting; that the specific gravity of honey tends to bring its watery particles to the front, where they can be evaporated by the heat of the hive or appropriated for use by the bees; and that nectar when collected only requires to have the water separated from it to become rich consistent honey.—R. S.

BEE-KEEPER'S CALENDAR FOR JULY.

In writing a calendar one is always beset with the difficulties and differences of early and late seasons, as well as early and late localities. In 1868 bees were gathering great stores from heather on the 24th of July. Some three years after that year the heather was just bursting into bloom about the 20th of August. Kent, Dorset, and other southern counties of England are much earlier than Lancashire and Cheshire, and these are much earlier than many counties of Scotland. Last year in the north of Aberdeenshire some of the best hives did not swarm till July, and some of the swarms rose in weight to 70 lbs., 80 lbs., and 100 lbs. each. The season there was favourable for honey-gathering; also in the Holderness district of Yorkshire and some parts of Norfolk. In 1842, bees in Middlesex and Hertfordshire continued to store-up honey till the end of September, whereas in most seasons honey-gathering there is over by the end of July. Generally speaking, white clover yields honey until the end of July, and heather up to the middle of September.

In writing this calendar the aim is to give the readers a firm hold of principles, or, in other words, the "why and wherefore," rather than an enumeration of details of management, knowing well that sound principles intelligently understood will make them superior to all the difficulties and exigencies of their apianry.

Where bees are not removed to the moors swarming should not be continued this month, and where they are annually taken to grouse land, swarms may be taken up to the end of the first or second week. Late swarming is objectionable for this reason, that the young queens left in the stock hives are so many days in their cells, and so many days after they are hatched (about three weeks altogether), before they begin to lay, that the honey

season ends before they have bred bees enough for winter. Hence the desirability of preventing late swarming.

Before I come to the various modes adopted to prevent swarming, let me call attention to the importance of examining old stock hives before their young queens commence to lay. Three weeks after their first swarms have left them the combs should be free from brood. A few drone cells may have healthy young brood in them till the twenty-fourth day, but if the centre combs of the hive have a few cells of worker comb unhatched, and these cells have scooped lids, suspect foul brood. Examine thoroughly, and if this disease exists in a hive, the bees should be driven out of it into an empty one. All the healthy brood has been hatched, and foul brood is an incurable distemper which paralyses all the activity of bees. The seasons to examine hives for foul brood are when there is no healthy brood in the combs—viz., three weeks after the old queens leave the hives, and at the end of the breeding season, say September.

Old hives and second swarms are exposed to a danger by their queens going off on their marriage tours when they are but a few days old. Many of them never return. In what way they are lost no one can tell. The swarms that thus lose their queens are thrown into a state of wild excitement, and for some days their loss is manifested by their paroxysms of grief and loud lamentations. Such swarms should be furnished with queens from other hives, otherwise they will dwindle away. When the bees of mother hives and second swarms are seen to kill their drones, the apianian may know that their queens are safe and properly fertilised. Drone-killing generally begins about ten days after young queens have commenced to lay. The general massacre of drones takes place at the end of the honey season.

We now come to notice the various modes of enlarging hives to prevent swarming. In favourable seasons for bees the hives of early swarms and their mother hives, as well as weak stocks that have never swarmed at all, are, generally speaking, well filled early in July, and should then be enlarged by ekes, nadirs, or supers. These, properly used, will prevent bees from swarming, and give them ample scope for building combs to hold both brood and honey. In all hives meant for stock for another year, breeding should now be promoted to the uttermost, for hives filled with brood in July and August will be strong and populous during next winter and spring. Now is the time to lay the foundation of success in 1875.

Eking is the best mode of enlarging hives where run honey is the object sought. Straw ekes or riddle-rims about 4 inches deep, and of the same width as the hives, placed beneath them, make them about one-fourth larger, without any complications whatever. Eking is the most natural and simple mode of enlargement, and the most certain to prevent swarming. When bee-keepers come to know that bees usually gather 6 lbs. in ekes for every 4 lbs. in supers, eking will become more general in England. It is practised extensively in Scotland, where run honey is largely consumed.

Nadiring is now well known to be the opposite of supering. Nadiring is accomplished by placing empty hives beneath full ones, and is adopted to secure both honey and stocks. The bees come through the crown holes of nadirs, and fill or partly fill these with combs, carrying most of the honey into the upper hives. At the end of the season the bees are driven below from the upper hives, which are put down for run honey.

Amongst amateurs, supering is the most popular mode of enlarging hives. Pure honeycomb is the *summum bonum* in bee-keeping to many people. Some letters on the art of supering appeared in this Journal last autumn. They compassed the whole subject, and might be read again at this season of supering with permanent advantage.

Supers of various sizes are made of wood, straw, and glass. Wood and straw supers are cheaper and more convenient than glass. When glass ones are used they should be covered thickly with wool or other materials. A hive or box fitted over a glass super is not enough. Whichever kind is used, and whenever used, the bees should be tempted to enter them at once, and commence work. A bit of guide comb in the top of every super, and a wood ladder to it, will enable the bees to reach the top easily. It should be borne in mind that supers do not always prevent swarming, and often in the hands of inexperienced people they do not even hinder it. Many swarms are lost and hives injured by ineffectual attempts at supering. Drone combs should be used as guides in supers; and all traffic between them and the outside world should be made through the hives on which they are placed—no doorway but one. Only the house-maids with clean feet and pure honey should enter supers. As soon as supers are filled they should be taken off, and empty ones put on. In bar-frame hives the bars of comb filled with honey should be removed, and empty ones put in their places.

Late swarms should be well attended to during the first ten days of their separate existence. Special attention and kindness to them are amply rewarded. A few half-pounds of sugar given at this time enable the bees to build comb rapidly, and as rapidly

fill it with brood. This branch of bee-management is less understood and attended to than many others. It is of the greatest possible importance to the bee-master to keep his swarms in a state of progress. For a little outlay in sugar he will receive in return "good measure pressed down, and running over." In June and July, swarms have a passion for comb-building and hatching brood. The sooner hives are filled with combs and brood the better, for early swarms, ekes, nadirs, and supers are frequently required. Three or four years ago my best swarms filled large hives and supers of 30 lbs. each afterwards.

By the end of this month many bee-keepers will be making arrangements for taking their industrious servants to the moors. The first journey to beginners is often a sad one; combs are shaken down, and the bees smothered. Amongst "The Private Thoughts" of an excellent clergyman, the Rev. Thomas Adams, we find one touching the loss of a cow which died; he wrote these words, "This morning I am a cow poorer but a thought richer." Of how many bee-keepers on their return journey may it be truly said, "They are some hives poorer but a thought richer." All such disasters would be avoided if cross-sticks in hives were used, and thorough ventilation secured. The doors and crown holes should be covered with fly-proof wire, and the hives securely nailed to their boards. Hives thus fastened will travel by road or rail one hundred miles without injury or the loss of a bee.

The harvests of honey gathered on the moors are often very great. Strong hives have been brought home 50 lbs., 60 lbs., and 70 lbs. heavier than when taken; but the wear and tear of such work destroys bee-life to a lamentable extent. We have taken hives with 10 lbs. of bees in them, and with brood from side to side, to the moors; and after gathering 50 lbs. each, they have come home with less than 3 lbs. of bees. Forty thousand or fifty thousand bees per hive have been lost on the heather. How can such an enormous loss of bees be accounted for? Well, when honey is in the flower bees will have it, will risk their lives to get it. In August hives become stored with honey, the space for brood is contracted, less work and fewer bees at home, more outdoors wearing out their lives with hard labour, and exposing themselves to sudden showers which frequently bring them to the ground by thousands. Thus they perish on the altar of their own industry. Some seasons are not so hurtful to hives as others. Mild weather and moderate work are not so destructive to bees; but the hives that are not taken to the moors are, generally speaking, fuller of bees and better for stocks than those that have been there; besides, heather honey increases the mortality of bees during winter; clover honey is more healthful.—A. PETTIGREW, *Salce, Cheshire.*

QUEEN BREEDING IN SUPERS.

LAST autumn one of your correspondents in the north wrote you advising the use of perforated zinc with holes three-eighths of an inch wide between stock hives and supers to prevent the queen bee breeding in the latter. He kindly sent me a pattern of the zinc, and I promised to let him know how it answered with me, but I was taken ill and unable to try it. I am now fitting it to my new frame hives, and should be glad to hear the experience of any of your correspondents who may have tried it, and if there are any objections to its use. I lost a fine super of honey, taken 4th of June, for want of some such preventive of the queen breeding in supers.—A. YOUNG, *APRILIAN.*

OUR LETTER BOX.

POULTRY HOUSE (*Irish Subscriber*).—The space you name (12 feet by 15) would accommodate twenty fowls if they have an unlimited run outside, or if they have a large one. There is plenty of space and air for that number, especially as the house can be ventilated under the roof. If, however, the outside run is limited and confined in space, not more than eight or ten fowls can be kept in such a house. They use it in the daytime much more than they would if it was so significant and so suggestive of space, that we will say we should not consider fowls confined if they had one or two acres to run over, especially if the surface of the ground be a broken one, covered with grass and shrubs. To fit up your house, the door should be in one corner; the perches should be within 24 inches of the ground, and running from side to side of the house, protected from draught by being put away from the door. The flooring must be of earth. It may be hardened by chalk mixed with it; this enables it to be swept with a birch or other hard broom. It should slant from the back every way to the door. The floor should be at least 6 inches higher than the ground on which the house stands. There should be windows for light and air. If glazed, they should be made to open; if made of wickerwork they should have shutters. They require to be open in summer, closed in winter. Glass is best.

GOOD OATS.—The sample of ground oats you have sent is very good. It is such as is used for poultry in the great rearing districts of Sussex. If you refer to our poultry advertisements you will see where the article is to be had and the terms.

UNING BEES BY SMOKING (*A Constant Reader*).—It is rather surprising to hear of bees being unaffected by smoke from both fustian and puff ball. We have never found any that could not be mastered by such smoke, and cannot suggest any reason why your neighbour's bees were not subdued like your own. Perhaps some comb or hindrance at the door prevented the smoke from entering the hive, the bees of which were furious. On one occasion we asked a young man to smoke a hive which we were about to

swarm artificially. He apparently did so, but on turning-up the hive the bees rose like a cloud in our face and stung very severely. The smoke had not entered the hive. When the infuriated bees had settled we took the smoking fustian in our own hands, subdued the bees, and swarmed them quietly enough.

DRIVING BEES (*Obliged Subscriber*).—If the old stock hive has honey enough in it to make it worth while to obtain it, we drive the bees out on the twenty-first day from swarming, whether a second swarm has issued or not. If second swarms have been had, the turn-outs will form smaller swarms, and should be put in smaller hives. The combs will be without brood three weeks after artificial swarming.

SWARM DESERTING ITS HIVE (*Idem*).—The large artificial swarm that remained only twenty-four hours in the hive probably had a queen, and returned to the old hive from caprice. Sometimes swarms are whimsical, and act in a very unaccountable manner. They leave their hives and gladly accept fresh ones. One swarm of ours was hived in three different new hives. It left them all. In your case the queen may have been injured and lost. But drive again if the queen be living, no harm has been done. The one hundred bees that continue in the 20-inch hive were young ones just hatched when driven-up with the swarm. They did not know the way back, and had not sense or power to follow the swarm.

REMARKS.

24th.—Heavy rain in early morning; thunder about 11 A.M., and again at 3 P.M.; fair after 4 P.M.
25th.—Fine morning, but windy; frequent showers at intervals in the afternoon, part of the day, with much wind.
26th.—Dull, cold, rainy, and disagreeable all day.
27th.—Dull morning; showery forenoon; afternoon and evening fine, but rather close.
28th.—Morning fair but dull; forenoon showery; afternoon moderately fine; rain again in the evening.
29th.—Fine morning, showers in the forenoon; fair but rainlike in the afternoon, and rain in the evening.
30th.—Very fine morning, forenoon, and afternoon; hot clouded over with high wind before 6 P.M.
Rain almost daily, and at times rather heavy, but no storms here. Temperature generally above that of last week, but weather much less pleasant.—G. J. SIMONS.

COVENT GARDEN MARKET.—JUNE 30.

BUSINESS remains tolerably firm, and very little change has taken place during the week; the weather, however, has materially influenced the trade in Strawberries, they having been much injured and deteriorated by the heavy rains; the later sorts, however, will be greatly benefited by them. Heavy importations continue of Cherries, Apricots, &c., and especially of Potatoes from the Channel Islands and elsewhere.

From observations taken near London during forty-three years, the average day temperature of the week is 75.3°; and its night temperature 50.5°. The greatest heat was 93½°, on the 14th, 1847; and the lowest cold 33°, on the 9th, 1353. The greatest fall of rain was 1.60 inch.

FLOWER GARDENS IN WINTER AND SPRING.

No. 2.

THE first paper upon this subject was devoted solely to the consideration of winter and spring flower-gardening from an economical point of view, and it was clearly shown that a bright and pleasing effect can be imparted throughout the spring to any design of moderate extent by means of annuals alone. Such being my object, I refrained altogether from any mention of bulbous-rooted plants for two important reasons—the first being that an annual outlay for bulbs is inconvenient to many, besides which I was anxious to do away with the very general, but erroneous, impression that bulbs and spring-gardening are inseparable; and the second, that owing to the very brief duration of the blossom of many of the bulbs, they ought not to be planted alone in beds forming part of a small design, or in a conspicuous position, but should be so intermingled with more durable plants that when the fading flowers and foliage are cut off no blemish or blank spaces may be perceptible. So used, bulbs are most desirable, serving as they do by their early-flowering habit to impart life and beauty to a design much earlier in the season than is possible when they are not available.

The rich blue *Scilla sibirica*; Snowdrops; purple, white, yellow, and striped Crocus; and such Tulips as Comte de Mirabeau, white; Canary Bird, yellow; Drapeau de France, rosy lilac; Queen Victoria, white, tinged with rose; Rembrandt, rich scarlet; Couleur Ponceau, pink; Moliere, purple violet, or kindred varieties; with some of the old kinds of Hyacinths, such as Regina Victoria, pale pink; Bouquet, deep red; Sultan Abdul Aziz, striped pink; Lilac Queen; Livingstone, deep purple; Pearl Gem, pale blue; Grand Duc, rosy white; Purity, pure white; would afford ample materials for the plan on page 8.

Where extensive borders are available our selections would be far more extensive, embracing the numerous varieties of Narcissus, Iris, Anemone, Cyclameu, Scilla, Grape Hyacinth, and many miscellaneous bulbs; and as most of these do not require to be annually renewed, I will give a useful selection of a few of the best.

Taking Narcissus first, we have the Spanish N. *Bulbocodium*, which, with its rich golden-yellow cups, is a very beautiful and distinct kind; Sulphur Kroon, with its large yellow and white double flowers; the old favourite and very sweet-scented Double White; the pretty poeticus (Pheasant's Eye); the rich yellow N. *odoratus* and its double form, better known, perhaps, as Queen Anne's Double Jonquil, and the Pseudo-Narcissus or Daffodils, of which there are whole acres of the common yellow form growing wild in Sussex. There are very many other varieties of Narcissus, but as they all range through various shades of white or yellow, to enumerate others would be to puzzle rather than assist.

Of Iris—another extensive class—I may call special attention to the lovely *Iris reticulata*; it has a delicious

perfume, and its flowers are of a deep glowing violet, with blotches of rich yellow on the lower segments, and it is altogether a distinct and most desirable kind. Most of the English, Spanish, and German kinds form valuable border plants; but for early flowering, the very dwarf *Iris persica*, the striking "Great-spotted Iris" (*I. ensiana*), and the pretty little Crimean section, *Iris pumila*, are preferable.

There are few spring flowers at all equal to *Anemone coronaria*, the Poppy Anemone, either for brilliancy or variety of colour; its foliage, too, is particularly elegant, the flexible leafstalks curving gracefully down cause the foliage to form a soft and pleasing foil to the brilliant flowers which, nestling in its moss-like greenery, produce an effect of the most charming description. It is to the single varieties I allude more particularly, the double flowers being neither so durable nor brilliant, and being only desirable for clumps in mixed borders; but the single kinds rank first even for such a position. To see it, however, in perfection, so as to realise its true value, considerable numbers of it must be massed together, in fact a bed or border must be devoted to its sole use and benefit. Its merits from a cultural point of view rank equally high, the plants derived from seed now sown yielding their first flowers in fair quantity next spring, just like an annual, but with this material advantage, that once established it requires very little after-care, thriving best if left in undisturbed possession of the same situation for a course of years. The dry roots procured from the shops, and planted in a rich sandy soil, give flowers in April and May, but they require a second season to develop their full beauty; the drying process to which the roots are of necessity subjected by exposure proving so exhaustive and detrimental that its effects are plainly visible in the ensuing season's growth.

The *Cyclamen* is another fine, but less common, hardy flower, which, from the susceptibility of its roots, is best adapted for rockeries or sloping banks in deep, rich, gritty, well-drained soil. *C. europæum*, *C. Coum*, *C. vernum*, and *C. hederifolium* are the best hardy kinds, the latter thriving well in an ordinary border. Most of them, however, are impatient of cold cutting winds or any great accumulation of water in the soil; but with a little care, most attractive groups of them may be established in any sunny sheltered nook, if the position is sufficiently elevated, by the side of shrubbery walks or other parts of dressed grounds.

First among the *Seillas* is the lovely bright blue *Scilla sibirica*; it is very dwarf, not more than 4 or 5 inches high, and when well established it forms a carpet of the most intense blue. For edgings to beds of *Rhododendrons*, for enamelling patches of rockwork, or for any position where it may remain intact year after year, there is not a more desirable or ornamental plant to be seen in the months of March and April. It also forms a lovely edging in pots for mixed groups in the conservatory. There are other early-flowering kinds, such as *S. bifolia*, *S. amena*, and the varieties of *S. nutans*, all worthy of culture, but none of them are equal to *sibirica*. Follow-

ing these in May and June we have another excellent kind of bolder type in *Scilla peruviana*, with fine blue spikes a foot in height.

The Grape Hyacinth (*Muscari botryoides*) answers well in mixed borders, the singular flower-spikes telling well among others. The compact *Muscari botryoides*, with its white variety the Large Musk Hyacinth (*Muscari moschatum majus*), and the familiar old Feather Hyacinth (*Muscari monstrosum*), are most worth growing.

Here I must pause till another week, when I hope to proceed with my selection, the chief difficulty being not to obtain materials, but to restrict the list as I have done hitherto, and yet not to omit any really choice kinds; for Nature has been so lavish of her vernal treasures, that while taking those we regard as the best, we cannot fail to regret the necessity which compels us to leave many others "out in the cold."—EDWARD LUCKHURST.

MIDLAND COUNTIES HORTICULTURAL EXHIBITION.

JULY 7TH TO 10TH.

THE Royal Horticultural Society's Provincial Show held in Aston Park two years ago seems to have made a lasting impression on the minds of the good people of Birmingham (well it might in one sense, for the downpour on that occasion were something to be remembered), and to have made them desirous of again having a horticultural show on a grand scale; and this they have secured through the energy of the enterprising proprietor of the Lower Grounds, Mr. Quilter, who has in his spirited undertaking received an amount of support from horticulturists that even the most sanguine private individual could scarcely have anticipated. The position and character of the grounds have been noticed from time to time in our pages, and the general arrangements of the Show were given at considerable length in our last week's number; it only remains to say that, instead of staging, turf banks are raised in the plant tents—in the long one next the winter garden, along the sides of a serpentine walk, with a circle in the middle; in the tent for large specimens round the sides, with a large oval centre. Although the Show is not equal to that held under the auspices of the Royal Horticultural Society two years ago at Birmingham, and last year at Bath, it may fairly be said that as regards the present one it has proved a worthy attempt to supply the place of such a show. Unlike the former great Show at Birmingham, this has been hitherto favoured with the finest of July weather, and from the large attendance on the first day we imagine it will prove a financial success. We will now proceed to details, to some of which, however, and to the horticultural appliances, we shall return next week.

STOVE AND GREENHOUSE PLANTS IN FLOWER.—As a rule, those intended for exhibition are at the height of their beauty in May and the early part of June, showing then a freshness and intensity of colour which they seldom present later in the season, and accordingly one does not expect in July so severe a competition as in those months; but even with the encouragement of prizes of £25, £18, and £12, and a twenty-five-guinea silver cup in addition, there are only three collections of sixteen. In the other classes we felt likewise disappointed at the small number of groups. In Class 1, for sixteen, Messrs. E. Cole & Sons, Withington, Manchester, are a long way ahead with a magnificent specimen of *Ixora coccinea*, *Allamanda nobilis*, very fine; *Erica metuliflora* bicolor, 3½ feet in diameter; *Aphelexis humilis* rosea, 4 feet in diameter, and in splendid bloom; *Statice profusa*; *Erica Candolleana*, large and in excellent bloom; *Azalea Chelsoni*; a plant of *Erica Cavendishii* over 5 feet in diameter; *Dipladenia amabilis* with a profusion of its large rosy crimson blooms; *Phæocoma prolifera*, beautifully fresh; *Dracophyllum gracile*, small; *Azalea Brilliant*, 5 feet high and in fine bloom; *Allamanda grandiflora*, with small flowers but an abundance of them; *Statice imbricata*, fine; *Erica Parmentieriana* rosea, and an excellent specimen of *Ixora Colei*, with numerous heads of white flowers. Mr. J. Cypher, Queen's Road Nursery, Cheltenham, has smaller specimens but very well bloomed, the best being *Ixora javanica* floribunda, *Dipladenia amabilis*, *Kalosa thecoccinea*, *Echebaria amazonica*, *Clerodendron Balfourianum*, *Allamanda Hendersoni*, *Ixora amboynensis* and *coccinea*, and *Phæocoma prolifera* Barnesii. The only other competitor is Mr. J. E. Maich, gardener to J. O. Bacchus, Esq., Norwood House, Leamington, who has a collection in which are excellent specimens from 2 to 4 feet high of *Rhychospermum jasminoides*, *Dracophyllum gracile*, *Dipladenia amabilis*, fine; *Clerodendron Balfourianum*, *Franciscia calycina* major, and *Hoya carnosus*, which, however, from the pedulous character of its flower-heads, beautiful though they are, is not an effective exhibition

plant. The first prize and the silver cup were awarded to Messrs. Cole, the second to Mr. Cypher, and the third to Mr. March.

In Class 2, for nurserymen (ten plants), Mr. Perkins, Leamington, has a remarkably fine plant of *Statice profusa*, *Allamanda Hendersoni* bearing an abundance of large flowers, *Cassia corymbosa* in splendid bloom, *Vinca oculata*, *Kalosanthea coccinea*, and *Pauferatum maritimum*. Mr. Cypher sends *Allamanda nobilis*, fine; *Hemanthus magnifica* with ten of its orange-scarlet heads, *Dipladenia amona*, and *Ixoras*. Messrs. Cole, however, have the best collection, the plants well grown, and for the most part in splendid bloom. *Allamanda Hendersoni*, *Aphelexis macrantha* purpurea and rosea, *Erica Parmentieriana* rosea, and *Azalea Brilliant* are the most noteworthy. Messrs. Cole are first, Mr. Perkins second, and Mr. Cypher third. In the corresponding class for amateurs Mr. W. Chapman, gardener to J. Spode, Esq., Hawkesyard Park, Rugeley, is first with splendid specimens of *Clerodendron Balfourianum*, *Erica Parmentieriana* rosea, *Statice profusa*, *Erica Candolleana*, *Phæocoma prolifera*, *Ixora javanica*, and *Anthurium Scherzerianum*. Mr. E. Chadwick, gardener to C. Nelson, Esq., Crackley Hill, Kenilworth, is second with, among others, good specimens of *Dipladenia amabilis* and *Allamanda Hendersoni*.

The best single specimens of stove plants exclusive of Orchids are *Dipladenia amabilis*, exhibited by Messrs. E. Cole & Sons, covered with a rich profusion of its splendid flowers, and forming one of the most brilliant objects in the Exhibition; and *Stephanotis floribunda* from Mr. J. Webb, gardener to J. Gulsan, Esq., Stoke, Coventry. This, like the other, is remarkable for its health and abundant bloom. Equal first prizes were awarded; the second going to Mr. B. S. Williams, of Holloway, for a fine *Anthurium Scherzerianum*. The best specimen greenhouse plant comes from Mr. B. S. Williams, of Holloway, and is a good specimen of *Phæocoma prolifera* about 3 feet in diameter. Mr. Parker, nurseryman, Rugby, is second with *Statice profusa*; and Mr. Chadwick, gardener to C. Nelson, Esq., third.

FINE FOLIAGED PLANTS.—There is a liberal display of these, though in many cases the plants are by no means remarkable for size. In the nurserymen's class for nine, Messrs. Cole & Sons are first with grand specimens of *Phormium tenax variegatum*; *Cycas revoluta*, with a spread of fully 10 feet; *Croton pictum*, *Dasyliroth gracile*, *Cocos Weddelliana*, probably the finest specimen in the country; *Eurya latifolia* variegata, *Croton variegatum*, *Yucca aloifolia* variegata, *Cyathea dealbata*. Mr. B. S. Williams, of Holloway, who is second, has in his collection a noble specimen of *Livistona borbonica*, *Croton longifolium* and *pictum*, both very fine specimens; magnificent plants of *Gleichenia spelnucæ*; the Bird's-nest Fern, about 7 feet across; a large plant of *Sarracenia flava*; and a fine specimen of *Dasyliroth acrotrichum*. An extra prize was awarded to Messrs. Felton & Son, Edgbaston, for a group in which there is a charming plant of that beautiful Fern, *Todea superba*. Mr. W. E. Dixon, Norwood Nursery, Beverley, also takes an extra prize; and one was likewise awarded to Mr. E. Pilgrim, of Cheltenham, for a good group in which *Euphephartos villosus* is especially noticeable. In the amateurs' class for the same number a group is shown by Mr. Brown, gardener to Mrs. Alston, Elmdon Hall, who has good specimens of *Maranta Veitchii*, *Alocasia Lowii*, *Croton interruptum*, &c. Another group, consisting of large specimens, comes from Mr. Foster, gardener to E. Greaves, Esq., Avonside, Warwick, who has *Cycas revoluta*, *Alocasia intermedia*, *Crotons*, *Areca Verschaffeltii*, *Stevensonia grandifolia*, and an excellent example of *Euphephartos villosus*. From T. M. Shuttleworth, Esq., Howick House, Preston, comes the first-prize group, Mr. Foster being second; in this *Croton undulatus* is specially striking by the richness of its colouring; *Gleichenia spelnucæ*, *Cyathea Dregei*, *Cocos Weddelliana*, and *Dasyliroth gracile* are also noteworthy. Mr. Brown takes the third prize. In the nurserymen's class for six both Mr. Williams and Messrs. Cole contribute; the former sending fine specimens of *Croton Weismanni* and *interruptum*, *Cordyline indivisa*, *Pandanus Veitchii*, and *Latania borbonica*. Mr. Cypher likewise sends a group. Among amateurs, prizes were awarded to Mr. J. March, gardener to J. O. Bacchus, Esq., and Mr. Brown, Elmdon Hall Gardens.

Prizes were offered for the best single specimens of fine-foliaged plants. The first went to Mr. Heath, College Nursery, Cheltenham, for a noble plant of *Cycas revoluta*; the second to Mr. Croucher, gardener to J. Peacock, Esq., Hammeramith, for *Pandanus Veitchii*, *Cissus discolor* being third. The best six *Dracenas* come from Mr. Brown, gardener to Mrs. Alston, Elmdon Hall, and include good examples of *D. ferrea*, *Shepherdii*, *regiæ*, and *Mooreana*. For the best specimen *Croton* Messrs. Cole are first with a well-coloured example of *C. angustifolium*; Mr. Heath, Cheltenham, second with *C. variegatum pictum*; and Mr. Chapman, Hawkesyard Park, third with a fine bushy specimen of *C. variegatum*.

FERNS AND LYCOPONS.—Ferns are numerous shown, stove and greenhouse species in particular being well represented. Of the latter, in the nurserymen's class for eight, Mr. Williams, of Holloway, is first with a group in which are fine specimens

of *Thamnopteris nidus*, *Gleichenia rupestris* and *flabellata*, *Cibotium regale*, and *Adiantum farleyense*. Mr. Cypher, of Cheltenham, is second with *Cibotium regale* and princeps, *Adiantum farleyense*, and others. In the amateurs' class, T. M. Shuttleworth, Esq., Howick House, Preston, is first with very fine examples of *Leucostegia immersa*, *Gleichenia rupestris* and *flabellata*, *Adiantum farleyense*, and good plants of *Cyathea Smithii*, *C. dealbata*, and *Dicksonia fibrosa*. Mr. Coleman, gardener to W. Bayliss, Esq., Walsall, is third. For single specimens of tree Ferns there are two classes, one for nurserymen and the other for amateurs. The best in the nurserymen's class is a grand specimen of *Dicksonia antarctica*, shown by Mr. Williams, occupying the centre of the circle in which Messrs. Jackman's group of *Clematis* is placed. Mr. Vertegans, Chad Valley Nurseries, is third. The best specimen in the amateurs' class is also *Dicksonia antarctica* from Mr. Jones, gardener to C. E. Matthews, Esq., Edgbaston. Mr. Williams likewise sends the best specimen stove or greenhouse Fern, *Adiantum* being excluded, in *Cyathea Burkei* with a 6-feet stem. Mr. Parker, of Rugby, is second. Of specimen *Adiantums* there are fine plants of *farleyense* from Messrs. Cypher, Williams, and Cole and Sons.

Lycopods are few and disappointed us, though well grown. Mr. Webb, gardener to J. Gulsou, Esq., Stoke, Coventry, is first. The second prize goes to Mr. R. Allan-Moseley, and the third to Mr. W. Jones.

In the class for twelve hardy Ferns, J. E. Mapplebeck, Esq., Woodfield, Moseley, Birmingham, is first with fine well-grown specimens of *Athyrium Filix-femina tortu-cristatum*, *coronatum*, *apumforme*, *Elworthii*, and *Pritchardii*, *Osmunda regalis cristata*, *Polystichum angulare cristatum* Jacksoni, and *Lastrea Filix-mas grandiceps*. He also exhibits numerous collections of new and rare British Ferns. Mr. E. Pilgrim, nurseryman, Cheltenham, who is second, has among others a fine case of *Trichomanes radicans*. Messrs. Ivory & Sons, of Dorking, are third.

PALMS.—The most noteworthy in the class for six, size of pot not limited, are those from Mr. Williams, comprising noble examples of *Livistona borbonica*, *Chamærops Fortunei*, *Stenersonia grandifolia*, *Areca lutescens*, and a fine plant of *Cocos Weddelliana*. Mr. Croucher, gardener to J. Peacock, Esq., Hammersmith, comes second with good specimens of *Dæmonorops palembanica* and *periacanthus*, *Areca rubra*, and *Calamus fissus*. Mr. Pilgrim, of Cheltenham, has among others *Welfia regia*, very effective by its red young fronds. Mr. J. March, gardener to J. O. Bacchus, Esq., is third. Palms in small pots suitable for the dinner table are well shown. Messrs. Felton have a pretty group. *Cocos Weddelliana* and *Dæmonorops marginatus* are truly graceful. Mr. E. S. Williams and Mr. J. Cypher also compete.

PITCHER PLANTS, including *Sarracenias*—The show of these is more numerous than could have been expected, and very good. T. M. Shuttleworth, Esq., is foremost for three—*Nepenthes Hookeri* and *Rafflesiana* finely pitcherled, and an unnamed *Sarracenia*. Mr. Williams comes second with *Nepenthes phyllanthophora*, and *Sarracenia flava* and *purpurea*. He is also first for the best specimen with *Nepenthes Rafflesiana* with seventeen large pitchers, and Mr. Shuttleworth is second with *Sarracenia Drummondia alba*, past.

HEATHS, with the exception of the single specimens, are very poor. The first prizes in the nurserymen's and amateurs' classes go to Mr. Dixon, Norwood Nursery, Beverley, and Mr. W. Chapman, of Hawkesyard Park. For single specimens Messrs. Cole are first with a splendid plant of *Erica venosa* some 3½ feet in diameter, and Mr. Williams second with *Erica obbata* as large, but not so full of bloom. Mr. J. Foster, gardener to E. Greaves, Esq., Avonside, Warwick, is third. Mr. Cox, Madresfield Court, has a large well-bloomed plant of *Erica tricolor* Wilsoni.

ORCHIDS.—There is not a large show of these, but those from Mr. Williams are such as well maintain his reputation as an exhibitor of these plants. He is first in the open class for ten, and also in the nurserymen's class for six (Mr. Dixon, Beverley, being second), with splendid plants of *Anguloa Clowesii*, fine pans of *Cypripedium barbatum superbum*, *Vanda tricolor* in several varieties, *Lælia purpurata*, *Aërides odoratum majus*, affine, *superbum*, and *Lobbi*; *Disa grandiflora*, *Cyrtocidium stellatum* with a score of spikes, *Vanda suavis*, and a pot of *Epidendrum vitellinum*. Mr. Mitchell, gardener to Dr. Ainsworth, Broughton, Manchester, has *Cattleya Mendelii*, five; *Odontoglossum Schleiperianum* with nine large pale yellow flowers, *O. grande*, *Vanda suavis*, and others. Mr. Mitchell is first in the amateurs' class for six, whilst Mr. Williams sends as the best specimen Orchid a magnificent plant of *Aërides odoratum majus* with twenty-three racemes.

CLEMATIS.—There are only two groups worthy of note. That from Messrs. Jackman, of Woking, is literally and truly a centre of attraction, occupying as it does a circle in the centre of the tent by the side of the conservatory, and the plants themselves proving incontestably that grand effects the new varieties are capable of producing both indoors and out. The group consists

of Jackmanni, magnifica, Mrs. James Bateman, remarkably fine; lanuginosa nives and candida, Thomas Moore, Lady Bovill, Alexandra, Rubra grandiflora, Rubella, and Lady Caroline Nevill. These are trained nearly in a cylindrical form, and some of the plants are so covered with flowers that but little of the foliage is to be seen. Mr. Vertegans is second.

PREMIAS.—The best four come from Mr. W. Cox, gardener to Earl Beauchamp, Madresfield Court, and consist of nicely-bloomed plants about 4 feet high, consisting of Victor, double, dark corolla; Maid of Honour, white corolla, scarlet sepals; Margioata, white sepals; and Marksman, double, dark corolla. Mrs. Brown, North Street, Rugby, is second. The first-prize collection of nine is also well flowered, especially Rose of Castille, Senator, Puritani, and Roderick Dhu. We could not ascertain the exhibitor's name, as indeed those of several others. The second prize went to taller plants, but not so well flowered, from Mr. Harborne, of Smethwick; and the third to Mr. Coleman, gardener to W. Bayliss, Esq., Walsall.

PELAGONIUMS.—Of the Show kinds Mr. Turner, of Slough, has a beautiful collection of twenty of not less than twelve varieties. The plants, of course, in such a class are not expected to be of the great dimensions of those shown in classes where a less number of plants is required, but these are of good size, and in fine bloom. The best in this respect are Scottish Chieftain, Achievement, Ruth, Warrior, Blue Boy, Conquest, Sunray, Protector, Corsair, and Highland Lassie. A first prize was awarded; and Mr. Turner is also first for nine, with Blue Bell, W. Bull, Mary Hoyle, Prince of Prussia, Rosicrucian, Prince Leopold, Pericles, King Charles, and Conquest. Mr. Quarterman, gardener to T. Gladstone, Esq., and Mr. J. E. March take the remaining prizes. Mr. Turner is also first for six, and Mr. Quarterman second. In Fancies the prizes go to the last named, Mr. Turner, and Mr. H. Coleman, but the specimens are by no means noteworthy.

In nine Zonal Pelargoniums Mr. March, gardener to J. O. Bacchus, Esq., stands first with finely-bloomed well grown plants of Clipper, Blue Bell, Virgo Marie, Rebecca, Rosemond, President Revell, Madame Vaucher, and Amelina Grisan. Mr. Cox, Madresfield Court, is second with Vesuvius, La Fontaine, Oscar, and others in fine bloom; and Mr. Quarterman is third. The best six double Pelargoniums come from Mr. Parker, Rugby, and consist of beautifully-bloomed specimens of Marie Lemoine, Madame Lemoine, Gloire de Nancy, Victor Lemoine, Marie Crousse, and W. Pfitzer. The first prize for Bronze Pelargoniums goes to Mr. R. Allen; the second to Mr. J. Newton, Rose Cottage, Shirley. Tricolors are finer than we have ever seen them in London. Mr. E. Ford, Baginton Hall, Coventry, has six splendid specimens. Gem of Tricolors in his collection is a glorious plant; so is Jock o' Hazeldean in the second prize lot, which comes from Mr. J. E. March, of Norwood House, Leamington.

SUCCULENTS.—For a collection of twenty-five Mr. J. Croucher is first, and exhibits some pretty specimens of *Haworthia papillosa*, *H. corallina*, *H. pentstemonifolia*, *Stapelia*, *Aloes*, &c. Mr. Pfersdorff, 73, South Row, Kensal New Town, is second.

CACTI.—For a collection of twenty-five Cacti Mr. J. Croucher is again first, and most curious and interesting are the specimens he exhibits—*Mammillaria bicolor cristata*, *M. Wildiana*, *M. Shiedesana*, *M. Muhlenfortii*, a perfect ball of regularly-placed spines. Altogether he has ten species of *Mammillaria*, four of *Pilocereus*, nine of *Echinocactus*, and *Cereus chilensis*. Mr. Pfersdorff is second. Mr. Croucher also exhibits *Echeveria Peacockii*; it is in the way of *E. pulverulenta*; but the glaucous leaves retain the white coating much better, and the whole plant is neater in appearance; a first-class certificate is given to it.

AGAVES.—For groups of Agaves, Mr. Croucher is again first, and Mr. Pfersdorff is second; a third prize goes to Mr. E. Pilgrim.

MISCELLANEOUS.—Of new plants Messrs. Veitch contribute a very extensive and fine collection, in which are included most of the plants sent out by the firm of late years, as well as some of their latest novelties. Among them may be mentioned *Croton Youngii* and other new species; *Adiantum Zahnii*, *Ocimum stelligerum*, *Anthurium crystallinum*, *Adiantum Zahnii*, new Pitcher-plants, *Gloxinias*, &c. Mr. Williams, of Holloway, also sends a numerous group. Messrs. Standish & Co., of Ascot, contribute a basketful of a pretty golden variegated Yew, *Taxus fastigiata aurea*. To new plants, as well as to some other subjects, we shall advert next week. Mr. Vertegans, of the Chad Valley Nurseries, Birmingham, and Promenade Gardens, Malvern, contributes two nicely-arranged groups not for competition, composed of *Lilium auratum*, Palms, and a variety of fine-foliaged plants. These are placed at each end of the Rose tent, and near them Messrs. Dick Radcliffe & Co. exhibit Fern cases, &c., in variety.

CUT FLOWERS.

HAVING attended most of the Rose shows this season, beginning with the Crystal Palace on June 22nd, and ending now with Birmingham on July 9th, I have no hesitation in saying that the one now being held at the Grounds, Lower Aston, under

Mr. Quilter's anspices, is the very best that has been held this year. Yet when this is said it must be borne in mind that this is not a Rose year. That there are many most beautiful flowers staged is true, but that many of our exhibits are not up to the mark, and many of our growers nowhere, are facts patent to anybody; and I may just instance two cases that have come under my own cognisance. Most of us know how excellently Mr. J. N. Baker, of Haverhill, Exeter, has shown for many years, and what a prominent place he has held in the prize lists. I saw his garden last week, and a more sad example of blighted hopes and blighted Roses I never saw. Not even Miss Jemima, who was crossed in love in her early days, and looks ever afterwards as if she were a crust of super-refined vinegar, could excel it. When I say that hundreds upon hundreds of Roses were literally dead and dying, and that the whole space devoted to them was only here and there relieved by some good plants on the seedling Briar, I am bearing a correct testimony and giving some idea of what a spring of sharp frosts and violent winds will do. Then there is the case of our valiant friend Keynes, of Salisbury, the veteran conqueror in many a hard-fought field. We have all complained of want of rain, but Salisbury seems especially to have been left unwatered, and for three months hardly a drop of rain fell. It may then be wondered at, taking into account the other disturbing elements of the season, that he should have been able to exhibit at all; and hence it happens that many, very many Roses, although fine are not in their true character—wanting, if I may so say, in that refinement which is one great charm in the Rose.

ROSES.—And now to the show of Roses. For the first prize, the challenge vase and a prize of £10, there are eight entries, and after a long and laborious investigation by the Judges, the first prize is awarded to Messrs. Paul & Son, of the Cheshunt Nurseries, his box of seventy-two containing some very fine blooms. And here let me say I do not intend to give complete lists, as I think this is unnecessary, but shall merely notice those which most struck me, amongst which were Baron Hausmann, Marquise de Castellane, La France, Dr. André, Mons. Noman, Mons. Boncenne, dark; Ferdinand de Lesseps, which I have seen very good this year; Henry Leslie, a very pretty seedling; Souvenir d'Elise Vardon, exquisite; Madame Thérèse Levet; Louis Van Houtte, a grand bloom; Catherine Mermet, very beautiful; Alfred Colomb, Horace Vernet, Beauty of Waltham, and Wilson Saunders, another seedling in the way of Charles Lefebvre. Mr. B. Cant, of Colchester, is a good second, running Messrs. Paul very close. Maréchal Niel, Marie Baumann, Niphetos, Duc de Wellington, Etienne Levet are conspicuous in his stand. Mr. Cranston, of Hereford, is third with Jean Sany, a remarkably fine flower very little known; Julie Touvais, Marie Baumann, Niphetos, Madame G. Schwartz, Duke of Edinburgh, and Madame V. Verdier. Mr. Charles Turner is fourth.

In the class for forty-eight, three trusses of each, Messrs. Paul and Son are again first. Here again Baron Hausmann, Etienne Levet, Marie Baumann, La France, Mons. Noman are very fine; and so in the second stand, Mr. Cranston's, are Jean Cherpin, beautiful in colour; Claude Million, Perle de Lyon, Maurice Bernardin, and John Hopper. In the third, which is creditably won by Mr. J. Keynes, are Claude Levet, very good if full enough; Devonienais, Xavier Olibo, Mdlle. Eugénie Verdier. Mr. Turner, of Slough, is an excellent fourth.

In the class for twenty-four, Hybrid Perpetuals only, Messrs. Paul & Son are again first, Mr. Cant second, Mr. Prince, of Oxford, third, and Mr. Perkins fourth. In the class for twenty-four single blooms Mr. James Merryweather is first, Mr. Cant second, Mr. Prince, of Oxford, third, and Mr. Turner fourth.

Amateurs come out very strongly, and I am not quite sure whether the box of forty-eights which wins the challenge cup for amateurs is not the best in the Show; it was awarded to Mr. Saitte, gardener to the Rev. E. Evans, Solihull, thus keeping up the distinction which the rectory gardens formerly held under the fostering care of the Rev. S. Smythe. Amongst the most noticeable flowers are Baroness Louise Uxkull; Paul Neron, too coarse; Maurice Bernardin, very grand; Charles Bernardin, Perle Blanche, Prince de Porcia, Baron A. de Rothschild, Etienne Levet, Mdlle. Marie Raby, Duc de Cazes, Fisher Holmes, La Motte Faignine, Madame Victor Verdier, Comtesse de Chabillant, Comte de Nanteuil, François Michelin, Edouard Morren, Antoine Ducher, Charles Turner, Lyonuais, and La France. Mr. Draycott, gardener to Sir B. Cunard, is second; the Rev. G. Arkwright is third; and Mr. Draycott, gardener to T. T. Paget, Esq., fourth. In the class for forty-eight Roses, single trusses, Mr. Evans, gardener to C. N. Newdegate, Esq., takes first prize with a nice box, amongst which are Charles Lefebvre, Emilie Hausburg, Alfred Colomb, Laurent Descourt, Duke of Wellington, Maréchal Vaillant, Sénateur Vaisse, Lelia, and Comtesse d'Oxford. The second goes to Mr. Parnell, Birchfield, Rugby; and the third to Mr. Draycott, gardener to Mr. Paget. In the class for twelve Roses the first prize is won by Mr. Brown with Antoine Ducher, Emilie Hausburg, Paul de la Meilleray, Marquise de Castellane, extra fine; Maréchal

Vaillant, Baronne Rothschild, Olivier Delhomme, Impératrice Charlotte, &c. Mr. Parnell is second, Mr. Evans third, and Mr. Saitte fourth.

The class of new Roses brings together four or five competitors. The first prize is awarded to Messrs. Paul & Son for Princess Beatrice, Etienne Levet, Hippolyte Jamin, Barocess Louisa Uxkull, Henry Leslie, Annie Laxton, The Shah, seedling, very brilliant in colour; François Michelin, André Duhaud, Reynolds Hole, very dark; Cheshunt Hybrid, and Madame Lacharme. Mr. Cant is second with Mrs. Laing, peculiar violet colour; Madame Prud'homme, Madame de Pulhat, L'Esperance, Madame Lacharme, Etienne Levet, Madame Caroline Kuster, Richard Wallace, Auguste Rigotard, Reynolds Hole, Annie Laxton, and Bessie Johnson.

In the class for twelve Tea-scented and Noisette Roses (nurserymen), Mr. Cant wins first prize easily with Madame Willemoz, Maréchal Niel, Souvenir d'on Ami, Rubens, Niphetos, Marie, Devonienais, Madame Caroline Kuster, Triomphe de Rennes, Perle de Lyon, and two others. In the same class (amateurs) Mr. Evans, gardener to C. N. Newdegate, Esq., is first with good blooms of Céline Forestier, Niphetos, Rubens, Comte de Paris, Madame Bravy, &c.; and Mr. Arkwright second.

In the class for the best six Roses of any variety of 1871, 1872, and 1873, Mr. Cranston is first, Messrs. Paul & Son second, and Mr. Cant third, all with blooms of Etienne Levet—a high honour for the Rose, but then I think it is an Etienne Levé year. In the class for twelve Roses, single blooms, a class the *raison d'être* for which I cannot understand, the first prize goes to Mr. Charles Turner for Nardy Pières, Alfred Colomb, Madame Lacharme, Souvenir de M. Boll, John Stuart Mill, Souvenir de la Malmaison, Baronne Rothschild, Edouard Morren, La France, Horace Vernet, Duke of Edinburgh, and Etienne Levet.

The two prizes for Alfred Colomb, twelve blooms of each, are won by Mr. Charles Turner and Mr. Cant, with fine blooms. For twelve blooms of Duke of Edinburgh Mr. C. Turner is first, Mr. Cant second. For twelve trusses of Baronne Rothschild Mr. Cant is again first, and Messrs. Paul & Son second with by no means first-rate blooms. Only one box of twelve La France is exhibited, and these are very poor. For twelve trusses of Marie Baumann (very exquisite), Mr. Prince, of Oxford, is first, and Messrs. Paul & Son second. For twelve trusses of Maréchal Niel, Mr. Cant is first, and the Rev. Mr. Benn second; and for twelve blooms of Devonienais Mr. Cant is again first, with a most exquisite stand of this lovely Tea. It will thus be seen that the Rose Show is very extensive, and far in advance of any that have been held this year.

PINKS, CARNATIONS, AND PICOTEES.—The time is rather awkward for Pinks, Picotees, and Carnations—too late for the first, and too early for the last; yet some good stands of both are exhibited, especially by Mr. Charles Turner, of Slough. His Pinks comprise Dr. Maclean, Dr. Masters, Shirley Hibberd, President, Superb, H. Hooper, Princess of Wales, Beatrice, and Aurora. Mr. Burn is second, and Mr. Hooper, of Bath, third. In Picotees, Mr. Turner is again first with Prince of Orange (yellow), very fine; Miss Sewell, Prince of Wales, Picco, seedling; Rev. H. Matthews, rose edge; Fearless, Miss Ward, Miss Small, Mrs. Fordham, very fine; Eugénie, and Mrs. Fisher. Mr. H. Hooper is second. Amongst his flowers his own very fine seedling, Mrs. Little, is conspicuous, certainly the clearest and most beautiful flower in its class. Mr. Catley is third. Mr. Turner is also first in Carnations with Mara, Ajax, Gem, Squire Meynell, Sybil, Brutus, Favourite, Sarah Payne, James Merryweather, Guardsman, Esther, and Admiral Curzon. Mr. Hooper is second, and Mr. Catley third.

TABLE DECORATIONS, &c.—There is no department of an exhibition where greater grumbling at the decision of the Judges arises than at the Table Decorations and Bonquets, and this Show is no exception to the rule. However, I have but to record results. There are some very beautiful hand-bouquets exhibited. The first-prize one is especially beautiful; it consists of blooms of *Pancretrium* interspersed with *Disa grandiflora*, *Spiraea*, *Forget-me-not*, white *Campanula*, a dark Rose or two, and *Maidenhair Fern*. This is won by Mr. Perkins, of Leamington; the second by Mr. W. Jones; and the third by Mr. J. Jackson. In the class for ball-bouquets Mr. Perkins is again first with a beautiful bouquet consisting of *Pancretriums*, Orange flowers, *Dracophyllum*, &c. Mr. C. Turner, of Liverpool, is second. In the class for three pieces for table decoration (to the exclusion of fruit), Mr. C. Cooke is first with stands prettily arranged—the usual modification of the March stand, having the tall vase above the two flat receptacles for flowers, and the lower one raised a little above the table. Mr. Jackson is second, and Mr. Cypher fourth. In the class for one centrepiece there are some pretty stands, but nothing that calls for any special observation; while in the class for button-hole bouquets Messrs. Pope & Son are first with buds of yellow Roses, *Bouvardias*, and *Maidenhair*. Mr. Bones second.

Let me add that the tent in which the Roses are exhibited is a very fine one, and that there is every opportunity of their being

well seen, although one regrets to find so many defaulters, there being space enough provided for double the quantity of exhibits. —D., *Deal*.

FRUIT.

THE entries in this department were unusually numerous, and an abundant space was accordingly allotted for the different classes. Many of those who entered did not, however, put in an appearance, so that the tabling has a scantily furnished appearance. Some of the more experienced exhibitors are of opinion that publishing the number of entries previous to the Exhibition is a mistake, as it has the undesirable effect of frightening the more timid exhibitors. The fruit is exhibited in a glass-covered house, and arranged on a staging elevated in the centre, the staging at the sides being devoted to table decorations, bouquets, &c.

PINE APPLES.—On the elevated centre of the staging devoted to fruit are arranged the Pines, seventy in number, and divided into four classes. In Class 88, two Queen Pines, there are eleven exhibitors, the competition being very close. The first prize was awarded to Mr. J. Harris, gardener to Mrs. Vivian, Singleton, Swansea; the weight is not stated, but it must be between 5 and 6 lbs. each fruit. Second comes Mr. T. W. Bond, gardener to G. A. Smith, Esq., Weybridge, Surrey. Third is Mr. C. Sandford, gardener to the Earl of Bective, Kirkby Lonsdale. Of two Smooth-leaved Cayennes Mr. D. Wilsoo, Castle Hill, South Moulton, is the only exhibitor, and has a first prize for fine fruit, well ripened. In the class for Any other variety, five exhibitors misunderstood the terms of the schedule, and staged Queens and Smooth-leaved Cayennes. One exhibitor, Mr. A. Bruce, gardener to J. Tildesley, Esq., Edge Lane, Manchester, has a nice ripe fruit of Prince Alfred, and gains the first prize. For six fruits, not necessarily distinct, Mr. J. Harris is first with well-swelled and beautifully-ripened Queens. Mr. T. W. Bond is second with the same variety, and Mr. D. Wilson third with Queens and two Smooth-leaved Cayennes.

GRAPES.—There are thirteen dishes of Black Hamburgh Grapes; many of them are remarkably well finished, and several worthy of a first prize had to be passed over. Mr. W. Coleman, gardener to Earl Somers, Eastnor Castle, Leicestershire, is first with very fine bunches, large in berry and well finished. Mr. R. Fleming, gardener to R. Houghton, Esq., Waterloo, Liverpool, is second; and Mr. J. Douglas, gardener to F. Whitbourn, Esq., Loxford Hall, Ilford, third, it is needless to say, with fine well-finished bunches. For three bunches of any other black variety Mr. W. Sweeting, gardener to T. Y. Venn, Esq., is first with Venn's Seedling Black Muscat. This is a good black Muscat. The fruit seems to set well and colours well. The second prize went to Mr. M. Henderson, Cole Orton, Gardens, Ashby-de-la-Zouch, for Black Mammoth.

Of three bunches of Muscat of Alexandria there are three exhibitors. Mr. J. Foster, gardener to E. Greaves, Esq., Warwick, is first; Mr. W. Cox, Madresfield Court, Great Malvern, is second; and Mr. J. Haynes, Millichope Park, Church Stretton, is third. The first-prize bunches are remarkably well ripened. In the class for three bunches of Buckland Sweetwater there are three entries. Mr. W. Cox has large bunches and berries, and gains the first prize; Mr. Douglas is second with well-ripened bunches, and Mr. J. T. Cushon, gardener to W. Willy, Esq., third. For three bunches of any other white Grape Mr. Douglas is first with the best bunches of Golden Champion we have yet seen exhibited. As seen like these, this is one of the best of White Grapes. Mr. W. Coleman is second with White Frontignan.

Collections of six varieties. Here the competition is very close, some of the most successful exhibitors of Grapes contesting for the prizes. Mr. J. Douglas comes in first with well-ripened Muscat of Alexandria, Black Hamburgh, Golden Champion, Royal Ascot, Buckland Sweetwater, and Loxford Hall Frontignan. Mr. M. Henderson is second, and Mr. Bannerman third.

PEACHES, NECTARINES, AND APRICOTS.—Mr. G. T. Miles, gardener to Lord Carington, Wycombe Abbey, Bucks, is first with fine Royal George; Mr. Bannerman, gardener to Lord Bagot, Blithfield, Rugeley, second with the same variety; and Mr. G. Jackson, gardener to J. Tyrer, Esq., Tiscall Hill, Stafford, is third with Violette Hâtive; these are also very fine. Twenty dishes are staged. Of six Nectarines there are thirteen competitors, and equal first prizes are awarded to Mr. Bannerman and Mr. Haynes, the second prize going to Mr. W. Coleman, and the third to Mr. M. Henderson.

Of eight Apricots, there are two nice dishes. The first-prize one is well ripened, and comes from Mr. E. Smith, Upper Alstone, Cheltenham; Mr. C. Winstone, gardener to H. B. Bristow, Esq., Fern Bank, Kenilworth, having the second best.

FIGS.—There are two nice dishes of Brown Turkey sent to represent this class. The best are Mr. Bannerman's; and Mr. J. Foster, gardener to E. Greaves, Esq., Avonside, has the second best.

CHERRIES.—In fifty black Cherries Mr. G. T. Miles has the best black Tartarian; Mr. W. Cox is second; and Mr. W. Gar-

diner, gardener to Sir E. Phillips, Bart., Shipston-on-Stour, third with Elton. For fifty white Cherries Mr. Miles is again first with excellent Bigarreau Napoleon, and Mr. Douglas second with the same.

STRAWBERRIES.—In the class for twenty-five of the British Queen or Dr. Hogg type, Mr. W. Cox has good British Queen, and gains the first prize; Mr. W. Gardiner being second with Dr. Hogg; the third prize going to Mr. J. Taylor for the same sort. For the same number of any other variety all the prizes go to Sir Joseph Paxton, which seems to have been in the highest position in many places this year. Mr. H. James, New Street, Kenilworth, is first; Mr. E. Chadwick, gardener to C. Nelson, Esq., Kenilworth, second; and Mr. J. Taylor third, an extra award being given to Mr. J. Douglas for Frogmore Late Pine.

MELONS.—Of single fruit of Green-fleshed varieties there are eighteen exhibitors. All the prizes go to white-fleshed sorts. Mr. W. Cox has the best Golden Gem; the second prize also goes to that variety from Mr. H. Nott, gardener to J. Anderson, Esq., Staines; Mr. W. Gardiner is third with Colston Basset Seedling. An exceedingly good-flavoured Scarlet-fleshed sort was entered by mistake in this class, and disqualified.

Of Scarlet-fleshed there are only ten staged, the best by far being Read's. Mr. J. Read, Arley Hall, Northwich, is first; Mr. J. Malcolm, gardener to the Marquis of Cholmondeley, Cholmondeley Castle, Nantwich, second; and Mr. W. Coleman third. All the other varieties are poor in flavour.

COLLECTIONS OF FRUIT (eight dishes, distinct).—A silver challenge cup value twenty-five guineas was offered in this class, besides the money prizes. It brings out only four exhibitors, however. The first prize goes to Mr. W. Coleman. He has two magnificent bunches of Black Hamburgh Grapes, fairly ripened; Muscat of Alexandria, a Moscow Queen Pine, Peaches and Nectarines, Figs, Strawberries, and a Melon. Mr. T. Bannerman is second; he also has a good Pine, and Black Hamburgh Grapes. Mr. J. H. Goodacre, Elvaston Street, Derby, is third.

VEGETABLES.

Here, as in the fruit tent, the entries are numerous and the quality excellent; indeed, having a recollection of the show of these at Aston two years ago, the exhibition is in this respect much superior to it. Though two tents have been devoted to them, one would have been sufficient.

COLLECTIONS.—For tea dishes Mr. G. T. Miles is first, and gains the challenge cup. He has twelve Naples Onions, weighing 17½ lbs.; splendid James's Prolific Peas, Globe Artichokes, Turnips, Dwarf Kidney Beans, Tomatoes, Asparagus, Cauliflowers, and very fine Mona's Pride Potatoes. Second is Mr. J. Turk, Tewkesbury Road, Cheltenham. He has good Alma Kidney Potatoes, Dwarf Kidney Beans, Mushrooms, and Peas. Third, Mr. J. Holder, Battledown Nursery, Cheltenham. In this collection are good Early Rose Potatoes. Five more collections are exhibited. Of eight kinds of vegetables, in which class, as in that just noticed, Cucumbers and Saladings are excluded, the first prize goes to Mr. C. Arkell, gardener to A. Z. Skinner, Esq., Cheltenham. He shows some good dishes. Large Red Tomatoes, Early Rose Potatoes, and Carrots are good. Mr. E. Ford, Baginton Hall, Coventry, is second. This collection is strong in Myatt's Prolific Potatoes and Early London Cauliflowers. Third prize, Mr. J. Burnett, gardener to Mrs. Hope, The Deepdene, Dorking. Eight more collections were staged, some of them being disqualified through not adhering to the terms of the schedule.

POTATOES.—The exhibitions of three dishes of Kidney varieties are very fine, and much difficulty must have been experienced by the Judges in determining the awards. Mr. Baker, Brampton, Oxon, is first with Rivers's Ashleaf, Early Blush, and a very well formed sort, name not known. Mr. H. Biddle, Park Lane, Loughborough, is second; a very distinct sort with a clear white skin is in this collection. Mr. G. Baggaley, Spyrston, Newark, is third. The same exhibitors hold the same relative positions in the class for three dishes of Round, being first and third, while Mr. R. Gilbert, gardener to the Marquis of Exeter, Stamford, is second. The best Potatoes are, of Rounds, Early Kemp, Red Emperor, Early Coldstream, Early Hands-worth, Climax, and Bresee's Prolific.

For a single dish of Kidneys Mr. H. Biddle is first with Prince of Wales, Mr. G. T. Miles second with the same sort, and Mr. G. Baggaley third with a variety named Champion of England. For a single dish of Round Mr. H. Biddle is first with Rector of Woodstock; Mr. G. Craddock, Compton Verney, Warwick, second with Climax. The third prize goes to Mr. J. Baker for Early Kemp—a variety well shaped, but mottled with pink about the eye.

PEAS.—In the class for three varieties, half a peck of each, there are sixteen competitors. The first prize goes to Mr. R. Gilbert, Burghley—he has Supplanter, G. F. Wilson, and Fillbasket; second, Mr. J. Richardson, Boston. In this collection is a fine dish of G. F. Wilson. This is a grand Pea, and shows up well in all the collections. Mr. W. Cox and Mr. Turk are equal third. For a single dish Mr. G. T. Miles is first, Mr. J.

Baker second with *Ne Plus Ultra*, and Mr. A. Dean third with James's Prolific. Mr. Thomas Laxton, of Stamford, gives prizes for Peas of his own raising—viz., Laxton's No. 1, Fillbasket, Superlative, William I., Popular, and Omega; four sorts to be selected from these six. Mr. J. Richardson is first—he has Fillbasket, Omega, Superlative, and Popular; Mr. R. Gilbert is second, and Mr. G. T. Miles third.

ONIONS.—In this class very fine Early White Naples are sent by Mr. W. Cox and Mr. G. T. Miles; but their dishes, through some unaccountable means, were passed over, and the first prize given to Hurst's White Tripoli Onion, from Mr. E. Smith, Upper Alstone, Cheltenham, the second prize going to Red Tripoli from Mr. J. Turk, Tewkesbury Road, Cheltenham. Mr. O. Arkell is third.

CUCUMBERS.—Mr. J. Douglas is first with a brace of his Tender and True; Mr. J. Holder second with a fine white-spined variety named Dreadnought; and Mr. E. Chadwick third with Improved Champion White-spine. Twenty-one brace are exhibited.

KIDNEY BEANS (fifty pods).—Mr. G. T. Miles is first with Canadian Wonder, very fine; Mr. R. Gilbert second with the same variety; Mr. J. Hall, Davenport, third with Negro.

CELERY (three sticks).—The white variety which gains the first and second prize is remarkably fine for the time of the year; it would be fine for September, and is named Lion's Paw. Mr. O. Arkell and Mr. A. Smith are the exhibitors. The third prize goes to Mr. G. Bloxham, Brickhill Manor, Bletchley.

OF OTHER VEGETABLES. Rhubarb comes from Mr. E. Smith, Mr. W. Cox, and Mr. J. Mitchell, Escrick Park, York; very fine Carrots from Mr. O. Arkell, Mr. E. Smith, and Mr. J. Baker. For Turnips, Mr. H. Holder, Mr. Joseph Douglas, Retford, and Mr. J. Barnwell, of Hereford, are the prizetakers.

Cabbages are fresh, and come from Mr. E. Ford, Mr. O. Arkell, and Mr. W. Brown. Cos and Cabbage Lettuce are well represented; Mr. W. Brown, Mr. W. Cox, and Mr. A. Dean, of Bedford, have the best examples. Cauliflowers are overdone, though Mr. Barnwell has three nice heads. Mr. E. Ford and Mr. Miles are also prizetakers.

There are some good dishes of Asparagus. Mr. C. Arkell has the best, Mr. E. Smith the second best, and Mr. J. Turk the third. Of Broad Beans Mr. Miles has a fine dish of Improved Longpod, and Mr. J. Richardson has the second prize. Mushrooms are not first class, the best being those from Mr. J. T. Cushon; Mr. T. Allen, gardener, Teddesley Park, has the second best, and Mr. J. Holder is third. The first prize dish of Tomatoes are those from Mr. W. Cox, and are very fine; and Mr. G. T. Miles has a nice dish of Hathaway's Excelsior. A good dish also comes from Mr. Arkell.

A class is also made for baskets or trays of not less than twelve varieties of salads. Four very nice baskets indeed are exhibited, although we do not think the Marigold, Nasturtium, and other cut flowers introduced, and which faded in an hour or two, are an improvement. The first prize is well deserved, and goes to Mr. E. Smith; his Celery, Endive, and Lettuce are very fine. Mr. Holder earns the second award, and Mr. J. Turk the third. These baskets were much admired, especially by the ladies.

DESTROYING WASPS' NESTS.

HAVING seen a receipt in this *Journal* for destroying wasps' nests by cyanide of potassium, I tried it this year on the first nest I found; and though I used it twice at two or three days'

Fig. 7.—Wasp-deceiving Apparatus.

interval the wasps came to life again, and on digging out the nest the queen was found alive and well. The next nest was taken in the following manner: In a common flower pot of medium size were cut two holes, one near the bottom, and the other at the opposite side near the top. A piece of old tin was placed on the top, and after some pieces of corduroy and tobacco had been put inside and lighted it was fastened tightly down with a bit of clay. Each of the holes being fitted with a tube (in this case two elder sticks with the inside taken out), the one from the upper hole was placed in the nest, while someone blew down the other, so that all the smoke went into the nest. In about five or seven minutes the nest was dug up, and all the wasps were quite stupefied, so that it was easily lifted whole into a bucket of water. I enclose a rough sketch of the apparatus (*fig. 7*), to render my meaning clear. As it

seems probable that this will be a very bad year for wasps, if anyone knows a simpler plan perhaps he will make it public. —B., Breconshire.

BELGIAN FARM GARDENS.

THE possibility of making a decent living for a family out of a farm depends in a large degree upon soil and climate. A small farm of a few acres in England, and more especially in Scotland, means semi-starvation. We have seen several instances in which the thing has been tried, and lamentably failed. A case occurred not long since within our personal observation, in which a land proprietor, by way of experiment, let a piece of ground, extending to about eight acres, with a house upon it, for a merely nominal rent. The land was good though a little rough, and the tenant set stoutly to work upon it. In two years he gave it up as hopeless. Another person made the attempt, and he also, in the same length of time, begged to be released of his lease, which was taken off his hands. The experiment was then very properly given up, and the land absorbed into a larger holding. It is quite a different matter trying to farm on a small scale in the Bay of Naples or in Belgium. There the farming is in reality a kind of gardening. Soil and climate, as well as old engrafted habits, conspire to make it practicable for a man, wife, and children to extort a living from a mere patch of ground. It is a pity that theorists who talk confidently about land-distribution, do not, from any personal knowledge, tell us how it is to be satisfactorily accomplished. We say distinctly that the cultivation of lands in Great Britain will not prove advantageous unless on a considerable scale, with professional knowledge, and capital to hire labourers, to buy and keep horses, to purchase artificial manures, and lie out of returns in the ordinary course of business. As regards that garden of northern Europe, the more fertile part of Belgium, the appearance of things there is certainly very fascinating—the neat whitewashed dwelling and outhouses, the trim miniature fields, the orchards in blossom, the industrious and simple habits of the people, the spires of village churches peeping out among the trees, all give one notions of the golden age, "when every rood of ground maintained its man." The very fertility, however, which produces this result is for the most part not natural. It is the effect of centuries of diligent application with the spade or plough, constant drugging with manure, and tact in changing the crops. But there is more than this. It is the result of intensely economical habits, of which we can hardly say there is any parallel in England. Without enumerating all the plants to which the Belgian farmer gives his care, the Colza, Poppy, Hop, Flax, Hemp, Chicory, Wheat, Rye, Buckwheat, and Haricot Beans may be named; and as root crops or forage, Turnips, Beetroot, Cabbages, Peas, Vetches, Oats, and the common or scarlet Clover. This variety gives to the country a very pleasing aspect; there are no large fields lying bare, as with us, waiting for the Wheat, but they rather appear like a garden, where are large beds of flowers of every hue. In early spring, the scarlet Clover alternates with the bright yellow Colza, then the beautiful blue Flax; the little white stars of the Buckwheat contrast with the gandy purple Poppy, and the large Tobacco-leaves, whose intense green recalls the vegetation of the tropics. Without these plants the owner never could pay either for the manure he puts in or his high rent, as Wheat grows very poorly. They require much labour, and the soil has no repose; the labourer is always digging with the spade, turning over the soil, hoeing, weeding, or harvesting.

English and Scotch farmers might take a lesson from the Belgian agriculturists in their prodigious care of manure—no wasteful exhalation, no neglect of the liquids which enrich the soil. We might almost say that the Belgian farmer is a reverential worshipper of manure. It is his idol, his treasury. In the first place, there is the manure produced in the cattle-sheds. No cow is allowed to go about in the open air; all stay within-doors, and liquids which we too often see running to waste are carefully conducted into covered tanks. Neither is the solid part allowed to be in the open air; it is covered from sun and rain, which destroy the ammoniacal salts, and trodden by three or four young cattle during the winter. In addition, the farmer collects from his ditches and streams aquatic plants, which he mixes with the manure, or uses them at once to hasten the growth of the Potato. He sends to a distance for the mud dredged from canals, and lime; in the nearest town he buys the refuse from tanneries and manu-

factories, animal black, cinders, street-sweepings, crushed bones, and the refuse of Flax and Colza. His younger children are out at dawn with a litter cart, gathering up from the roads and fields all that, according to agricultural chemistry, can restore to the land what has been drawn from it. Peru sends it guano; and the farmer is seen in spring, sack in hand, sowing the precious powder on the barren portions of his land; and the flinty soil swallows it all with such promptitude, that it must be manured twice or three times a-year. In no country is such high farming carried on, and it would be ruinous without the rich return of these plants, and the accessory crops which are gathered after the principal ones.

In Eastern Flanders, of one hundred acres of land seventy-two are sown with cereals and plants used in manufactures; twenty-eight with roots and forage; but to this must be added thirty-one acres of after-crop, which gives sixty-nine as affording excellent food for cattle, superior to common meadows, and which explains how poor land can pay a rent of £5 an acre. The second sowing consists of Turnips and Spargula after Colza, Flax, and early Potatoes; and the Carrot which is sown in spring with the preceding crops, and carefully hoed after they have been taken away. The Clovers having occupied the ground during winter, leave it clear for the April sowing; and the giant Cabbage develops during the cold season, making a stem 6 feet high, and giving abundant and excellent leaves for milch cows. Culture thus pushed to the extreme necessarily requires some capital, and it is reckoned that through a system of rigorous parsimony and saving, double the sum per acre is used in Belgium to that employed in England, and two-thirds more in the best farms. In this way the most dense population in Europe can subsist on a soil so little favoured by Nature. Here it will be observed that the small farmers of Belgium, with the ten or fifty acres, place their reliance on a variety of crops, such as we could not profitably introduce into England. We might say the same thing of small farming in Lombardy. There the land bears three crops at once—Mulberry trees, grown for the sake of their leaves as food for silkworms; Wheat beneath the trees; and Vines in the hollows of the ridges. In the south of France we see the same diversity; in some places Olive trees for the oil they produce, taking the place of the Mulberry. In such parts the country is like a garden; and with little winter, there is something growing all the year round.

Turning to one of the most fertile parts of Belgium, all, as has been said, is charming—every road is bordered with trees; not a rise in the ground is seen; all is calm, uniform, and presents an image of quiet comfort and peace. Each house is detached, and surrounded with large Apple orchards, hedged in by Box, Holly, or Hawthorn, where the cows are brought to feed every morning and evening; it is of one storey only, and thatched, containing four rooms, the first for meals, the second for the dairy and preparing the food for cattle, the others for sleeping rooms. The old-fashioned oak furniture is a model of brightness; tin and copper utensils shine on the walls, which are whitewashed. The garden is gay with Wallflowers, Dahlias, and Hydrangeas, and the florists' flowers which are to be shown at Ghent. Outside, everything is in its place; nothing spoils the green sward; the ditch and the manure-heap are banished; the latter is always under the roof of the stable or cow-shed. In this stand five or six large cows, the constant care of the farmer's wife, who gives them abundance of green meat in the summer, with straw, hay, and a kind of warm soup, mixed with Carrots, Turnips, or Rye in winter. Thanks to this nourishment, and the constant rest they enjoy, the animals give from 15 to 25 quarts of milk daily. The tools are simple, but of first-rate construction; the plough is light, drawn by one horse, and works with ease, rapidly, and regularity. The harrows are of various kinds, triangular, rectangular, or a parallelogram; but the special tool with which the Fleming has fertilised sands, dried-up marshes, and forced back the sea, is the spade. The proverb on the banks of the Scheldt is: "The spade is a gold mine to the peasant;" and different kinds are made for light or heavy soil. The fields are mostly square, and rarely contain more than an acre; the ground is curved symmetrically, the centre being the highest, so that the water drains down equally in all directions. Round the field, and a foot lower, extends a strip of grass, 3 or 4 yards wide; still lower, a hedge of Elders is planted, which is cut every seven years; and, finally, the plot is surrounded by a ditch, bordered with trees of larger growth. Thus each piece furnishes rich Grass, firewood every seven years, and timber

for building every thirty years. The plough is generally used; but every seven years the subsoil is turned to the top by the spade, and thus it acquires a depth unknown to all but the best gardens; the principal object being to produce Flax and butter, not cereals. The best farmers never sell their corn, but allow their cattle to consume it. Unhappily, the farm-labourer there, as elsewhere, does not enjoy much comfort; working harder than most men, he is the worst fed. Rye-bread, Potatoes, Beans, buttermilk, without meat or bacon, is the usual fare, chicory the constant drink; beer is reserved for Sundays and fair days. His wages vary from 10d. to 1s., and he could never live upon it did not all the members of his family work without ceasing.

Yet, though their life is so hard, the towns do not attract the rural population. Habit and family traditions bind them to the plough; whilst every nine years, at the renewal of their lease, the raising of the rent fills them with anxiety and poisons their existence. It makes them distrust all those who are making inquiry on the state of agriculture, and dissimulate as to the fertility of their land and the produce they obtain from it. Western Flanders is crossed by a strip of land which is particularly difficult of cultivation; until lately it was scarcely inhabited, and covered with low brushwood and marshy heath. The Reindeer Moss enveloped the trees with a layer as of white ashes; abundance of Ferns and Moss grew, and the sickly appearance of other plants gave the country a sterile appearance. But by means of the Pine tree this land has also become valuable. About 30,000 young trees are planted on an acre; at the end of seven years these are thinned and sold for firewood. The land must be rich and provided with Fir poles, 3000 to the acre; as it grows the stems have to be tied, and liquid manure given to those plants which show yellow leaves; finally, at the time of harvest, numbers of work-people have to be gathered together for the picking. But whilst in England the whole of the ground is sacrificed to the Hop, there are in Belgium the most splendid crops of Wheat and Beetroot growing between. Chicory, like the Hop, is a very expensive article of culture; but it gives a rich return, estimated at £40 an acre. The produce of Colza is also very valuable. It will be seen that few sheep are fed in a country where there is so little pasture. Horses of great strength, and milch cows which give much butter, and can be fed in the stable, are considered most advantageous, and statistics show that more of these animals are fed on the acre than in any other country. It is to be remarked that the Flemish farmer has compensated for all the disadvantages of his soil and climate by a simple means within the reach of all—that of restoring to the land what it gives to the wants of men, the secret of agricultural chemistry.—(*Chambers's Journal*.)

THE PEACH CROP IN THE UNITED STATES.

THE Delaware Peach-Growers' Convention met on the 16th of June at Dover. Mr. Townsend, of Newcastle County, probably the best authority on Peaches on the Peninsula, presented some twigs to the meeting, which exhibited the condition of the different varieties in his own county particularly, and the country generally. The Hale's Early were the fullest of the specimens shown, and a good crop throughout the Peninsula of this variety, the earliest, is expected. They will probably form a very large part of the entire yield for the season. The Trotha were also very full, but the Early Yorks did not seem so good. The Old Mixons exhibited only a very small chance for a crop. The Smocks will probably be only tolerably full. The Stump-the-World made a poor show, and the Crawford's Late were about on a par with them. The Crawford's Early made a very excellent show. The Reeves' Favourite looked very promising, and the Moore's Favourite here looked well.

Mr. Townsend also reported to the Convention that the crop for the present season would fall very far below even that of last year; that, probably, there would be only one-third as many. There were about 1,500,000 baskets last year. A grower, representing Smyrna and the country around, reported the prospect for a good crop in that neighbourhood as very uncertain, and a gentleman from Dover thought that the yield from this section would be very thin, in fact almost a failure. In Kent County, Maryland, a very prolific Peach section, the crop was reported a failure. In Sussex County, Delaware, a like report was made, and the same from the lower portion of the eastern shore of Maryland. The estimates

were then called for, and the following were reported by the growers representing the different sections:—

From Mount Pleasant, 20,000 baskets; Kirkwood, 10,000; Armstrong's, 35,000; Middletown, 75,000; Townsend, 25,000; Giums, 2,000; Black Bird, 5,000; Green Spring, 5,000; Clayton, 35,000; Brentford, 10,000; Morton, 25,000; Dover, 20,000; Wyoming, 20,000; Woodside, 5,000; Canterbury, 10,000; Felton, 10,000; Harrington, 5,000; Farmington, 3,000; Greenwood, 2,000; Bridgeville, 10,000; Seaford, 5,000; Laurel, 10,000; Delmar, 2,000; Salisbury, 5,000; Dorchester and Delaware Railroad, 10,000; Junction and Breakwater Railroad, 10,000; Kent County Railroad, 25,000; Maryland and Delaware Railroad, 25,000—making a total estimated shipment by rail of 412,000 baskets. It was also estimated that 158,000 additional would be shipped by water, making a total shipment from the entire Peach country of 600,000 baskets. This report was accepted by the Convention, although some of the growers thought it rather a low estimate; but it seems to be the general opinion of those who should know, that this will be the extent of the crop for this year.

AMONG THE NORTH-FOLK.—No. 2.

I sat down to tell more of all I know and have seen of Hunstanton, but must first relieve my mind of the "Norfolk dumpling." Never was a greater delusion. I had read of it, heard of it, and sat down to it, and found it was nothing but a large yeast dumpling! Accompanying it was a tureen of gravy, and I was told that that is its orthodox accompaniment.

Well, that's off my mind; and my next note is on that special English text, the weather. I see in the Lynn papers that the centre of the county was visited by a frost and keen wind on the night of June 20th, which cut down the haulm of the Potatoes and the Kidney Beans, but it did not reach this north coast, and the Potatoes, Peas, and Kidney Beans are uninjured and most promising.

When it is high tide at Hunstanton at eight o'clock in the morning, the ebb is at its very lowest about twelve, and the Submarine Forest may be visited by any pedestrian. If at the hour last-named from beneath the wall of the lighthouse garden he looks in a northerly direction he can see on the sea's margin what appears like an expanse of black earth. It is about a mile and half distant across level, stoneless, but wet sand; its blackness is caused by its being a mass of dark-grey unctuous clay, with mussels thickly spread about its surface. In that clay the prostrate forest trees are embedded. It is a low flat bank, about a quarter of a mile long and averaging about 40 yards broad. Above the surface of the clay protrude two or three stumps of tree trunks, the sides of many prostrate trunks, and stumps of their branches. All are intensely black, yet so well preserved that the grain of the wood of the branch stumps when broken is plainly discerned. I have specimens showing clearly that they are Oak. The few trunks which I was able to trace along portions of the length ranged east and west, with their heads towards the quarter last-named.

This bank is the burial ground of a very small portion of the drowned forest, for the Rev. George Munford, who well studied the natural history of the district, has recorded that "this submarine forest commences at Brancaster Bay, stretching by Holme and Hunstanton, across the Wash, and extending all along the coast of Lincolnshire from Skegness to Grimsby. This now submerged tract was once inhabited by herds of deer and oxen, as is evident from the remains of their horns and bones which have been occasionally found there; the foot of man has also trodden these now ruined wastes, for works of art have been met with buried with the forest beneath the waves. The prostrate forest consists of numberless large timber trees, trunks, and branches, many of them decomposed, and so soft that they might easily be penetrated by a spade. Many of the trees, however, are quite sound and still fit for domestic purposes; and, indeed, they are sometimes used by the proprietors of the neighbouring lands for posts and rails. But the most extraordinary thing met with was a British flint celt or axe embedded in the trunk of one of the decomposed trees, about 1½ inch, by its cutting edge. This curiosity is now deposited in the Norwich Museum."

This excursion to the submarine forest made me more than ever conversant with the abundance and variety of Seaweeds. I have already noticed their employment here as a manure; and now I saw cows quietly walking down to the beds of growing Seaweeds, each taking a mouthful or two, and then returning as leisurely to their grass pasture as they had come from

it. They know that the salt in the Seaweed makes them feel comfortable, as we know that it promotes their digestive power. Among the Seaweeds was the *Chondrus crispus*, often used as a substitute for isinglass; and *Dulse*, *Rhodomenia palmata*, which is considered invigorating when boiled in milk for invalids. All Seaweeds early in the present century were burnt to form kelp, then the only source of alkali for the glass and soap makers, but now these weeds are used for other purposes. They are distilled by highly heated steam, and an illuminating gas, oil, acetic acid, iodine, and chloride of potassium, all useful in various arts, are thus obtained. The residuum has a powerful deodorising power, and can be used for that purpose with sewage for manure.

I will in a short time communicate my notes on Hunstanton Hall.—G.

ROYAL HORTICULTURAL SOCIETY'S FLORAL COMMITTEE.

YOUR reporter has given me credit for two very well-grown pans of *Nertera depressa* at the South Kensington Show on the 1st inst. They were no children of mine, but as they had no card in front, and as my card was before a bottle of cut Lilies very near, the *Nertera* was credited to me. If the Floral Committee continue the new rule of not allowing exhibitors' names to appear, care should be taken to place cards with names immediately after judgment. I have heard of several mistakes, and not a little discontent caused by the omission of this.

Old stagers say that the exhibitor's friends know his plants without the name appearing, and that knowledge is really only withheld from those who would make good use of it. Our Fruit Committee rule of having numbers instead of names for collections of fruit exhibited for prizes, seems to work well, but this case is rather different.—GEORGE F. WILSON, *Heatherbank, Weybridge.*

APPLES AND SOILS.

DURING an extended observation of several years we have noticed a peculiar adaptation of varieties of Apple trees to site and soil. We have found the English Golden Russet succeeding best on decidedly dry soils, and sunshiny slopes, or high land. Tops liable to winter kill when trees are young, hardy when older. Not an early bearer, but bears regularly and well with age. A poor nursery but good orchard tree.

Talman Sweet chooses a strong, rich soil, where it can make a good annual growth. Young trees very liable to bark-burst, and a bad nursery tree on that account. Here the tree is almost hardy—receives injury many winters, but with strong soil and good culture will recover. When in bearing is very productive, trees from eighteen to twenty-five years old bearing twelve to thirty bushels of Apples.

Fameuse thrives best on limestone, clay, loam, or Oak-bush land, such as is found at Baraboo in the State. Fails on sandy land, and is worthless there. A good nursery tree, and where it succeeds, one of the most profitable orchard trees.

Duchess of Oldenburg—hardy on most soils, but suffers considerably from drought on sandy soils. Needs a clay or loam, and will do well where it is too cool and moist for the Golden Russet. Very liable to send-up water-spouts from the roots on account of early maturity of growth of top before roots naturally would.

Alexander is very hardy, but liable to fire blight. Thrives best on clay loam soil, and blights most on sandy soils and hot exposures.

Yellow Belleflower has not proved productive or profitable as far as we have seen it, and is not hardy enough to endure well here.—A. L. HATCH (in *American Horticulturist*).

LELIA MAJALIS.

THIS species is always admired, and always desired by Orchid amateurs, and yet very few succeed with it when they do become possessed of the plant. It is a dwarf-growing plant, forming somewhat ovate or sub-rotund pseudobulbs, which vary from 1 to 2 inches in height. The leaves are usually solitary, some 4 inches long, oblong in shape, thick and leathery in texture, and deep green in colour. Like all the genus, the spike springs from the top of the pseudobulb, and is generally single-flowered; more rarely two are produced (our illustration shows these). The flowers are large and showy, and from the

thickness of sepals and petals last a long time in full beauty. They measure between 3 and 4 inches in diameter. Sepals and petals delicate rosy-lilac in colour, the latter much the broadest; lip large and three-lobed, bordered the same colour

as the sepals and petals; the centre, however, is white, more or less streaked and spotted with lilac and chocolate. It blooms during the months of May and June. Native of various parts of Mexico.

Fig. 8.—*LÆLIA MAJALIS*.

Lælia majalis I have found thrive best upon a good-sized block of wood. Indeed I am of opinion that it does not long retain its vigour if treated as a pot plant; but there is not the slightest reason why the block should not be placed in a pot if found more convenient. This plant, like many of the Mexican Orchids, enjoys full exposure to the sun, and it should be kept near the glass during the summer. Under this treatment, and with a free circulation of air, the thermometer will run up to

80° or 85°; and if it falls again to 65° or even lower during the night so much the better will the plant thrive. The plants must be well supplied with water at this season; not so much overhead as between the pots (when so placed), or upon the floors and stages and blocks when they are suspended, in order to keep the atmosphere from becoming too arid. During winter very little water will suffice; and the temperature by day may range from 50° to 60° upon bright days, whilst at

night the nearer the thermometer stands at about 45 the better. Mr. Anderson, gardener to the late J. Dawson, Esq., of Meadowbank, and the Messrs. Backhouse & Sons, of York, have perhaps hitherto been the most successful in flowering this truly beautiful species.—*EXPERTO CREDE.*

THE CURIOUS WAYS OF PLANTS.

Who can account for the ways of plants, or explain why a certain species will grow in one place, and will not in another exactly similar, so far as human intelligence can determine? Some wild flowers disappear on the advance of civilisation; while, on the other hand, the Plantain, if the truth is told, goes wherever Europeans go; and in this country was unknown until after the English came, following so closely on their tracks that the Indians gave it the name of "White Man's Foot."

Some species, as above intimated, may be found in a particular locality, and nowhere else within half a dozen miles. There is, for example, in this neighbourhood, in central New England, one spot where are a few shrubs of the Mountain Laurel (Spoon Wood) in a little patch by the roadside; and although this would seem the natural country for it, it can be discovered in no other place anywhere about.

Then there is the Fringed Gentian, which has been seen beside a secluded road some six miles away; but, with that exception, appears wholly unknown in the vicinity; yet the Closed Gentian is abundant. Another of the perversely disappointing flowers is the Dog-tooth Violet; not, however, more capricious than the Yellow Violet and the noble Liverwort (*Hepatica triloba*), which, in certain dry Maple woods in the one case, and in open knoll-covered pastures in the other, grow in great abundance; still, one might search acres of similar woods and pastures for them, all to no purpose.

Another case, somewhat in point, is the Holly—indigenous, or at least one variety, to moist woods along the eastern border of New England; but so partaking of the aforementioned eccentricity, that he may count himself a happy man who can find it, and prove his success by great armfuls of it wherewith to deck his house at Christmas. One gets glimpses of it while riding through some swampy tract on Cape Ann; the bright berries and evergreen leaves, so suggestive of English good cheer, betraying it. There, too, in summer, by searching diligently, one may find a species of *Magnolia*, that being about its northern limit.

No common New-England flower is so little to be depended upon as the trailing *Arbutus*. It is difficult to determine what it wants. It abounds in gravelly knolls by the wayside, and thrives on the very edge of pasture bogs, and in the shade of woods; and yet, with all this versatility, there are many towns where it is never found, and where, though transplanted and tended with care, it cannot be made to live.

Quite opposite, in these respects, is the Cardinal Flower, whose home is by the water side, the only place where it grows naturally, although the kind of water is not of imminent consequence, for it will do just as well in a dark nook under the upheaved root of a Willow, on the edge of a mill pond, in the muddiest ooze, as in the cleanest sand along a river's bank, its chief requirement seeming to be that it shall not be crowded, one stalk always standing by itself, independent of its kind, and not in close neighbourhood to other plants. It is so adaptive that it will bear removal to a garden, taking kindly to its new conditions; and there it will come up, year after year, flaming out in live scarlet, in "one glorious blood red," as if nothing had happened to it.

There are other facts, more singular, as to the ways of growth and "how" of blooming. One can understand that a Grape Vine may hold to its support by means of a tendril, while an Ivy or a Virginian Creeper secures itself by thrusting its rootlets into a crevice of a wall or in the bark of a tree; but why should a Honeysuckle and a Bean vine wind in opposite directions, the one going to the left and the other to the right? and either will swing on the wind, or sprawl over the ground rather than turn the other way.

The *Ketmia* opens at nine o'clock in the morning, and shuts at ten, as if it had a visual weakness; while a bed of *Portulacas* never expands unless the sun is out, and the hotter he shines the wider they spread themselves; and the Evening *Primrose* waits until he has gone down, and then comes open with a snap, like a subdued kind of fire-cracker.

But most unaccountable of all, perhaps, is the Night-blooming *Jasmine*. You see a simple tree-like plant, with a plain

style of leaf, at the base of which grows a spray of yellowish green tubes, like lilac buds, suggesting, more than anything else, a string of small candles. You look at them in the middle of the day, and they are "only that and nothing more;" and you might, if you did not know their ways, forget all about them; but when evening comes, forgetting is impossible. The room is full of fragrance, rich as Orange flowers, and almost as subtle as Violets; and lo! your little candles are all lighted: and from somewhere about them comes that perfume which is so delicious and so mysterious as to its source. The next morning they begin to contract; by noon, the five points are all close-packed, and there is no scent to them or about them at all till night comes on again; and so they continue, scentless through daylight, but of exquisite sweetness when darkness appears.—(*American Christian Weekly.*)

DIMORPHISM IN THE ROSE.

It may interest some of your readers to be informed how a Rose tree in my possession has lately illustrated the adage, "*Naturam expellas furca, tamen usque recurret.*" About nine years since an Austrian Briar Rose was planted against a south-west wall, and has from that time periodically produced flowers of that peculiar and attractive colour which it is very difficult to define, but with which florists are well acquainted. This season, however, at a distance of 7 feet 8 inches from the base of the stock where the bud was inserted, a small shoot of about 6 inches in length has produced six bright yellow Scotch Briar blooms, whilst towards the extremity of the same branch many pure Austrian Briar Roses have presented themselves. It is worthy of remark that there is one strong shoot, about midway between the stock and the yellow variety, which has as yet borne no flowers, although it appears to be of precisely the same character as the rest of the tree, less the particular shoot alluded to. This is surely a remarkable effort of Nature to reproduce itself.—*WEST-COUNTRYMAN.*

WEST KENT HORTICULTURAL SOCIETY.

THE fourth annual gathering of the West Kent Horticultural Society took place on Saturday last in Camden Park, Chislehurst, the seat of the Empress Eugénie, by her kind permission. The day was fine, and the Show was visited by a large number of well-dressed people. About 1 p.m. the Empress honoured the Show by her presence, and was attended by the Committee, headed by their President, Lord Sydney, and accompanied by the Earl of Darnley; and during the afternoon the Committee had the honour of conducting the Prince Imperial through the tents, and who left a substantial present to be divided amongst the cottagers.

The Exhibition was held under canvas, and occupied three tents, 300, 200, and 100 feet long respectively. The first was filled with plants of which there was a goodly representation in thirty-one classes, and various miscellaneous groups sent by Messrs. J. Veitch & Sons, Chelsea; Messrs. Rolisson & Sons, Tooting; Carter & Co.; and Downie, Laird, & Laing, of Forest Hill. These groups formed an excellent adjunct to the Show, being as varied and quite equal to the groups shown by these firms at the metropolitan exhibitions. Foliage plants were shown in large numbers, and of good quality. A large miscellaneous group was shown by Mr. Shaw, gardener to E. Wilson, Esq. Cut Roses were shown by G. Paul & Sons, Mr. Cant, of Colchester, and Mr. Cattel, of Westerham, as well as from numerous amateurs living in the neighbourhood, many of which were in excellent condition.

Fruit was also well represented. There were three collections of fruit, containing Pines, Grapes, Peaches, Nectarines, Melons; and there was a fair show of these kinds of fruits in the classes as well as Strawberries. Vegetables were contributed largely by amateurs and cottagers, the Committee encouraging the latter by giving prizes for the best-arranged gardens, as well as a copious schedule for the different kinds of vegetables.

VANDA LIMBATA.

This is a beautiful new species, now flowering (for the first time, I believe, in England) in the establishment of Mr. B. S. Williams, of Upper Holloway. It is a small-growing plant, somewhat resembling *V. Roxburghii* in size and habit, but it differs from that species both in the flowers and its leaves also, which are not so sharply keeled below. *V. limbata* produces leaves some 10 inches long and 1 inch broad, channelled above but rounded below, and bright green in colour; spike erect, many-flowered; flowers $1\frac{1}{2}$ inch in diameter; sepals and petals somewhat spatulate, bright chestnut, tessellated with markings of a darker brown; lip large for the size of the flower,

and, together with the column, bright rosy-lilac, tinged with purple.

I am not aware if the native country of this elegant species is known, but it is a fine addition to this noble genus of Orchidaceous plants.—*EXPERTO CREDE*.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE 31st anniversary dinner of this Institution took place in the London Tavern, Bishopsgate Street, Alfred de Rothschild, Esq., M.P., in the chair, supported by Mr. Alderman and Sheriff Whetham, the Rev. W. Rogers, Rector of Bishopsgate, Major Snell, Alfred Smee, Esq., F.R.S., Messrs. Wrench, Hurst, J. Burnell, B. S. Williams, John Lee, and other members of the nursery and seed trade. After the usual loyal and patriotic toasts had been given in appropriate terms and enthusiastically received, the Chairman in proposing the toast of the evening, "Success and Prosperity to the Gardeners' Royal Benevolent Institution," after remarking on the beauties of flowers and their influence in human affairs, said "the English gardener had by his industry, skill, and enterprise brought the science of horticulture to a perfection which stood unrivalled, and was not even equalled in countries where the sky was sunniest and the climate less capricious. He spared no trouble or expense in introducing from tropical zones the rarest of Orchids and other exotics, and his care was unceasing in nurturing and fostering those delicate, and in many cases half-withered, plants." The Chairman concluded by an eloquent appeal to the company to support the charity in aid of which the entertainment was given.

The subscriptions of the evening amounted to 771 guineas, of which the Chairman and his family gave 100 guineas. As usual the room was profusely decorated with flowering and ornamental-foliaged plants contributed by the leading London nurserymen.

PACKING FRUITS AND VEGETABLES FOR TRANSIT BY RAIL.

GARDENERS who have to send a supply of fruit and vegetables for their employers' table long distances by rail, generally find out by experience what measures are best. Still, judging from what we have seen, more especially at exhibitions, in the way of packing, and from establishments where better things might be expected, we should imagine that there are not a few of the craft who are not experts at the business, and others who have not had that experience which is quite as essential in that as in other matters. In packing either fruit or vegetables, the first point is to get rid of all unnecessary bulk and weight. We recommend all fruit-boxes to be packed in hampers, and not sent separately or tied in bundles. The hampers should be made of the strongest white willows, and furnished with wooden clogs, otherwise the bottoms will wear out in a few months; and they should also have stout iron bolts and eyes for securing the lid effectually. The basket-maker should have instructions to rivet the eyebolts through the bottom of the hamper, instead of simply attaching them to the rim in the usual way, in which case they get loose in a short time, necessitating the use of ropes to keep the lid down.

Two small hampers are much better than one big one. The concussion is very much less with the former when they are pitched about as we have seen them at the King's Cross platform, and by the Parcels Delivery Company when taking them about to their destination. We have known Melons burst and other fruits to be spoiled through no other cause than this, and we long ago had to discontinue using hampers above a certain size for that reason.

For packing Grapes in, there is nothing better than tin boxes, 18 inches or 2 feet long, 6 inches deep, and 12 inches wide: these sizes will be found to fit suitable-sized hampers. Packing materials should consist of fine paper shavings, or coarse unbleached cotton wadding. It is not contact so much as rubbing which destroys the bloom of the berries; the bunches should therefore be packed very firmly, first wrapping each bunch in one or two sheets of soft tissue or fine drapery paper, and afterwards wedging them together in the box, so that when the lid is shut down they cannot move about, in whatever position the box or hamper may be laid or thrown. Grapes packed in this way rarely get damaged, nor is the bloom of the berries much affected. Peaches require to be a little more carefully handled than Grapes. It is not an un-

common practice to have the tin boxes for these divided into compartments about 4 inches square, or large enough to hold a Peach wrapped in cotton, and afterwards to enclose the boxes in wooden cases; but this plan is cumbersome and expensive, as a dozen Peaches so packed will occupy just about double the space they would require if simply folded in cotton, and packed as closely together as they will lie. Our tin Peach boxes are 12 inches square and 4 inches deep, without divisions, and are consequently adapted for holding either large or small fruit, and the quantities can be regulated according to the demand by using fewer or more boxes. Nectarines may be folded in the cotton wadding without paper; but it is indispensable that Peaches be first folded in the softest tissue paper procurable before folding them in the cotton, as the wool adheres to the skin of the fruit, and cannot easily be removed without injury to the tender skin.

Figs require even greater care in packing than Peaches, they are so easily injured when perfectly ripe, as they ought to be before they are pulled off the tree. In their case a soft Vine leaf should take the place of the tissue paper to keep the cotton wool off them, otherwise they may be treated in the same way. Strawberries are the most ticklish of all kinds of fruit to carry, and need to be gently fingered in packing—in fact, we do not like to finger them at all. Wrapping each fruit in a leaf is a good plan, but deft fingers only can perform the operation without bruising the berries. We like to pull them off the plants by the footstalk, and to lay them in the box in the same way, simply placing a flaccid Strawberry leaf between the berries. In this way they can be wedged as tightly together as needful. The boxes should be 2 inches deep, and before packing a thin layer of cotton wadding should be laid on the bottom, and on this soft Vine leaves; above the fruit, nothing binds so well as the soft Strawberry leaves before mentioned; and above, layers of cotton or leaves to keep all in their places. It is very important that the Strawberry leaves for packing should be gathered some hours before they are wanted, and allowed to dry and flag in the fruit room: leaves freshly gathered are altogether unsuitable. In packing Pines and Melons it is only necessary to guard against crushing by using somewhat elastic packing materials. Gooseberries, Currants, and Cherries, and other small fruits, may be packed in boxes not above 3 or 4 inches deep, with a layer of leaves above and below only. Only choice specimens of Apples and Pears require to be packed singly, and in layers, with some soft material between, but ordinarily no such care is required. Dessert Plums, however, it is worth while to pack with care in a bed of soft leaves pressed down firmly with the lid; in this way the bloom is not much injured.

It is not necessary to say much on the head of vegetables. We may remark, however, that hampers of moderate size are best for vegetables. Too great masses of such things as Spinach, Brussels Sprouts, or Greens, &c., soon ferment, and if they are long on the road, or happen to be left unpacked for a while, they soon spoil. Everything should be cleaned and tied in bundles, as far as practicable, and packed in an orderly manner; and an invoice should accompany every hamper for the convenience of the kitchen authorities and others.

Small salads, such as cheese herbs, which we find are among the daily indispensables, should be packed by themselves in shallow baskets, as even small quantities ferment and rot almost directly if buried among other things. Such things should also be unpacked and laid out in a cool place immediately on arrival.

Vegetables are better when gathered and packed in the morning; and we think, when it is worth while sending a supply regularly, that they should be sent by passenger train. The railway companies are always willing to enter into arrangements to carry such goods at so much a hundredweight; and when we consider that the loss likely to occur through delay by goods trains will probably exceed the difference in the price of carriage, it is evident that the quickest train is the cheapest. We find it so at least; but we are aware that in some cases the hampers are always sent by goods train, on a two-hundred-miles journey, and only once a-week. Seeing that the expense of carriage is the same in the end, it is much better and more convenient to send at least twice a-week, and less quantities at a time; then both vegetables and fruit will be in a fresher condition.—J. S. (in *The Gardener*).

BREMEN INTERNATIONAL EXHIBITION.—A medal for merit was awarded to Messrs. J. B. Brown & Co., London, for excellence

and perfection in workmanship, and cheapness of production, of their galvanised wire netting.

ELSHAM HOUSE.

THE SEAT OF W. HORNSBY, Esq.

GRANTHAM is situated on the river Witham; and placed on a piece of rising ground commanding good views of the town and surrounding district is the pretty villa residence of Wm. Hornsby, Esq., one of the partners in the well-known firm of Messrs. Hornsby & Sons, the eminent implement manufacturers. This firm employs a great number of hands, and, I believe, the town owes much to this enterprising firm. However, it is not of Grantham that I wish to note a few particulars, but of Mr. Hornsby's interesting garden, and more

particularly the spring bedding. At the time of my visit (May 7th), all the beds were full of spring flowers, and every bed was perfect—not a single failure, all seemed to have done well. It was indeed, as a friend remarked, a "grand hit." I will first take a glance at the hot-houses and other glass erections and their occupants.

Attached to the house there is a very pretty conservatory. It is often the style in filling such with flowering plants to aim at crowding as many flowers as possible into a given space: nothing can be more prejudicial to the well-being of the plants. Here every plant is allowed to stand as it were clear of its fellow, at the same time there is no feeling of emptiness about it. A few really well-grown plants are always far more satisfactory in our point of view. A good plant of Azalea Bride of Abydos was here in fine bloom. Ferns are also in-

Fig. 9.—ELSHAM HOUSE.

troduced with excellent taste. The house is not large, but the contents are such as anyone who takes an interest in plant-growing may well feel proud of. There are three vineries, all in excellent condition and producing plenty of fruit; they are mostly trained under the rafters, and all are making fine, strong, healthy young wood. In a plant stove I noticed some well-grown plants, such as *Clerodendron Balfourianum*, *C. fallax*, *Bougainvillea glabra*, *Rhynchospermum jasmnoides*, *Stephanotis floribunda*, showing flowers at every point of the young wood; *Hibiscus rosa-sinensis flore-pleno*, *Pavetta borbonica*, with pretty leaves; many varieties of *Croton*, and a nice plant of *Anthurium Scherzerianum*. There is also a stove devoted to exotic Ferns, containing some well-formed plants, such as *Adiantum macrophyllum*, *A. cuneatum*, *A. formosum*, a grand Fern when well grown; *Gymnogramma sulphurea*, *Lomaria gibba*, one of the finest Ferns grown; *Cyathea medullaris*, and *Dicksonia squarrosa*, two fine tree Ferns from New Zealand. There are three greenhouses containing good collections of *Ericas*, *Epacrises*, and *Azaleas*, and also a good selection of other hardwooded plants, such as *Aphelexis macrantha purpurea*, *A. prolifera Barnesi*, *Leschenaultia laloba splendens*, *Pimelea spectabilis*, and many others. Pine Apples are grown in span-roofed houses, with a walk down the middle and a bed on each side. Queens are the only variety cultivated; they are all in pots and look healthy and at home, the young plants are making a fine sturdy growth, which all

Pine-growers like to see. Peaches and Nectarines are grown in two houses; Melons and Cucumbers have three span-roofed houses for their cultivation. There is also the usual assortment of cold pits and frames for growing Potatoes, &c., and bedding plants in spring.

From what has been stated it will be seen that there is a good number of glass houses; they were all well filled with good healthy plants.

The kitchen-garden ground is not very large, it is enclosed by excellent walls, with young trees recently planted. By the sides of the walks there are a good many pyramid Pears and Plums, good young trees lately planted.—J. SMITH, *Exton Park Gardens, Rutland*.

[We shall publish full details, with diagrams, of the bedding next week.—Eds.]

INSECTS AND BIRDS.

NEVER in my experience have insects been so general and abundant as during the present season. Aphides of many kinds peculiar to particular plants are unusually prevalent. Peaches on walls have been literally covered with the green aphides (*Aphis Pyri-mali*), which attacks the Apple and Pear, the former very abundantly this season. The brown Peach aphid (*A. persica*) has given endless trouble in fumigation in Peach houses, and is most difficult to eradicate. Plum trees

have been literally swarmed with *Aphis Pruni*, scarcely a leaf escaped being curled up to the midrib. Cherries were not free of the black fly (*A. Cerasi*), and Gooseberry and Currant bushes were severely attacked with *Aphis Ribis*, and Rose bushes were smothered with *A. Rose*. Whenever aphides are unusually abundant the weather is mostly dry and cold, and whenever there is a great plague of aphides honeydew is deposited proportionately. I know some of your close observers, as the Rev. W. F. Radclyffe, deny, or appear to deny, that honeydew is due to and has its origin in insects. The Editors I think are justified in pronouncing against us (for I do not stand alone) on this point; but whatever the appearances are, for or against our ideas, we must all give way to those facts over at the command of the attentive observer. In no instance have I noticed honeydew without being able to find insects

(aphides) infesting plants, shrubs, or trees, directly over or in close proximity to deposits of honeydew.

To insect agency any observing person may ascribe the formation of honeydew, no other agency natural or artificial causing it to be deposited. The aphides and scale (*Coccus*) tribe of insects do not exist on plants without creating honeydew; it is deposited on all surfaces under or near these insects, be they leaves of plants, walks, paths, soil, stages. It is not found on the parts of plants above the insects, but may be found on surfaces at a considerable distance from the feeding ground of the aphides, yet always lower than it. It falls, as everyone knows, and is never found on surfaces above the aphid-attacked trees. In a plantation of bush fruit trees that may have some standard trees of a kind not infested with aphides, whilst the bush fruit trees are, the latter will

Fig. 10.—SPRING BEDDING AT ELSHAM HOUSE.

have a great quantity of honeydew on the leaves, especially the lower ones, but the insects being at the points of the shoots the upper part of the bushes may also have, and usually have, a slight deposit of honeydew, the standard trees being perfectly free. If the honeydew is not caused by insect agency, why is it present on the bush trees and not on the standard? I have two Apple trees in a plantation of "berry" trees; honeydew is on the latter, the Apple trees are free. Another plantation or quarter is free of honeydew on the low-growing subjects free of the fall from two standard Plum trees which are attacked with aphides; the deposit of honeydew is on the leaves of the Plum trees, and on those of the plants under and for a short distance from the aphid-attacked trees, but the other subjects of the quarter are clear of the deposit. Then we have some groups of Roses near clumps of shrubs; the Roses are attacked with aphides, and the foliage clammy with honeydew, which is not on the grass, the shrubs, or any part of the surroundings.

It may be urged that honeydew is a secretion of the plants, the aphides not being the cause but the consequence of the attack. The honeydew is deposited on the upper surface of leaves, never on the lower, and the aphides come to feed on the under surface, and suck the honeydew through the leaf. It is not a secretion of the plant due to insect agency; for if we take a plant infested with aphides, free it of them, cleansing the leaves and stem of honeydew, making the plant perfectly

clean, on covering it with a hand or bell-glass we shall not find any deposit of honeydew in twenty-four hours. This shows that the secretion, if of the plant, ceases with the removal of the insects, and gives ground for considering the honeydew not a secretion of the plant; for were it so, and arose from the punctures of its tissues by the insects, it is highly probable that the plant would continue to secrete the fluid, for a time at least, after the removal of the insects.

Let us introduce on the plant under the glass two or three aphides, the kind peculiar to the species, and cover again with the glass. Within twenty-four hours we have on the surface of the leaves immediately under the insects dots of honeydew, proving conclusively that its presence is due to the insects, that it is not a secretion of the plant attracting the insects, nor a secretion of the plant caused by the insects, but the secretions of the insects. Anyone can put to the test these simple facts, demonstrating on a Rose bush in a pot, or a *Pelargonium*, the cause of honeydew as clearly as were he master of all the mysteries of vegetation.

The cause of honeydew may appear but a matter of little or no importance to the cultivator, but it is, nevertheless, not altogether insignificant. If it were established that honeydew is a secretion of the plant not attributable to insect agency, it would follow that the condition of the plant caused it to be attacked by insects, and we should then only have to keep the plants healthy—apply that which nature does not afford, and

we should have perfect immunity from insects. If, on the other hand, it were established that the honeydew is a secretion of the plant following an attack of aphides, it would follow that the removal of the insects would restore the plants to health and vigour. It is not, however, a secretion of the plant, but an excretion of insects, which feed on the under surface—the breathing-pores side of the leaves—sucking out the life-blood of the plant, and covering the upper surface with honeydew, a fluid which on thickening completely prevents the action of light, &c. Hence growth of the part attacked is impeded or arrested; immature ripening of the wood results, and the crop of flowers or fruit is rendered imperfect. We thus arrive at an estimate of the damaging effect of attacks of insects on vegetable growth, and become convinced of the necessity of freeing plants of them with the least possible loss of time. Insects derive their support from the plant and leave a deposit. That of the aphid and coccus is a gummy sweet fluid—honeydew. The tiny red spider and thrips leave dots which, whilst the insects feed on the juices of the plant, ultimately result in a fungoid growth and consequent disorganisation of tissue.

The cause of insect attacks is probably the result of some law of nature to meet the demand that will be made by other of Nature's creatures, the feathered tribe, which in a dry and sunny season breed immensely, and then require a greater quantity of succulent insect food than in a wet and sunless season. Be that as it may; the fact remains, that when insects are unusually prevalent their great enemies appear more than ordinarily plentiful, and are uncommonly active. Their great enemies are the birds. There are few, if any, birds that do not feed their young with insects—few birds but what are more or less insectivorous—none, so far as I have experience, that do not at one or more periods of the year destroy an immense number of insects: hence their value to the gardener in keeping the insects (small and comparatively insignificant creatures individually, but in innumerable hosts) from so exerting themselves on vegetable life that the garden would be turned into a wilderness, and the field into a desert. The balance of power as regards the insect and vegetable kingdoms appears to rest with the birds. They have after suffering much, and it is to be feared unknown persecution, been protected by law, an amendment to a previous Act of Parliament being introduced during the present session. It may, therefore, appear needless to point out the value of birds, they being recognised as useful and deserving of preservation; but their value is nevertheless not sufficiently known and so acknowledged as to lead to their encouragement, which is very different to a law passed to prevent their extinction. Of the various uses of birds in a garden I propose hereafter to treat, and hope to enlist such sympathy as to encourage their breeding.—G. ABBEY.

REMEDY FOR DAMP WALLS.

To equal parts of Portland cement and lime add a piece of soft soap, then apply. On stone I have found this resist all wet, so much so that to put on a second coat is impossible.—W. T.

I fear the application will not meet the case complained of at page 487, vol. xxvi., for the wall was that of a brick-built dwelling; and whatever coating was put on outside ought to be transparent, so as not to alter the character of the building in appearance, which I fear a mixture of cement and lime would do, as it must give a colouring. I may mention that soft soap was one of the ingredients with which a sort of rough varnish was made for coating the wall several times twenty years ago, without much effect. I forget now the mode in which it was applied; but I know some care was required to prevent air-bubbles, and I think alum was also used in addition to the soft soap. The composition was colourless, and did not alter the appearance of the brickwork. Some glutinous or resinous substance that would give body without colour and resist the weather would probably answer, only it ought not to be costly. Many glass structures require shading during extremely hot weather, and limewash and other materials now used are capable of vast improvement. A useful transparent wash for damp walls might give us a hint to use it elsewhere.—J. ROBSON.

SALISBURIA ADIANTIFOLIA.—I have a fine specimen superior to the one at Kew, that having lost one of its good branches. Mine is between 20 and 30 feet in height, if indeed not near to 40. My soil is sandy and dry, with a steep fall, fully ex-

posed to the south-west. Mr. W. Wilson Saunders always spoke of it with pleasure. When it was planted I cannot say, but I have lived here since 1855, when it was of a good height. It was planted, I presume, by Mr. Feskitt, who formerly lived here.—W. D. PAINE, *Reigate*.

EXCESS OF PEARS IN CANTERBURY, NEW ZEALAND.

ACCOMPANYING this brief notice is an illustration of a heavily-loaded branch of the little Swan's-Egg Pear, grown in my own garden, which branch should have been in an upright position had it not been for the weight of eighty-four Pears on it. Of this variety of Pear, its hardiness and adaptableness for the changeable climate of this part of New Zealand there needs no proof.—WILLIAM SWALE, *Christchurch, Canterbury, N.Z.*

[The photograph shows that the Pears were roped on the branch as Onions are roped.—EDS.]

NOVELTIES IN THE ROYAL GARDENS, KEW.

Is the stove *Amorphophallus campanulatus*, a very remarkable Aroid, has now an inflorescence, which is indeed curious. The club of the spadix is about 20 inches in circumference, and deeply crumpled. It is dark purple in colour, approaching to black, with a few irregular yellow spots near the top. The spathe is beautifully spotted on the outside. When in flower the odour exhaled is detestable. On another plant a gigantic leaf is being developed; it is now about 5 feet high, and when the divisions spread will be strikingly ornamental. This species is of medicinal importance in India, where it is also largely cultivated for food. The rootstock contains a large quantity of starch. It is of the easiest cultivation, does best in fibrous loam, and should be potted in April, or when indicating a desire to grow. While in active growth it requires water freely, but which, as soon as the leaf turns yellow, must be gradually withheld. It may be cultivated in an intermediate house. The inflorescence is rarely produced, except from large imported rootstocks.

Albucca minor in flower in the Cape house is very pretty, though belonging to a genus usually without beauty. The flowers are yellow, drooping, and borne on slender stems, the glandular appearance of which adds to the elegance of the plant.

Among Orchids recently open are *Thunia alba*, of graceful habit, the leaves of which are glaucous, the flowers white, and the lip marked with purple lines; *Stanhopea oculata*, a plant with seven spikes; *Dendrobium dioxanthum*, a beautiful yellow-flowered species, easily cultivated; *Acrides odoratum*; *Proemnea stapelioides*, interesting from the resemblance of the flower to a *Stapelia*; and *Dendrobium japonicum*, the flowers of which are white or pinkish white, and, though not of highly ornamental character, is worth cultivation.

In flower on the Rockwork are the following:—*Spraguea umbellata*, a plant of much interest from California, which though known for some time is not yet common. It may be treated as an annual or biennial. Sown early under glass it will bloom the same year. If sown out of doors it should be where the mature plants are required; although it will bear transplanting, it is better without that operation. *Lilium canadense*, "one of the first plants introduced to European gardens from America."—(Mr. Baker.) *Lilium Washingtonianum*, one of the most beautiful and distinct. The flowers are white and delicately spotted with purple. It may be known from all the other funnel-flowered Lilies by its having the leaves arranged in whorls. *Allium McNabianum*, a very pretty species, recently figured under this name by Dr. Regel. *Sedum scarpavivoides*, a plant now rare in cultivation, and often searched for in vain; *S. altissimum* is frequently sold for it. It has a rosette of broad leaves, and produces pretty flesh-coloured flowers. *Milla ixioides* (*Calliprora lutea*) is a very pretty Californian bulb, having an umbel of numerous yellow flowers. It prefers a peat soil. *Hutchinsia alpina*, a diminutive Crucifer, with pure white flowers, has been in beauty for a considerable time. It is a native of the Alps, where, we are told, it is gathered and eaten as a salad. We can find no confirmation in books. It is still worth a trial, as it would combine beauty with utility. The flavour is precisely that of *Cress*. Seed is sometimes offered as *Smelowskia alpina*.

In the bulbaceous ground *Funkia Sieboldiana* is very orna-

mental; it has bold glaucous foliage and strong racemes of large white flowers tinged with lilac. *Salvia chionantha* is one of the most ornamental; it has narrow leaves at the base, and the panicles are tall, bearing large pure white flowers; the branches are peculiarly slender towards the point. *Polygonum* (*Mühlenbeckia*) *complexum*, from New Zealand, forms a dense mass of slender black stems, with small round leaves. It is of trailing habit, and may be grown as a climber in the greenhouse. *Eryngium maritimum*, from its silvery spiny foliage, might surely be used with good effect in combinations of fine-foliaged plants.

Bouvardia triphylla, an old species with scarlet flowers, is very pretty in one of the beds in the Temperate house. It appears to do well planted out, and though not so valuable as some of the hybrids, it is still worth cultivation. A decoction of the branches is used in Mexico as a cure for hydrophobia, and it is said with considerable success.

THE SUSSEX ANCHOR HOOK.

Our illustration represents a very useful implement which, having used, we can speak of in the best terms. It combines the means of performing more than one operation; but the principal use to which it may be applied is that of a lawn-weeder, the forked ends of which being well adapted for eradicating Plantain, Cocksfoot, Hawkbit, Cat's-ear, Thistles, Dandelions, and other coarse-growing herbage. We have used it very much for this purpose, and have found it the best lawn-weeder we

Fig. 11.

have ever had. Then there is a cutting edge on one side of the form of the letter L, which is serviceable for cutting over Thistles, Docks, Brambles, and other tall weeds, while at the end there is a semicircular blade to serve the purpose of a spud. It is a very handy and useful tool, and we heartily recommend it.

NOTES ON VILLA AND SUBURBAN GARDENING.

Those that have Asparagus beds just now, in the midst of the growing season, and while the soil is moist, should apply soakings of manure water with good portion of salt added thereto, taking the precaution of applying in due season stakes and lines to the outside rows at least, to prevent the heavy rains and winds breaking down the plants, which is very injurious to the crowns. Sea-kale, too, is particularly fond of manure water and salt applied, and this is the season of the year to assist it in forming strong crowns to ensure good cuttings of luxuriant fine-flavoured Kale another year; take care too that the crowns are duly thinned. Give every encouragement to late Strawberries by applications of manure water mixed with a good portion of chimney soot, which Strawberries particularly delight in. Such attention will prolong the bearing a considerable time. Keep the surface of the soil well stirred among the growing crops of Onions, or they may be seriously injured by mildew or maggot if showery weather continue to prevail. If the aphides make their appearance about the Carrot and Parsnip crops, dredge them well early in the morning with dry ashes, charred wood, or wood dust, or chimney soot, either of which are good drivers of these pests; but the three mixed together have a most beneficial effect, not only by clearing away the nuisance, but also in fertilising the soil and producing healthy luxuriant crops. If any of the Brassica family are infested with any of the above pestiferous vermin dredge them in a similar way, and if infested with root-maggot apply it in a liquid state. Continue to put out winter stuff in every spare piece or corner of land, and prick-out young plants for future planting. Do not allow either Peas or Beans to encumber the land after the bulk of the crop has been secured, but clear them away and crop with other articles, among which do not forget a portion of Leeks and Celery for winter use. Get a spare corner, too, well forked and pulverised in readiness for sowing the principal crops of Cabbage for another spring.

This has been a peculiarly trying season for the florist. Auriculas and Polyanthus must be kept well watered and free from insects, and shaded from the bright sunshine. Thrips, fly, and red spider are apt to make sad havoc on the leaves of the Polyanthus in such a season as this; nothing is better for eradicating these pests than syringing under the leaves with tobacco water, lime water, or clear soot water. Where the seed is ripe it should be carefully removed and kept in the seed vessels until sowing time in February or March. Carnations and Picotees will require rich waterings to give size to the

flowers, but if too rich expect the colours to run and be foul. Pinks may be struck by cuttings, and so may the forwardest of Carnations and Picotees, though layering is the surest process, unless you can command a nice gentle bottom heat and a tight hand-light. Ranunculuses should be raised when the foliage is quite withered, the roots separated before they become hard and brittle, and placed aside when properly dried in bags or drawers until planting time returns.

Peg down Verbenas, or insert short bushy twigs among them. Tie Dahlias and Hollyhocks. Look to climbing Roses on poles and chains in these windy days; clear away the decaying Rose buds from Rose trees; transplant from the reserve garden, so as to fill all vacancies. Sow early-blooming annuals for autumn flowering. Remove everything dying and decaying to the rubbish heap; mow and sweep, hoe and rake, and give to every place an appearance of neatness.

Achimenes.—There are few plants more beautiful or that will better reward the cultivator for any extra attention than the different species and varieties of *Achimenes*. I have had fine specimens of the grandiflora in bloom for six weeks, and they look as if they would continue to bloom in fine condition for as much longer. The longiflora, though not so fine with me as I have seen it with others, has also been beautifully in flower; whilst *hirsuta* and *pedunculata*, the latter with bloom little inferior to *picta*, are just showing their flower buds. One advantage which *picta* possesses over the others is, that it will grow and flower more freely in the winter months when placed in a stove temperature; but then all the others will flourish for a longer period in a greenhouse temperature. One of their great recommendations to amateurs of limited means, and to persons who wish to make a great floral display in summer and autumn, with but limited means for keeping-up a stock during the winter, is that during the cold months of the year as soon as done flowering, they require no attention more than keeping the roots dry and free from frost. My plan with these, as well as *Gloxinias* and several of the *Achimenes*, is merely to lay the pots on their broadsides, and pile them up in brick fashion in any snug corner below a stage. The *Achimenes* will stand a greater degree of cold with impunity than the *Gloxinia* will do, unless the roots of the latter are very dry, when they are apt to become so much shrivelled as to impair their future luxuriance. To preserve them safe neither of them should be exposed to a lower temperature than 35°, and if 40° is made the lower temperature so much the better. The roots will keep better in the pots in which they were previously growing, than if taken out and put away in drawers, &c. The soil to be equal parts of turfy loam and turfy peat, with an addition of about one-sixth part of silver sand, rotten dung, and lumps of charcoal in equal proportions, using more charcoal if the soil is not lumpy and full of fibre. It is a little matter whether they are grown in pots or pans, as though the roots are inclined to run shallow, I have found them at the bottom of the largest pots. Whether pots or shallow pans are used there should be no deficiency of drainage. To keep-up a succession of bloom as long as possible, succession tubers should be excited in February, April, and the end of June, or any time between those periods. If excited later they will be of small service to the amateur who has got nothing but his greenhouse, frame, or pit. There will be no difficulty in exciting any of them except the rot, and that difficulty will not exist with the amateur if he has a pit heated by any means except dung for his early Melons and Cucumbers. For accomplishing that object the scaly tubers should be shaken out of the pots and placed with a little earth about them in small shallow pans, and at once transferred to a situation commanding a temperature of 60° or 70° with abundance of atmospheric moisture. This can be as easily done in a dung-bed frame as anywhere else, with this difference, that after the plants have sprung and after they are potted and commence growing the frame must have a little air night and day, and in bright weather the plants require shading, or the action of the sun on the leaves of the young plants when covered with the dense vapours arising from the dung beds will mark them with brown blotches, which will mar their beauty, however well they may be grown afterwards. In moving the plants from the pans in which they were excited (which should be done when the plants are an inch or two in height), they may be transferred into small pots to be again shifted, or they may be put into their flowering pots at once, which is the method I prefer. In doing so some cultivators place the requisite number of tubers at regular distances over the pot, but in general, and especially with such sorts as *pedunculata*, *grandiflora*, *hirsuta*, &c., I prefer bringing all the growing ends of the tubers to the centre of the pot, and placing the other ends in a line to the circumference, like the spokes of a wheel, so that the specimen may resemble a single plant, and not a potful of suckers.—W. KEANE.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

Two weeks ago we said that hush and pyramid fruit trees should be looked over and have the young growths shortened

back. A press of other work prevented us from doing ours until the end of last week, when a beginning was made. The young growths must not only be cut-back, but it is also highly desirable to thin them out. No good fruit can be produced from any variety of fruit tree if that is a thicket of wood. If Apples, or Pears, or any stone fruit of a hardy nature, is to be of good quality, it must be freely exposed to sunshine and air. The nature of closely-cut-in trees is to become crowded with wood, and many amateurs at the work are afraid to use the knife.

We have a fair crop of Apples, but Pears and Plums, the latter especially, are very scanty. Some of the Cherry trees have gummed badly. Correspondents sometimes ask for a cure for this disease (it may be called), for it is a disease even if it is induced by a rusty nail or tight tying. It is like the Vine disease, or rinderpest in cattle, though it is not infectious. The best way is to destroy the tree altogether when it is badly attacked. We have commenced to layer the Strawberries, beginning with Black Prince. This is yet the best for early work, and for this purpose should be layered in small 60's (2½-inch pots), and re-potted in a month after layering in 5-inch. They will be ready to cut from the plants in two weeks after layering, and generally in two weeks more may be potted into their fruiting-pots. We used to be very particular in mixing the compost that was used for potting into their fruiting-pots; but one season having on hand a large quantity of the soil that had been used for growing Melons, this was taken both for the layering of the runners in small pots and for the final potting, and gave most satisfactory results. Fix the runners in the pots with a small peg. When once the black aphid has taken a firm hold of any tree, it is very difficult indeed to destroy it. On the Morello Cherry trees they clustered in millions, and though the shoots were dipped in a solution of tobacco water and soft soap sufficiently strong to kill them, some escaped, but their enormous powers of reproduction soon brought forward a fresh supply.

Vinerias.—In a dry season like the present it is well not to overlook the outside Vine borders. When Vines are in healthy growth they require a large supply of water at the roots, and in dry districts with rainfall so much below the average that it has been this year, the Vines will suffer if the border does not receive two or three good waterings. Inside, the same attention is required. The Grapes have not yet commenced to colour in the late houses; when they do, some attention is necessary to prevent scalding. Lady Downe's is very much subject to this, especially if the house is kept close and moist. The opposite conditions to this will produce freedom from scalding—viz., plenty of air in the day with the surface of the borders and paths sprinkled with water twice a day in hot weather, and only once if the days are dull and cold, and that in the morning. In many gardens the appearance of the bunches of Black Lady Downe's is quite spoiled by inattention to admitting plenty of air at the time the Grapes begin to colour.

Pot Vines, as shown at exhibitions, and as seen in well-managed gardens bearing fruit, are not at all what they ought to be, the Vines making little wood, and bearing small bunches with badly-set berries. It is sometimes necessary to grow pot Vines for fruiting when young Vines have been planted, and a supply of fruit is required before they come into bearing, or for some other cause; but the practice is not to be recommended if it can be avoided. Where canes were started or eyes put in early, so that the wood would be ripened for early forcing next year, it will now be ripening. Still continue to give plenty of water at the roots, and syringe freely, maintaining a high temperature, and not until the leaves near the base of the Vines show signs of changing to a yellow colour should this treatment be altered; then more air should be admitted, the temperature ought to be lowered, and the atmosphere drier, the leaves will then gradually fall off. The Vines may then be removed to a cool house, and water given sufficient to prevent the soil from becoming dust-dry. Over-dryness destroys many of the small active fibres, which is no doubt the cause of many failures. The reverse treatment—standing them out of doors until the pots are deluged by the autumn rains, is equally injurious.

Peach House.—The routine work here is much the same as that detailed in previous numbers, though a few words may not be out of place as regards gathering the fruit; and having recently seen a quantity badly bruised by bad management, a hint to some may be useful. No fruit is more easily damaged than Peaches, it must therefore be carefully handled, gathered, and placed on cotton wadding at once, even if it has only to be carried as far as the fruit room. Should it be necessary to send Peaches a distance, a thick layer of cotton wadding should be placed in the bottom of the box, and a strip of wadding wrapped round each fruit, place it on its base, and lay them close to each other. The strip of wadding will prevent the fruit from touching.

PLANT STOVE.

Amongst the most useful of stove plants may be named *Ixoras*. The flowers last a long time in beauty, and the whole of the varieties are of free growth and easily managed. *I. coccinea* is one of the very best, so brilliant in colour. *I. javanica* is not

possessed of such richly-coloured trusses, but they are more freely produced; and very distinct in character is *I. Colei*, which does not seem to grow so healthily as some of the others, but which may be grown into good plants, as the very fine examples of it exhibited by the Messrs. Cole abundantly testified. The insect pests that chiefly favour *Ixoras* are scale and mealy bug. If the latter is not cleared from the plants before the trusses of flowers open, the bug will gather into the centre of the bunches, and cannot possibly be dislodged without spoiling them. Stove plants of this character should be well syringed under and over the leaves when in growth, which helps to keep them clean. *Eucharis amazonica* is also in full beauty, and not even *Phalanopsis* itself, the wonderful Moth Orchid, can surpass it in the snowy whiteness of its flowers. The plants with us flower about three times in twelve months. Pot in good turfy loam, with a little rotted manure and leaf mould added, also sand if the loam is heavy. The plants are grown in the stove, but when in flower it is best to remove them to the greenhouse, as the flowers are very fugacious if the plants are kept in heat; they will also last much longer if cut, taken indoors, and placed in water at once. Crotons are also amongst the most ornamental of our foliage plants, and they have within the last few years been introduced in sufficient abundance to satisfy the most ardent admirer of them; it is questionable, however, if any will become such great favourites as *C. angustifolium*, the Fountain Plant of India; its slender wavy leaves place it at the head of the list for graceful effect. *C. Weismannii*, *C. undulatum*, and *C. Youngii* may safely be added to the most select list. Nor should any stove be without a few of the best *Dracenas*. *D. ferrea*, *D. terminalis*, and *D. Cooperii* are the best of the old sorts, but they will certainly be displaced by the new introductions. The most unique amongst them is the new one introduced by Mr. W. Bull last year, *D. Goldiana*. It has its leaves much broader than any of the other species; these are dark green, and distinctly marked and barred with greyish white. *D. Regina* is also very distinct. *D. Fraseri*, *D. Mooreana*, *D. magnifica*, and others too numerous to mention, are very valuable acquisitions to our stoves. A fault with *Dracenas* is that they in the course of a few years become leggy by losing the bottom leaves. To prevent this, or rather a remedy for it, is to cut a notch in the stem at the base of the leaves, and wrap some sphagnum moss round the cut. If this is kept moist roots are emitted, and the stem can be cut quite through under the roots, when it may be potted. It has been a usual practice to allow the fires to go out for six weeks at least about midsummer. We did so this year, but some of the plants showed the ill effects of it this year, and artificial heat was again applied.—J. DOUGLAS.

TO CORRESPONDENTS.

•• It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

SHAMROCK (*Scotch Thistle*).—You will find a life-sized plate of the Shamrock in "British Wild Flowers," No. 4, published at our office.

BRIAR OR MANETTI (*Jane*).—The Briar and Manetti Roses are quite distinct, and both are used as stocks on which to bud Roses. The former is the common Dog Rose, and the latter is so named from an Italian botanist. Worsted will do to tie buds, but cotton is more generally used.

RAISING SNOWDROPS FROM SEED (*W. L.*).—Mr. Robson did not doubt that snowdrops could be obtained from seeds when he mentioned that those which he had sown had not produced plants. Failure probably arose, he remarks, from birds and other enemies, or from the seed being simply scattered broadcast over all kinds of rough ground, most of it not touched either with the spade or hoe. He adds that during the past winter he has found the double snowdrop very useful for gathering for bouquets, although it does not multiply itself so fast as the single form, nor is quite so early.

STRAWBERRIES FOR FORCING (*Keens' Seedling*).—The best for forcing are Black Prince, President, Keens' Seedling, Vicomtesse Horticulteur de Thury, and Sir Charles Napier.

CHEMICAL PROPERTIES OF BURNT CLAY (*H. L. E.*).—Burnt clay not only improves the staple of a heavy soil by making it more workable, but thereby renders it more porous, so that the air can more readily penetrate. Those are not all the benefits, for burnt clay absorbs ammonia, not only from the atmosphere but from the animal manures decomposing in the soil, and retains it, and imparts it to roots of plants in solution in the rain water which reaches it.

TOBACCO WATER (*Idem*).—The simple prevention of its offensive smell would be to boil only as many of the stalks at a time as would make a quantity of liquor useable before it became putrescent.

PAPER FOR HOTBED FRAMES (*Newton*).—It is possible to render paper waterproof, and the following extract comes to us opportunely in reply:—"Common paper, by a very simple process, may be converted into a substance as strong as parchment, by means of sulphuric acid. The paper is simply dipped in the acid; but the acid must be of an exactly determined strength, and mixed with half its bulk of water. A sheet of paper dipped in this,

liquid is almost instantaneously changed in character. It becomes tough hard, and fibrous, but its weight is not increased, and it is far better for writing purposes than animal parchment. It can be rubbed better than paper, and almost as well as sheepskin; and it serves for vellum in book-binding, and for all legal purposes, as well as animal parchment, for strong binding, and as a substitute for bladders to cover pickle and jam jars; and any paper that has even been printed on may be converted, by means of sulphuric acid, into vegetable parchment. Paper can be made waterproof without giving it the character of parchment by dissolving 21 ozs of alum and 4 ozs of white soap in 2 lbs. of water; also, 3 ozs. of gum arabic and 6 ozs. of glue in 2 lbs. of water; the two solutions are to be mixed, and the sheets of paper dipped into the mixture while warm. They are then to be hung up to dry, and pressed. This paper is very useful for packages exposed to the damp, or for any purpose connected with the preservation of articles from moisture.—(Cassell's "Household Guide" for July.)

VIOLA (Tertian).—It is impossible to judge of the merits of your seedling *Pansy* from a dried single flower. Send a plant to the Floral Committee or to Chiswick.

OLD GOOSEBERRY AND CURRANT BUSHES (E. D. L.).—Cut out the young centre branches. Destroy half the bushes, and plant young ones this autumn, and destroy the other half and plant young ones in the autumn of next year.

GRASSES FOR COW FODDER (Wellington).—All the Grasses and Clovers, &c., you name are perennial except the Italian Rye Grass. We should have Perennial Rye Grass in place of the Italian, and not depend on one subject alone, but have a mixture. For your soil a suitable mixture would be two bushels Perennial (Pacey's) Rye Grass, one bushel Italian (best quality), Red Welsh Clover, 5 lbs.; White Clover, 4 lbs.; Alsike Clover, 1 lb.; Trefoil, 5 lbs.; and your soil being moist as well as light, you may add 2 lbs. Timothy Grass. The above quantities are a mixture for one acre. For early cutting the seed would be best sown in September, the land being in good tilth and clean. It may give four or five cuttings for forage the first year, and if left a second, being well manured, three or four.

SWAINSONIA SEEDLING CULTURE (C. W.).—Pot them singly in small pots, using a compost of three parts sandy turfy loam, one part sandy peat, half a part leaf soil and old dry cow manure, and one-sixth each silver sand and pieces of charcoal, with good drainage. Shade for a few days, and keep rather moist, syringing freely, so as to keep down red spider, affording an airy position. Shift into larger pots as soon as they are in bloom full with roots, keeping rather dry in winter, and encourage growth in spring with moisture. When shifting into larger pots be careful not to pot them below the seed leaves.

GRAPES MILDEWED (W. C. D.).—The Grapes not having commenced to ripen change colour you may syringe them, and whilst wet dust them with the flowers of sulphur, and you may free them of the sulphur by syringing before the Grapes change colour; but if they have commenced ripening you may cause the sulphur to adhere, as it will to the mildewed parts, by forcing it against them upwards with an instrument the same as is used for the application of tobacco powder, and which may be had of any dealer in insecticides. By all means apply fire heat, so as to enable you to ventilate freely, and coat the hot-water pipes with flowers of sulphur of the consistency of paint, brought to that with a soft-soap solution, 1 lb. to the gallon, applying to the pipes with a brush.

PLANTS FOR WINTER-FLOWERING (Novice).—You do not say whether you require the plants for in or out-door decoration. If the latter, you would see what Mr. Luckhurst in the number of July 2nd says on those; but as we apprehend you mean those for in-door decoration, our advice will relate to them. Few are the subjects you will be able to raise from seed—*Primula sinensis* in variety, *Cineraria*, *Cyclamen*, and *Mimnomette*. For blooming in winter, the *Cineraria*, *Cyclamen*, and *Primula* should be sown in March or April and the *Mimnomette* may be sown now. Intermediate Stocks are also good; seed should be sown at once. Of plants, *Camellias*, *Epicurises*, *Epiphyllum* var., *Eriogon gracilis* autumnalis, *rubra*, *melanthera*, *hyemalis*, *colorata*, *cuffra*, and *arbuscula*; *Coronilla glauca*, *Cytisus racemosus*, *salvia* *Heeri*, and *Chrysanthemums*. For early winter-flowering the Roman Hyacinth is very desirable, and you may keep up a good display with *Crocuses*, *Tulips*, *Hyacinths*, *Dielytra spectabilis*, *Spirea japonica*, *Deutzia gracilis*, and *Lily of the Valley*, introduced at intervals of three weeks from the beginning of January to March.

LILY—TUBEROUS-ROOTED GERANIUM (K. S. M.).—We do not recognise the Lily from your description. Send a specimen. It may be *Lilium Martagon* *sepalis albis*. The Geraniums are probably in the Royal Botanical Garden, Kew.

STRAWBERRIES ULCERATED (Perplezed).—We never saw the fruit similarly affected. Not knowing anything about the cultivation adopted, we can only suggest that the ulcers arise from want of sap. If so, copious watering with weak liquid manure might save the unaffected berries.

NAMES OF PLANTS (P. P.).—2, *Viburnum Lantana variegata*; 6, *Gerista triquetra*. We cannot name plants from leaves only, and the other flowers had dropped. (D.)—*Hedysarum coronarium* and *Astragalus major*. (P. Q.)—No. 1, *Juniperus Sabina variegata*; 2, *Abies Nordmanniana*; 3, *Cupressus macrocarpa*. (G. S.)—*Eryvum hirsutum*.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE SILVER POLANDS AT READING.

I FEEL it but justice to the Judge at the Reading Show (Hants and Berks), as my two pens of Silver Poland have been criticised somewhat freely by the poultry press, to explain that when I entered the pens I intended to send a different pair in the pen priced £2 2s., and to which was awarded the first prize; but one of the birds was so ill that I could not send it, and therefore I had either to leave the pen empty, which does not add to the beauty of the exhibition, or substitute another pen; this I did, claiming them myself at once.

There will always be differences of opinion, and I apprehend the great majority of fanciers would disagree with the judgment at Reading, (I mean simply as regards the two pens, for

as I was not there I cannot say anything about the other competing pens), and place the highly commended pen first. I should certainly myself. Yet in some respects both the birds in the first-prize pen were superior to the highly commended pen; indeed, but for disease that in infancy attacked the cock in the first-prize pen and marred his development, I should consider him the better of the two. He is better coloured, better marked; and had the topknot been equally developed on each side, he would have been, to my thinking, altogether the better bird. The hen was larger than the highly commended hen; but otherwise the highly commended bird is a beauty, and greatly the superior. But to show that the pen is not quite so bad as some of the descriptions made it out to be, I may state that the cock had been exhibited three times previously, taking two first prizes and highly commended; whilst the hen was in my silver-cup pen at Chesham three years ago, and first at Lewes in the fall of the same year, and has not been exhibited since. I certainly consider the highly commended the better pen; but my opinion of their relative merits cannot be gathered from the prices attached to them. I may add that the hen in the first-prize pen was a spangled hen, and by some judges these are considered superior to the laced hen. I disagree with such a dictum; still it is held by some fanciers, and they have a right to their own opinion, and should they be judges at an exhibition, have a perfect right to carry it out. One paper remarks that the topknot of the prize hen was so white; this is well known to be the result of age, and should not militate greatly against a bird's chances of success.

I have felt it but justice to Mr. J. Bailly, whom I do not know except by correspondence, to state the facts of these two pens. Perhaps, after my explanation, it may be thought the judgment was less strange than the prices attached to the two pens would lead an outsider to expect.—JOSEPH HINTON, *Warminster*.

ESSEX AGRICULTURAL SOCIETY'S POULTRY SHOW.

THE annual Meeting of this Society took place at Stratford, on 30th June and two following days. The extraordinary confusion that prevailed with regard to the numbers prevented our publishing a prize list last week. The numbers in the catalogue differed in nearly all cases from the birds that should represent them in the pens; we could, consequently, give no accurate list of the owners of the winners. If the catalogue was wrong it could have been revised and the matter put right; but if, on the other hand, the birds were wrongly penned, which many circumstances led us to believe, we are at a loss to understand how the Judge accomplished his task; the usual "judge's book" would be useless, and he must have taken the cards in his hand and placed them on the pens as he made his selections. We had not an opportunity of inquiring, but we think this course must have been adopted, as the prize cards appeared generally in the proper places on the best birds.

Class 1, Dorkings. The catalogue contained four entries, but we could find only three pens of birds. The first number, 277 (Mr. Lingwood's), we could not here trace, but a pen of birds that should have appeared in this class we found with Cochins, pen 292. We at first thought they belonged to Mr. Watts from the fact of finding a basket numbered 280 underneath the pens; but on returning to pen 280 we found it occupied with a pen of birds marked third prize. Coming to the Cochins we find the third prize for Buffs given to a number which in the catalogue is shown in the next class, and belonging to Mr. Woodgate, while Mr. Woodgate's White Cochins, which we think should have occupied this pen, we found in pen 296, belonging to Mr. Malden, and marked first prize. Mr. Lingwood's Dark Brahmas, which we recognised, and which also obtained a first prize, were treated in the same way; we found them in pen 308, belonging to Mr. Levick. This was continued throughout the Show, which, under the circumstances, was fortunately not a large one, the total number of poultry and Pigeon entries amounting to only 218. We feel, from what we have referred to, it would be useless to attempt any detailed report of the judging, as we should probably fall into errors, and our remarks might do an injustice to many exhibitors, who, if they succeed in getting their birds correctly home, will at least have lost the satisfaction of seeing them in their proper positions in the catalogue.

BRAHMAS.

[We have received from Mr. G. P. Burnham, Melrose, Massachusetts, U.S.A., a letter, and a communication from him published in the *Philadelphia Fanciers' Journal*. We can only afford space for extracts. We decline re-opening the controversy about Brahmas, for fanciers have recognised them as a distinct breed.—Eds.]

"I enclose an article just published over my signature, correcting the strange errors committed by Mr. Lewis Wright in his lately-published "Illustrated Poultry Book," connecting me

with originating the name of the Brahma fowl, with which I never had anything to do, as you are probably aware."

"*Imprimis*, you will observe that I (Mr. Burnham) never laid any claim to this 'Brahma Pootra' misnomer. I did not make this name. I then called my fowls 'Grey Shanghais'—never by any other name, and simply for the good reason that Dr. Kerr, who sent me my first pair from Philadelphia, September 3d, 1849, in his letter said, 'Though they are called 'Chittagongs' (precisely as Mr. Cornish called his at first), they came into Pennsylvania, from Shanghai, China.' My second lot of Light Greys were procured in 1851 through W. T. Porter, Esq., Editor of the *New York Spirit of the Times*, from on board a ship at New York, direct from Shanghai, China. I then had other Chinese fowls of different colours, but these last were light grey. What else could I properly call them, but what I did—viz., 'Grey Shanghais'?"

"And here let me quote what Dr. Gwynne, of England, says: 'I obtained of Dr. Bennett, of the United States, five pairs of these birds. Three of these ten fowls only had compressed pea-combs; in none of the others was this found, nor could I recognise in them anything but what could be found in the Shanghai birds. I had several communications from Dr. Bennett, and in reply to all my inquiries, directed to learn the cause of naming as 'a new breed,' birds, most of which were essentially Shanghais in shape and character, I could gather no information but that the difference of colour between these and other Shanghais precluded their being thus classed; but I cannot accept this as adequate proof of 'Brahma Pootras' being a 'new breed,' and therefore prefer the conclusion that they are identical with the Shanghais, and only a new variety of that fowl. Another circumstance which confirms me in this view, as to the identity of these birds with the Shanghai breed, is the fact that the fowls recently presented to Her Majesty by Mr. G. P. Burnham, under the name of Grey Shanghais, are admitted by Dr. Bennett to be precisely similar to his own; and Mr. Burnham assures me that the original stock from which the 'Grey Shanghais' presented to Her Majesty were bred, was imported by himself, through Dr. Kerr, of Philadelphia, direct from Shanghai.'

"Thus I continued to designate my fowls long years after Dr. Bennett fixed 'Brahma Pootra' first, and then 'Brahma' for his birds, though at that very time (1852) Dr. Bennett voluntarily wrote Dr. Gwynne as above, which was the true statement, but which I do not find in Mr. Wright's account."

FATTENING CHICKENS BY MACHINERY.

It seems to be generally admitted by gourmands that no chickens of mechanical fattening have such exquisite flavour as those submitted to the process. In the Gardens of Acclimation at Paris this is very scientifically practised under the direction of M. Odile Martin. "Its advantages," say the authorities, "do not consist in the rapidity of the process alone, but above all in the special quality of the meat thus produced. It is solid, very tender, exceedingly fine-grained, not overfat (which would not be an advantage), very white in colour, and of a flavour quite exceptionally excellent." If this is so, of course there is no help for the chickens. They must perforce enter their *épinettes*, and be mathematically crammed. Here is the ingenious contrivance of the Gardens of Acclimation for manufacturing this "exceptionally excellent" flavour:—

It is a huge cylinder with fourteen faces, each in five storeys of three compartments each. It holds, therefore, 210 fowls. The cylinder is hollow and empty, except for the axis on which it turns. This hollow construction renders it easily ventilated and kept clean. Before it is a box for the operator. This box, or carriage, moves up and down by pulleys. The *gaveur*—that sounds less offensive than crammer—operates thus: Commencing at the bottom of one of these fourteen faces, he seizes with his left hand the neck of the chicken; and pressing on each side of the beak, the bird is forced to open its mouth, as any lady knows who has doctored a sick chicken or Canary. The *gaveur* then introduces the metallic end of the rubber tube into the throat of the chicken, and by a pressure of the foot on a pedal the food rises, and at the same time the amount passing through the tube is indicated on a dial in front of the operator. It is, therefore, a skilful operation; for the *gaveur*, whatever other motions are necessary, must pay strict attention to the needle on the dial, or he will give his chicken too much or too little. The three chickens duly fed, he turns the cylinder on its axis a little, and the next face of it is before him. When he has completed the round he turns the crank, and the carriage rises to the next storey; and so he goes on to the top. Having completed the upper circuit, every chicken in that *épinette* is duly fed. Then he turns the crank in the other direction, and the carriage descends to the floor, where it rests on a railroad. It is then moved along before the next *épinette*, and the whole operation on 210 more chickens is repeated. A skilful operator will *give*, or cram, four hundred chickens in an hour! That is less than nine seconds to each one; for the time to move the

cylinder, to move the carriage up, down, and to the next *épinette*, must be counted out.

Under this *épinette régime*, it requires an average of fifteen days to fatten a Duck, eighteen for a chicken, twenty for a Goose, and twenty-five for a Turkey. The food used for chickens is barley and corn meal mixed with milk into a dough so thin that no other liquid is necessary. The ordinary quantity given is from ten to twenty centilitres, or from seven-tenths to one and four-tenths of a gill each time; but this quantity is reached gradually. When the maximum that any chicken can assimilate is found, the number indicating this quantity is placed before its compartment, and the *gaveur* must measure it exactly on the dial. Truly this is an age of wonders. What a labour-saving invention this *épinette* must be to the chickens! Maybe it is not wise to give these details. What if some enterprising American should be thereby tempted to invest his whole fortune in a grand improved automatic steam-power *épinette*, warranted to feed ten thousand chickens a minute!—(*Harper's Magazine*.)

SPALDING POULTRY SHOW.

TURNER's pens were used and placed under a grand tent, and all were well attended with both food and water, Mr. Boyce being the person in charge.

Dorkings had but three entries, Mr. Lingwood landing first, and the Rev. Mr. Bartrum second. In *Game*, we are sorry to state that Mr. Matthews's grand cock, which was otherwise in the finest possible bloom, had had his wing injured on the way to the Show, and was in consequence sent home, a good Brown Red from Edinburgh winning first; while the Boston cup cock was placed second. In Black Reds the first, though best, had a Daw eye; but the first was an extra good one in hens, the second also being too light in eye. In any other variety, the first was a Duckwing with a grand head but rather dark back; second also a Duckwing. The first in Buff *Cochins* was much faded in colour. In the next class the cup was well awarded to a good pair of Whites, the second also being of that colour, Messrs. Crabtree having only the cock in the pen; but in the next class, the cup for *Brahmas* was awarded to a good pen from that yard, the second in the class being fine chickens in all respects of size, symmetry, and colour. *Brahmas*, Light, poor; but *Spanish* very good, but one of the grossest mistakes in the Show, for there were no two opinions here as to how the awards should have been made, the second being by far the best. In *Hamburghs* the decisions of the previous were mostly reversed, as also in *Polands*. In *Hamburghs* the cup went to Golden-pencils, which were only highly commended at Boston; and in *Polands* the Golden-pencilled was placed before the Silvers, which is decidedly wrong. In *French* fowls the first prize pen of Crèves contained one of the best hens we have ever seen; the second being a very good pair of Houdans.

In *Ducks* there was a mishap, for the cup for the best pen was not awarded till after the Judge had left, but was eventually satisfactorily placed upon a nice pair of Bahamas.

There were six classes for *Bantams*, all being single birds. The first in Brown Reds was a coarse-headed bird but capital in colour. The second, a chicken, had a grand head and eye, but was rather light in breast. The highly-commended bird being about the best in the class. In hens, a grand pullet was awarded first, and the second was the cup hen at the Palace, but rightly placed here. In Black Red cocks again the awards were reversed, and we have no hesitation in stating this was altogether wrong, the cup bird, although not a bad one, losing somewhat in head, and even much in colour. The Acerrington cup cock coming second. First in hens a grand old bird only highly commended at Boston; but we were surprised to see Pen 101 passed unnoticed, for this was the most stylish hen in the class. No. 103, highly commended, the best colour in the class. The second-prize hen looking as if it had been trimmed over the eyes. Any other colour cock, first was a good Duckwing well placed; second a good Pile; and cup cock at Boston only highly commended here. Mr. Hall showing a real good Duckwing in hens, which was, however, beaten by the Boston first. Second a Pile of good properties. In Black Bantams we should have placed Mr. Reed's birds first and cup, Ashton second, and have highly commended the cup pen. The R-v. Mr. Tearle was first and second with good birds in Whites. In the next class for cocks and in hens, a Pekin was first, and Silver Sebright second.

In *Rabbits* and *Pigeons* the entries were exceedingly good, and we thought we recognised some of Mr. Fulton's grand stud. We are, however, open to correction, as that gentleman's name was not to be found in the catalogue.

DORKINGS.—1, Henry Lingwood, Barking, Needham Market. 2, Rev. E. Bartrum, B-rkhamstead.
GAME.—Brown breasted Reds—Cock—1, Dr. Harley, Edinburgh. 2, H. E. Martin, Southorpe. Hen.—1, H. E. Martin.
GAME.—Black-breasted Reds—Cock—1 and Cup, W. J. Pope, Biggleswade. 2, Mrs. Deacon, Dundi. C. J. F. Hollingworth. Hen.—1, S. Matthew, Stowmarket. 2, Dr. Harley.
GAME.—Any other variety—Cock—1, E. Winwood, Worcester. 2, J. A. & H. H. Staveley, Driffield. Hen.—1, S. Matthew. 2, J. A. & H. H. Staveley. 3c, W. Barker.

Laced *Bantams* were bad; while there were some good Blacks. In Game Bantams the first was carried off with a stylish pair of Black Reds; second a pen of Pile chickens; and extra second a good pair of Black Reds.

Turkeys large, the first prize hen a very fine one. *Geese* also large, but all irregular in colour. In both classes of *Ducks* were some good ones, and the solitary pair of Blacks in the Variety class were of rare quality. In extra stock was a very good pair of Rumpless fowls, a variety not often seen so perfect as these.

Pigeons were a grand display, every class containing high quality, Mr. Horner carrying off most of the prizes offered with birds in capital bloom. In Carriers both were Duns, the first heavy birds; and second of this year. English Owls were a good even lot, the first being grand-headed birds. In Magpies an extra second was given, the class being very good. A pair of Blue African Owls won in the Variety class; the second being a pretty pair of Pigmy Pouters.

Only one class was provided for *Rabbits*; an amateur giving a cup, which also succeeded winning with a handsome Black-and-white Lop buck.

CARLIERES.—Young—1, W. Massey, Spalding; 2, W. Bulmer, Spalding, *hc*. Mr. Warren, Spalding (2); W. G. Hamock, K. (ford; W. Salazar, Spalding; H. Yardley, Birmingham. *cc*, W. Massey; S. Warrell; W. Minson; H. B. Massey.

CASHIERES.—Black—Cock—1, H. Yardley, 2, G. Hammock, *hc*, R. Cant.

W. Massey Hen—1 and 2, W. G. Hammock, *etc*, R. Cant, Brompton Road, London, *hc*, R. Cant; W. Bulmer, *c*, W. Massey; H. Yardley.

CASHIERES.—Any other colour—Cock—1, A. Storrer, Peterborough. 2, W. Massey *hc*, R. Cant; W. G. Hammock, Hen—1 and 2, W. G. Hammock, *hc*, W. Massey; A. Storrer; J. H. Ivimey, Ellersfield, Basingstoke, *c*, H. Yardley.

POULTERS.—Cock—1, H. Pratt, Hampton-on-Arden, 2, H. Simpson, *hc*, R. Cant (2); W. Nottage, Hen—1, W. Nottage, 2, Mrs. Ladd, Calne, *hc*, R. Cant, *c*, R. Cant, H. Pratt (2); H. Simpson, Spalding.

TUMBLERS.—Bills and Beards—1, R. Cant, 2, *hc*, and *c*, W. Woodhouse, King's Lynn. *c*, T. Holmes. Any other variety—1, W. G. Hammock, 2 and *hc*, R. Cant, *c*, T. Yardley; W. G. Hammock; R. Cant.

BARS.—1, G. Hamock, 2, W. G. Hammock, *hc*, H. Yardley, *hc*, W. Massey.

Young—1 and 2, M. Cave, Spalding, *hc*; H. Yardley, *c*, W. Massey.

JACOBIENS.—1, R. Cant, 2, W. G. Hammock, *hc* and *c*, J. Young, Bishop Auckland.

TRUMPETERS—2, R. J. Smith, Yarm.
OWLS—1, R. Cant, 2 H. Yardley, C. J. Young.
DRACOONS—1, W. G. Hammon, 2—Yoeft, Spalding, C. H. Yardley.
ANY OTHER DISTINCT VARIETY—1, H. Yardley, 2, J. Young, C. - Barnea.
SELLING CLASS.—*Price not to exceed 4.8-1*, Miss E. Pickworth, Moulton
Marsh 2, H. B. Massey.
SELLING CLASS.—*Price not to exceed 60s-1*, H. B. Massey, 2, P. Hutchinson,
Spalding. *etc.* J. W. Massey, C. R. W. Atkinson, Spalding; P. Hutchinson.

CANARY.—1 and 2, Knight & Spencer, Ardesley Siding. *hc*, J. N. Harrison, Belpor.

LINNET GOLDFINCH, OR OTHER ENGLISH FINCH.—1, J. N. Harrison. 2 and *hc*, Knight & Spencer. *c*, L. Belk, Dewsbury.

BLACKBIRD.—1 and 2, W. A. Jonsdoss, Boston.

PARROT, PARAKEET, LOAT, OR OTHER FOREIGN BIRD.—1, C. K. Morris, Spalding. 2, J. R. Capps, Spalding (Bird-regars). *hc*, G. E. Storr, Boston (King Parrot); J. R. Capps, Spalding (Parrotet).

HEAVIST = J. A. Bowman, Groves, York. 2, R. Buffham, Spalding. *hc*, P.

G. B. Pitt, 18, The Grange, York. 2, A. T. Allard, Pinchbeck (Silver
Grey). *hc*, W. Beetey, J. T. Tedder, Spalding.

At the annual Show held at Ripon July 3rd, poultry and Pigeons were allotted a section, but the prizes were small, and it is a matter of surprise to us that so many entries can be got for the amount; yet this proves the popularity of the Society, and is sufficient guarantee that with a good list the poultry and Pigeons would become a self-supporting and very interesting portion of the programme. The pens were borrowed from the North-Harston Society, whose assistant was in close attendance the whole of the day; and the birds well fed and watered.

Of *Game* there were ten pens, but only three of any quality; the first *Duckings*, and second *Brown Reds*. *Spanish* were moderate, the hens good. The positions at *Tairak* being reversed the first hen having attained considerable condition meantime. *Dorkings* and *Brahmas* were poor; only one good pen of *Crève-Cœur*s was sent. *Polands* pretty good, the winners *Golden Cocks* very poor, except the first-prize *Buff* hen; the second being *Black*. There were some fair *Hamburgs*, the best were the *Golden-pencils*; the first going to a splendid cock about perfect in all respects, and a pretty fair hen; second a good cock in all respects, except that his tail was too red, but the hen better. Pen 332, very highly commended, had by far the best hen, but the cock had a horrid comb, and nearly a black tail.

PIGEONS.

CARRIERS.—1, E. Horner, Harewood, 2, G. Sadler, Boroughbridge. *hc*, W. Bodily, Ripon; A. & T. Wells, Ripon; S. E. Seaton, Leeds.

TUMBLERS.—*Atwood*—1, E. Horner 2, S. E. Seaton. *Any variety*.—1, E. Horner 2, W. Bodily. *hc*, A. & T. Wells; W. Scott, Grantley. *c*, G. Akers, Fishergreen, Ripon.

POUENES.—1, E. Horner, 2 and *hc*, A. & T. Wells.

WALKERS.—1, E. Horner, 2, S. E. Seaton. *vhc*, Hellwell & Ingham, Halifax. *hc*, J. Walker, Ripon. 2, Horam, jun. Ripon (2).

RABBITS.—1, D. & W. Boden, West Harlepool, 2, E. V. Donaldson. *hc*, H. Walker, Ripon.

The Judge was Mr. E. Hutton, Pudsey.

The amateur Pigeon fanciers among your readers may take a hint from the following incident. On visiting my aviary this morning I was much vexed at finding that a pair of high-bred Almond Tumblers had so neglected their family duties that the survivor of a pair of their offspring, a week old, was just dying of starvation and cold. At first I thought it was actually dead, and picking it out of the nest pan I "laid it out" on a shelf, determined "to bury it decently," and swallow my grief. A moment afterwards it gasped faintly, and a sudden thought struck me, Why shouldn't I try an experiment? Catching up my little patient I hurried into the kitchen, and calling for a flannel pet—a piece of flannel—I wrapped it carefully round the dying bird and popped it into the oven, cautioning the cook not to bake it alive.

In another minute I was off to "the daily grindstone," and on my return home to luncheon cook came to me as soon as I was inside the house, bearing in triumph my poor little bird still wrapped warmly up in the flannel, but now as lively as a

squeaker could be, and ready to peck my fingers' ends off in search for milk. I popped it back at once into the nest pan, and the old birds were so delighted with the resuscitation of their baby that they set to work and fed it handsomely. To-night I have slipped it under a Baldpate, and have taken a young one from the latter to put in the oven.—T. F. S.

THE POULTRY-KEEPER.—No. 10.

LA FLECHE.

HEN—CHARACTERISTICS.

Of rather smaller size than the cock. Firm and confident walk. Eye lively and bold. Body slender, rounded-off. Legs of middle length, strong and sinewy; all the fleshy parts well developed. Flesh fine and abundant. Head strong, beak strong. Feathers of the abdomen thick, but slightly spread-out. Plumage black. (See fig. 12.)

Fig. 12.—La Fleche Hen.

Weight.—At full age 6½ lbs., and sometimes 7½ lbs.; as a fat chicken, 8½ lbs. to 9 lbs. 14 ozs.

Stature—From the upper part of the head to under the feet, in an ordinary position, 17½ inches; from the back under the feet, 14½ inches.

Head—Long, strong, having all the characteristics of that of the cock, but smaller.

Comb—With very small horns, but very noticeable from their inclined position in front.

Wattles—Much rounded, 1½ inch long.

Ears—White, and very apparent by their decided colour and the large space they occupy.

Nostrils—Like those of the cock.

Beak—Strong and long.

Eye—Of the same colour as the cock's.

Physiognomy of the Head—Very sharp and very sprightly, much like that of the cock. Its comb in the form of horns causes it to have the local name of "The horned hen."

Foot—Strong, of middle size; toes solid and long.

Feathers—Pretty abundant and compact on the body, but behind less developed. All the feathers of the body shiny, black, iridescent with violet and green, with the exception of those of the abdomen, which are greyish-black; feathers of the legs are a dull brown black.

Laying—Good and precocious, the eggs of a large size.

Sitting—A non-sitter.

BOSTON (LINCOLNSHIRE) POULTRY SHOW.

Most favourable weather fortunately ushered in the morning of the Show; but even had it by mischance proved the reverse, ample provision had been made by the Boston Committee for the security and accommodation of the largest and best collection of poultry ever consigned to their care. An extraordinary attendance of visitors was the result, and we heartily congratulate the managers of the Show on the well-earned success of

this year's undertaking. The classes opened with Grey Dorkings, and, strange to say, with an entry of only three pens in both classes. These were, however, very good, both the cock and also the hen shown by Mr. Moffitt being particularly so. But why so limited an entry? The Buff Cochins were almost as small in numbers, Mr. Crabtree winning with a cock shown in the highest condition and feather, but still not nearly a first-class specimen, being grizzly-winged, and not the even colour it might be expected in a first-prize fowl; he had, however, none to dispute his honour. Mr. Crabtree's prize Buff hen was an exceedingly good one, but now fast dropping into moult. It is not the best policy to exhibit her too frequently now whilst the plumage is being reproduced if her future successes are to be fairly consulted. She is a good specimen, and well deserves care. In the next class the rivalry was strong, and here again Mr. Crabtree won first and extra plate with a grand-feathered Partridge Cochins cock, with a quality of plumage as though just moulted for a Christmas show, and yet they are his old feathers, and of late he has spent nearly the whole of his time either on the rail or in the show pen. He appears to be one of those strong-constituted fowls nothing will injure. A very fine White Cochins of Mr. Whitworth's took the second prize, the latter exhibitor also taking first with a very fine White Cochins hen. With the exception of the two prize Dark hens the *Brahmas* have certainly been better represented at former Boston shows. The *Spanish* could not be expected at this season to show to especial advantage. Mr. Beldon's prize cock, however, was of the highest quality of face, and in very respectable feather; all the others were coarse in face and mostly out of all show trim, whether cocks or hens. *Hamburgs* proved exceedingly good, Mr. Beldon keeping mostly to the fore. The Committee, however, would do well, if they cannot give separate classes to every variety, to reconstruct their prize schedule, so that the Pencilled might compete together, and the Spangled follow the same course, as having Pencilled and Spangled in the same class is a decidedly awkward arrangement. *Game* were few, but some were decidedly good, especially Mr. Martin's Brown Red pen.

We regret to have again to call attention to one of the most ill-judged arrangements that railway officials can possibly arrive at—viz., putting fox terriers and poultry or Pigeons in the same van during transit, as any reflecting person must expect nothing but mishap can ensue from such mistaken saving. In this case one of the fox terriers, under the influence of the hubbub around him, sought his own pleasure during the journey to the Show in ripping-up the basket and worrying one of Mr. Fletcher's best *Game* cocks, a bird that no doubt, even in angry battle, would easily have held his own against any feathered biped, but was now quite outmatched by his vicious quadruped opponent. It had become so lacerated during the *melée* that its destruction was a matter of compulsion. When will railway officials consult their own credit and their employers' interest by abandoning this foolish save-penny arrangement? It is certainly time they did so, as such annoyances are constantly occurring, and often in cases where money cannot replace the loss.

The *Game Bantams* were among the best classes in the Show tent, Mr. Entwistle being there, as last year, with a very fine collection, securing almost all the prizes, but missing the extra plate Bantam prize, which was awarded to a capital Red Pile cock of Mr. Fletcher's. The Local class Any variety, restricted to residents within fourteen miles of Boston, was a decided failure, the first prize going to Silver-spangled, the second to Golden-spangled *Hamburgs*, both very poor, the birds being scarcely worth the prize money awarded to them. *French* fowls were of high merit, the *Crève* being in the ascendant. Some of the best of Golden and Silver *Polands* were present, and obtained great successes.

Geese and *Turkeys*, always a short entry about midsummer as to numbers, proved meritorious. The *Aylesbury* and *Rouen Ducks* were good, especially the first-prize *Rouen Ducklings*. A pen of singularly well-plumaged *Vidua* *Whistling Ducks* stood ahead in the Variety Duck class, and a very fine-grown pen of White *Muscovy Ducks* were the winners of the second prize.

Appended are the awards for Pigeons and Rabbits, which did not arrive in time for publication last week along with those in the poultry classes.

PIGEONS.—The entries of these were quite equal to those of poultry, Mr. Fulton carrying off most of the first prizes. In *Carrier* cocks the same exhibitor succeeded in taking both the first and second prizes, Mr. Yardley's bird losing owing to want of condition. In *Pouters* the first prize went to a grand Blue, the second to a Yellow, and the third to White, the whole being good in all points; and in *Tumblers*, Almond, the colour and marking of the first and third were most exquisite, the head properties being also good, and the second was a grand bird. In *Balds* and *Beards* Mr. Woodhouse won five out of the six prizes with excellent stock. In Any other variety all the winners were *Agates*, and in *Barb* all three were Black. For *Turbits* Mr

Gardener was first with a nice Yellow, and ought also to have attained the second place with a Blue, the second being the third best. Jacobins were a splendid class, not one bad bird being shown; the first and second prizes were Reds, and third Blacks. In Fantails Newark was again to the front, and the class very good. Dragons, first a grand Blue, second a good Blue, and third Red, splendid in colour, but not quite up to our ideas of a good Dragon in other respects. Antwerps were well placed, all the winners being Silver Daws, and very good as Short-faces. A White African Owl won the first prize, and most deservedly the piece of plate in the Variety class. A nice Nun was second. There were classes for local competition in both poultry and Pigeons, and some of the birds were very good.

PIGEONS.

Mr. Edward Hewitt, of Sparkbrook, Birmingham, was the Judge.

CARE OF YOUNG CHICKENS.

AFTER the newly-hatched chicken emerges from the shell, it is wet all over, and each tuft of down is enclosed in a very thin membranous sheath, but as the chick dries with the warmth of the hen, the down expands and assumes that appearance so fascinating to all young amateurs. Chickens do not require food for at least ten or twelve hours after hatching, during which time they should be left with the mother entirely undisturbed; they require the heat of the living body to nourish them, and it would seem to impart vitality to them which no artificial warmth can do.

The first food of young chickens should consist of eggs boiled hard and chopped up, mixed with double the bulk of bread crumbs, and the whole slightly moistened with milk; this they will pick up quite freely as the appetite begins to sharpen. At first they will eat very little, and seldom drink any during the first day; but provided they are tolerably strong on their legs, and lively, nothing should be done to induce them to eat beyond placing food and drink before them. If anything comes naturally to animals of any kind it is eating, and therefore any attempt to teach chickens this act is a work of supererogation. Some people still entertain the idea that it is necessary to remove the horny scale which is to be found on the beak of nearly every newly-hatched chicken, by means of which it breaks the shell, with the thumb nail; but this is not at all necessary. Nature never provides any animal with an appendage which it is necessary to remove by artificial means. It will of itself drop off in due time. If any of the newly-hatched chickens show debility, it would be well to supply a stimulant, and a little raw egg beaten up with brandy may be given. After a few days the chopped egg and bread crumb may be discontinued, and a regular dietary scale commenced.

Ground oats, oatmeal rather coarse-ground and mixed with about one-third barleymeal, where both can be afforded, make an excellent diet, varied occasionally with some kind of grain; wheat screenings are, perhaps, the best. Backwheat, cracked corn, and barley may also be given. For very expensive chickens, canary or crushed hempseed may be given in the first instance; but as this is expensive, it cannot long be given with profit. If it can be supplied at small expense, then their soft food should be mixed with milk instead of water, and for early chickens, new milk warmed given them to drink early in the morning has a wonderful effect on their growth and in bringing them through cold weather; but care should be taken that it is

not left too long so as to get sour; if so, it may cause serious trouble. A little meat chopped fine may be supplied, of which young chickens are very fond, and it greatly assists in maturing them. Chickens are very early risers, and have generally good appetites, and should, therefore, have an early breakfast. In summer they will be thoroughly awake at four o'clock, and should then have something to eat; we have found it a good plan to place a little food within easy reach of them after dark the previous night, so that when they pass out in the morning they can satisfy their hunger. Long fasting is very prejudicial to their growth and happiness. As a rule, food should be given so as to fully satisfy their appetites and no more; just as much thrown down as will be all clean picked up, leaving none to be trodden into the ground, or to remain over. Chickens for the first two weeks ought to be fed every two hours; after this, and until they are a month old, every three hours; and after that four times daily will be sufficient. In this country, where milk is cheap, curd, of which they are very fond, may be given to chickens. A little alum in the new milk will cause it to curdle immediately.

Nothing conduces so much to the health and growth of young chickens as a good grass plot, where it can be obtained. Early in the season, however, no matter how wide may be the range at other times, this will be impossible to procure; it is, therefore, very necessary to provide a substitute; this will be found in a head of early lettuce, which, if occasionally given, will be found of great benefit, and also a great preventive of diarrhoea. When the weather admits of it, chickens ought to be cooped out, the coop so placed that the back will face the wind, and be sheltered from any sudden storm that may arise; by this means the hen is confined while the chickens have full liberty. For other reasons also it is beneficial: it prevents in damp or cold weather the hen bringing the chickens too far away and getting wet and chilled, from the injurious effects of which they may never recover. Once a chicken is thoroughly chilled, it rarely if ever gets the better of it; and even if it does, it checks the growth and injures it in many ways.

The importance of dryness under foot in rearing chickens is very great. Some breeds will endure dampness better than others, but dampness under foot will be likely to bring on cramped feet. In the early part of the season boarded floors will be best, but they must be kept well sprinkled with dry ashes to prevent insects, and when the weather admits of it, cooped outside during the whole or part of the day.

When chickens arrive at between six and eight weeks of age the mother will in all probability show signs of leaving them if allowed her liberty and not kept cooped, or she may begin to lay at this time if she has been allowed to partake freely of the chickens' food. In either case she will begin to lose that foulness of them previously so noticeable, and some means should be at hand to provide for this contingency. If the weather is still cold, a dry warm place ought to be ready to put them in at night, which should be daily cleaned out, else it will soon become so foul that the chickens will not resort to it, or will catch some disease by continuing to remain in it at night. In such a place, kept nice and clean, it is surprising how long they will continue to resort to it, huddling up together and keeping each other warm. Sometimes, if the hen is permitted, she will go to the perch at night, and the chickens will follow her, and as many as can will get under her wings, where she will still continue to brood them; but this will not continue long, nor is it desirable in the case of some breeds that it should. Large breeds should not be allowed on the roosts until they are fully three months old, nor in the case of birds for exhibition would we allow them to roost at any age until after maturity. A crooked breast may be the result, even with the utmost care exercised, which to exhibition birds is a disqualification. Chickens, however, should not be allowed with the old fowls under any circumstances, but should be kept apart and fed freely.

In the case of birds for show they ought to have as much as they can use—a more than liberal supply. When they are growing fast, any check to their growth will be of permanent injury. Four good meals must be regularly given, one of which, at least, should be of soft food mixed nice and dry, and if the place admits of it, scattered about so as to allow them room to pick it up clean; but if not, it should then be placed in vessels kept clean, and free from sourness. Milk, if it can be had, may still be given them, even up to the age of six months if the range be good; but if kept in confinement, not more than about three months; in such cases, it is too much for the sluggish digestive organs. At the age of from ten to twelve weeks the cockerels ought to be separated from the pullets, and kept by themselves. They never grow so large when the sexes are kept together, besides which it saves trouble, and the cockerels are not so ready to fight among themselves as if with the pullets. In all the large breeds there will be little difficulty in picking out the cockerels, the comb and spur of which will be a pretty sure indication of their sex. In cases where a good run is impossible and the chickens are kept in small yards, these should be kept regularly swept out, and occasionally sprinkled with carbonate

of lime, which kills all the offensive smell, and prevents disease among the chickens arising from this cause.—(*Canada Farmer*.)

WOOD PIGEON AND DOVECOTE PIGEON PAIRED.

I beg to thank "T. G." for his courteous reply on the above subject, and for enlightening my south-country mind on the meaning of the word "acar." The fact, undoubtedly, of the pairing of the two birds in a wild state is certainly remarkable, and the like I never heard of; therefore it well deserved to be put in print. May I, though a stranger, be permitted to congratulate "T. G." upon his lifelong love for, and interest felt in, the Great Creator's works, which, as the Good Book says, "are sought out of all them that have pleasure therein?" and the seeking gives increase of pleasure. May "T. G.," who tells us he has reached seventy-six summers, long continue to enjoy all he sees around him in the world of beast and bird, of eye and ear too. He no doubt feels as I feel—

"That Nature never did betray
The heart that loved her; but 'tis her privilege
Through all the years of this our life, to lead
From joy to joy."

—WILTSHIRE RECTOR.

PIGEONS AT THE BATH AND WEST OF ENGLAND SHOW AT BRISTOL.

As a Pigeon-fancier I am sorry to say I have very little opportunity of seeing my birds in a position to compare them with others, and in consequence I am obliged to judge of their merits or demerits by reading the various reports published in the poultry papers. I must say of late I have been rather unsettled as to what is a good Pigeon, and as "WILTSHIRE RECTOR" leaves the "poor Trumpeters" to "blow their own trumpets," allow me to say a word for the first-prize pair. For the first time they have been described as a poor lot. What had "our Journal" to say about the same birds last year, when they were awarded first at the same show at Plymouth? They were also first at the last Exeter Show; the Judge then awarded them the first prize, and Mr. Fulton's foreign birds the second. I am also puzzled at the reports on the Owls. "WILTSHIRE RECTOR" describes them as "none too good," and a contemporary as "not a first-rate short-headed bird in the class." For the second prize pair I only wish to remark that they are the same as mentioned in "our Journal" a short time ago, when they won first at the Royal Cornwall Show the first time they were ever exhibited; but what I question is the report as concerning the first-prize pair belonging to Mr. Smith. The cock bird was shown at the Bristol Show held last January, and was then awarded the cup for the best bird in the several classes to which the cup was allotted, and that in competition with birds exhibited by the owner of the cup bird at the Crystal Palace (I do not know if the champion was at Bristol). Mr. Smith informs me he has won several prizes with the same pair. "WILTSHIRE RECTOR" no doubt recollects his remarks on the English Owls at the Bristol Show. *Vide* "our Journal."—F. B.

VAGRANT PIGEONS, &c.

PIGEONS certainly do not like a very light loft, or they would not always prefer, as they do, the nests in the corners of a room. For the possession of these they will fight; they like them because they are dark. Further, they dislike noise, and the quietest loft is most loved. Then they like a sunny roof; I put a hurdle or two on the south side of my coach-house, to which they always go and bask. High trees near blowing about, especially the shivering black poplars (*Abeles*), are objectionable. Rats, of course, will drive them away. Feed your squeakers upon soaked peas; if of a large variety on soaked beans, cramming them.—WILTSHIRE RECTOR.

DO OLD QUEENS BANISH THEMSELVES?

I SHOULD like the opinion of some of your practical contributors on the question, "How are aged queens disposed of?" as this must be a question of some concern to most bee-keepers. If they are allowed to die in the hive, then it is not likely they can continue to lay eggs to the last day of life, as would almost be necessary for securing a successor. Or do they banish themselves when approaching barrenness, or when death threatens the extinction of the royal race? The alternative of their being either banished or slain by their subjects I can scarcely believe. An incident that has just happened in my apiary may serve to throw some light on this question.

On June 22nd I hived a good top-swarm. I found the queen on the ground not able to fly far, and when I put her into the hive the whole swarm followed in a few minutes. I was almost perfectly certain this queen must be at least three years old, and her faded appearance and tattered wings confirmed my opinion. All went well, however, till the 25th, when about 8 p.m. I found so unusual stir about this hive. Although late in the evening, there was almost as much ado as if a swarm were going off. The bees flew hither and thither searching every bush, and ran out and in the hive in great excitement. This continued in a less degree until 1 p.m. on the following day, when I discovered the lost queen (the same old lady), under a heap of bees among the potato plants about 6 yards from the hive. When I replaced her on the flight-board there was great joy in the hive. I have no doubt that she had been out all night.

This strange adventure was repeated two days afterwards. The queen was missing in the evening, was sought for and lamented as before, until found by me with a few attendants next day about noon. This time, however, there was rather less concern manifested, and fewer bees followed the queen. When I placed her on the board the bees rushed at her as if she had been an enemy, but in a moment, having discovered their mistake, they cleared for her a pathway to the vacant throne, and the hive resounded with their merry song. She has remained in since, although I expect to find her repeat her strange conduct. I believe she must be still laying, for the bees are fast filling the hive with combs and carrying pollen daily. Have any of your readers witnessed anything like this? She could not have been banished, for her loss was certainly mourned, eager search made for her, her person shielded for many hours, and her return celebrated with enthusiasm.—A SCOTTISH SCHOOLMASTER.

ARTIFICIAL SWARMING.

"A SCOTTISH SCHOOLMASTER" gives the complete text of the abridged extract from Bonner, which appeared in our Journal a few weeks ago, with the Editors' hint that both Schirach and Wildman have a claim to priority in the matter of making artificial swarms; but Bonner's method was so superior to theirs, that precedence may well be accorded to him.

Schirach's method as described by Kays "is by a double hive, and the bees are compelled to ascend into the upper one by the smoke of rags, &c. A piece of brood comb is cut out, of 4 or 5 inches diameter, containing a maggot or maggots precisely of three days old, and properly placed in an empty hive, together with part of a comb of farina and another of honey; about a quart of bees is then to be introduced and the hive stopped up, except a small passage for air, and so remain three days. There will be a great tumult and noise in the hive for some hours, when it will subside and the bees will begin to build a royal cell. The fourth day an opening is to be made of a quarter of an inch, that the bees may come out leisurely. After roving about for some time they will return to their hive. It should be done in the spring." (page 252).

Thomas Wildman's method is—"If an old hive is so full of bees that they rest in the night under the board and yet show no disposition to swarm, turn the hive bottom up, give it some slight strokes on the sides so as to alarm the bees—they will immediately run to the extremity of their combs. If you look attentively to the middle of the hive you will there perceive the queen among the foremost. Seize her between the forefinger and thumb, and confine her in your hand till most part of the bees take wing; let her then go, the bees will soon join her and settle on some branch of a tree. Put them into an empty hive. Put the old stock in its place, that the bees which had been out in the fields may enter it on their return; and having remained there an hour or so, it is then put on another stand near or next its own. The hive, having what may now be called a swarm in it, is then placed on the stand of the old stock, and if the bees in both work regularly, carrying loads, all is well." (page 133).

Bonner was acquainted with Schirach's discovery, but at page 55 he says, "Long before I heard of Mr. Schirach's theory or experiments I had often taken off swarms without leaving any queens or royal cells in the mother hive; notwithstanding which they bred young queens, which surprised me greatly how they had obtained them, as the received opinion was this, that they could not breed a queen bee if the old queen was taken away before a royal cell was erected," &c.—R. S.

["A SCOTTISH SCHOOLMASTER" has sent us the same extract from Bonner's work.—EDS.]

STANNARD OF THE DRAGOON.—I have read "WILTSHIRE RECTOR's" remarks on the Bath and West of England Show, and as an old Dragoon fancier, I may say that his description of a Dragoon is the very best I have had the pleasure of reading, and that he knows what a Dragoon is or ought to be. I wish he would undertake the task of judging the Dragoon class at a few

of our shows, then the long-veined question would soon be settled.—W. WOODHOUSE, *King's Lynn*.

BEES SWARMING IN A BUILDING.

As during the bee-swarming season it is no uncommon occurrence to have a swarm make their way into some part of a building out of which it is almost impossible to get them again, the following account of a successful plan may be of use to others. Last May a swarm effected an entrance into a ceiling in my house through a crack over a window. Having seen the bee-trap invented by R. Aston, Esq., Upper Bar, Newport, Salop, favourably noticed in your periodical last year, I wrote to him to know whether it could be used in this case, and he sent me a trap with a perforated zinc cage fitted to it to hold the bees as they passed out through the trap. It was only necessary to screw the trap and cage firmly to the window-frame, stopping up every hole but one, before which the trap was fixed, and as the cage filled to sulphur the inmates.—S. J. HIDDLESTON.

OBSERVATIONS ON THE DEVELOPMENT OF BEES.

In the unicomb hive noticed in my article on the queen bee, page 395 of your Journal, I have been able to keep a colony of bees all winter. One of the combs is a little bent, causing one side to be near the glass, while the opposite one has more space. In this space the bees have attached to the glass a piece of comb containing about a hundred cells. Previous to this year the bees had always used these cells for storing honey and bee brood. On the day following that on which I despatched the article above referred to, I was surprised to see about a dozen eggs laid in the cells attached to the glass. Some of the cells are at right angles to the glass, the glass forming the bottom of the cell. Others are formed horizontally to the glass, in which case the glass forms one side of the cell. I was twice enabled to see the eggs in every position, and all the subsequent processes of bee-growth in the cell. Had I tried it I could not have placed them better for observation. Some of the eggs were deposited on the glass right in the centre of the cell, others were placed on the side of the cell, where I had a full view of the whole egg and bee as it grew to maturity. And as it may be interesting to some of your sparian readers who have not had the opportunity of observing this, I will describe as well as I can all that I saw.

To make the subject as clear as possible, I will give the dates and progress of growth of one egg out of many from the notes I made at the time of observation.

I took the precaution of putting a number on those cells which I had selected for more particular notice, and noted down the changes which took place at the time the observations were made.

Egg laid (in No. 4.) between 8 p.m., June 1st, and 6 a.m., June 2nd.

June 5th, 10 a.m. Grub just hatched.

" 8th, 4 p.m. Grub a good size, but still lying in a circular form.

" 10th. Grub eating at the bottom of the cell, with the abdomen extended towards the top. Bees sealing-up the cell.

" 17th. The form of the eye seen as a light brown spot.

" 18th. The joint between the body and abdomen developing, and legs forming, wings also forming. Still retaining the white colour of the grub.

" 21st. Changing colour; legs moving.

" 22nd. Hair and wings grown to full size. Bee moving in the cell during the day, and between 9 and 10 p.m. of the 22nd the perfect bee had emerged from the cell.

It is difficult to note the hour of every change which takes place in the development of the bee, the progress is so gradual when looking on, but on leaving it for a time the change is very marked in some of the stages; and though other observers may differ from me regarding the time required in each stage, I must observe that much depends on the temperature of the hive in which the process is going on. During the whole of May I was afraid I should not see one egg arrive at maturity, the weather was so cold; and I took the precaution to place woollen cushions against the glass to keep up the temperature when not observing, and at that time the eggs were sometimes six days in hatching. As the temperature increased the time has been shorter, but none less than the one noticed.

When the egg is first deposited it is pure white; in twelve hours it begins to become transparent at the point, and becomes more so till the grub emerges from the egg. Previous to, or just about the time the grub comes out of the egg, a bee deposits a small globule of white matter, like that which the queen bee gets, but thinner. The quantity each grub gets of this white jelly, as we may term it, is about the same as a bee can hold of honey in its honey stomach. This white jelly is deposited by the bee immediately beneath the egg, and as the grub emerges

from the egg it comes in contact with it and begins to consume it, one part of the grub being in the jelly and the other part still holding on by the shell of the egg, which it gradually leaves and burrows itself overhead in the jelly. The grub, as it passes out, bursts the sides of the egg longitudinally as well as at the end. The other food it gets is placed by the bees at the bottom and round the sides of the cell walls, and seems to consist of pollen moistened with water or honey, as I have seen the bees mixing it up with their mandibles against the glass, and then placing it on the cell walls.

Each cell is provided with this food before the egg is laid, but should the queen chance to lay an egg in a cell immediately after a young bee has eaten itself out, the bees can and do put the food into the cell after the egg has been deposited.

When the young bee leaves the cell another bee generally comes and trims the mouth of the cell, then enters it, feels if all is right, wipes it up with its sucker, which is just a pointed mop, and then proceeds to put in the food for the future bee. The grub goes on increasing in size among the white jelly for about three days, then it begins to the food laid on the cell walls, keeping in the circular form. As it clears away the food, it requires to turn its head or mouth more into the bottom of the cell, where the food is deposited in greater quantity than on the cell walls. At this stage it eats voraciously, somewhat like a caterpillar on a rose or cabbage leaf, cleaning the glass completely where the food has been laid on it. As the head descends into the bottom of the cell the abdomen extends upwards. At this stage the bees seal up the cell. Here, then, is a period of the grub's growth, when it increases rapidly in size, with its head the wrong way, and it is seemingly impossible that it can ever turn itself. If I had not seen it as well as others I could not have believed that it would turn; but it continued eating, notwithstanding, till it seemed to be unable to eat any more. It took about an hour to turn itself, and when it did so it began to eat at the top of the cell off the glass. At last it could eat no more, but kept moving its head as if it were doing so, then it ceased altogether, and became motionless, lying on its side, as they all do, or on the back, none on the belly. And so ends the second stage of a bee's growth.

No one could ever imagine that from the plain-looking worm quietly reposing in a cell there would come forth a perfect bee, having so many marvellous adaptations for the work assigned to it in creation, and complete in all its parts for the wonders it performs. The first perceptible change that takes place in the grub is a light brown spot the shape of the eye, then small protuberances on the body, from which the legs grow, and the divisions of the body from the abdomen gradually develop themselves. The legs increase in length, and at last are perfectly formed, but the whole still retain the white colour of the grub, with the exception of the eye, which gets darker. The head and mouth then begin to appear, and the joints of the legs begin to have streaks of brown colour, which extend all over the body. The thick part of the abdomen is the last to change colour. The proboscis or sucker can be seen growing down the belly.

On the last day the hair has grown, and the legs begin to move twelve hours before it comes from the cell, always increasing in motion; then the whole body moves, turning itself round every few seconds; very restless up to this time—about three hours before it comes from the cell. The proboscis continues as a solid trunk, so that it cannot turn it in as it does at other times; at last it, too, becomes split up as in the normal state.

Then the now-developed bee begins to eat itself out, which it does in two hours. When it does make its way out it seems very happy, but none of its sisters take any notice of it then. It is, as a matter of course, occurring in hundreds of cases every day during the breeding season.

Though these remarks are confined to one bee, they are the result of the close observation of a number of eggs.

Though a number have been hatched, yet many more have failed, both as eggs, and more in the grub state; none after they have passed into the bee stage.

In a number of cells two eggs were deposited at a time, in other cases a second egg was deposited on the following day, and in two cases an egg was deposited after the first grub was hatched; but in no case did a bee ever move an egg but by eating it; both eggs were allowed to remain till they were hatched, then the grub of one would be consumed by a bee, and sometimes they would be left till both were devoured. When one observes the firmness with which the eggs are glued to the glass or cell, it is difficult to conceive how the bees could remove such eggs and stick them on to another cell, as they doubtless must be, as they are not dropped, but pressed against the cell.

In the earlier part of the season, when the weather was cold, I have seen a bee approach an egg, feel it with its antennae, presenting its mouth filled with the white jelly to it, and remain in that position for half an hour, allowing the grub, not yet out of the egg, to eat the jelly out of its mouth. I saw this distinctly on several occasions, but it does not seem that bees do it at all seasons, as I have not seen it lately.

A bee will frequently take up its position in a cell beside an egg and remain motionless for hours. Whether it is to rest or sleep, or to give heat to the egg, I cannot say; I only state the fact.

I had an opportunity the other day of testing the white jelly from a queen cell, imagining it to be albumen or starch, as in appearance it is like these substances; but it did not coagulate by boiling, but partly became soluble. Instead of giving a blue colour by the addition of a solution of iodine it indicated a brownish colour, so that it is neither albumen nor starch.

I was always under the impression that the bees deposited the honey in the cells by means of the sucker, but I find I am wrong. It is from the mouth proper that it is expelled. When in the act of expelling it the mouth seems large in proportion, in the form of an oblong square with the corners rounded. As the bag or stomach gets emptied air-bubbles are expelled at last, as if one pressed liquid from a bladder. The same occurrence takes place when they are putting the white jelly in the cell. It was seeing them putting in the jelly which first drew my attention to the fact.

In these observations I am fortunate in having a good microscope at my service.—A. SHEARER, *Yesterday*.

OUR LETTER BOX.

DONCASTER SNOW.—Mr. A. A. Vander Meersch took the second prize for Jacobins, and not Mr. Bamford.

DORKING COCK AND BONEHEAL (H. F. H.).—I am sorry to say I cannot remember anything about "H. F. H.'s" bird. It is almost impossible for any one to recollect a single bird at a show unless it had some very special mark, or was in the Any variety class, where, perhaps, only one bird of a sort appears. Most likely "H. F. H.'s" bird was not large enough; all the prize Dorkings are the largest of the class, other properties, of course, being good. Boneheal is of no use except for chickens of large breed, and not to them if they have a range where they can get all the feed. The proportion used is an ounce with every half-pint of dry meal before adding the milk or water.—WILTSHIRE RECTOR.

MR. TODMAN'S PARTRIDGE COCHINS (E.).—We have received more than one communication on this subject, all stating that the criticism was written by one either ignorant or negligent. We have inserted Mr. Todman's statement and Mr. Hewitt's refutation of the criticism. No one who knows anything of poultry will consider the critic's opinion is of the slightest value compared with Mr. Hewitt's opinion.

GROUND OATS (J. E.).—They are advertised in our columns every week. Prepared as you say, they would make good cakes for greyhounds when out of training. Make the meal into a stiff dough, dry the cakes thoroughly, and then if kept in a dry place they will remain serviceable for months.

PHEASANT FOWLS (Jane).—The Golden-spangled Hambarghs were formerly called the Pheasant Fowls. The name did not arise from any similarity of shape, but because there was a likeness in the dark spots or moous at the end of each feather common to each breed. There have been enthusiasts who have believed such community of feather has been the result of contact between the two breeds; but it is not the fact. The hybrid between any two birds is quite distinct from either of them, and is also sterile.

PRESERVING EGGS (Flycatcher).—We hold it to be something to get eggs for puddings all through the winter. We always save ours in lime. We have them sometimes fit for breakfast, but we are yet seeking a method of preserving eggs that will keep them new-laid!

LICE ON FOWLS (H. B.).—The presence of vermin is always accepted as a proof of low condition. It is especially the result of rice-feeding and of accumulated dirt in their houses and haunts. The probability is the corners of their house want cleaning out with a stiff brush steeped in strong preparation of lime. The best way to get rid of them is to put in their baunts, and even, if their house is a large one, in their house, a heap of dust or wood-ashes with which may be mixed some black sulphur, a pound to a bushel. The birds will bask in this, and it will be found a cure. Where an immediate cure is wanted, the patient may be caught and a drop or two of oil may be put at the back of the poll, on the middle of the backbone, and under the wings.

STOVE FOR FOWL HOUSE (E. B.).—No stove is needed.

FOWLS CROOKED-BREADED (Tyrol).—The cause is in most instances that the birds are too highly fed, and are forced along so fast that the bones cannot support the weight of the body. In roosting, the grasp of the feet is not sufficiently powerful to steady and support the body on the perch, and the breast therefore rests upon it. Being in a cartilaginous state, it adapts itself to the shape of it, and becomes crooked. Large fowls like Brahmas should not roost at the age you name. If you let them roost on the ground you will keep straight breasts.

DRAWING HONEY (An Apianian Subscriber).—As you are now in possession of a hundredweight of honeycomb in bare, and likely to have a great deal of run honey, we think your better way will be to go yourself with your bars to some man for honey, and there sell what you have, and make arrangements with some dealer for the reception of your future supplies. It is hardly fair to expect us to mention the names of buyers, but we may say that you will have no difficulty in finding plenty of them at the prices named. You will please bear in mind that the wholesale house in Ireland which you have been treating with have probably to sell the honey to wholesale houses in England, and these to retailers at wholesale prices. As to packing your bars to travel safe by road or rail, we think you will do well to put them in their natural position in a bar-frame hive, or some such contrivance, to avoid the friction or pressure of comb against comb. The modes of taking honey from combs will be noticed in our first number for August.

SWARM FORSAKING ITS HIVE (W. E. M.).—We do not think your driven bees swarmed out of the hive in which you placed them because of the loss of their queen, otherwise you would never have caught them again as a swarm, which we infer was the case, as you say you "wanted them to another." Had their queen been lost they would have simply joined some other hive, not unlikely their old companions. We believe there is no remedy for the loss of a

queen on her honeymoon trip except substituting another queen for her, or furnishing the hive with brood comb out of which to rear a queen. We do not like Mr. Payne's plan; it is too uncertain of success. There is nothing like driving both swarms or stocks into a common third hive, as discovered by "B. & W."

PIGEONS (T. O. J.).—Mr. Fulton's address is Duke Street, Deptford.

CANE FOR HIVES (A. B.).—We do not know a house where cane can be had in London. Most basketmakers have it, and almost every toy shop sells it. Neighbour & Sons, who are large dealers in hives, may tell you where it can be obtained at wholesale prices. The price of honey and honeycomb ranges between 1s. and 1s. 6d. per lb.

BEE-DRESS (B., Breconshire).—Probably any of the dealers in hives who advertise in our columns could supply you with one. If you have one home-made, a very simple and convenient one is formed of green lino, and a mate as to enclose the head, neck, and shoulders; indeed, it is like a bag, with sleeves to tie at the wrists. The sleeves are made of green glazed cambric. With its aid the most difficult operation may be performed without the possibility of being stung.

MELTED COMBS—SHADING (J. R. B., Chichester).—Shading should always be had recourse to in such weather as that of the middle of July, and more especially so for swarms of the year. In those cases where it has unfortunately taken place, it will be better to shade immediately and nothing more, leaving the rest that is to be done entirely to the bees. Should the weather prove very hot and sultry, it will be necessary to shade newly-bred swarms for a few hours in a day, say from ten till two o'clock; a green bough answers very well for this purpose—that from the fir trees, perhaps, is the best, as well as the most durable.

REMARKS.

- 1st.—Rainy morning, but a beautiful day afterwards.
 - 2nd.—Very warm, pleasant summer day.
 - 3rd.—Fine day, rather cooler, the wind being high.
 - 4th.—Fine morning, rain from noon till 4 p.m., after that time fine, except a short sharp shower between 6 and 7 p.m.
 - 5th.—Very fine during the whole day.
 - 6th.—Fine morning, but looking very stormlike at noon, and again between six and eight in the evening, but no rain fell; bright fine night.
 - 7th.—A very fine day throughout, but with a falling barometer.
- A week of pleasant weather, the wind at times rather high, and the sky looking stormlike, but gradually clearing without either thunder or rain. Temperature higher than during the previous fortnight, and that in sun very high.—G. J. SYMONS.

COVENT GARDEN MARKET.—JULY 8.

MARKETS remain firm at last week's quotations, with the exception of English Pines, which are now much cheaper in consequence of the large importation of foreign ones.

From observations taken near London during forty-three years, the average day temperature of the week is 73.9°; and its night temperature 50.5°. The greatest heat was 94°, on the 17th, 1831; and the lowest cold 34°, on the 16th, 1863. The greatest fall of rain was 1.37 inch.

MELON-GROWING AND JUDGING.

HAD made some notes with a view of writing a short article on Melon-growing before I saw the paper on judging Melons by Mr. G. Abbey, in the number published July 2nd. With your permission I will briefly criticise a few of Mr. Abbey's remarks, and, as he says he should be glad to have the views of others, he will kindly excuse me for saying that in many points my views are quite in an opposite direction to his own. If I am not qualified to speak it is not through want of practice, for growing Melons is about the most important thing I have to do, that luscious fruit being in almost daily request here during summer and autumn. I have at present five houses planted in succession, two of which are planted for the second time this season.

I partially agree with Mr. Abbey when he says that flavour should not be the sole test in judging a Melon. A noble Melon is a great addition to the dessert, especially where Pines are not grown; but I cannot conceive anything more disappointing to the connoisseur, who has been watching and longing for a slice all dinner-time, than to find when the fruit is cut that it is not so good as it looked. Many people there are who do not know what a good Melon is, and can enjoy an inferior one with the same relish as children eat Crabs and sour Gooseberries. I often envy them; for do what I will, when I have once tasted the flavour of a good fruit or a good vegetable, it always haunts my imagination, and I cannot be quite satisfied with anything that has even a shade of inferiority about it. If there are twelve points in judging a Melon, I would certainly give eight to flavour.

Mr. Abbey says, "The smallest examples, not the consequence of overcropping, have the highest flavour;" and again, "high colour is no criterion of flavour." This is totally opposed to my experience, not only of Melons, but of all kinds of fruit. I have generally found that the most perfectly-developed and highest-coloured fruit of any given kind was also the best flavoured. On the other hand, I do not think that netting, ribs, or hard skin, will afford any guide as to flavour. The Melon is about the only fruit we cultivate of which we cannot tell the quality by the exterior, and to be judged correctly it must be cut and tasted, even were everyone to exhibit the same variety; for in Mr. Abbey's own words, "in many cases it is only a question of culture."

Culture is everything: I will now give my mode, which I daresay does not differ materially from that of other successful growers. I happen, however, to have good houses, good soil, and I grow a good sort. The sort is that known as Meredith's Cashmere, four fruits of which, since reading Mr. Abbey's paper, I have had the curiosity to measure and weigh. Their average girth, measuring both ways, and taking the mean, is 1 foot 11 $\frac{1}{2}$ inches, and their average weight, 6 lbs. 12 $\frac{1}{2}$ ozs. Mr. Abbey's rule for ascertaining weight by measurement comes pretty

near in this case; but weight depends a great deal on the sort, and its culture. We never have a fruit of this kind that is not eatable, unless it is during the dull days of late autumn. It will be said, probably, the Cashmere Melon cannot be grown to 6 $\frac{1}{2}$ lbs. without being unduly fed. I can only say that the plants have never had the smallest particle of manure, either liquid or solid; the soil they are growing in averages exactly 2 cubic feet for each plant, and is placed on a hard bottom of stones and ashes. The plants have borne six or seven fruit each.

I make my first sowing early in February, placing the seeds singly in small pots filled with heavy loam; these are placed in strong heat in a light situation, and as soon as the little plants begin to make their first rough leaf they are shifted into larger pots, and afterwards planted, 6 or 7 feet apart, on little hills formed of very heavy loam pressed together as closely as possible. As they grow the main stem is trained straight up the trellis, and without any pinching or stopping it throws out laterals 10 inches or a foot apart, which are trained at right angles to the main stem. These laterals, when they have nearly filled the space allotted to them, are stopped, and they in turn produce sublaterals, which invariably bear female blossoms. In the early part of the season it is necessary to fertilise the blossoms; afterwards, when the outside air is more genial and abundance of air can be safely admitted, they will fertilise themselves.

The knife is never required for Melon plants if they are grown properly. The shoots should never be allowed to grow where they are not required; it is a waste of energy to allow them to form and then cut them off.

I sow about once a fortnight from March to June, so that I always have plants ready whenever a house is at liberty. Some plants are grown to a large size in 12 or 13-inch pots, to follow other crops in the same house. They are easily transplanted at any time by placing them in position and breaking the pots.

Melons are not very particular as regards temperature; mine have a range of from about 50° to 130°. When they are setting their flowers, however, the flowers and young fruits are apt to get scorched if the temperature rises too high. I therefore, as my houses are rather short of means for ventilation, find it necessary to shade them for a few days at the time of impregnation.

The Cashmere Melon has two drawbacks—it is rather difficult to set, and it is liable to crack open. The latter failure I counteract by strangling its neck or cutting three-parts through the stem when nearly full-grown. The setting is easily managed on the sublaterals, but, as far as my experience goes, not otherwise. I often try a fresh variety in competition with the Cashmere, but at the end of the season always receive the same command—return to the old favourite.—WM. TAYLOR.

TABLE DECORATIONS.

ALLOW me to make a protest against encouraging the habit of making table decorations too flimsy and too transitory in their nature. Having been to a good many shows lately,

I have seen prizes awarded to table decorations that would not have lasted even during the time of an ordinary dinner party. At Tanbridge Wells and at the Crystal Palace the first prizes were given to vases of the Murch type, where single flowers of the *Delphinium formosum* and *ceruleum* were wired on to pieces of grass, and the chief effect produced by means of flowers that would die before dinner was half over.

There is such a thug as making vases too heavy by overcrowding them with flowers, however choice the flowers may be; but surely there is no need to run into the opposite extreme and encourage poverty of idea and paucity of flowers. There is a limit to the use of Grass and Ferns; nor can I see any beauty in white sand stuck all over with Grass, and a few flowers thrown promiscuously at the base of the stand.

The excuse given for wiring the flowers on grass for table decorations is, that the same practice is adopted for hand-bouquets at Covent Garden; but surely Covent Garden is not to rule the taste of judges at horticultural shows, and what may be allowable for a hand-bouquet of a mere transitory nature to be used for one night, is not to be a guide for a table decoration which ought to be of a more permanent character. A stand of flowers for the centre of a drawing-room or dining-room table ought to be fit to be seen the next morning. If dinner tables are decorated at a nobleman's or gentleman's house when a large party is staying in the house, the breakfast table or the luncheon table should be able to profit by the decorations of the previous evening.

The habit of introducing plants in pots by means of holes cut in the table is, I am in hopes, dying out, even where it was for a short time adopted; and I also trust that poverty and paucity will not be encouraged under the pretext of lightness and elegance. The best table decorations ought always to consist of choice flowers, not overcrowded, nor, on the other hand, too formally arranged, but every flower used should be good of its kind, and foliage should be accessory and secondary, and not the principal object.—C. P. P.

NOVELTIES IN THE ROYAL GARDENS, KEW.

On the Rockwork in flower are two very interesting new plants from Morocco, brought home by the Expedition of Dr. Hooker, Messrs. Maw and Ball, in 1871—*Bellis rotundifolia*, var. *carulea* (the Blue Daisy), and *Salvia taraxacifolia*. "The Blue Daisy is one of the commonest spring flowers in various parts of Morocco, abounding in fields with a rich soil on the hills near Tangier, and occurring in great profusion by the watercourses of the valleys of the Greater Atlas in latitude 31°, at elevations of 4000 to 11,000 feet" (Dr. Hooker's "Bot. Mag." 1873). It is easily cultivated, and may be grown in pots, but is better planted on rockwork, where it grows freely. Increase may be effected by division. It is as yet exceedingly rare, and is much inquired after. The leaves of *Salvia taraxacifolia* are pleasingly scented; the flowers are pale pink, and are produced in spikes. It does not seem to stand our winters well; a few plants should therefore be grown in pots and wintered in a frame. A stock is best obtained from seeds, which are freely produced and grow readily.

Begonia S-denii is heavily covered with scarlet flowers. *B. carminata* is also very handsome, with flowers of a yellowish hue. *B. intermedia* and *B. Aquarion* are also beautiful; the flowers of the former are very fiery.

There are a few half-hardy plants that may with propriety be planted on the rockwork in summer, among which may be named the tuberous *Begonias*. They are an additional point of interest and beauty without being in the way, and serve to attract those who can see no beauty that does not consist chiefly of flaring colour. Cuttings strike freely; it is the only way of getting the best kinds true. They are easily grown and flowered from seed, when a variety may be obtained. Heat is never required; fine specimens may be grown in a greenhouse, preferably with a north aspect. When the plant is mature for rest the supply of water must decrease, and the tubers be placed in a moderately dry and cool position. They grow well in rich fibrous loam. The New Zealand *Lobelia (Pretii) littoralis* is very charming. It has a neat creeping habit, and bears a profusion of pure white flowers. It may not be quite hardy, but only requires the protection of a frame in winter; a few plants in pots would hold it safe. In summer it likes a moist and rather shady position. It appears to be rare, but by means of the rooted stems may be increased to a great extent. *Trierythra macropoda* is rare and curious; it has yellow flowers with numerous small dark purple spots; the

leaves have usually a few large ones almost black. *Lilium Washingtonianum*, mentioned last week, is represented in this country by the variety *purpureum*. The type, it is supposed, has not been introduced to cultivation.

In the Herbaceous ground *Erigeron mucronatum*, nearly a yard across, is producing a mass of flowers on slender much-branched stems. The flowers are Daisy-like, are white at first and then turn red. This plant till last year was everywhere known as *Vittadenia triloba*, with which it has nothing whatever to do. It is a native of Mexico and Venezuela, and therefore must not be called the New Holland Daisy. Here it is quite hardy and of perennial habit. It grows freely from seed, and being so pretty and distinct is worth cultivation everywhere. *Coreopsis auriculata* is very fine, much in the way of *C. lanceolata*. *Scolymus maculatus* is a striking perennial of Thistle-like aspect, with many large yellow flowers. It is not at all common, and is best grown from seed. *Campanula celtidifolia* is a very fine species, about 3 feet in height, with panicles of large flowers (it is also in bloom at the Rockwork). *Salvia Horminum*, var. *rubra*, presents a pretty change of colour from the commoner violet form. *Calandrinia umbellata* during sunshine is so brilliant as scarcely to be equalled by anything else. Though a perennial on well-drained soil, it may also be treated as an annual; sown early, the crimson flowers are produced the same year. *Genista æthensis* is a very handsome and graceful shrub. The branches are composed of slender, green, leafless twigs, bearing a profusion of yellow flowers. *Dianthus monspessulatus* is very pretty with pink flowers, the petals of which are deeply fringed. *D. ramosissimus* is very distinct in habit; it produces a dense tuft of slender stems, bearing numerous small pink flowers.

In the Cape house *Eucomis punctata* is very ornamental. It has tall racemes of greenish white flowers, the ovaries of which are dark violet. Several plants are in flower of the new *Pelargonium oblongatum*. It has dwarf fleshy stems without any inclination to branch. A few *Mesembryanthemums* are very showy. *M. coccineum*, *M. inclandense*, *M. blandum*, *M. falciforme*, *M. bulbosum*, and *M. lacerum*, of which a single flower is quite an ornament; it is large, and of a fine rose colour.

THE LAWN-MOWER COMPETITION AT BIRMINGHAM.

MEDALS were offered in this section of considerable value, and it was to be regretted that there was not a larger number of mowers to take part in the contest, although, as matters were arranged, the work that fell to the share of the Judges was of a very laborious character. For instance, instead of testing the draught of each machine by a dynamometer, which could readily have been obtained for this purpose, and which would have given the result with accuracy, each machine had to be tested by the muscular exertion of those who had to adjudicate on its relative merits. Surely the work that falls to the share of the censors at an exhibition like that at Aston is trying enough both to the mind and the body without oppressing them with work that might be performed by a donkey or other beast of burden. Conductors of exhibitions would do well to take a note of this when organising another contest of this character; do let the work of the judges be as pleasant as possible. Another feature in the machines which could not be tested in a competition like this is their liability to get out of order; but this could only be ascertained by a whole season's practice. Of course simplicity of construction may, to some extent, be considered a guarantee that the machine would continue to work for a period in proportion to the least number of parts, cogwheels, &c., of which it is possible to construct it.

The new "Royal" machines exhibited simplicity of construction in a very marked degree; these were sent by Messrs. Green and Son, and are totally different in construction from the machines made by them and worked by chain-action. The broad wheels at the sides are certainly objectionable when it is intended to cut amongst flower beds, around large pedestals, &c. Still, none of the machines cut quite up to pedestals, and in practice it would not matter much whether the space to be cut with shears was 6 or 3 inches broad.

The contest ought to have commenced at 11 a.m. on Wednesday (July 8th), but owing to some delay it was mid-day before the first machine was set to work. The following were the sizes of the machines entered, and the conditions are also specified below.

12 or 14-inch machine,	to be worked by one person.
20-inch, "	" " two persons.
30-inch, "	" " a pony.

CONDITIONS.—1. Strength and simplicity of construction.
2. Capability to cut a smooth lawn.

3. " " rough grass.
4. " " wet grass.
5. To cut close to an object, such as a pedestal.

The competitors were Messrs. Crowley & Co., of Sheffield; Green & Son, of London and Leeds; Hartley & Sugden, Halifax; Barnard, Bishop, & Barnard, of Norwich; and Mr. Harris, of Birmingham. Messrs. Green's new "Royal," cutting 30-inch, worked by two men, made the first work. Cutting one breadth twice and another once it did its work well, and did not rib the grass so much as some of the other machines. When worked with a pony it did not do the work nearly so well as by hand. Barnard, Bishop, & Barnard were the only other firm that tried pony machines, and theirs cut well on level ground, and threw the grass out well. It cut very close to the pedestal (a round and square one were on the ground); it was very noisy, but this was owing to their using a galvanised collecting-box, which was stated to be more durable than those made of wood and iron. It also worked well round a small circular bed, but the work was ribbed on uneven ground.

Twenty-inch machines.—Hartley & Sugden, cut the first widths with the Windsor, followed by a "Silens Messor," sent by Mr. Harris. The first named cut pretty well on the dry grass, but ribbed badly and was difficult to work when set to work where it was wet. The "Silens Messor" cut better than the "Windsor" on wet grass, and was more easily worked.

Edwards's patent machine, "The Invincible," sent by Crowley and Co., certainly made the best work on the dry ground, and its superiority was more evident on the wet grass; and when the grass is long and peculiarly stubborn to cut, the roller is by a contrivance made to be shifted from the front to behind the knives, and when it was tested on the longest of the wet grass in this way, the work was also well performed. Barnard & Co.'s 20-inch machine was hard to work, but it cut without leaving the grass badly ribbed. It did not, however, take the bents so clean as some of the others. Their 30-inch pony machine on the wet threw the grass out well, and did not rib so much as Green's. The 14-inch machines made beautiful work in nearly every case.

Crowley & Co.'s and Mr. Harris's machines worked the easiest, though all of them threw the wet grass well forward, and the grass was well wetted. It was thoroughly soaked before the machines—so much so, that one came to the end having the box half full of water. After the trial one machine from each exhibitor was taken to pieces by the exhibitor himself, and minutely examined by the Judges, all the points being minutely considered. The first prize, a gold medal, was then given to Messrs. Crowley & Co. for "The Invincible;" second, a silver medal, to Mr. Harris for the "Silens Messor;" third, a bronze medal, to Messrs. Hartley & Sugden for "The Windsor."

Two machines were also submitted to the Judges for cutting grass edgings, one from Mr. Harris, which is attached to a lawn mower; and the other from Messrs. Green, which is either attached to a lawn mower or small roller. The principle in both is the same—a set of revolving knives cutting against a steel plate. Green's machine worked much better than the other, and it will, no doubt, be very useful where miles of edging have to be cut; but as shown, it will not supersede the old-fashioned shears for beds in geometrical gardens. It may be improved, as it is yet in its infancy. Even as it is, it is a step in the right direction. The silver medal was awarded to it. Messrs. Green also exhibited a machine for cutting the turf round edgings, which also requires some improvement to make it serviceable.

The Judges in this department were Messrs. Bennett, of Hatfield; Fleming, of Cliveden; Lowe, of Wolverhampton; and Hassall, of Birmingham.

LOVE AMONGST THE ROSES.

AND why not? True I am not exactly the model for *un petit cupidon*; my beard is grey and my head bald, but these slight drawbacks have often not prevented many a possessor of them from making a fool of himself—the worst, according to the proverb, fool of all. Yet for all this I may lay claim to being a lover; and it is one charming feature in the fair queen whose devoted servant I am, but whose eyes I never wish to gaze upon, that she does not disdain the homage of a very old lover. In fact our affection is platonic. I never look for a nearer embrace than to get a whiff of the gentle fragrance which she diffuses around her, and if I sound her praises or tell of her triumphs, it is because I delight in all that brings honour to her name; and when I see "young men and maidens, old men and children" hovering round her, I feel that she has rightly assumed the throne from whence no rebellious spirit in the domain of Flora will attempt to dethrone her. And as I have been lately doing homage at her court in various places, I would now summarise a little the result of my attendance, and firstly

THE WISBEACH SHOW.

This was held in the grounds of J. T. Baker, Esq., at Colville House, and, indeed, the whole Exhibition was due to his energy and good will. There had been some difference of opinion about an Exhibition, and he took upon himself to bear all the risks. It was unfortunate in one respect, that it was fixed on the same day as the National Rose Show at the Royal Horticultural Society; and to those who imagine that exhibitors are influenced by mere greed, it will be, I think, worthy of notice that not even the tempting prizes offered here could induce them to forego the hope of winning the prizes at South Kensington. It must have been a disappointment to Mr. Baker to miss the well-known names of Paul, Cranston, Turner, and Keynes, the result being that it was an easy walk-over for Mr. Cant, who was so far in advance of the only other stand exhibited in this class, that the Judges withheld the second prize altogether, for they felt that a prize of £10 ought to have brought together better Roses. Amateurs were fairly represented, but neither amongst their stands were there any remarkably fine flowers. I think that the Wisbeach people in setting the example of offering these large prizes for Roses deserve well of their country, and the neighbourhood cannot but reap the advantage of having such competition amongst them. I pass by the stove and greenhouse plants, Ferns, &c., because my notes are to be upon the Rose, but I wish at the same time to do honour to the excellent plants contributed by Messrs. Dixon, of Beverley; House, of Peterborough; and Cypher, of Cheltenham.

Have any of our readers any experience of Sutton Bridge Station? If not, amongst their delightful outings for the autumn, let me advise them to essay the journey from Wisbech to Spalding by that route. You have such delightful leisure that you may see the country to the greatest advantage, knock up a lifelong acquaintance with the amphibious animals whom we should designate as porters, but who, in this region of canals and dykes, have "pilot" in red letters on their caps; and engage in statistical inquiries as to whether a wet country like this tends to a greater or less consumption of beer and baccy. Be this as it may, we were glad, as we were obliged to leave Mr. Baker's hospitable mansion earlier than we wished, to make the eighteen miles from Wisbech to Spalding in two hours, and to find ourselves very comfortably established there in the evening; and so the second court where our queen was to be viewed was

THE SPALDING SHOW.

And first as to the place itself, charming in its quaintness, reminding one much of Holland, with the river flowing through its streets, the quaint old houses, narrow alleys, and the well-kept gardens; and, indeed, although I was not aware of it until this visit, it is so called in all documents—"parts of Holland in Lincolnshire." Originally colonised from thence it retains its name, and has, of late years at any rate, made a greater claim in the eyes of florists at least to be so called, from its being a famous centre for the growth of Dutch bulbs, especially the Snowdrop and the Crocus. Nearly all of the former bulbs sold in England are grown here, while acres upon acres of Crocuses, Tulips, Lilies, &c., find their way from here to the London market. One of the first things I saw on entering the town was a small pony-cart, with the owner's name and "buyer of Snowdrops and Crocuses" painted on it, while over several shops one saw the same. I took the opportunity of asking a few questions, and was surprised to find that the Snowdrop was peculiarly subject to disease, I having thought that it was hardy enough to resist anything, and that it takes a hundred pounds' worth of small bulbs, or, as they are called here, "seed," to plant an acre; so that it requires some capital to invest in a bulb farm. The soil seems particularly well suited to it, and the bulbs come out with that clean shining look we are accustomed to admire so much in the Dutch bulbs. The Show at Spalding is held in gardens which are a fitting adjunct to the place itself both in name and character, Ayseough Hall. The gardens are filled with the finest Yew hedges and curved walks, trees clipped into curious forms, the inevitable pond or canal, and old-fashioned herbaceous borders; while on the green lawn the band of the 2nd Life Guards gathered round it such an assemblage of fair ladies as one does not often see, and of which I, a venerable old gentleman, may speak without an *arrière pensée*; while the kindness, hospitality, and good fellowship of all those who had to do with the arrangements tended to make it for us strangers a day of real enjoyment. Those who as Judges are lookers-on in the fray, while having

no doubt a difficult and onerous task to fulfil, are yet freed from the excitement and anxiety which do possess the exhibitor. It is the latter who can alone say with *Troilus*—

"I am giddy; expectation whirls me round,
The imaginary wish is so sweet
That it enchants my sense.

I fear it much; and I do fear besides
That I shall lose distinction in my joys,
As doth a battle when they charge in heaps
The enemy flying."

The Roses exhibited on this occasion were greater in number than at Wisbeach, although Mr. House was the only exhibitor amongst nurserymen for the cup for seventy-two blooms. His flowers were very good, as were also those shown by Mr. Draycott, gardener to Sir Bache Cunard, Mr. Farren, and Mr. Fryer. Particularly fine were Duke of Edinburgh, Marquise de Castellane, Charles Lefebvre, Etienne Levet, Dapuy-Jamain, Madame Lacharme (exhibited in good condition), John Hopper, Maréchal Niel, and other well-known flowers. There was one part of the arrangement which I think might be well copied in other places. A large tent was placed simply for the exhibitors of Roses and cut blooms to arrange their flowers in, and consequently when the proper time came each exhibitor had simply to carry his boxes to the tent, and then place them. We have seen them at South Kensington and other places shoved about from place to place, and the flowers quite disarranged before the Judges came round. Here again one's enjoyment had to be cut short; invitations poured in on us, and we might have remained some days, but we were due elsewhere. I had to be at Exeter by the next morning, and could only do so by travelling all night, and the fair city of the west must be my next trysting-place; this I must reserve for another time.—D., *Deal*.

BULBS.

FLORISTS' catalogues now contain a number of bulbs which are reputed hardy, but their hardiness must depend in some degree on the depth at which they are planted, and about which no directions are given. If planted too deep they are beyond the influence of the advancing sun in spring, as well as his ripening power in autumn; if too shallow they may be injured both by frost and drought. Nor is their depth in their natural habitat any certain guide—at least, if it is true that the Lilies in California are to be found 2 feet below the surface. Few gardeners here would like to bury their dear-bought treasures so low down. As regards old favourites, as Hyacinths, experience teaches us, but I feel dubious as to newer importations, as *Cyclobothras*, *Brodias*, and the like, many of which have very small bulbs, and yet I do not wish to continue them in pots if they will thrive in the open ground. If any of your correspondents have found such bulbs really hardy, and would favour us with a list of them, and the depth at which they have been planted, I believe such information will be valuable to many.—G. S.

MERCURY (CHENOPODIUM) AS A COOKED VEGETABLE.

SOME years ago I was in the habit of visiting at a farm not many miles from Lincoln, and I remember a large bed in a corner of the garden, and in the spring of the year the plant was frequently on the dinner-table, and generally approved of. I consider it worthy of more attention than it at present receives. I enclose a paragraph, cut from a local paper, bearing on the subject.—G. HARRISON.

"We would particularly recommend to our readers as in all seasons a first-class vegetable for early spring use the Good-King-Henry Chenopodium, or rather *Agathophytum Bonus-Henricus*, or English Mercury. This is extensively grown by the Lincolnshire farmers, almost every garden having its bed, which, if placed in a warm corner and abundantly supplied with manure, yields an abundant supply of delicious vegetables a fortnight or three weeks before the Asparagus comes in, and for some weeks afterwards. From a south border we generally commence cutting the Mercury early in April, and continue cutting until the end of June. Some of our friends say they like it better than Asparagus; but we cannot go that length, though we like it very much. When properly grown the young shoot should be almost as thick as the little finger, and in gathering it should be cut under the ground, something the same as Asparagus. In preparing it for use, if the outer skin

or bark has become tough, strip it off from the bottom upwards, and then wash and tie in bundles the same as Asparagus. It is best boiled in plenty of water, with a handful of salt added. When tender, strain and serve simply, or upon a toast. Some have melted butter with it, others eat it simply with the gravy of the meat.

"Now, in cultivation, the Mercury will grow anywhere; but to have it in the best form superior cultivation is necessary. To this end you cannot have the ground too deep nor too rich. Hence we should say, Trench the ground 2 feet deep, mixing in an abundance of rich manure, and plant your plants as early in the spring as possible. As the plant ranks among the perennials, it is necessary to get an abundant yield of shoots, and to get them as strong as possible, and hence in time each plant may be a foot or more in diameter. In planting we generally put the rows 18 inches apart, and the plants 1 foot apart in the row; and after we begin to cut we drench the ground frequently with manure water, or sprinkle the ground with guano in showery weather. Of course the plants must not be cut too severely until they are thoroughly established, say in the third year, and then you can scarcely injure them. A year or two back we grew a quantity in pots for early forcing; but we found them impatient of heat, and possibly we gave them rather too much. Spinauch with boiled ham and eggs is a favourite dish with many. Those who like it will be equally well pleased with Mercury. As the plant is a native it may be procured in many places, and those who can procure it may do worse than prepare ground and plant it at once."

ELSHAM HOUSE.—No. 2.

THE flower beds and borders are nearly all seen from the house. The first object which attracts attention is the border represented in *fig. 13*, which is situated on a gentle slope facing

Fig. 13.

- | | |
|------------------------------|---------------------------------------|
| 1. Golden Feather Pyrethrum. | 3. White Daisy edged with pink Daisy. |
| 2. Cliveden Blue Pansy. | 4. Red Daisy. |
| | 5. <i>Aubrietia græca</i> . |

the house, but raised a few feet above the other beds, which are nearer to the house. This is a very telling arrangement. The Golden-feather Pyrethrum (1) gives it an air of brightness, which few other plants would do so well. Partly hidden from view by shrubs, near to a very pretty summer house, there is a straight border 60 yards long (*fig. 14*), 3 feet wide, planted as follows:—The first line at the back *Myosotis*, blue; 2, *White-variegated Arabis*; 3, *Cliveden Blue Pansy*; 4, *Saxifraga*, as a line of Moss or Sedum; 5, *Red Daisy*. This border is very neat and pretty.

The bed shown in *fig. 15* is a good sample of what spring beds may be made. Here 1, *Purple Pansy*, is very effective; again *Golden Feather* is most telling at 2; and *Aubrietia græca*

comes in charmingly at No. 3 on the plan. Fig. 16 is very pretty, but rather too much cut up for all the colours to show distinctly.

I have only named a few of the many spring beds at this

lovely villa residence. Not one empty bed or border was to be seen anywhere, and all were in a high state of keeping; not a weed to be seen, and the lawn like a carpet. All was very perfect.

2. Cliveden Blue Pansy.
3. White Daisy.

4. Cliveden Purple Pansy.
5. Red Daisy.
6. Aubrietia græca.

The entrance lodge is very pretty; from it to the house there is a border about 120 yards long by 3 feet wide, and each side is planted as shown in fig. 17. Here again Golden Feather takes the lead in the arrangement, and well it does its part. There is a grass verge next to the gravel, and the border is backed up with evergreen shrubs.

Fig. 17.

1. Golden Feather.
2. White Daisy.

3. Myosotis, blue.
4. Red Daisy.

Taking this place altogether it is the most charming piece of spring bedding I ever saw, and I question if there is much better in any part of this country. When once seen it is a sight not easily forgotten; it is, indeed, a veritable fairy scene. Standing in Mr. Hornsby's drawing-room, and having the blinds slowly drawn up, it is almost like a scene in a play; no one who has not viewed it thus can form any idea of the charming effect which spring flowers can be made to produce when taste and skill are combined, as here, in the different arrangements of the colours. Mr. Hornsby's gardener, Mr. Samuel Ellis, is certainly to be congratulated on his success in spring bedding. There is no doubt but that the gardener is well supported by a liberal employer, who takes great delight in

his garden. May Horticulture win many more such worshippers at her shrine!—JAMES SMITH, *Exton Park, Rutland*.

GLAZING WITHOUT PUTTY.

Fig. 18.—Glazing without Putty.

THE annexed is a section of a sash-bar to be glazed without putty (see fig. 18). Even if putty were used, the cap would be a great preservative and protection to it, and it can be removed to restore glass without injury to the bar.

a, Cap to be fastened through the sash-bar, with a capped screw-pin at intervals; f, Caulking of nail-bag strand saturated with white lead; b, Glass; c, d, Screw-pin with head. Brass or galvanised iron.

—V.

ROYAL HORTICULTURAL SOCIETY.

JULY 15TH.

THERE WAS ON this occasion quite a large Show, and in most respects a remarkably good one. It filled the two corridors on the eastern and western side of the conservatory with quite a brilliant glow of bloom.

Zonal Pelargoniums were the principal feature. In Class I, for eighteen florists' varieties, in 6 inch pots, both the first and second prizes were withheld, and a third was awarded to Mr. J. George, Putney Heath, for seedlings of his own raising. The best were A. F. Barron and Lord Mayo, scarlets; and Polly King, salmon. In the next class, for twelve Nosegay or Hybrid Nosegay varieties, again no first prize was awarded. Mr. George had a second prize for several seedlings, of which Grand Coup was promising, together with Mrs. Musters and Mrs. Holden.

In Class 3 for six in 8-inch pots, Mr. Catlin, gardener to Mrs. Lermite, Finchley, exhibited the finest specimens in the Show, grand plants from 3 to 4 feet in diameter. The varieties were The Bride, Virgo Marie, John Williams, and Corsair, extra fine; M. Rendatler, and W. Catlin. Mr. J. Herrington, gardener to J. Price, Esq., Thornton Road, Clapham, was second.

For six Nosegay or Hybrid Nosegay varieties in pots of the same size, Mr. Catlin was again first with excellent specimens of Douglas Pearson, Mrs. Gibbons, Miss Saunders, Rose Bradwardine, Mrs. Hole, and Mrs. F. Burnaby.

For six florists' varieties sent out since 1872, or not in commerce, the first and second prizes were withheld, as also in the corresponding class for Nosegays or Hybrid Nosegays, the third in both cases going to Mr. George.

The show of six double kinds was very poor, and the first prize was withheld, the second and third for plants in 8-inch pots going to Messrs. Wright, of Lee, and Mr. R. Watson, gardener to T. H. Bryant, Esq., Surbiton Hill. The latter also took the highest prize awarded—a second, for plants in 8-inch pots; Mr. Whittaker, gardener to S. Williams, Esq., Putney, being third.

Of Golden Tricolor varieties there was a large display of plants ranging from 10 to 24 inches in diameter, and extremely good both in growth and leaf-colouring. Mr. Turner was first with admirable specimens, the most noticeable of which were Miss Morris, Lucy Grieve, Sir Robert Napier, Mrs. Turner, Golden Queen, Prince of Wales, and W. Sanday. Second came Mr. T. Peatridge, Boston Road, Brentford, with plants closely approaching in quality, including capital examples of Lady Cullum, Sir Robert Napier, Achievement, Miss Goring, Prince of Wales, Princess of Wales, Mrs. H. Little, Mrs. Headley, and E. R. Benyon. Mr. H. B. Smith, Ealing Dean Nursery, was an excellent third. For six the prizes went to Mr. J. Hurrell, gardener to F. A. Davis, Esq., Surbiton, Mr. R. Watson, and Mr. G. Thomas, Turner Road, Lee.

For six Silver Tricolors Mr. H. B. Smith took the lead with fine plants of Mabel Morris, Italia Unita, Impatrice Eugénie, Silver Cloud, Lass o' Gowrie, and Charming Bride. Mr. Peatridge was second, and Mr. Watson third, Mr. Turner being disqualified.

Next came a class for six Golden Bronze or Bicolor varieties. Here Mr. Peatridge carried off the first honours with good plants, having nicely coloured leaves, of W. E. Gumberton, Impatrice Eugénie, Black Douglas, Crown Princess, Maréchal MacMahon, and Reine Victoria. Mr. L. Watson was second; and Mr. Keeler, gardener to H. Simmonds, Esq., Denmark Hill, third.

The special prizes given by Mr. Pearson, of Chilwell, for

twelve distinct varieties, not variegated, raised and sent out by him, in 8 inch pots, the plants to be grown with as little training as possible—if they did not bring numerous competitors, secured a splendid display of varieties which, for brilliancy of colour and freedom of bloom, it will be difficult to surpass. Mr. Catlin was first with magnificently-bloomed plants of Mrs. Mellows, Lady Belper, Matilda, Thomas Speed, extra fine; Charles Burrows, Mrs. Turner, Mrs. Tait, General Outram, Corsair, Mrs. Musters, and Mand. Mr. Birse, gardener to J. H. Lermite, Esq., was second.

Fuchsias were better shown than we have seen this year. In the nurserymen's class for eight, Mr. Mould, of Devizes, took the lead with finely-bloomed plants, averaging about 6 feet high, of Queen Victoria, Pauline, Rose of Castile, Marginata, Lustre, Mrs. Lye, and Mrs. Mould. Second came Messrs. Wright. In the amateurs' class excellent specimens came from Mr. King, gardener to R. V. Leach, Esq., Devizes Castle; Mr. Weston, gardener to D. Martineau, Esq.; and Mr. Keeler. For twenty-four in 8-inch pots the prizes went to Mr. King and Mr. James, of Isleworth.

There was only one group of six Hydrangeas; this was furnished by Mr. Aldous, of South Kensington, who had plants with from six to ten excellent heads of bloom. There was likewise a class for six Clematis, in which Messrs. Jackman, of Woking, exhibited some of their splendid specimens, taking the first prize; whilst Messrs. Outbush were second with smaller but neat plants. There was a nice show of Carnations and Picotees. These will be referred to hereafter.

In the miscellaneous class Messrs. Veitch, of Chelsea, exhibited a group which deservedly obtained a silver medal, in which a splendid plant of *Vanda cœrulea* formed a prominent centre. With this were *Ixora Willmsii*, *Ficus Parcellii*, *Abutilon Sellowianum marmoratum*, *Dracæna Baptistii*, and many other noteworthy plants. Mr. Williams had a similar award for a group, including some fine *Orchids*, *Aucubas*, &c. Bronze medals went to Messrs. Outbush and Mr. Aldous for groups of plants; to Dr. Deony for Pelargoniums of his own raising; to Mr. W. Paul, of Waltham Cross, for cut Zonal Pelargoniums; also to Messrs. Veitch for Roses. The same firm also sent a very fine group of *Retinosporas* and other Conifers.

FRUIT.

The prizes that were awarded in this department were given by the Messrs. Veitch, of King's Road, Chelsea. The fruit was arranged on a table 40 yards in length, and occupied a centre position in one of the arcades. This exhibition showed what can be accomplished when liberal prizes are offered. The complaint has recently been made that fruit has been poorly represented at our exhibitions, and this complaint has been well founded in the case of the London shows; but when a liberal prize list has been made up sufficient to compensate growers for their trouble, the result has always been, as in the present case, satisfactory. Great praise is due to the Messrs. Veitch for taking up in such a liberal spirit this too-much-neglected branch of our national horticulture.

The first class was for a collection of ten distinct sorts, and the highest position has been well earned by Mr. W. Coleman, gardener to Earl Somers, Eastnor Castle, Ledbury. His Black Hamburg Grapes and also the Muscats were magnificent. He also showed a fine dish of Royal George Peaches, Rivers's Large Early Apricot, British Queen Strawberry, a handsome Eastnor Castle Melon, Lord Napier Early Nectarine, Brown Turkey Figs, and May Duke Cherries. Mr. G. T. Miles, gardener to Lord Carington, Wycombe Abbey, Bucks, was second. His Foster's Seedling and Black Prince Grapes were good, but inferior to the fine bunches sent by Mr. Coleman. His Peaches, Nectarines, Cherries, Strawberries, and Plums were very fine. Mr. Jones, gardener to Her Majesty, Frogmore, Windsor, was third. He had a good dish of Peaches and Victoria Plums, but the collection was spoiled by containing a nearly rotten Smooth-leaved Cayenne P.n.

Collections containing six distinct dishes were sent by Mr. Bannerman, gardener to Lord Bagot, Blithfield, Rugby; Mr. J. Watson, gardener to W. E. Harcourt, Esq., Mucham Park Grapes, Abingdon; and Mr. W. Bones, gardener to D. McIntosh, Esq., Havering, Romford, who took the prizes in the order named. Mr. Bannerman had good Muscats and Black Hamburg, a Queen Pine, Bellegrape Peaches, Nectarines, and Brown Turkey Figs. Five collections were staged in this class.

In the class for three Pines, any variety, Mr. J. Stirling, gardener to H. H. Vivian, Esq., Park Weir, Swansea, showed three very fine Queens, and took the first prize; Mr. D. Wilson, gardener to Earl Fortescue, Castle Hill, South Molton, was second with three Smooth-leaved Cayennes; Mr. T. W. Bond, The Beeches, Weybridge, third with Queens. An extra prize was given to Mr. W. Sparkes, gardener to J. W. Jeakes, Esq., Winchester Hill, Highbury, for six Queen Pines.

Three bunches of black Grapes. Mr. W. Coleman was first with his Black Hamburg; Mr. J. Loudon, gardener, The Quinta, Chirk, second with two bunches of Madresfield Court, very fine, and one of Black Hamburg. Mr. J. Deaville, gardener

to Mrs. Bannerman, Wyaston Leys, Monmouth, was third with very well-finished bunches of Black Hamburgh. An extra prize to Mr. R. Fleming, gardener to R. Houghton, Esq., Waterloo, Liverpool, was well deserved. He had fine bunches, though the berries were not sufficiently thinned-out.

Mr. J. London exhibited two grand bunches of Golden Champion, and an equally fine Muscat of Alexandria, and gained the first prize in the class for white Grapes. Mr. W. Coleman was second with Muscat of Alexandria, very fine; and Mr. Woodbridge, of Sion House Gardens, Isleworth, third with the same variety.

Six Nectarines, one variety. Mr. J. Gill, Spring Place, Bradford, was first with very fine Violette Hative; Mr. W. Kemp, Albury Park Gardens, was second; and Mr. W. Coleman third with the same variety.

There were no less than twenty-two dishes of Peaches. The first prize was given to magnificent fruit of Royal George from Mr. J. Heamen, Eaton Hall, Congleton. Mr. J. Richards, gardener to Baron Rothschild, Gunnersbury Park, Acton, was second with very fine well-ripened fruit of Bellegarde; Mr. G. Sage, Ashridge Park Gardens, Great Berkhamstead, third with Royal George, also highly-coloured. Extra prizes were given to Mr. T. Pitt, Bury Hill, Dorking; and to Mr. W. Coleman.

Mr. D. Wilson, gardener to Earl Fortescue, Castle Hill, South Molton, was awarded an extra prize for ten fine Melons.

FRUIT COMMITTEE.—Alfred Smea, Esq., F.R.S., in the chair. Messrs. Barr & Sugden exhibited fruit of Daniels' Duke of Edinburgh Cucumber, grown from seed obtained from Messrs. Daniels, of Norwich, which proved to be Marquis of Lorne. They also exhibited Dyer's Champion and Telegraph, which proved to be synonymous. Mr. Johnson, The Garden, Glamis Castle, N.B., sent specimens in the haulm of Allan's Champion Pea, which appeared to be a desirable variety, and which was recommended to be tried at Chiswick. Mr. N. Dean, of Bedford, sent a Lettuce called Murray's Champion Cos, which was passed. Messrs. James Carter & Co. exhibited a collection of forty-five varieties of Lettuce in pots, to which the Committee recommended that the Council should award a bronze medal. Messrs. Carter also exhibited a very interesting collection of Peas, the plants, with pods and blooms, being dried and preserved as for an herbarium, and very neatly mounted in frames. This was a most interesting exhibition, and Messrs. Carter intimated their intention of presenting the collection to the Society.

Mr. Harris, The Gardens, Singleton, near Swansea, sent four very handsome Queen Pines, which were intended for competition for Messrs. Veitch's prize, but having arrived too late were exhibited before the Committee, and a bronze medal was proposed to be awarded to them. Mr. Perkins, Stanmore Priory Gardens, sent a handsome specimen of Enville Pine, weighing 8 lbs. 10 ozs., grown from rootless suckers planted August 17th, 1873. It was awarded a cultural commendation. Mr. Woodbridge, The Gardens, Sion House, Isleworth, exhibited fruit of a variety of Musa, which was remarkably rich in flavour, and to which a first-class certificate was awarded, subject to the determination of the name, it being grown at Sion under the name of Champa. Mr. Jack, The Gardens, Battle Abbey, sent fruit of a seedling Raspberry, but which did not appear to be superior to other varieties in cultivation. Rev. W. Kendall, Lutworth Vicarage, Wareham, sent fruit of a seedling white Raspberry, which was not equal to the old White Antwerp. Mr. David Smith, Glamis House, Forfar, sent fruit of a seedling Strawberry, which was considered not to be equal to other varieties. Mr. Bennett, The Gardens, Hatfield House, sent a Melon called Hatfield Hybrid, a cream-coloured, smooth-skinned, oval variety, very slightly netted, and with red flesh. Its flavour was inferior. Mr. Dewsbury, gardener to Lord Darulry, Cobham Hall, sent a handsome fruit of Read's Scarlet-flesh Melon, a handsome, oval, very thickly-netted variety, of a dingy cream colour; but it was not sufficiently ripe. Mr. Johnson, Glamis Castle, N.B., sent a large handsome fruit of Hicks' Scarlet-flesh Melon. It is thickly netted, and of a clear orange-yellow colour. The flavour was inferior. Mr. Johnson also sent a fruit of Duke of Edinburgh, a very large, oval, smooth, and ribbed fruit, of cream colour; but the flavour was inferior. Mr. Thomas Speed, The Gardens, Chatsworth, sent four Melons, grown with their roots in water, accomplished by renewing water three times a day. None of the fruit possessed sufficient flavour to warrant its obtaining a reward.

FLORAL COMMITTEE.—R. B. Postans, Esq., in the chair. Mr. T. Petridge, of Brentford, sent Tricolor Pelargonium Mr. H. Little, and Bronze Pelargonium The Czar. Mr. R. Dean, of Ealing, sent Lobelias and cut blooms of Carnations. These last were not of the florist's type, but were good border flowers. Mr. Lipping, of Richmond, sent seedling Pelargoniums Golden Shower and Templar, the first a golden leaved sort very similar to Golden Chain. Mr. Turner, of Slough, sent boxes of seedling Roses. Royal Standard, a fine rose-coloured globular flower, received a first-class certificate; Miss Hazard is a nice peach-coloured flower in the way of La France; Rev. J. B. Camm, and John Stuart Mill. Mr. J. Fraser, of Lea Bridge, sent Francois

Courtin, a nice crimson Rose. Messrs. E. G. Henderson and Son, Wellington Road, St. John's Wood, sent two very beautiful Somerilas, Hendersonii and Hendersonii argentea, which had first-class certificates awarded. The same firm sent Tricolor Pelargonium Sparkler; a white-flowered white-leaved sort Bridal Bouquet, and a basket of a very neat green-leaved Zonal named Distinction, with two plants of the double-flowered Cineraria, the flower deep blue and very double.

Mr. Jack, of Battle Abbey Gardens, sent flowers of Mandevilla suaveolens, produced there out of doors on the walls, where also are growing many other greenhouse plants, favoured by the warm climate of Sussex and the slightest amount of protection. G. F. Wilson, Esq., Weybridge, contributed a fine group of cut Lilies. Mr. Rudolph Barr sent a large collection in competition for Messrs. Barr & Sugden's prizes. Mr. W. Paul had a first-class certificate for his Purple Birch, several times noticed before; also for double Pelargonium Alcyonere. A like award was made to Mr. George, Putney Heath, for Sir Garnet Wolseley scarlet Pelargonium, which was also well shown in his prize collections. It has large flowers and a fine truss. A first-class certificate was also given to Mr. J. Fraser for Ixora Fraseri, one of the same batch of seedlings as I. Williamsii, and, as shown, superior to it, good as the other is. Campanula Smithii, a pretty little gem, had also a first-class certificate.

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 21.

TALKING of the Handel Festival at Sydenham suggests the thought that the season has been quite a festival one with many species of insects not at all favourites in our gardens; these have been holding, not a three-days celebration, but high revels for a month or so past. Recent rains have somewhat spoilt the sport of some; and others, having run their round of existence, have now passed away, after providing us with a future brood which we will hope may not be quite so numerous. Probably they will not trouble us next year as they have this, for there is an action and a re-action always going on. Early in the spring I ventured to predict (though aware of the usual fate that befalls prophets) that we were likely to have a run of dry weather and a host of insect pests in consequence thereof, and thus it has happened. Easterly winds and the lack of rain conjointly favour aphid-development in a remarkable manner, and these insects have been, perhaps, more troublesome to the horticulturist as yet than any others one could name.

By a recent book from the pen of Mr. Shirley Hibberd I perceive that he gives in his adhesion to the theory that aphides, and also numerous species of insects that we usually regard as our enemies, are decidedly of utility, with few exceptions, because they act as scavengers. Applying this theory to the peculiarities of the present season, it would be argued that, by unfavourable atmospheric phenomena, the juices of many plants and trees become vitiated, and so furnished an appropriate pabulum to insects which would not otherwise have shown themselves. Still, I cannot admit that when we see a twig or a leaf swarming with aphides, for instance, it is thereby demonstrated that the plant is in a sickly condition, nor even that it is most probably the case. If we see this in a garden it may be proof of neglect on the part of the horticulturist. It should be added, since I wish to do full justice to the views of those I differ from, that the circumstance is certainly remarkable how tardily the various foes of the aphid appear; whereas if they showed themselves in full activity early in the summer they would soon make a great reduction in those soft-bodied insects which fall so easy a prey to their devourers and parasites.

The Syrphii and Coccinellæ have already been considered, and they are pretty good workers in their way; in fact, the common aphid of the Plane (*A. platanoides*) seems hardly to have any enemy except a species of Syrphus, the larva of which appears to be out a good while, and leads one to suppose that there must be more than one brood annually of these flies. 'Tis strange what a variety of insects frequent the places where other aphides are congregated, not always for the purpose of attacking them, but, as in the familiar instance of the ants, seeking them out that they may glut themselves with the honeydew deposited by the aphides. Species of the order Lepidoptera settle upon it, guided thither by some delicate odour it emits, I presume; and I was last summer rather surprised to notice a swarm of cockchafer (*Melolontha vulgaris*) buzzing about a tree that was thick with aphides and honeydew, and as I could scarcely think they intended to feed upon the insects, the honeydew must have been the attraction.

Mr. Doubleday has pointed out the singular fact that some plants secrete honeydew spontaneously when in an unhealthy state without any interference of insects.

So remarkably tardy this season were our friends of the insect race that make the aphides their food, that, as I observed on several shrubs, these creatures had gone through a succession of generations, and were even beginning to show themselves in the winged condition ere the young larvæ of the Ladybirds had come out to clear off a few of them. Those that had wings might take this as a hint to depart and seek "fresh fields and pastures new." Some aphides had, doubt-

less, been picked up by birds, though these do not apparently rid us of many aphides; they give the preference to larger game. What one might call the skulkers among them—that is, those which hide themselves in rolled leaves and contorted sheets, frequently escape the attacks of the larvæ of the Syrphi and Coccinellæ, which content themselves with seizing the aphides more easily to be secured. We owe much to the exertions of a host of busy minute flies belonging to the Hymenopterous order, which are much more investigative, and seek out aphides in nooks and corners, as well as on exposed leaves and twigs. There may now be seen on many plants, mingled with the cast-off skins of aphides that have gone through their transformations, the carcasses of others that have had their interiors removed by the minute maggots which have been hatched from the eggs deposited by the aphides. It has been thought by some that the eggs of these little flies are produced late in the autumn in readiness for the coming year; but as winged females are abroad tolerably early in the summer season, the probabilities are that they make the start, though there may be several successive broods afterwards. As time advances we shall get to know more about these aphidii; they have most of them many-jointed antennæ, with wings of rather a dingy hue, as also

is the body, the legs being paler. A. Rapæ has been oftener noticed than others of its brethren; this has a black body, though the wings are of a smoky tint, and the legs, under a glass, show dark brown bands on a reddish ground. Mr. F. Walker, who has done so much towards the disentangling of the history of the aphid and its parasites, not long since published a curious account of A. Nymphææ and its aphids. In this instance the parasites were greatly outnumbered by the aphides; possibly, he thinks, they were in the proportion of about ten to one; but as the aphid in question is only found upon water plants, and so is in no way harmful to man, there is less call for effort on the part of Nature to keep it in check. This entomologist asks, "Could we not transfer to such places as needed them thousands of aphidii, taking them ere they had emerged as flies from the carcasses in which they have been sustained?" Beside the aphidii, several more of the minute four-winged flies belonging to the Chalcididæ prey on aphides, and also some that are allied to the Microgasteri, which kill so many of the caterpillars of our common white butterflies.

"What a beautiful fly!" is the exclamation one occasionally hears in the garden as that delicate insect, the Lace-winged fly, *Chrysopa perla*, is watched by some stroller as it reposes on a leaf preparatory to taking its evening flight. Admiration will be probably changed to disgust should a close inspection be attempted and the insect be touched, for, unless the handling be done very tenderly, it exudes an odour which is far from being agreeable, and no doubt serves as a defence to the species; there are times, however, when no smell is perceivable. In this and other species of *Chrysopa* the tender structure of the insect and the absence of all defensive weapons would expose

it to much peril could it not deter in some way part of its would-be foes. The large slight wings, the make of the body and legs, and the hue of green and white, relieved only by the eyes which have a golden or golden-red lustre, all bespeak weakness. Should these insects be successful, according to the Darwinian hypothesis, in so far improving themselves as to get rid of the signs of weakness and fragility, we may suppose they will then cease to be malodorous—what they lose in beauty they will gain in sweetness! Flying also with the Lace-winged flies is rather a painful process, judging from the awkward laborious way in which they make their aerial journeys. Softness is certainly not the characteristic of the larvæ of these flies, which have earned for themselves the epithet of "aphis lions," though they are scarcely so desperate in their attacks upon those pests as are the larvæ of the Syrphidæ. Not a few microscopists have hastily plucked a leaf on which was a cluster of the eggs of a *Chrysopa*, and popped it into a box for home examination, believing that they had secured some curious vegetable growth. These eggs are stalked, but I am not aware that any entomologist has seen a fly in the act of depositing them, so we are not able to explain how it is managed. They are grouped in clusters of from ten to twenty, or even more; the stalk supporting the egg

Fig. 19.—APHIDES AND ANT (magnified.)

is four or five lines in length, and, what is singular, it rests upon a small disc or plate of a silvery appearance attached to the leaf. We do know a little about the emergence of the young larvæ, as they have been noticed in the act of eating a hole in their shells, and then crawling down the stalk or peduncle, not dropping to the leaf. These are furnished with six feet, and are able to move with rapidity over the leaves and flowers of plants; they are less frequently seen on twigs or branches. Like others in the same Neuropterous order, they are apt to be spiteful towards each other should they come into collision by accident, but their staple food is aphides. Having fattened-up, each larva spins a silken cocoon, in which a few weeks is spent by the pupa ere it bursts the shell to appear as a winged insect. One of the old authors on entomology gave to these flies the name of Hemerobii, the derivation of which tells us that it implies they live only for a day. This is a slight error, as their existence in the fly state lasts longer than that, and "*Chrysopa*," appropriate to their golden and sparkling eyes, is a mere suitable designation. The French have chosen to

call them Land Dragon-flies, which hardly fits-in with the very pacific character of the mature insect.

A full list of the enemies of the aphids would not be brief, and I place upon it some that other authors might reject. Thus, I have for a good while held to the opinion that ants not only milk aphides, but sometimes devour them (see *fig.* 19), and the like belief is held by those who had devoted more time to the study of ant-economy than I have. As no mean authority on the opposing side, Mr. F. Walker must be named, since he regards ants as the invariable protectors of the aphides, though for selfish ends entirely. It is well known that they collect them and keep them prisoners, and with such omnivorous propensities as ants have it does seem that they would not much hesitate at eating their cows, supposing food ran short. Earwigs, herbivorous in the general way, feed also upon aphides and small fry of the insect races when inclined for a little variety. Then *Aphis vastator*, which has furnished a figure for a comic slide in a dissolving view, seated squat upon Paddy's favourite vegetable, and representing "*Aphis vastator*," makes prey of its own brethren, though, as I have failed to meet with or at least identify this species, I cannot vouch for this from personal observation. The fact has been several times stated by naturalists, some of whom have, I think, now placed it in a different genus. Another friend, not to be ranked with the insects, but properly a Crustacean, is the spider; the webs spun by several species will be found to swarm with aphides at this season. On some Lime trees, where the aphides were just appearing in the winged form, I have noticed that hundreds of the leaves are bespread with small webs, which trap the aphides beautifully, and destroy, indeed, a great many more than will ever be eaten by the spiders.—J. R. S. C.

CROTONS (CODIÆUM).

In my early days amongst plants *C. variegatum* and *C. pictum* were the two kinds which represented the genus in our plant stoves; and even now, amongst so many fresh introductions, these fine old plants nobly stand their ground. In this year of grace, however, we have so many kinds to make a selection from, that it is a somewhat difficult task for even an old hand to choose aright. It is therefore by no means surprising that a young amateur should get slightly bewildered, a state into which your esteemed correspondent "*T. J. H.*" had probably fallen when he turned towards you, Messrs. Editors, to help him. In the few remarks I intend offering it may be that some besides "*T. J. H.*" may find something of advantage; although, be it remembered, I am far from holding the opinion that Crotons can only be successfully grown in the way which I here describe, although the system here advocated has brought me a fair share of success.

To be handsome, Crotons should be furnished quite down to the pots. When this cannot be done naturally, recourse is often had to sticks and strings to produce the effect. For myself, however, I have a decided objection to the training of these plants in any shape or form, for the proper way to show or grow them is in the shape of handsome bushes. Amateurs making their selections should choose short-jointed plants, but these who have lanky young plants should cut them down and insert a branch having a whorl of shoots to it. In this way a young plant may be obtained with laterals close to the pot, and the foundation is at once laid for a handsome pyramid. Such young plants are more expensive to purchase than those having a single shoot only, as a matter of course; but then it is penny-wise-and-pound-foolish to study price rather than quality with these as with most other plants, for, if a proper start is not made, how can one hope to progress satisfactorily?

Crotons are robust-growing plants, and should be well supplied with food. Nevertheless, I think many cultivators err in affording them overmuch pot-room; for whilst I should certainly avoid letting them get much potbound, saving with very old plants, I certainly am of opinion that they like (to use a gardeners' phrase) to feel the pot. Indeed, not only with these, but many other ornamental-leaved plants, there seems to be a great desire, amongst amateurs especially, to get their specimens into large pots; and I mention it here because, both from practical experience and close observation, I am firmly of opinion that in the majority of cases it is a mistake. In potting, drain well. Use rich turfy loam for soil, to which add a portion of sharp sand to keep it porous. Pot firmly, and give only moderate-sized shifts. Let them be well rooted to

the sides, and the pots become well filled with roots before repotting. They enjoy a liberal supply of water both upon their foliage and at their roots, and when they are well rooted an occasional application of liquid manure will be found of immense benefit to them. In order to induce them to put on their rich colouring they must be kept well up to the glass and have full exposure to the sun's rays; and lastly, good strong heat with a moist atmosphere is absolutely indispensable to their welfare.

The following in my opinion are the best dozen varieties now in cultivation. Many others are very beautiful; but when the collection must be limited to this number these would be my selection, all being extremely handsome and thoroughly distinct—

—EXPERTO CREDE.

WHAT A PRESERVING STRAWBERRY SHOULD BE.

It is surprising that even in these enlightened days many persons look upon all Strawberries as equally well adapted for this purpose, but such is not the case really. Perhaps—may, I am sure—there is no class of fruit in which so great a difference presents itself. A good Strawberry and a bad preserver will not attain the desired end. A middling fruit with a good preserver will do wonders, but to have a fine preserve all things must be right. What, then, should a good preserving Strawberry be? In my opinion it should have at least three or four essential qualifications, and each so close on the heels of the other that I knew not which to place first. Colour, flavour, and substance are so necessary that to want one of them is simply to be without a good preserving Strawberry. Though size is a secondary consideration, a medium size is always preferable; and then there is condition or ripeness not to be overlooked, also time of gathering.

I will suppose colour to be the first essential. It should be as red as possible throughout, the deeper the colour the better. A white-fleshed fruit is most objectionable. Did you ever see the two after having been preserved? If so, they must have been a lesson that you could not have forgotten—the one rich and tempting, the other an uninviting, disagreeable, tasteless mass. Why I think colour goes first is because it is difficult to hide it, and a good-coloured dish of anything on the table is sure to entice someone to partake of it. Flavour can be concealed to some extent, and the true one only missed by the old fruit-eater; but a badly-coloured preserve will often be passed though good in flavour. This is demonstrated daily to those who have to do with fruit.

As regards flavour, few cooks or housekeepers know what is best for a Strawberry to have in order to make the best preserve; there are a few, no doubt, and gardeners too, but they are the exception. Ten out of twelve would take the sweetest fruit; but such are not the best, on the contrary, always to be rejected when those of a subacid or acid flavour can be had. The varieties commonly called the Pines are what I allude to. From possessing the acid flavour they "take" the sugar much better than others. Strawberry preserve is not a general favourite except with children, for the very reason that it is naturally of a flat sickly taste, we therefore greatly enhance its value by choosing such varieties. A sweet Strawberry of the Queen class will not take sugar well, and is often spoiled in a short time; it seems to ferment more, will not keep nearly so long, and is always too sweet to be relished by most people. There are Strawberries somewhat between the Pine and the Queen—for instance, Keens' Seedling and Black Prince—that will make excellent preserves; but less sugar should be used than with the Pine-flavoured.

It seems almost unnecessary to say a word about substance. It must be apparent to all that a solid Strawberry will be preferable to a soft woolly one; in fact, it should be as "solid as a rock," the more so the more substance will be found in the jam; and in cases where the fruit is preserved whole it is all-important that it should be so.

I will just add a word or two on other points. Condition and ripeness should be particularly attended to. A good fruit should not be too ripe, if so it loses its flavour, and that can never be replaced. I have no faith in leaving quarters until

half are "dead" ripe in order to secure a large bulk to "go in at once." Quarters should be looked over twice a-week at least. Care should be taken about all the fruit being thoroughly ripe, otherwise the flavour cannot be there. Men and women are often careless about this if not looked after, and good preservers will not use the fruit, so that it is only gathered to be thrown away. I need hardly remark that the fruit should be gathered without being bruised; the less they are handled the better (I have seen some completely smash them in doing so), nor should too many be placed in one lot. They should likewise be taken to the house as soon as gathered, and, to keep matters smooth, the all-important person should be informed of their coming a day or two beforehand. Never gather when wet, and the longer after rain the better. I do not care to gather in the great heat of the day; when dry weather sets in, I prefer evening, or from ten to twelve in the morning.

I dislike the idea of "anything will do for preserving," sending the best to the table, and then the small to come in for boiling-down. A quarter of the best, and that of a suitable variety, should be grown expressly for the purpose. I do not believe in mixing different sorts together; one or two varieties are ample, and they should be Myatt's Eliza, the best of preserving Strawberries, or the Elton Pine. Many others are good; indeed, if they possess the qualities I have enumerated, do not despair of good results if they are properly treated afterwards. Too often they are spoiled before boiling-down. It has just come to my knowledge that a large lot has been kept six days before being so treated.—JOHN TAYLOR, *Hardwicke Grange*.

FRUIT PROSPECTS—WEST NORFOLK.

Some months ago I wrote to you stating that the prospects of the coming season were not promising, and since then there has not been much improvement, Apricots being almost the only wall fruit that will be worth anything. Plums bloomed and set most profusely, but at present are conspicuous by their absence, having, as I believe, succumbed to the coldness of the weather, and a succession of dry harsh winds accompanied by frequent frost. The wood has broken very badly, and the prospect for another year does not at present look very encouraging. Pears are middling, Apples very thin, and the trees look cut very much, and not at all healthy. Bush fruits are plentiful, particularly Gooseberries.

Your correspondent, "G.," speaks of Gooseberries being still called "Thebes" in Norfolk. I think Peabes is meant, though more usually pronounced Fapes. Culpepper speaks of the Gooseberry as the Feaperry, Gerarde calls it Feaberry bush, Tusser speaks of it as being cultivated in the reign of Henry VIII., and perhaps the gentleman who has favoured us with the interesting articles on Tusser may be able to tell us what he calls it.

We have had some very sharp frosts lately, the last being on the night of the 20th of June, when bedding plants and Potatoes were much cut, the Potatoes in some instances being cut nearly to the ground, and generally presenting a blackened appearance. A temperature of 2° below freezing was registered at 5 feet from the ground, but I think on the ground the frost must have been double that or more. On the 2nd of July the thermometer rose to 88°, thus in about twelve days showing a variation of something like 60°. Such a frost is not remembered here by the oft-quoted "oldest inhabitant."—JOHN PLATT, *Gardener, Hillington*.

STRAWBERRY RUNNERS.

GENERALLY speaking people are not very successful in producing a good crop of fine fruit the first year after planting. I have found the following plan a most satisfactory one. Select the largest plant on each runner, cutting off all the others. Under this plant take off from 2 to 3 inches of soil with a spade. On the same spot lay a thick piece of turf, 3 inches by 6, with the grass side downwards; on the turf place the soil in the spade, on this rest the young plant; a little good dung would assist the growth. At the proper time remove the plant with the turf to the new bed. The turf will be found to be full of vigorous fibrous roots, and the plant double the usual size.—OBSERVER.

THE CANDLE PLANT I have in one of my houses. It is the plant referred to in your paper, and it is by no means a rare plant in this district. A clergyman gave one to me some years

ago, from which I have raised several plants, distributing them among my friends; and should your correspondent wish for a plant I shall have great pleasure in giving him one, either a plant or cutting (offshoot). They are by no means difficult to strike. The plant is more curious than pretty. The blossom is very poor, resembling the common Groundsel.—E. W. RUSSELL, *The Cottage, Springfield, Chelmsford*.

FLOWERS FOR OUR BORDERS.—No. 36.

PENTSTEMON WRIGHTII.—DR. WRIGHT'S PENTSTEMON.

THE subjects previously selected for illustration from this popular genus have been chosen from those bearing blue flowers. Our present selection, *Pentstemon Wrightii*, is taken from those producing red flowers, and if not the most valuable of its class, it is nevertheless one of the most interesting and distinct of the species.

Fig. 10.—*Pentstemon Wrightii*.

It is a native of Texas, and requires a little protection in winter, for most of the species from thence are somewhat tender; but this will hardly prove an obstacle to its adoption in an age when greenhouse plants are so largely employed for open-air decoration.

It is readily raised from seed, and if sown early, the young plants would probably flower the first season. It is, however, best treated as a biennial, the seed being sown in March or April; for although the plant is reputed to be of perennial duration, and will often survive two or three years, so far as we have seen, it never blooms effectively more than once, especially when allowed to ripen seed.

It may be conveniently grown in pots the first season to allow of its protection in a frame during the winter months, but should be planted out the following spring as early as circumstances permit. It grows from 2½ to 4 feet high, and bears a very long branching panicle of flowers. The lower leaves are spatulate, and lengthened at the base into a narrow petiole; the upper ones are almost heart-shaped and sessile; all of them are smooth, and with margins destitute of serratures. The corolla is remarkable for its spreading limb, and has been compared, not inaptly, to that of the *Achimenes rosea*, which it also resembles in colour. The intense rosy carmine of the flowers, which are borne in June and July, is quite unrivalled in the genus, especially for a few days after expansion; subsequently this tint loses a little of its depth, but this rather adds to than detracts from the general effect.

It was first introduced to the Royal Gardens at Kew in 1850,

and flowered there the following season.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

HUNSTANTON HALL.

THE SEAT OF HAMON STYLEMAN L'ESTRANGE, ESQ.

NEVER were family, mansion, gardens, and park more in harmony than here. There is a solidity and antiquity characterising all the surroundings that are befitting an uninterrupted possession of eight hundred years. Why, there are rows of Cardoons in the kitchen garden which I had not seen grown for blanching within the last fifty years, and which the gardener recently appointed had never before cultivated.

Hunstanton Hall is about 2½ miles from the railway station, the road passing parallel to the sea and by the lighthouse, the keeper of which, by-the-by, is an indefatigable gardener; and

turning down by the church you reach a wall which might be mistaken for a bastion of some old battery, for it is not straight, but in this crenelated fashion, surmounted by a closely-clipped Holly hedge some 6 feet high. This crenelation is of the wall's face, not its top. Through that wall you enter a long, dark, subterranean passage, and at its end emerge into the kitchen garden, of which more presently. The tradition is, that at a tournament held in the time of William the Conqueror at Castle Peverel in the Peak of Derbyshire, among the nobles and knights present were two sons of the Duke of Bretagne; and the younger, named Guy, was by way of distinction designated Guy le Strange (Guy the Stranger), and from him descended the families of the Stranges. They had estates in Shropshire, Northamptonshire, Norfolk, Leicestershire, and Gloucestershire. This Guy L'Estrange received

Fig. 21.—HUNSTANTON HALL.

Hunstanton and other estates from an elder branch of the family; and when the grant was confirmed to one of his descendants in 1342, it was on the condition that he rendered annually to the representative of the grantor a Rose at the feast of St. John the Baptist (Midsummer-day), in lieu of all other services. From that time Hunstanton has remained in their possession uninterruptedly. The name of Hunstanton is literally "Hunna's residence." That Anglo-Saxon was probably deprived of his estate by the strange Norman, but it deserves remark that a Mr. Hunn is a principal farmer here. Who can prove that he is not an offset from Hunna, whose descendants have lingered here?

The principal entrance to the quadrangle, which is really now the back of the house, is on the east side through a stone-arched gateway bearing the date 1623, and various heraldic bearings and mottoes, "Dirietur possessionem" being one, and "Ubi non est sepes" another. To the left of this quadrangle is a second; and in its centre, standing alone, is another arched stone gateway, also bearing the L'Estrange arms, and dated 1618. The greater part of the mansion still remaining was built by Sir Roger L'Estrange, who died in 1506; but the gateway, granaries, and other outbuildings of the first quadrangle were erected by Sir Hamond L'Estrange in 1623. Recent additions have been made. The house was moated, but the moat remains perfect only on the east and west sides. The

wall in front of our drawing is the side of the western moat. The family, either immediately or collaterally, have been connected with the three families of the Norfolk proverb—"Never was a Paston poor, a Heydon a coward, nor a Cornwallis a fool."

In the "Household and Privy-purse Accounts" are various entries which may interest many of our readers, but we will make a few extracts only from one in Henry VIII.'s reign. Money then was from ten to twelve times more valuable than now. In 1519-1522 for "six gees" 20*d.* were paid; for "six checcous," 6*d.*; for "2 lbs. sugar," 13*d.*; for "three chaldre of colys," 16*s.*; and for fifty eggs, 6*d.* There are continued payments for all departments except the garden, so it is not surprising that there are "rewards" to servants and others who brought as presents "Strawberries," Apples, "Graps," "Peachys," "Medlers," "Fyggs," "Wardens," "Orangez," and "Lemondes."

Now for the gardens, beginning with the kitchen garden, the first I entered. It is unique in arrangement, being divided into portions by hedges clipped uniformly, each about 8 feet high and 6 feet wide. Some are of Yew and some of Holly. They are capital shelters; but the gardener, not being an antiquary, evidently thought that walls would afford quite as much shelter and might be made much more productive. The

kitchen garden is seven acres, walled round, and its crops all looked well, and were evidence of good cultivation. Pears are abundant, and so are the Plums and Cherries, both on standards and walls, but Apples are a total failure. This may be accounted for by the frosts, which usually occur earlier, not occurring this year until the Apple trees were in blossom. At present the only glazed structures are a late viney and an orchard house, but others are to be erected. The Peach, Nectarine, and Apricot trees, all grown in 12-inch pots plunged to the rim in the border, were abundantly fruitful, and all past the dangerous period of their stoning—dangerous only, I think, when proper culture is neglected.

Proceeding to the pleasure grounds I passed the apiary, of which no other remark is needed than that the bees are all in the old bell-shaped hives. The dressed grounds are about four acres in extent, and are chiefly lawn. Facing the west front on the lawn is a square enclosure, as shown in our woodcut (*fig. 21*) the hedge 3 feet high of clipped Yew, and the space within is occupied by variously-shaped flower beds. The Roses—whether bush, or standard, or against the walls—were most healthy, most profusely flowered, and the coloured flowers intense in all their tints.

The Yew hedges are the great characteristic of the grounds. One broad walk some hundreds of yards in length, with broad turf on each side, and that turf terminating at the foot of a lofty Yew hedge, passes in a straight line from the west front of the house; and the appearance of the house from the most distant end of the walk is very effective. Another broad walk full 100 yards long, at right angles with the other, has similar hedges, but on the turf on each side is a row of thirty-two very symmetrical Irish Yews, that are in good accord with the other arrangements of the garden.

Various spaces enclosed by lofty clipped Yew hedges are in other parts of the garden. One of them will in the course of years form a circular domed room, for the hedge is clipped so as to bend inwards with that object in view, and the branches of a Yew planted in the centre are spreading out to meet those of the hedge.

Although a notice is posted up at each of the park gates that "trespassers will be prosecuted according to law," I was allowed to be an exception, and am grateful to the gardener, Mr. G. Nesbit, for his courtesy and attention. It is usual to add some praise of the gardener's skillfulness; but I shall only paraphrase the epitaph on Sir Christopher Wren—"Go to the gardens and look around."

From the gardens I passed into the park; it and the gardens are four miles in circumference. The park is of very varied surface and beautifully wooded. The trees of all species are fine and ancestral, but especially the Oaks and Elms. The White-thorns, single-stemmed and trees in size, are scattered numerously and singly. In one part of the park, unfortunately far from the house, are many good *Arcaurias*, and some of the finest *Deodars* and *Picea Nordmannianas* I have ever seen. Their stems at 4 feet from the ground are nearly 12 inches in diameter, and the *Deodars* must be 50 feet and the *Piceas* 40 feet high. They are all vigorous, and with branches outspread all round to the surface of the turf. They are evidence that the soil and situation suit Conifers, and suggest that those I have noticed deserve to be companioned so as to form a pinetum.—G.

MR. T. APPLEBY.

VERY early in our career we had Mr. Thomas Appleby on our permanent staff of contributors, and he only left us to occupy what promised to be a more lucrative position. Rheumatism and paralysis have vanquished him. He is now seventy-nine, and requires aid in the closing period of life. He has been elected to a pensionership of the Gardeners' Benevolent Institution, but he will receive no assistance from it until next October, and is now in great distress. We ask our readers, therefore, to aid him. Any donation, however small, may be sent to him at his lodging, 263, Morton Street, Park Avenue, Longsight, Manchester.

THE ROSE SHOW AT LYONS is put off to September owing to a hailstorm, or rather an icestorm, which occurred on the 26th of June. Pieces of ice as large as one's fist fell, weighing 1½ lb., which broke nearly all the glass in the greenhouses, many of the windows, chipped pieces off the walls, and broke the tiles on the houses in many places. The flowers and beds of the Roses were destroyed, and pieces of bark and wood

were cut out of the branches. At Charpennes a Rose-grower rushing out to cover his glass had his hands fearfully lacerated. On the 2nd and 3rd of July the heat was excessive, exceeding 90° in the shade.—W. PAUL.

INFLUENCE OF THE GRAFT.

IN a translation of the work of George Galesion on the Orange family, published in the New Orleans *Home Journal*, we find these observations on the effect of grafting on the fruit, and its connection with the stock:—

We must acknowledge that the graft does influence all that belongs to the development of the vegetable organs, as well as culture and the soil. A graft is an individual which is forced to live upon a root which is strange to it, and not regularly adapted for its natural nutrition. But this root is equally assimilated to the soil. If its organs are able to furnish the graft with all the aliment it is capable of assimilating, or more, this latter may take on a wonderful growth, which it might never have done upon its own root, or it may remain feeble and slender if the root which sustains it is not capable of supplying it with all the aliment it requires. These different circumstances can, as well as culture, bring about the phenomena that the Service Tree of the hunters presents when grafted upon the White Thorn, *Mespilus Oxyacantha*. The Service Tree, *Sorbus Aucuparia*, grows more rapidly, and acquires more size and fecundity; and also that of Apple of the fields, which, grafted upon the Apple of Paradise, becomes a little shrub, frail, almost without a trunk, and the branches scarcely attain the height of 3 metres. These phenomena are due solely to the abundance or the lack of nutrition, and present otherwise no changes, except in the greater or less development of the different parts of their growth.

Another remarkable effect has been observed in ordinary grafts. Every grafted plant seems to display, at least for a certain period, a luxuriansness of foliage greater than that of the free tree, when the graft has been taken from an individual of that nature; but this phenomena is due to a very simple cause. The free tree develops a great number of branches; it yields fruit only every two or three years, and when it does bear, it sets them on its branches in such a way that it costs great labour to nourish them. From the moment it is grafted there are several changes produced in it. Its wounded and tufted head disappears, and is replaced by the solitary branch which has to nourish itself all the sap of the root. It spreads, it is true, but it never replaces wholly the branches which usually crown the free tree. A grafted tree is always thinner and less tufted; therefore the foliage is better nourished and handsomer, and the fruits, which are always less numerous, are larger and more savoury.

Another circumstance, perhaps, also influences the greater elaboration of fruit in grafted plants. The graft unites a branch of one variety to the root of another; this union being unnatural, forms a sort of a knot at the point of insertion, which arrests the rapidity of the sap's flow. We know that by this artificial retardation in the course of the sap, we succeed in feeding our buds better, and produce thus more fruit buds than leaf. A tree which does not fructify is often rendered fertile by an excoriation near its root. The cultivators of vineyards bend the twigs and break them slightly at the point where they desire fructification to begin; and I have obtained Oranges of immense size by twisting or crooking the branches which bore them. All these means are well understood by cultivators, and it is not doubtful that their effect is due solely to the greater slowness in the course of sap, which, therefore, influences the quantity and the quality of the fruit. But these are the limits which nature has fixed upon the influence of the graft upon vegetation. It facilitates or hinders their development, but it never changes nor modifies their form, their proportions, their juices, or their colours; never has the graft changed a wild Pear into a Butter Pear, nor a Butter into a Muscat Pear; the fruit of the Bigaradier is never ameliorated, nor does it lose its bitterness by the operation of the graft. I have a root upon which I have already grafted three times upon itself, graft upon graft; it gives me larger fruit, but the fruit does not otherwise differ from those of the plant which supplied the buds.

The graft is nothing more than a kind of budding. It places the branch of one plant upon the root of another; and this branch or sprout which contains in itself the rudiments of the plants which should come out of it, only drains from the stem upon which it is fastened the alimentary juices

which are necessary for it, in the same way that the natural bud would draw them immediately from the earth. It may be that in the passage which these juices are forced to make throughout the roots and the stems of the subject, they reach the fibres of the bud better elaborated than they would have been if drawn directly from the soil. But whatever may be the state in which they may be found at their entrance into the fibres of the bud, they will always be modified by the organs of that individual, as those would be if drawn from the air, or those drawn from the earth, if they were placed in it without interception of another plant. Experience has confirmed these principles, and the world is convinced that a graft does nothing more than to perpetuate species or varieties without altering them.

I have made in the course of fifteen years a series of observations upon this subject, keeping always the mother plant side by side with the grafted one. I have grafted Oranges upon Lemons, Lemons upon Oranges; I have grafted the sweet Orange upon the Bigaradier, and reciprocally I have grafted Apricots upon the Plum, Peaches upon Apricots, and I have not been able to see the slightest difference between the fruits furnished by the graft and those of the plant from whence it was taken. I have never obtained any other result from these experiments, except simply to preserve rare varieties which I was not able to propagate from seed, from the double reason that they very rarely had seed, and if they had they so frequently produced degenerate varieties.

NAMES OF PLANTS—ENGLISH VERSUS LATIN.

My friend asks, "What is this pretty flower?" "Gelasine azurea." "What a long name!" "I cannot shorten it." "But why have a Latin name? Better call it *Blue Smiler* in plain English." "Then you like such names as Shamrock, Blue Bella, Eglantine, and Culverkeys?" "Certainly, everyone can understand them." "You can recognise the plants?" "Easily." "Well, I can show you in print endless discussions as to what they are. On the other hand, I defy you to produce two persons who disagree as to what plant is meant by *Eucharis amazonica*. Now, look at page 32 of 'our Journal.' Would you like some of the plants described in the *American Christian Weekly*? The Night-blooming Jasmine must be very desirable, but what European nurseryman could understand the name? Looking down Don's long list, he would at last hit upon *Jasminum noctiflorum*; but as this is a native of Sierra Leone, it is not likely to be the right plant. Paradoxical as it may seem, Latin is in such matters more intelligible even to an Englishman than English."—G. S.

CERCIS SILIQUASTRUM.

WHILE visiting the Botanic Gardens at Leyden, in Holland, at the beginning of May, I was very much delighted with the beauty of this curious yet beautiful plant. In the above gardens there are three grand specimens, one against a west wall and two others against a south wall. The circumference of one of these, at 6 feet from the ground, is about 12 inches, the stem reaching to the top of the wall, which is from 15 to 18 feet in height. At the top of this wall the branches extend in a horizontal position to the length of 45 or 48 feet.

During my visit the whole of these trees were covered with their beautiful blooms. The flowers, which are of a bright rosy pink, are produced in bunches from the old wood, without any foliage, which has a very curious yet beautiful appearance.—A. M. C. JONORINDT CONINCK, *Tottenham Nurseries, Dedemsvaart, near Zwolle, Netherlands.*

A NEW MODE OF GLAZING.

IN answer to Mr. Robson, the practical value of nail-bag strand is its being a soft medium for utilising and retaining white lead (which will dry and harden), and so rendering the latter effective for the object of fastening the glass and keeping-out water. Cotton or Flax fibre might do equally well; but I think the white lead would render the other just as durable, and it is of no cost, and ready made.

I quite assent to Mr. Robson's objection to a strip of wood having to be removed to replace broken glass, but I do not consider this would be necessary; and if a groove were cut out of the solid bar for the glass, the caulking could be taken out, if required to replace glass, where wanted. There would be no chipping of the wood as in the case of putty. I do not

consider that this caulking would swell at all; the oil in the white lead should, and would, effectually resist moisture. I have not tried this for glazing. The idea suggested itself on reading the article in your Journal of April 9th, page 287. I have, however, found the caulking answer perfectly and permanently in stopping leakage in a lead gutter, and cracks in walls and joints in coping, and all I can say further to Mr. Robson is, "Try it."—V.

HEATING.

WE have received a very long communication on this subject, but can only insert the following:—A correspondent expressed an opinion that a combination of something like the "Arnott," plus boiler and piping, would be "an effectual and economical heating medium." A combination somewhat analogous has just been brought out by Dennis & Co., of Chelmsford, and I annex a section of it (*fig. 22*). Mechanically it is

Fig. 22.

an independent boiler surrounded by an air-casing. Again, part only of the atmospheric air necessary to sustain combustion is allowed to enter the fire below the bars; the remainder traverses the casing in the direction of the arrows, and is drawn (by this time partially heated), into the fire at the top of the burning fuel; so that in this boiler we have a parallel arrangement to what is known in the steam engine as the jacketed-cylinder and feed-water heater.—(G. FAWKES.

DAMP WALLS.

If salt is the cause, I know nothing effectual. Sea sand used in mortar, hair from salted hides, hanging fitches of salt bacon against walls, are common sources of the evil. The salt gets into the bricks and it becomes a chronic disease. Mr. Robson says battening inside "cannot be done" in his case; but will this avail him?—strips of wood 2 inches by half an inch nailed horizontally or vertically on the interior of the wall, and on these half-inch deal boards. These may be formed into panels, according to taste and space, by nailing on 1-inch-by-half-an-inch stiles, moulded on the edges. The boards should be dry and the joints rebated, and, of course, planed on one side. This, stained and varnished, makes a comparatively cheap and permanent lining to a room, and is very effective. If Mr. Robson liked to be at the trouble of removing the plaster, this boarding would occupy little if any more space.—V.

Your correspondents who suffer from damp walls should try the petrifying liquor of the Silicate Paint Company, Fenwick Street, Liverpool. I have not tried it for an outside wall, but I have tried it on the inside wall of a cellar made of porous red

sandstone and saturated with damp. It is now a good dry meat larder.—H. W.

DESTROYING WASPS.

A much less complicated plan of taking wasps' nests than that described in last week's Journal, is given below.

Take half an ounce of gunpowder with or without a pinch of flour brimstone, wet it with a few drops of water, and with a spatula or case-knife crush the grains of powder, and make the whole into a mass of the consistence of wet clay; roll it up into the form of a cartridge, wrap a bit of paper round it which has been rubbed with a little of the powder to make it into touch-paper, lay it aside for a short time to dry, and then when you want to take the nest set fire to the touch-paper, and as soon as the fire reaches the powder thrust it into the mouth of the nest, and immediately cover it up closely with a sod. In two minutes all the wasps will be torpid, and by digging the nest out and putting it into boiling water the whole brood are destroyed.—T. G.

DEVON AND EXETER ROSE SHOW.

[Our report having from some cause not arrived, we extract the following from the *Western Times*—Eds.]

ALTHOUGH the season has been so unfavourable to the growth of good Roses, yet there has rarely been a show of the beautiful blooms equal to that held on Northernhay, Exeter, on July 3rd, and never in its history has the Devon and Exeter Horticultural Society had so grand a collection. As is well known, rare and beautiful stove and greenhouse plants form the main feature of this Society's exhibitions, but the executive determined to this year have an exhibition composed entirely of cut flowers, and by issuing a liberal prize-list they obtained a most attractive show.

The main contest was in the first class, where collections of seventy-two single Roses, each of a distinct variety, competed for a prize of £20, presented by the Rev. J. B. M. Camm and Mr. R. N. G. Baker, and also for the honour of being at the top of the tree. The competition was restricted to nurserymen, and for the £20 prize there were seven exhibitors. After very minute and careful judging, lasting over an hour, the award was given in favour of Messrs. Paul & Son, of Cheshunt. Among their seventy-two they showed most perfect blooms of Centifolia roses and Duc de Rohan, as well as remarkably good specimens of William Saunders, the new Rose The Shah, Charles Lefebvre, Abel Grand, and a handsome dark seedling. There was hardly an indifferent Rose in the box. The same must be said of the collection shown by Mr. C. Turner, of Slough, who took the second prize, and who ran his more successful competitor very closely for the first honours. Perhaps as perfect a Rose as ever seen was his bloom of Le Havre: and among the others in the box particularly noticeable were Charles Rouillard, Général Jacqueminot, Dr. André, Camille Bernardin, Exposition de Brie, and Céline Forestier. For the third prize there was a smart competition between Mr. Cranston, of Hereford, and Mr. Prince, of Oxford, and eventually the Judges declared both to be equal. Mr. Cranston had some remarkably fine blooms, far beyond the ordinary size. Particularly noticeable were Général Jacqueminot, Marie Baumann, Elie Morel, and Maréchal Niel. The other boxes that did not come in for special mention were filled with blooms of such excellence that they would have undoubtedly taken high honours in any ordinary show.

In the forty-eight class, three trusses, Mr. Turner came to the front with six boxes of very fine blooms, including Sénateur Vaisse, Camille Bernardin, Prince Camille de Rohan, Lelia, and Baroness Rothschild. The second was Mr. Keynes, of Salisbury, whose blooms, though somewhat smaller, were very excellent, particularly Mdle. Bonnaire and Climbing Devonensis. Very good Roses indeed were Edouard Morren and Ferdinand de Lesseps, shown by Mr. Cant, of Colchester, who took the third prize. The best twenty-four, three trusses, were those shown by Mr. G. Prince, Oxford, and included very fine Marie Baumann, Xavier Olibo, and Duchesse de Moray. Mr. Turner, who came second, must have pressed Mr. Prince very hard for first. Mr. Keynes, third, had a superb truss of Charles Lefebvre. Those who had competed in the first three classes were not allowed to enter the twenty-four single-truss class, and the result was that only two competed. Mr. G. Cooling, of Bath, easily won the first prize; in the second, Messrs. Lucombe, Prince, and Co., Exeter.

In the competition for Tea-scented and Noisette Roses Mr. Cant's flowers were a long way ahead of the others; among them was a very good Madame Bravy. In the class for Roses of the last two seasons Mr. Turner exhibited a box of remarkably good blooms, including Princess Beatrice, a perfect dark velvet Beauty of Thame, Warrior, and M. J. Sisley; whilst the second box of Messrs. Paul's included The Shah, Wilson Saunders, and Cheannat Hybrid. For the prizes for twenty-four trusses of

any variety Mr. Prince was first with a magnificent lot of Marie Baumann, whilst the second prize went to the Baroness Rothschild owned by Mr. Turner. The other variety shown in this class was the Marquise de Castellane.

At the higher end of this tent Mr. Walters, of the Matford Nursery, Exeter, who has on various occasions carried off the leading prizes, showed several boxes, not for competition, of magnificent blooms. Most noticeable were four boxes of the Madame Rothschild, all of such good colour and such excellent bloom that they drew a very large share of attention. A very rich boxful was made up by his eighteen trusses of Alfred Colomb, and there were good specimens of Louis Van Houtte, Marie Baumann, Comtesse d'Oxford, Louise Peyronny, &c. Opposite him several boxes were shown by Messrs. Curtis, of Torquay, and included good specimens of Abbé Brametel, Camille Bernardin, and Eugène Appert. At the other end of the tent a vacant space had been filled by a small collection of handsome stove plants sent by Messrs. Lucombe & Pince.

The principal amateur Rose prize (forty-eight distinct varieties) was won by Rev. J. B. M. Camm, Charnmouth, who exhibited a very excellent collection, including remarkably good specimens of Alfred Colomb, Ferdinand de Lesseps, Duc de Rohan, and Exposition de Brie; whilst the collection of the second winner, Mr. J. W. Chard, Salisbury, was noticeable for the perfect flowers of Baroness Rothschild, John Hooper, and Hippolyte Flandrin. Mr. Beachey, of Kingskerswell, was third. In the twenty-four variety class, three trusses, a well-arranged collection of Mr. Chard's came first, but the remainder shown were indifferent, and no second prize was awarded. In the single-truss competition, twenty-four varieties, Rev. J. B. M. Camm was again first with a splendid box of Roses, and Mr. R. N. G. Baker, who was awarded second honours, was not far behind. Those who had competed in the former classes were not allowed to compete in the two following. Mr. C. A. W. Troyte was first in both, and he had very fine specimens of Duc de Rohan and Coupe d'Hébé.

The table decorations were deservedly a great attraction, each one bearing evidence of much taste in the selection of the flowers, and much trouble and care in the assortment. The main contest was that for the prizes of three groups of vases of flowers for the dinner table. All the competitors were ladies of the neighbourhood except Miss Harris, of Salisbury, and she won the handsome gold bracelet which was presented as a first prize by the Sheriff of Exeter, Mr. W. H. Ellis. From the centre of the middle stand a Palm leaf sprung up, and supporting it were choice flowers, intermixed with Ferns and Grasses; the two smaller vases on either side were similarly decked, and all three had a very light and elegant appearance. In the class for a single vase or other ornamental stand of flowers adapted for the dining or drawing-room, Miss Harris was again first—most of the flowers were wild. The second was that shown by Miss Wish; and for the third two were bracketed as equal. Miss Gray, of Heavitree, had very lightly and tastefully arranged the wild flowers which took first prize. A noticeable feature in one of the collections was a large lump of ice. The competition for the hand-bouquet prizes was small. Miss Veitch was first, Miss Harris second. On the whole the Exhibition was very attractive and successful; the attendance was large.

THE DROUGHT.

From near Lincoln we have the following:—

"From May 23rd to this date (July 13th), we have only had a little over half an inch of rain. On the 9th and 10th thermometer in the shade, 4 feet above ground, 89°. Burning sun and parching winds have scorched up the pastures. Not a Turnip is to be seen for miles. Here the foliage of Raspberries is positively burnt as if seared by a red-hot iron. Fruit of Strawberries, Currants, Raspberries, and Gooseberries absolutely (where exposed to the sun) broiled on the trees. Water scarce by dry brooks and low springs. No sign of rain yet. Barometer high, standing at 30.00, 136 feet above sea level.

NOTES AND GLEANINGS.

WE are informed that the Royal Horticultural Society, by way of ENCOURAGING A TASTE FOR HORTICULTURE AMONG THE YOUNG OF THE MASSES of the population, have caused a number of broeze medals to be struck, to be presented to successful exhibitors at the flower show of St. Botolph's, Bishopsgate, which has been so long successfully conducted by Rev. W. Rogers. This is indeed sowing the seed of horticulture in suitable soil; and who can tell how much the winning of these medals may affect the life of the winners? We can imagine in some future day an intelligent gardener holding a high position, telling as his boast that while a boy in the parish of St. Botolph's, among the smoke of London, he gained one of these medals, and that made him what he is.

— At the EVENING FETE OF THE ROYAL BOTANIC SOCIETY, held on the 8th inst., there was a large display of table decorations, bouquets, &c.; while Mr. William Paul, of Waltham Cross, furnished a beautifully-arranged Rose garden, in which some eight thousand trusses of cut Roses were employed. Mr. Wills, of Brompton, furnished the Society's decorations.

— A MEANS OF preventing the spread of the Vine pest, the PHYLLOXERA VASTATRIX, is said to have been found in the spreading of a layer of fine sand on the ground round the stems of the plants. The sand is said to be too loose for this insect to pass through, and the consequence is that it is intercepted in its passage from one plant to another. We are sorry to hear a report that this plague has found its way into Australia. The Vine-growing districts of our Australian colonies are becoming so important that we trust this report may be unfounded. At all events steps should be taken to prevent its introduction into any of our colonies: such a measure will be easier than its destruction, should it ever gain a footing in them.—(Nature.)

NOTES ON VILLA AND SUBURBAN GARDENING.

Cyclamen Culture.—In few plants are so many recommendations combined for the admirers of curious, gay, or fragrant flowers, as in the species and varieties of *Cyclamens*, yet anyone acquainted with their appearance might well be surprised to find them so much neglected. Flowering at various seasons, but particularly during the winter and spring, the greenhouse or even the windows of the amateur's sitting-room may be made attractive with such plants during all the spring months by growing a few of the early-flowering kinds.

In cultivating the different sorts of *Cyclamens*, it must be observed that some are much hardier than others, and may remain in the open border all the winter, while some are destroyed by a few degrees of frost; but it must also be remembered that all suffer alike from excess of moisture during winter; they are therefore best adapted for being grown in pots, as the summer and autumn-flowering kinds may then be plunged in their pots in the open borders through the flowering season, taken up again before winter, and placed in some dry situation until the following season. The *Cyclamen* is increased in two ways: first by cutting the largest tubers to pieces, which is a bad practice, as they are liable to rot during the first season after cutting, or while in a dormant state, unless the parts are kept very dry—a state very injurious to the early-flowering kinds; secondly by seeds, which should be sown when ripe, whether it be autumn or spring, in pans or pots, well drained, and filled with a mixture of equal parts of sandy loam and leaf mould, to which should be added a small portion of well-rotted manure. Then place the pots or pans in a cold frame or pit, to be kept close if sown in the spring; but if sown in the autumn they should be placed on the back shelf of the greenhouse, and kept rather dry during the winter, and the soil gradually watered more as the spring advances.

The autumn-sown plants will be fit for transplanting about the end of May or beginning of June following if properly treated, while those sown in the spring should not be removed from the seed pans before the following spring; they will by that time have formed tubers about the size of a hazel nut. Prepare for them some large pots or pans, well drain, and fill them with the same kind of soil as that in which the seeds were sown, and transplant the young tubers from the seed pans into these, placing them about 3 or 4 inches apart, according to their size. Return them to the cold pit or frame, and keep them close until they begin to grow; afterwards admit air freely by day, but keep the pit close at night till the beginning of July, when the pots should be plunged and the plants fully exposed both day and night, taking care, however, that the soil does not become sodden with too much rain, or become too dry. They will require no trouble except keeping free from weeds and slugs till the middle of September, when they should be potted singly into small 48-sized or 60 pots, according to the size of the roots, filled with the same kind of soil as that previously used.

In potting, the tubers should never be entirely covered with the soil, but about one-third left exposed. When potted they should be placed on the back shelf of the greenhouse or in a cold pit, where they can be kept dry and free from frost until they begin to grow. If they are early-flowering kinds a few may be placed in the window of the sitting-room, and but sparingly watered until they commence growing, when they should have a more liberal supply.

The plants will begin to bloom in the second season, and may be placed on the shelves of the greenhouse, or if they are hardy kinds which flower in summer or autumn, the pots may be plunged in the open border. When done flowering they should be returned to the cold pit or frame, where the lights must be kept on during the night in cold and wet weather, but let them have plenty of air at all times, observing as they cease growing that water should be withheld, and finally the roots

should be gradually dried. The tubers, when dry, should be allowed to remain in their pots, and not be shaken out as is frequently done, for when taken out of the soil they are almost sure to get too much dried before they are again potted; this is particularly the case with the early-flowering sorts.

The proper time of the year for resting the flowering roots entirely depends on the sorts. *C. persicum* will be at rest when *C. europæum* and *C. neapolitanum* will be in full bloom, and *vice versa*.

Cyclamens should be shaken from the soil and repotted directly the least sign of vegetation is observable, but the early spring-flowering kinds may be forced earlier into bloom by potting a few of the strongest roots sooner, and placing them in a warm dry place; they must not be excited too rapidly or watered freely, for if they are the leaves are almost sure to damp-off during the dull winter months, and particularly those of the beautiful *C. persicum* and its varieties.

Preserving Bulbs.—As far as my experience extends bulbs generally keep well in the ground, especially *Hyacinths*, which, when taken up, manifest a strong tendency to decay, although they rarely fail to appear again when left alone from season to season. *Tulips* and *Crocuses* are less subject to disease when dried and put away during the summer, but in the ground they never suffer at all. Why, then, is it considered indispensable to remove bulbs every year? Not for their safety, as every gardener knows, but for the maintenance of their good qualities. *Tulips* left in the ground only for one season will deteriorate in their bloom the second year. But it is worthy of inquiry why the flowers of bulbous plants lose their size and beauty unless the roots are taken up every year. I cannot pretend to answer the question, which requires a physiological acquaintance with the structure and functions of bulbs, and an extensive collection of facts, but will merely throw out a suggestion to which others may give a practical bearing. Is it not the division of the bulbs, the separation of the offsets, and the replanting into the new soil which keeps up the quality of the flowers? If so, and if being kept out of the ground some months has nothing to do with this effect, then the safest mode of treating bulbs will be to dig them up, divide, and replant at once. This theory, which has led to practical results in the case of the *Potato*, may be equally applicable to *Tulips* and *Hyacinths*. But supposing the system of harvesting is adopted, care must be taken that the foliage is fully decayed before the roots are raised, as this is the only certain proof that the bulb is at rest. Before this time the elaboration of juices is not complete, and the want of consolidation will expose its subject to premature decay. When the ground is wanted for other things, bulbs may be carefully removed with a spade to another spot without disturbing the soil about them, and they may mature themselves without being grudged time and opportunity for that important work; but at all events they must be ripe. When this state is ascertained let them be taken up and dried, first in the shade and afterwards in the sun. The collection may be stored away until planting time.

The *Ranunculus* cannot be left in the ground without injury to the roots and the future bloom, and its drying is an important part of the florist's duty. The object should be to secure a plumpness of the fangs of the root, and at the same time sufficient dryness to resist mildew. If *Ranunculuses* are exposed to the air too much when first taken up they shrivel and perish during the summer from atrophy. They must be dried very gradually, and then put away in drawers, each kind being enclosed in a little paper bag.—W. KEANE.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

PLANTED-OUT a fresh lot of *Celery*. The earliest has run to flower, as it invariably does to a large extent in our soil. The sure road to success, if that is attainable under all circumstances, is to keep the plants growing freely. A check of any sort will cause them to "bolt;" especially is this the case when the seeds are sown in pans or boxes, and the plants raised on hotbeds.

Asparagus is making good growth. Now is the time to apply liquid manure or surface-dressing of any rich stimulant—guano, salt, &c., and wash it in with clear water. Just in proportion as the plants are attended to now, and encouraged to make strong healthy growth, so much will be the quality of *Asparagus* improved for next spring. We very seldom can find time to place sticks to it; otherwise, if a stout stick be placed to each crown, and the stalks are tied to it, their being broken by the wind will be prevented. If the stalks are snapped at the base by the wind or in any other way long before they have completed their growth, the crowns must be weakened in proportion. The growers for the Paris market are as careful of their plants when making the summer growth as *Dahlia*-growers are with their *Dahlias*. Such wonderful heads as they send to market could not be produced if no more care were taken of the plants than we see in many English gardens.

Sea-kale.—We usually obtain from amongst that sown in spring a fair proportion of crowns for forcing during the suc-

ceeding winter. This year the plants are not making such free healthy growth as we have been accustomed to; we shall therefore have to trust more to the smaller plants that were planted out in the spring, and to the old roots that were forced. One cause of the backward state of many crops is the frosts that we had about the middle of June. Plants that were not quite cut down nevertheless suffered severely from the effects.

We have kept the hoe at work amongst Brussels Sprouts and all Greens. The rains a few weeks ago gave the weeds a start, but since then hot dry weather has been suitable for hoeing them down.

Last season was a bad one for small fruits being picked for preserving. It was barely possible to get them in a dry state, so that preserves kept badly. This year the fruit has been gathered in capital condition.

Mushroom House.—The samples of Mushrooms exhibited in Mr. Quilter's grounds at Birmingham went to show that they are not at their highest state of perfection at midsummer. If possible the Mushroom house should be a lean-to against a wall facing north; it will therefore be in the best position to secure a cool atmosphere inside at this season. If the house, as is usually the case, has a slated or tiled roof, some thatched hurdles, or thatch in some form, should be placed over the roof to keep the heat out. Shut up closely in the daytime, but the windows and doors ought to be thrown wide open at night. The house becomes in this way cool internally; and the object of shutting up closely in the early morning is to retain the cool air and prevent the heated air from getting inside, and the thicker the walls and roof are the better. Thick walls and roof are equally desirable for winter, as they then keep the cold out, and an equable temperature is thus obtained summer and winter.

FRUIT AND FORCING HOUSES.

Pinerias.—Pines are not likely to suffer from excessive heat, but the thermometer standing at 93° in the shade, as it registered at Loxford last Thursday, necessitated shading the houses and throwing the ventilators as wide open as possible. Pines that are swelling are very easily injured by excessive sun heat acting upon the fruit. During the present hot weather fire heat will not be necessary. As a rule, fire heat may be dispensed with from the middle of June until the end of August; of course, if a cold period should set in, the fire may be lighted and a little heat kept up, letting them go out again with a favourable change of the weather.

Orchard House.—Surface-dressing the trees is, perhaps, the most important work in connection with the summer management of Peach and Nectarine trees; the space in which the roots are confined is so small, that unless sufficient nourishment is washed down to them by these surface-dressings the fruit will be of small size and poor flavour. The value of the surface-dressing is apparent by the rapidity with which the roots run into it. Watering the trees with liquid manure has also been tried, using it weak and using it strong, but the trees do not seem to like it; the leaves become spotted and otherwise unhealthy.

GREENHOUSE AND CONSERVATORY.

At this time of the year, when Azaleas have been removed to a warm house to make their wood, and nearly all the hard-wooded plants are out of doors, and the conservatory is filled with Caladiums and other stove plants, it is necessary to shut up the house at night and syringe Camellias, Lapagerias, &c., finishing their growth. Our Camellias were in bad health a few years ago, owing to a change in the potting material. When the discussion on freshly-cut loam was in progress in this Journal, the Camellias at that time requiring potting, they were potted in the loam cut from our own fields. The plants made very good growth the first year, but declined afterwards, and it was soon evident that our loam did not answer for them; using it with three parts of turfy peat added they succeeded well.

Stage Pelargoniums have been removed out of doors to ripen their wood, and in a week or ten days the plants will be cut down; and of those that it is required to increase the stock cuttings will be put in, four or five in a 5-inch pot. The cuttings should be placed in an open airy position in the greenhouse or cold pit, but they must not on any account be subjected to a close moist atmosphere, otherwise many of them will die. *Spiraea palmata* is also a most distinct and useful greenhouse plant. It is very liable to be attacked by red spider, still this can easily be destroyed by syringing; but, indeed, it will not appear at all if the plants have been syringed when in growth. The time when this and other plants of the same character are neglected is after flowering. Anyone acquainted with plant-culture knows very well that from the time the flowers fade until the growths are ripened is the time to study the growths for next year. The leaves of *Spiraea* and those of all other herbaceous plants should be kept green and healthy as long as possible after flowering, and just in proportion as the prolongation of the leaves is insured, so much the stronger will be the growths the following season.

In many gardens Grapes are grown in the conservatory. The plants that would be injured by shade and heat may now be

placed out of doors; and the Grapes would be much improved if the house could be shut up early, say between four and five o'clock in the afternoon. If, on the other hand, a succession of flowering plants has to be kept up all the year round, it would be much better not to grow Vines in the house at all, as the treatment required by the former is not suitable to the Vines. Flowering plants require a cool airy atmosphere with ventilation night and day; Vines require light, and a warm, moderately moist atmosphere. Auriculas may also be classed in the greenhouse department, as they will not succeed if without a glass protection. Green fly has been troublesome, and the plants are not in a position where they can be fumigated, so that it has been necessary to brush the insects off. The plants are about starting into growth, and will be potted as soon as an opportunity offers.

FLOWER GARDEN.

On Friday and Saturday nights the longed-for rain came with a vengeance. A terrific thunderstorm burst immediately over us, and in an hour or two 2.15 inches of rain fell. On Saturday afternoon we had another storm, and 0.80 inch fell in little more than an hour. Where the ground was not covered with any mulching material it was much hardened with the heavy rain. The usefulness of decayed manure has not only been proved by the excessive drought this season, but also by the excessive rain. Pegged-down *Verbena*s, *Heliotrope*s, &c. Picked withered flowers from *Roses*, and hand-picked the weeds from flower beds. Tied *Phloxes* to the sticks: no flowers are more easily damaged than these if the spikes are allowed to hang about in a loose manner.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

TRADE CATALOGUE RECEIVED.

Ant. Roozen & Son, Overveen, near Haarlem, Holland.—*Catalogue of Hyacinths, Tulips, Crocus, and other Dutch and Cape Bulbs, &c.*

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

BOOKS (*A. A. M.*).—No periodical is published relating only to garden design. "Flower Garden Plans," published at our office, might suit your American friend. You can have it free by post if you enclose 5s. 2d. with your address.

SEEDLING STRAWBERRY (*G. C. S.*).—The berries are medium-sized, very high-coloured, and flavoured like Keen's Seedling. If it has any superior merit it must be in being a profuse bearer, and of this we have no information.

CANDLE PLANT (*Brisbane*).—Your specimen is the species referred to. Thanks for your obliging offer, but plants have been procured.

BRITISH WILD FLOWERS (*J. P. K.*).—Six volumes are completed, price 21s. each. The work is completing in monthly numbers at 1s. each.

GROUND VINERY.—(Mrs. I. B. A.).—If you enclose thirty postage stamps with your address, and order "The Vine Manual," you will receive it post free, and it contains all the information you seek for.

HEAP OF EARTH (F. J.).—Of no use except to improve the staple of heavy soil.

DESTROYING INSECTS BY HOT WATER (J. K.).—Immersing plants in heated water to destroy insects is an old practice, and yet is but little adopted, though many blight and insect-destroying compositions owe much of their efficacy to the heat at which they are recommended to be applied, and at the same time it must be said a great deal of the injury resulting from such applications is due to the high temperature of the solutions. It is difficult to say with safety the temperature of the liquid in which plants should be immersed for the destruction of insects. Green aphids is destroyed by a temperature of 120°, and they require to be immersed for two or three minutes, a time which acts injuriously on the tissues of softwooded plants, and also hardwooded plants in growth, though it does no injury when the growth is complete and the wood firm. The scale insects may be destroyed by syringing the plants, laid on their sides, with water at a temperature of 140°; but it will not do to immerse the plants even for a minute in water at so high a temperature, as it injures their soft parts, and the leaves fall from the ripened growths. It is a subject that requires great caution, the state of the plant being well considered. At best there is great danger of injury or loss of plants.

BRUGMANSIA ALBA NOT FLOWERING (A. W.).—Your plant certainly requires a pot rather than a tub, its roots not being in a healthy state. We should at once have the plant removed and placed in a pot—one that will hold the roots after most of the old soil has been removed, repotting in entirely fresh compost, providing good drainage, watering carefully, shading from bright sun, and sprinkling overhead two or three times with water until it has recovered from the potting. Then expose it more fully to air and light, and shift into a larger pot when the others fall of roots, and towards autumn reduce the supply of moisture, and water so as to insure the ripening of the wood. In winter the plant should be kept dry, but not so much so as to cause the wood to shrivel, pruning in spring to sound firm wood, and leaving three or four eyes of last year's wood. After it has made shoots an inch or two long place it in the tub, and it is likely you will have a good growth and bloom.

CONSTRUCTING AND HEATING PIT (T. D.).—As your sashes are 8 feet long they will not allow of your having a pit 8 feet wide. The lights should have a fall of 1 foot in 3 feet of width. Little else will do to insure the run-off of rain water. Your back wall should be 4 feet 6 inches, and the front 2 feet high; but if you have the tank in front of the pit it will be necessary to take the wall a foot higher, and that foot we should have 4½ inches thick, and plastered with cement, which will give you a 4½-inch wall as strong as the 3-inch, and afford room for plants; in fact, form a ledge 4 inches wide. A wood tank would answer, but will be apt to wear out. It will need to be 6 inches deep to allow for the swell of the water, and should be 8 inches wide, with 1½-inch division up the middle, and a waterway at the farther end from the boiler of the same width as the others. In the length you name the tank should have a fall to the boiler of about an inch, and the return water will have that much of fall. If the tank be a few inches above the top of the boiler it is sufficient. Eighteen to 20 inches would be a good and suitable distance to leave between the floor and the glass if low-growing plants are cultivated, or it would answer for Cucumbers or Melons, but we should for these prefer 24 inches. The tank will do covered with slates, and the floor of rough boards, but you will only in this case have bottom heat. For top heat we should have holes in the wood that will allow of the heat from the chamber beneath rising through funnels of wood; or 3-inch draught pipes will do, with a plug to close them or let out the heat as required. If you have not soil on the boards it is likely that sufficient heat will rise through the interstices of the boards to give you as much top heat as you will require. As you have so much wood we fear it would not be safe to have the furnace inside the pit with the door outside, but you may, if you can with safety, have it inside, and so economise a considerable amount of heat.

CUTTING MELONS (S. S. A. K.).—The Melons should be cut as soon as they begin ripening, which may be ascertained by one or all of the following symptoms: The fruit changing colour, its slightly cracking or showing indications of parting from the footstalk, and by its aroma. As soon as the latter commences to be given off the fruit should be cut without delay, for it is the best general evidence of a Melon being fit to eat. The fruit should be kept in a dry room; and when coloured throughout—every part of its exterior alike—and before it begins to show spots of decay it is at its best, and should be eaten at once.

GARDEN INUNDATED BY SALT WATER (East Anglia).—We presume you wish to know what will succeed in your garden ground, the grass land having recovered. The garden ground would grow the various kind of greens, as Cauliflowers, Broccoli, Borecole, Savoy, &c., and Turnips, and by next spring will be available for most kinds of vegetable crops and fruit trees, according to the amount of moisture falling in the autumn. It would be useless, however, to replant fruit trees unless you can prevent by an embankment a recurrence of the disaster. If the grass was destroyed we should have the pasture broken up, and brought into good tilth by September, then sow it with Grass seeds. A suitable mixture per acre would be, if the land is wet:—*Poa fluviatilis*, 4 lbs.; *Alpecurus pratensis*, 2 lbs.; *Poa trivialis*, 4 lbs.; *Agrostis stolonifera*, 4 lbs.; *Festuca loliaeae*, 4 lbs.; *F. pratensis*, 4 lbs.; *Phleum pratense*, 2 lbs.; *Lolium perenne* (Pacey's Perennial Rye Grass), 12 lbs. We are unable to say that the above mixture would suit your soil, as it may not be wet; but if drained and otherwise not subject to be overflooded, the land would be suitable for the better kinds of Grasses and Clovers.

STRAWBERRIES FOR LIGHT SOIL (C. T. S.).—Sir Joseph Paxton, though not so early as some, is very good for early use, President for second early, and Dr. Hogg to succeed it. The last succeeds well on a light soil if the ground, after being manured and deeply dug, has the surface made firm. If you wish for a later kind than Dr. Hogg, Frogmore Late Pine will suit. If you can obtain well-rooted runners, July is the best time to plant; but we have planted early in August with very good results.

RAISING HYACINTHS FROM SEED (W. S.).—The seeds may be sown in September in light sandy soil, and covered to the depth of half an inch, sowing on a warm sheltered border, and protecting in winter from frost; or you may sow in a pan or box, and place in a greenhouse, keeping moist, but we prefer outside. The following year, when the leaves die down, cover the bed with an inch of soil, and the year following in September the bulbs may be taken up, and planted singly in rows 3 inches apart, and 6 inches from each

other in the rows, planting 2 inches deep, and covering with an inch of leaf soil on the approach of frost. The bulbs may remain in this bed with the annual mulching until they flower, or they may be taken up annually and replanted. They bloom in from three to five years after sowing.

ALYSIMUM SAXATILE COMPACTUM FOR SPRING-FLOWERING (Spring Garden).—If this was sown early in June, the plants should now be pricked-out in rich light soil 3 inches apart in rows 6 inches from each other, shading them until established. If planted out in autumn they will flower next spring, but not so well as plants that are a year older. We prefer them two years old. Mr. Luckhart, you would see last week, had more notes on plants for spring gardening, and will no doubt commend the plants you name—viz., the above as the best yellow, and Iberis sempervirens as the best white.

WEIGHT OF PEACHES (B. A.).—We have known a Late Admirable weigh 13 ozs., and a Salway 19 ozs.

CALADIUMS, &c. (W. H. D.).—The leaves of the Caladiums from the Corcovado Mountains are very novel, especially that with the white and crimson ribs. The *Scolopendrium vulgare* variety is the most deeply crisped of the variety digitatum we ever saw. We cannot identify the shrubs from the leaves only.

GRAPES DISEASED (Nero).—They are both shranked and spotted. Water the roots liberally twice a week with tepid very weak manure water. The flowers were smothered by the post-office panaches. You need not send Bagonias, for we cannot name florists' varieties.

VINE LEAVES SPOTTED (A Subscriber).—The spots on the leaves and the seven Grapes tell that the roots of the Vine are too dry. Water liberally two or three times a week.

PINKS, CARNATIONS, AND PICOTEES DEFINED (M.).—Carnation marks are in flakes, or ribbons, of colour, from centre to edge, and through the edge; and the more dense these ribbons, or stripes, or flakes of colour are, and the more distinct the white ground between them, the better, and the more equally divided as to quantity they are the better. As the petals are broader as they approach the outer edge, so also are, or should be, both the colour and the white. They are divided into classes, called Bizarres and Flakes; the former having two colours of stripe beside the white, the latter only one colour. These Bizarres and Flakes are subdivided, there being purple Flakes, rose Flakes, and scarlet Flakes; and among the Bizarres, scarlet Bizarres, which have scarlet stripes, and a second colour, which is considered better for a rich contrast of black, and approaches to it; then purple Bizarres, which have purple stripes, with a light pink, or rose, or some other colour, forming a contrast. The *Picotee* has the colour only on the edge, and broad or narrow, as the case may be, but ramifying towards the centre; any mark or spurt of colour that does not touch the edge is a blemish. Some, therefore, are only marked round the edge very distinctly, but as narrow as possible; others have a sort of feathering, narrow or deep, as the case may be, but feathering inwards from the edge; the outer edge solid, and the inner edge rough or feathery. The *Pink* is distinct from both these. The lacing, as it were, of a *Pink* is rough outside and inside, with a portion of white outside the lacing, as if a band of colour had been laid on; besides this, there is colour at the base of every petal, and, perhaps, one-third of the distance along the petal, so that it forms an eye, or centre, of colour, which is peculiar to itself, and which never occurs in the *Carnation* or *Picotee*. A *Pink* without its lacing all round each petal, and its narrow strip of white outside it, would be worthless as a show-flower. The more distinct this lacing is the better; it should look like an even piece of embroidery, just fairly within the outer edge of the white.

INSECTS (West Cumberland).—It is impossible to determine by such small shrivelled bits of plants (without any insect) what the species of larva may have been which is said to attack indiscriminately Onions, Cauliflowers, Broccoli, and all other kitchen garden plants.—I. O. W.

NAME OF FRUIT (An Old Subscriber).—There is no doubt it is May Duke Cherry, but this dry season has prevented the swelling of the fruit to its usual size.

NAMES OF PLANTS (H. M.).—*Hypericum calycinum*, Large-calyxed St. John's Wort. It is a native plant and popularly known as Aaron's Beard, referring to its numerous stamens. (*J. P.*).—1, *Chrysanthemum coronarium*; 2, send a specimen in flower. (*West Cumberland*).—1, *Crataegus rubra*; 2, *Tradescantia virginica*; 3, *Campanula* sp. (*T. P.*).—1, *Cyrtanthus Pohlmann* var. *Justicia carnea*, Lindl.; 2, *Sedum redexum*; 3, *Lilium Martagon*. (*T. M.*).—*Valeriana pyreocica*. (*X. Y. Z.*).—1, *Populus grandidentata*; 2, *Alnus glutinosa laciniata*.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE POULTRY-KEEPER.—No. 11.

NOTES ON LA FLÈCHE FOWLS.

THE La Flèche of a fine strain, is peculiar to Maine. Its type is always kept pure, especially in the environs of La Flèche, where they practise the mode of fattening that suits them. Mr. Létrône, to whom I owe some of the information, thinks that the origin of the La Flèche is unknown. Their reputation, he says, may be dated from the fifteenth century according to some old historians. I think, however, they have a more ancient origin. It was in Mans that they had these beautiful fowls first, then at Mûzeray, and then at La Flèche. Also they are known under different names. Poultry-rearing has ceased for a long time in Mans, it decreases at Mûzeray, and is not well kept-up in La Flèche and the surrounding places.

The La Flèche fowls are easy to fatten, are very hardy, and rarely ill. They acclimatise themselves in whatever country they are sent to, and the purity and superiority are easily preserved, provided promiscuousness is avoided, and fresh blood is introduced every now and then. They habituate themselves to any food after they have attained a certain age, but they ought at first to be fed with food something like that they have in their native country. Brought-up at liberty they do not roam far, particularly if provided with grass.

The variety of La Flèche may be included among the three or four of the most beautiful of the French varieties. Though its plumage is uniformly black, it is very rich on account of the beautiful violet and green iridescence. Its comb and gills are of a deep red, which with its large transparent white ear, form with the plumage a contrast as remarkable as that of the Spanish variety. The fineness, delicacy, and superior flavour of the flesh are very perceptible even when unfattened, and most conspicuously developed when fattened, as is demonstrated in the pullets and cockerels submitted to fattening at seven or eight months old. These last are put aside when required, that they may have no intercourse with the hens, and that is why they are called virgin cocks. The hens are just as easy to fatten before they begin to lay. Most fowls require from nine to eleven months to arrive at a state of perfection. But they derive from this a compensating advantage, for the chickens being very long in becoming adults, and not following the hen till very late, continue to grow in the winter, and come in during the spring at the time when good fowls are very rare. Never cross this variety, for it would deteriorate this property.

There is a variety exactly similar in form and qualities to the principal race excepting the comb, which is large, of a single lobe, nearly round, flattened at the top, and forming a point behind, granulated in the upper part. It is generally those with the granulated comb that are known under the name of the *Mais Fowls*. These two varieties have also certain similarities. They possess the same qualities, are equally easy to fatten, and the birds give, in proportion to the weight they attain, a good profit to the fatterer, because they are more early than the large varieties.

The usual food for the La Flèche consists in giving them three times a-day barley still in the husk. The keepers ration them, because they are very voracious, and at certain times fatten too quickly. They give to chickens and to the mother after the particular food of the first few days, a soft mixture of meal during the six first months. The older they are the more you may increase their rations of bran, and diminish that of meal. Grass they should always have abundantly.

BLACK BANTAMS.

I AM pleased to see in the Journal that Mr. Cambridge has made a stand against entering his Black Bantams in any class that comprehends more than Black and White; for I contend in a very mixed class the quality is not the test, but the idiosyncrasies of the judge decide the matter; for if he is a fancier of Sebrights, Japanese, or any other particular kind, it is natural to suppose he will more readily see their perfections, and, no doubt, will better understand their points; and having a partiality for that sort he would in a nice point be much inclined to let the balance weigh in their favour.

There is another point that requires a little rectifying—that is, in many schedules a certain amount is offered in some of the classes, while often less than half the amount is offered for Bantams, although the entrance-fee is the same. Why it is so I cannot comprehend, as on the average more Bantams are exhibited than fowls of any other class, and as a rule pay a committee better. I have heard some people say the reason is that they are not so important or useful a class of fowls; but if it comes to that, I should like to ask, Which of the show birds are really useful? For what person would be so idiotic as to give from ten to twenty guineas for a fowl to put in the pot; or to give from half a guinea to a guinea and a half per dozen for eggs for breakfast, when he could get just as good fowls for about 3s. each, and as good eggs at 1d. each? Therefore I contend that all show birds are for fancy, and what can it matter whether it is a pigmy or a giant that is the particular fancy? And although I do not exhibit largely, I have made up my mind not to enter at any show where the prizes are less for Bantams than for other breeds and the entry-fee is the same.—A BANTAM FANCIER.

PRESERVING EGGS.

VARIOUS correspondents have inquired as to the best mode of preserving eggs, and as no one has given the plan which I find very good, I send it. Take a three-quarter-inch board, say a foot broad and 3 feet long. With a brace bit of 1½ inch bore fourteen sets of holes; you will be able to get five in a row. Then nail together four strips of deal of the same thickness as the piece before mentioned, and 2 inches deep, with which form a four-sided open frame of the same dimensions as the first-mentioned board, and 2 inches deep. Nail the perforated board on the frame, and round the edges add a bead of half an inch deep. You will then have an egg-board which will hold seventy eggs, and with such boards eggs are kept in my house perfectly good from August to the following March. Care must be taken that the eggs have always been kept dry.

The rationale of this is that when an egg is laid on its side, the yolk, being of slightly greater gravity than the white, gradually sinks to the side, and then soon becomes unfit for use;

whereas in a frame such as I have described, and the egg being put the small end down, the yolk floats in the centre of the white, and is kept from any contact with the shell. If the eggs are small, say such as are laid by the Hamburgs, bore 1½-inch holes.—T. G.

MANCHESTER POULTRY AND PIGEON SHOW.

THIS Show was the first of the kind that has ever been held in the Royal Pomona Gardens, Manchester; and although in numbers not large, the quality of the generality of the classes was highly commendable. The arrangements were good, the birds being placed in single tier, and the light was such as no one could find fault with. The heat of the day was excessive, and those fowls that stood in the direct rays of the sun showed symptoms of much exhaustion. The feeding and watering were attended to most sedulously—nothing was left undone on that score. One of the most necessary precautions, however, seemed to have been altogether forgotten—viz., that anyone so inclined could not follow closely on the judges during the time they were officially engaged, and crowd around them, "to see what was going on." True, a few zealous and experienced exhibitors did by a little perseverance keep back for a time the most intrusive, but upon the least laxity being shown numbers surrounded both the judges by scores, and proved a considerable hindrance both to expedition and also in making a minute examination of the birds to be judged. An official should always be placed at the end of the avenue to prevent persons from going where the judges are engaged. The amount of space available for a poultry show at the Royal Pomona Gardens is surprising, and with care and attention future shows held there might be of the highest character.

Very few of the birds shown were otherwise than first-class, the general moulting being the only drawback. *Dorkings* were good as a whole, but mostly out of condition, and the long spell of dry weather only increased the numbers of "bumble-footed" ones. Some fine chickens not sufficiently matured to compete with old fowls were exhibited in capital feather. In the class for any other variety of *Dorkings* a pen of truly beautiful Silver-Greys stood first, but the remainder were not by any means faultless. In *Boff Cochins* Mr. Crabtree's pen (of late so successful) were again in the front rank. Somewhat strangely, almost every pen contained a good and an inferior specimen, as two really first-class ones shown together could not be found, however carefully sought for. The class of *Partridge Cochins* was such a one as at this time of year is rarely to be witnessed. Mr. Tudman, the owner of the first and the third-prize pens, being himself present, was congratulated by many fanciers on his successes with home-bred specimens that are a credit to his perseverance. Mr. Stretch also showed a marvellously nice pair, which were second, and these were also in very superior condition. From such an entry Mr. Crabtree's grand *Partridge* cock shown with a very meagre hen was quite out of the hunt, but with a partner of equal merit its success would have been a certainty. Light *Brahmas* might have been a more taking class. The first-prize, Mr. Dean's "Young Hero," will be improved when he has obtained his new suit; and the hen was certainly not equal to some at times sent from the same yard. In *Dark Brahmas* there was a general display of right good ones. In this class a marvellously nice pen of chickens well grown—the cock one of the truest feathered ever seen so early in the season, wings, breast, back, and hackles the very perfection of colour, and with a framework that bids fair to become a giant—was the object of continuous scrutiny, the general opinion being "he will stand in the way of a good many in prizetaking," and it was the envy of not a few *Brahma* fanciers. Mr. Beldon exhibited some *Spanish* of high quality and in good feather. A few very good single birds might have been easily selected from the pairs shown, but no other pen than the first was well matched or in show condition. *Hamburgs* throughout were really good, and it will be seen that great successes have been achieved in these varieties by a new comer. The Variety class might easily and justly have received double the number of prizes that were appointed by the prize schedule; and in the Variety Duck class the same applies even more forcibly. The Show was well attended throughout both days.

DORKINGS.—Coloured.—1, J. Scott. 2, J. Walker. 3, Mrs. T. W. L. Hind. *he*, G. Fox; *she*, H. Stott; Mrs. Arkwright; T. C. Burnell. *White and Silver*.—1, Mrs. H. Barcay. 2, H. Feast. 3, L. Wren.

COCHINS.—*Cinnamon and Buff*.—1, W. H. Crabtree. 2, R. P. Percival. 3, Mrs. T. W. L. Hind. *he*, J. Royle; G. Fletcher. *Partridge*.—1 and 3, E. Truman. 2, T. Stretch. *he*, T. Ashton; W. H. Crabtree; E. Truman; M. M. Cashmore. *White*.—1, R. S. Woodgate. 2, H. Beldon. 3, W. Whitworth, jun.

BRAHMA POULTRY.—*Light*.—1, T. A. Dean. 2, R. P. Percival. 3, J. Mitchell. *Dark*.—1, R. P. Percival. 2, Horace Langwood. 3, J. Watts. *he*, F. E. Ansah; W. H. Crabtree. *c*, R. P. Percival; W. Whaley.

SPANISH.—1, H. Beldon. 2, J. Leeming. 3, Farness & Sadali. *he*, J. Thresh. **GAMES.**—*Black Red*.—1, J. K. Fletcher. 2, W. Barker. 3, T. Tomlinson.

Brown.—1, J. W. Brindley. 2, J. K. Fletcher. 3, H. M. Jahan. *Any other variety*.—1, J. A. & H. H. Farley. 2, J. Mason. 3, W. Barker.

HAMBURG.—*Golden-pencilled*.—1, J. Long. 2, H. Beldon. 3, W. Speakman. *Silver-pencilled*.—1, J. Long. 2, H. Beldon. 3, H. Feast. *Golden-spangled*.—1, P. Henson. 2, N. Marlor. 3, G. & J. Duckworth. *c*, J. Hall. *Silver-spangled*.—1, H. Beldon. 2, Ashton & Coath. 3, J. Long. *he*, J. Fielding. *Black*.—1, J. Long. 2, N. Marlor. 3, H. Royle. *he*, H. Beldon.

FRENCH—Any variety.—1, R. B. Wood. 2, E. Walton. 3, W. H. Crabtree. 4, G. W. Hubbard. 5, W. H. Crabtree; H. Feast.

ANY OTHER VARIETY—1 and 2, H. Bolton (Silver and Golden Polands). 3, Rev. A. G. Brooks (Majors). 4, J. E. Walton (Watts Majors). T. Aspley (Black Cochins). J. Walker; J. Royle (Polands); H. Feast; A. W. Crichton (Polish). 5, A. & W. H. Silvester (Gold Polands).

BANTAMS—Game—Reds.—1, W. E. Entwistle. 2, Annie G. Hall. 3, G. Barnes. 4, J. Anderson. Any variety Red.—1, J. R. Fletcher. 2, H. Hall. 3, R. J. H. Harley. 4, E. Walton. Any variety not Game.—1 and 2, M. Leuo. 3, R. H. Aspley. 4, W. Moore. H. B. Smith.

DUCKS—Aylesbury.—1, J. Walker. 2 and 3, I. K. Fowler. Rouen.—1, W. Evans. 2, G. Fox. 3, J. K. Fowler. Any other variety.—1 and 2, M. Leuo (Whistlers). 3, W. Binns (Chilian Pintails). 4, H. B. Smith (Whistlers). Chilian Pintails, and Bahamas; J. Walker; W. Binns (Kassarkas).

GESEK—1, Mrs. H. J. Bailey. 2, I. Walker. 3, J. K. Fowler.

TURKEYS—1, J. Walker. 2, M. Kew. 3, Mrs. H. J. Bailey.

SPANISH—Cass.—1, J. Pitt (Black Spanish). 2, A. Bamford (Buff Cochinchina). 3, T. C. Barnett (Dorking Hen)—1 and 2, F. Barnes & Sadall (Black Spanish). 3, A. Bamford (Brahma). 4, R. P. Percival (Dark and Light Brahma); T. Aspley (Buff Cochins); E. Kendrick, jun (Dark Brahma); T. F. Asndell (Dark Brahma).

PIGEONS.

POUTERS—White.—1, D. M. Garalde. 2 and 3, No competition. Black or Blue.—1, H. S. Salisbury. 2 and 3, No competition. Any other colour.—1, W. J. Warhurst.

CARRIERS—1, H. Yardley. 2 and 3, No competition. Young.—1, R. White.

TRUMPETERS—Short faced.—1 and 2, J. Gardner. 3, H. Yardley. Any other variety.—1, J. Watts. 2, A. & W. H. Silvester. 3, No competition.

OWLS—Foreign.—1, J. R. Fletcher. 2, A. Handford. 3, H. Yardley. English.—1, W. Binns. 2, J. Watts. 3, C. E. Brooke.

TURBOTS—1, H. Yardley. 2, T. W. Fekersley. 3, J. Gardner. 4, T. Foster. **DRAGONS**—Blue or Silver.—1, H. Yardley. 2, E. H. Preston. 3, No competition. Any other colour.—1, H. Yardley. 3, E. H. Preston. 3, W. Binns.

JACOBS—1, H. Yardley. 2, H. S. Salisbury. 3, No competition.

FANTAILS—1 and 3, J. E. Loversidge. 2, Q. Blum. 4, H. C. Bowman; Rev. A. G. Brooke.

ANTWERPS—1, W. Justice. 2, R. Brierley. 3, A. Bingham. 4, H. Yardley; J. Wright; J. Gardner; A. Bingham.

ANY OTHER VARIETY—1, A. & W. H. Silvester. 2, H. Yardley. 3, Rev. A. G. Brooke (Barnes). 4, F. Appleton (Archangels and Black Magpies); T. Foster (Swallows); Rev. A. G. Brooke (Nuns).

ROLLING CLASS—1 and 2, R. Watts (Black Barbs and Carriers). 3, R. E. Horsfall (Black-mottled Trumpeters). 4, T. Foster (Turbits).

Mr. Thomas Chaloner, of Workop, judged all classes of Game fowls; and Mr. Edward Hewitt, of Birmingham, the remaining varieties.

ENGLISH OWLS AT THE CLIFTON SHOW.

"F. B." MAKES some remarks upon these birds, and adds that "WILTSHIRE RECTOR" no doubt recollects his remarks on the English Owls at the Bristol Show, vide our Journal." I turn to the number of THE JOURNAL OF HORTICULTURE for January 29th, 1874, and read in my account of the Bristol Show, "The English Owls were very foreign-like," meaning that is just what they should not be. It is fast coming to this, that the English Owls shown are half-bred foreign ones, as the professed unpeppered Canaries are more than half peppered. If this go on, the English Owl Pigeon, a fine, strong, somewhat large, and good flying Pigeon, that has been a fancy bird in England for the last hundred years, will cease to exist. Keep the little, newly arrived, *petite*, pretty gentry to themselves; and I sincerely hope that no judge will give a single prize to a half-and-half Owl, while every judge will look favourably upon an honest powder-blue English Owl, one of the nicest of all Toy Pigeons.

I would further observe that I was not at the Royal Cornwall Show, and am not responsible for the opinions of others. "F. B." also alludes to the Trumpeters at Clifton last June. A contemporary, I see, says of them they were "very poor." I was not at Plymouth or at Exeter, so I could not have written about them.—WILTSHIRE RECTOR.

WINTERTON POULTRY SHOW.

THIS Show was held on the 7th inst., but in the face of large exhibitors the entries were not good, although we hope the Committee will not be discouraged, as a little revision and augmentation of the list will bring the desired numbers. The arrangements and management seem to have given general satisfaction, except that the pens for poultry were far too small. Of *Dorkings* there were but three entries, the highly commended pen being five chickens. The first in *Cochins* were a really good pair of Bufts. *Brahmas* were good, the Sheffield pen running hard for the cup; the *French* also coming up well. *Crève-Cœurs* took both the prizes. In Black Red Game the first was a fair pen; the best cock was that in the second-prize pen. In the next class Brown Reds won both prizes. *Hamburghs* were mixed classes; in the Spangled Gold were first and Silvers second; and in Pencilled Golds won both prizes, the first being of fair quality. Of *Bantams* there were only nine pens in three classes; the first-prize pen in Class 12 containing one of the best hens we have ever seen. A well-known pen of *Spanish* were rightly awarded the cup for the best pen in the Show. *Polands* were Gold first and Silvers second, the first a very good pen.

Pigeons were a poor show if we except the first in Fantails. A pair of Nuns received a first prize, only one bird having a hood, which we consider stretching a point too far.

Rabbits.—Of these there were but three entries in two classes.

Dorkings—1, G. Bray, Winterton. 2, T. Sawyer, Winterton. 3, W. G. Waters, Eisham.

Cochin-Chinas.—1, W. Harvey, Sheffield. 2, W. Heseltine, Beamoncote.

Brahmas.—1, W. Whiteley, Sheffield. 2, W. G. Waters. 3, J. F. Smith, Sheffield.

FRENCH—Any variety.—1, Mrs. Wicks, Appleby. 2, W. Harvey, the Mrs. Cross, Appleby Vicarage. 3, Rev. J. R. Lane, Roxby. 4, G. W. Hubbard, Gooly, Hild.

GAME—Black-breasted Red.—1, J. B. Henworth, Hattfield, Doncaster. 2, O. Barnsdale, Newark. 3, W. Heseltine. Any other variety.—1, A. Canty, Barton-on-Humber. 2, J. B. Henworth.

HAMBOURG—Gold or Silver-spangled.—1, Tock & Furness, Crosby. 2, W. G. Waters. 3, G. or Silver-spangled.—1, Mrs. E. Newbitt, Epworth. 2, W. Darley, jun, Brigg.

BANTAMS—Game.—1, Mrs. E. Newbitt. 2, W. Heseltine. Hen.—1, Wells and Taylor. 2, and 3, A. Canty. 4, Mrs. Wicks. Any other variety.—1, W. Darley, jun. 2, A. Canty.

SPANISH—Cup and 1, Mrs. E. Newbitt. 2, J. Gillyard, Winterton.

POLANDS—1, W. Harvey. 2, W. G. Waters.

POULTEERS.—1, W. Sawyer, Winterton. 2, W. Blanshard.

DUCKS.—Any variety.—1, W. Heseltine. 2, W. Cross.

PIGEONS.

ANTWERPS.—1, Wells & Taylor.

FANTAILS.—1, J. F. Loversidge, Newark. 2, A. Canty. 3, Mrs. M. W. Clarke, Winterton. 4, J. Sadler, Winterton.

NUNS.—1, Mrs. M. W. Clarke.

BARBS.—1, S. Stubbins, Winterton. 2, A. Canty.

JACOBS.—1, A. Canty. 2, Mrs. M. W. Clarke.

TRUMPETERS.—1, W. H. Atkinson, Winterton.

BEST PEN OF PIGEONS IN THE SHOW.—1 and 2, A. Canty.

RABBITS.—Any variety.—Duck.—1, A. Canty. Doe.—1, A. Canty. 2, C. Bray, Winterton.

The Judges were Mr. F. Sales, Crowle; and Mr. Wheeler, Carlton, Nottingham.

CHEAP RABBITRY.

DR. POND, of Cassadaga, N. Y., gives the following directions in the *Chautauqua Farmer* for constructing Rabbit hutches so cheaply as to be within the means of any boy:—

Rabbits have been and are kept in common dry-goods boxes, with the cover fastened on by leather hinges, and a few holes bored around the side for ventilation. In this primitive manner most excellent success has been attained. Of course in such quarters cleanliness is indispensable. The box must be cleaned out and fresh litter given every day, or at least every other day.

Another simple arrangement is a shoe box. This is usually about 3 to 3½ feet long, 15 to 18 inches deep, and about 12 inches broad. This is placed on the side on supports, or fastened against the wall, with the door or lid hung from the upper side, thus lifting up. The door may be of wire-cloth, lath, or simply the lid of the box with a few holes bored in it, and hung by iron hinges or strips of leather. One end of this box may be set off by a partition for a nesting-room; this need not be over 9 inches wide. On this point I differ with most other writers on this subject; they advocate a nesting-box of 12 to 15 inches in width, and the depth of the hutch, whether 1 or 2 feet from front to rear. My experience is, with these large nesting-boxes the young Rabbits, as soon as they are able to crawl, will often get out of the nest and get chilled, and are unable to get back again. Having lost a number of litters in this way, I have reduced the size of these boxes to 10 inches diameter for Lops and Belgians, and to 9 inches for the smaller varieties, and also when the hutch is deep, I place a semi-partition, about 2½ or 3 inches high, across the nesting department, about 1 foot from the front of the hutch—entrance to the apartment by the door being by an opening in the back part of a hutch through a hole 6 inches wide and 8 inches high. Hutches of this kind may be placed in tiers two or three or four high.

Another and still simpler mode of keeping Rabbits is in an unoccupied room in any outbuilding. This can be divided into apartments by boards, the partition to be carried up to a height of 3½ or 4 feet. The apartments may be of such size and shape as suit the fancy of the amateur. In one corner of the pen put a box, say about 10 by 15 inches, with a round hole 6 or 7 inches in diameter cut in one end; hinge the cover and fasten it down by a simple hook or button, so as to afford better opportunities to examine the young. Care must be taken to exclude cats and rats from the room. For young stock I especially recommend keeping them in this last manner. My pens are four in number, about 5 feet wide by 10 feet long, and in one of these I have had as many as thirty-five Rabbits at one time, varying from six weeks to four months old. They have ample room to exercise, and seem to thrive much better than when in more confined quarters, even in small numbers.

SUGGESTIONS FOR SETTLING THE POUTER DISPUTE.

THE present seems to me particularly the important time for fanciers to agree upon the subject of the Pouter, inasmuch as the most elaborate work on fancy Pigeons is being published, but the portion relating to the Pouter is not yet issued. Many letters have appeared on the subject, particularly from the great Scotch breeders and exhibitors, and I think that very great weight ought to be attached to their utterances, as the Pouter is *par excellence* the bird of Scotch fanciers. But then, alas! the Scotch doctors don't agree. I wish they were all "U. P.'s," I mean "United Pouter" men, but then they are not. Full im-

portance also should be given to this variety, because though other Pigeons are pretty, graceful, elegant, yet of the Pontor only can the word "grand" be used. It is, indeed, a *grand* Pigeon.

Now, looking back historically, I find that the only Ponters that were considered strict fancy birds were the four Pieds—Blue, Black, Red, and Yellow; but the laws of the fancy are not like those of the Medes—unalterable; thus White has been added, and rightly, although the old writers do not mention it at all, and even Brent, writing so recently as 1860, says only "pure White are admired by a few." But, to come to present days, I find that the two national representative Shows, the Crystal Palace and Glasgow, differ as to the order of merit (inferred by their arrangement of classes) as to colour. I will premise that a hundred years ago the order was Yellow-pied, Red-pied, Black-pied, and Blue-pied last. Brent gives them thus: Blue-pied, Black-pied, Red-pied, Yellow-pied, and White. The Crystal Palace Committee arrange the colours thus: Pieds—Blue, Black, Red or Yellow, and White, following Brent, then any colour or markings; while our Glasgow friends arrange the colours in this order—Black-pied, White (mark this), Blue-pied, Red-pied, Yellow-pied, then Mealy-barred, then lastly irregular in colour and marking.

I should like the order of colour to be settled; an election taking place like the rose election, with this difference, that once done it is done for ever, or for years. I incline to the colours being placed according to the difficulty in getting them good; then, of course, White would stand last.

I would, as I have before written, add Mealy, although Eaton, a recent writer, calls it "the most despicable colour in the feather," and I have myself written against it; but all matters, even the highest political affairs, are now settled by compromise—giving and taking. Perhaps each leading Pouter fancier would send his order of colours as he thinks they should be. These lists sent to our Editors would by them be sent to me, and the whole table printed together. Here we should have a basis to work from, and perhaps the Crystal Palace Committee, and perhaps Glasgow too, would adopt whatever the result of the election would show to be the predominant feeling.

I would, as I have before stated, have smaller prizes for the newly-advanced colours, the fact of Meales and Chequers having prizes awarded at all would tend to encourage "the young and poor fancier." I do not think there is any real difference of opinion between myself and my friend Mr. Huie, according as I understand his last letter. I will only add, in I hope what is pure Scotch *this* time, that a letter from him is always "a sight gude for sair een" to—WILTSHIRE RECTOR.

BEES RE-SWALLOWING HONEY.

MR. PETTIGREW'S challenge on the subject of bees re-swallowing honey has received a capital response in the result of the experiments of your able correspondent "R. S." I had hoped myself to put the question to the proof, and had hived a swarm in a beautiful observatory hive, presented to me by Mrs. Woodbury after the death of her much-lamented husband. Unfortunately the bees took a dislike to the hive, and disappeared just as I was leaving home for a fortnight. But nothing can be clearer told or better managed than the experiment as conducted by "R. S." Having no bar hives in operation just now in my own apiary, I cannot myself try the question in the way indicated; but nothing can be more easily put to the test by persons who are more fortunate than myself. The more witnesses to any presumable truth the better. I observe that my theory upon evaporation is fully endorsed, or rather is sufficiently corroborated, by the experiment of "R. S."—B. & W.

THE CARE OF CANARIES.

A PAIR of Canaries I give to your care.
Don't blind them with sunshine, or starve them with air,
Or leave them out late in the cold and the damp,
And then be surprised if they suffer from cramp;
Or open the window in all kind of weathers
Quite near to their cage till they puff out their feathers.
The birds that are free fly to bush and to grove,
If the wind be too cold or the sun is too hot;
But these pretty captives depend on your aid,
In winter for warmth, and in summer for shade.
When they chirrup, and ceaselessly hop to and fro,
Some want or discomfort they're trying to show;
When they scrape their bills sharply on perch or at wire,
They're asking for something they greatly desire;
When they set every feather on end in a twinkling,
With musical rustle like water as sprinkling,
In rain or in sunshine, with sharp call-like notes,
They are begging for water to freshen their coats.
Cage, perches, and vessels, keep all very clean,
For fear of small insects—you know what I mean!—
They breed in their feathers, and leave them no rest.
In buying them seed, choose the cleanest and best,
I feed my Canaries (excuse me the hint)
On hemp and canary, rape, millet, and lint.

I try them with all till I find out their taste—
The food they don't care for they scatter and waste.
About their bright cages I hang a gay bower
Of shepherd's-purse, chickweed, and groundsel in flower.
At a root of ripe grass they will pick with much zest,
For seeds and small pebbles their food to digest.
But all should be ripe, and well seeded, and I brown,
Few leaves on the groundsel, but plenty of down.
In summer I hang them out high in the shade
About our hall door by a portico made;
In spring, autumn, winter, a window they share,
Where the blind is drawn down to the afternoon glare.
This window, if open beneath them, we close,
Lest the cramp should seize hold of their poor little toes.
A bath about noon on every mild day
Will keep your small favourites healthy and gay.
In hot summer sun-shine, some calico green,
As a roof to their cage, makes a very good screen.
On winter nights cover from lamplight and cold;
And they'll sing in all weathers, and live to be old.

—The Animal World.

OLD QUEENS.

THE question of "A SCOTTISH SCHOOLMASTER," "Do old queens banish themselves?" is very interesting and important, as I believe far the greater number of losses of stock hives occur through the absence of queens when the bees are unable to produce others. My experience may throw some light on the subject, while there are certain points on which I should be glad to be enlightened.

When I commenced bee-keeping, about ten years ago, I purchased a good and early first swarm, which in the following season gave me two swarms—the first having, of course, the old queen of my original stock. The next season my three hives seemed equally strong, and the two hives with young queens swarmed early; while the other—that with my original queen—although full of bees, hung for a fortnight later. I happened to be close by when they swarmed, and saw the queen come out and drop on the ground, one wing being broken. I picked her up and carried her where the bees were thickest, placing her on a branch, where she was speedily joined by the other bees and safely hived.

I carefully watched this hive, and just two months afterwards found the same queen brought outside dead. I then turned out the bees, and found a queen already hatched and laying. I then formed an opinion (comparing this circumstance with what I had read of queens destroying embryo queens when they attained a certain size), which I have since confirmed by several other observations—namely, that when the queen gets very old she is unable to destroy the young queens, and they are often allowed to hatch before the old one leaves or is driven from the hive. I have seen so many proofs of this that I have no doubt at all on the subject. Only last summer I had a hive with an old queen, which swarmed before nine o'clock on a morning not very fine. The queen fell as I expected, and I hived her with a handful of bees for an experiment, allowing most of the bees to return. The same day I heard young queens piping, and a second swarm followed in three or four days. The old queen had evidently been forced out, as the young queens were hatching. My opinion is strengthened by the fact that I can remember about a dozen cases of my own or neighbours' bees swarming and returning to the hive, the old queen being almost invariably found on the ground with a small cluster of bees, and the second swarm with her successor generally coming in from three to six days.

The practical lesson from all this seems to be not to keep queens beyond their third year. They may go safely into the fourth season, but are not likely to do so successfully.—A DORSET SCHOOLMASTER.

APIARIAN NOTES.

THE honey season of 1874 will, we imagine, show very different results in different parts of the country. I am writing on the 6th of July, in the midst of magnificent weather, such as in other years would content the most exacting of bee-keepers. White clover is abundant everywhere, and has been in full bloom for more than a fortnight, yet my bees are comparatively idle, and have made no perceptible addition to their stores for the last month. In some later swarms I can see no sealed honey whatever, and hardly a sign of honey in the open cells. Only one cause is apparent to account for it, which is the excessive drought—exactly the contrary reason which I gave last year as accounting for the extraordinary scarcity of honey which then prevailed.

Here, in our part of Somersetshire, we are as dry 3 inches underground as we were six weeks ago. It is fully twelve weeks since we had rain sufficient to penetrate to the depth of 4 inches. It has been different elsewhere, heavy and abundant rains having fallen recently, which no doubt will enable the fortunate recipients of Heaven's bounty to tell another tale in regard to honey as in other things. The early part of the season gave us

a fair share of honey from the apple blossoms and elsewhere, so that those stocks which survived the winter in tolerable health are pretty well supplied for the coming season. Not so the swarms of the year. And yet evidently a dry summer following an open winter is more productive of honey than a moist summer following a wet winter, as was the case last year; for by this time last year my bees had become impoverished, having eaten up in June almost everything they had gathered in May. I observe, also, that the bees were twice or three times as numerous last year as they are this; breeding, in fact, going on very languidly in all my stocks this year, whereas last year the population of all hives was overwhelming. We shall be glad to know what experience other bee-keepers have to tell of in other parts of England.—B. & W.

BEE PHENOMENON.

NATURE sometimes plays queer pranks, and now and then we witness eccentricities which upset all prior deductions derivable from observations of Nature's laws. Such a case I am about to set before your readers. On the 23rd of June Mr. John Boulton, of Ulverstone, North Lancashire, one of the most ardent and successful of bee-keepers, in examining a hive of pure Ligurians noticed that it contained two fertile queens. Mr. Boulton has been a bee-keeper for many years, and the phenomenon was so contrary to all his preconceived notions, that he naturally felt hard of faith, and kept his own council for the time being. The hive is a square wood and straw, with eight bars, and on each of the two centre bars were the queens, with their attendant subjects, working in the greatest apparent harmony. The queens had been hatched about a month previously. On the following day Mr. Boulton made a further examination, and seeing that the cells in each bar contained numbers of eggs, called the attention of other bee-keepers to the fact. Each and all were of opinion that one or the other of the queens would soon be driven out; but up to the 4th inst. this had not taken place. A friend of mine states that he can remember his grandfather speaking of a similar occurrence; but, of course, this was mere surmise, as the hive was one of the old-fashioned kind, and could not be examined with the same facility as the present one, which is Woodbury's.

Mr. Boulton is anxious for information as to what the result may be, and also as to what course he should pursue. But in order to arrive at this, it should be stated that in the spring he was under the impression that the hive had lost its queen. Later, on an examination, he found two young queens just coming from the cells. They are both pure Ligurians, and have both been fertilised; the broods from them are also pure. The hive has been visited by many bee-keepers, and discussion on the question is very animated here. Would you and your readers kindly give us the fullest information on the subject? It would be esteemed a favour by many subscribers of THE JOURNAL OF HORTICULTURE, who naturally look to you for the solution of matters of difficulty.—J. R. R., *Ulverstone*.

[We should be obliged by our apiarian readers sending us notes on the above.—EDS.]

RAISING QUEEN BEES.

MR. PETTIGREW'S theory of working bees removing eggs into royal cells requires practical proof before we can accept it as matter of fact, and I would suggest that a hive of bees be deprived of their brood and queen now, while there are many drones and eggs of all ages in the neighbouring hives; and surely if they do possess the faculty of transporting eggs, the stock will not perish for want of a single grub. We know they will rob other hives of honey at the risk of their own lives, then why should they not transport a single egg to save the colony? Perhaps it is commonly done; although I have been a sufferer in such cases as sterility in young queens, and young queens being destroyed by misadventure; and perhaps it may be proved to account for the wonderful population of some hives as compared with others in the same stand. At present I do not believe a working bee has the power of securing an egg to the bottom (or rather the top) of a royal cell.—THOMAS F. WARD.

HONEY PROSPECTS.

I NOTICED in my communication last week that the produce of honey both this year and last, has been very scanty in the flowers, and that from quite different causes. And yet I can imagine that some of your correspondents in surprise will tell of considerable gains in honey that have befallen them. If so, we may be sure they have been blessed with heavier rains, or more extensive honeydews than have prevailed generally. It may also happen that here and there under the most unfavourable circumstances of weather and climate, a stock or two have proved exceptionally profitable. I know one or two such instances in my own neighbourhood, where the honey produce has

been generally very defective. How may this be accounted for? It can only be owing to some exceptional state of the stock at the time when honey most abounded. At such time, perhaps, swarming was at its height. Such was mostly the case in May, when almost all our honey hereabouts was harvested. We had some fair ingathering just at that time, and those of my own stocks which happened to be freed from internal commotions and most populous, made the best of the opportunity. They would have done much better but for the miserable condition in which almost all my stocks found themselves at the close of winter.

I fear the exhibition at the Crystal Palace this year will give but a poor notion of the capabilities of English bees. Certainly not many of us would care to exhibit our supers. I have not a single pound. Bad as last year was, I could have exhibited a 20-lb. super; not so this, although my stocks are in general well supplied. I did not enjoy the supers of last year, having been compelled to give them to the bees for food. Anything more untoward for the exhibition could hardly be. Yesterday a little honey was seen glistening in some combs in two or three supers; to-day it has vanished, brilliant and delicious as the weather is. All but farmers and bee-keepers are in ecstasies about it.—B. & W.

WAX.

"A YOUNG APIARIAN" naturally wants to know the cause of combs being different in colour at various times in the season. The combs built in his hives up to the beginning of June were pale yellow; since that time those built have been pure white. He noticed the same differences last year. As the production of wax and comb-building are both interesting to youthful apiarians, I will offer a few remarks here instead of giving an answer through the "Letter Box."

Thousands of people fancy that the pollen carried by bees into hives is for the erection of combs, and many bee-keepers up to the days of Huber were of the same opinion. Happily we live in times more enlightened, when all students of apiarian science know that pollen is gathered for other purposes than comb-building; that bees carry into hives filled with combs great stores of pollen; that when a swarm is put into an empty hive it vigorously commences to build combs, and generally has three or four large cakes built before a particle of farina or pollen is carried into the hive.

Wax is a secretion of bees—that is to say, it is made, or manufactured, or secreted in the bodies of bees from the honey they gather, as milk is a secretion of cows. Wax is both a secretion and an excretion of bees; for after it is formed in their bodies it is excreted on the under side of the belly. Anyone interested in the subject may satisfy his curiosity by seizing a few bees by their wings during the comb-building season. Two small flakes or laminae of wax may be seen exuding from many of them on the under side of the abdomen. These scales or flakes of wax thus excreted are the bricks and mortar of comb-building.

Wax is costly in labour and materials. To fill a large hive with combs a great deal of honey must be gathered by, or sugar given to, the bees of that hive. Baron Liebig's experiments indicated the consumption of 20 lbs. of honey to make 1 lb. of wax. Though I believe his experiments were honestly made and accurately reported, I cannot endorse them, for they were made with 10 ozs. of bees only. Warmth has a great influence on bees in building combs. Experiments must be repeated again and again before one can place much confidence in their correctness. Comb-building is a very costly affair, and when this becomes generally known the bee-keepers of England will utilise their empty combs in a way more satisfactory and profitable than they do at present. The bees in hundreds of hives throughout England died last winter. How valuable are hives with sweet empty combs at the present moment to those who know how to use them for swarms, for nadiring, for supering!

"Do you really advise bee-keepers to use secondhand combs for supering and nadiring, as well as for swarms?" Yes, certainly. We use them in all these ways with very great advantage. If 10 lbs. or 20 lbs. of honey can be stored up instead of being consumed in comb-building there is considerable gain to the bee-master. When a large swarm is put into a hive filled or partially filled with sweet combs, the activity of bees in gathering honey is most strikingly manifested. Neither time nor honey is wasted in comb-building, and for a few days there is no brood needing attention. But why use secondhand combs in supers? To have them rapidly filled; and when hives containing discoloured combs are used for supering, it is with the intention of putting such supers down for run honey, and keeping the bottom ones for stock, and *vice versa* in the case of nadiring.

As to differences of colour in newly-built combs, it may be safely affirmed that the cause of the difference lies veiled in the honey from which the combs are made. No two kinds of flowers produce the same kind of honey, or honey alike in all particulars; and no two kinds of honey produce (through the bees) the same colour of wax. The wax built in spring from the produce of fruit trees is yellow—darker from one kind of fruit than from

another. From the honey of field mustard (*Sinapis arvensis*) the combs are very yellow indeed. The soiled feet of the bees may help to yellow the combs while working on that flower. The combs built from honey gathered from beans are very white. In the case of beans the feet of bees do not touch the farina of the flowers. The petals of beans are pierced at their bottom, and the honey is sucked through the holes thus made. White clover yields very clear and excellent honey, but the combs built from it are not so white as those built from the brown and coarser honey gathered on the moors. Indeed, treacle, when given to bees, yields a much whiter comb than refined sugar. I think it is Huber who states that sugar yields more comb than honey, when given to bees weight for weight. I am not able to confirm or contradict the statement. All I can say on this point is that a few half-pounds of sugar given to a swarm help it very much, whether it is gathering honey or not.

One more thought on this subject, and I shall have done. Wax is a voluntary product of bees. Than this fact there is nothing more wonderful in bee history. When they want wax they produce it; they manufacture it at home speedily. Liebig was wrong in saying that it "took thirty-eight hours to convert honey into wax." Bees commence to build combs a few hours after they are hived. Our artificial swarms build combs as large as a child's hounds in less than ten hours. Frequently in a shorter time than that they have pieces of comb built as large as a watch face. When ventilated too much on their way to the moors, a journey of two or three hours, they often lessen the ventilation by daubing white wax on the wire over the crown hole. The mystery of this voluntary secretion of wax will in my opinion be for ever veiled from the ken of mortals. —A. PETTIGREW.

OUR LETTER BOX.

GAME BANTAMS (G. H.).—The report was written by one perfectly disinterested and qualified. If you are of the opinion you mention, write to the party you wish to challenge to public competition.

SPLIT PEAS FOR PIGEONS, &c. (Ecopias).—We have seen Pigeons eat both split peas and beans, but they are not so suitable to the formation of their throats, and, therefore, not so pleasant for them to swallow. If whole beans or peas were put by the side of split, they would leave the latter for the former. It matters not as to food whether the peas are white or brown, but the brown are much the cheaper. A stamp on the wing of a Pigeon, and on it the owner's name, ought to be used and at once disqualify the bird. Other exhibitors would, and rightly, be up in arms. Supposing some great exhibitor, say Mr. Fulton or Mr. Yardley, put their names on their birds, we scarcely think there would be a second show. If you can mark your birds in some very minute way—for instance, chipping, as we have known the point of one certain feather on one wing, a smaller not a large wing-feather—then the mark would be noticed, and, consequently not be objectionable, and at the same time the owner would be able to identify his birds.

DRIVING BEES (Apis).—If you wish the bees in your old stock to fill another hive this year, the sooner they are driven into it the better.

ADDING AN EKE (Kosa W.).—The hive with a glass super on it could be easily eked. First give the bees some smoke from old cotton rags or tobacco, then lift it off the board, put the eke in its place, and the hive on the eke. But if this be done the bees will commence to fill the eke rather than the glass super. If the weather continue for ten days more as favourable as it has been for the last week, your bees may fill both eke and super.

BEES NOT SWARMING (A Constant Reader).—We advise you, if possible, to prevent your bees swarming now. It is much too late in the season. Should they swarm, you had better drive them as usual, and put the swarm in the parent hive's place. Then turn-up the old hive and cut away all the royal cells you can see. Then return the swarm and put the hive back again as before. We cannot account for the absence of drones, except on the supposition that the bees destroyed them early, and have no intention of swarming.

DRIVING BEES (W. Clarke).—If you want to put the bees in a fresh hive and get the honey from the old one, you may turn them out on the day you have named; then help the turn-outs, by feeding, to make combs and one or two batches of brood. Late swarmers are now heavy, and will yield a great deal of honey.

CROSS STICKS IN HIVES (T. G.).—Without cross sticks in common hives the combs are easily disturbed and shaken down. It is dangerous to turn up or remove hives without them. They are generally made to run from side to side of a hive; and the guide comb is used to induce the bees to build their combs from front to back, thus crossing all the sticks to which the bees fasten them.

DRIVING BEES (Idem).—You are right in thinking that it would be less trouble to drive artificial swarms into the hives prepared for them, but we like to be certain that the queens are with the swarms, and hence we drive them into hives without sticks, so that we can have a full view of the swarms. When driven into hives with cross sticks the bees hang in clusters on them, making it a difficult matter to see the queens. As soon as the queens are seen we give the hives a sudden shake or violent thump, causing every bee to lose its foothold, and in an instant throw them into other hives prepared with sticks and guide combs. If you do not look for the queens (and many beginners do not), in artificial swarming, the bees should be driven into the hives prepared for them at once.

BEES NOT SWARMING (A Young Apiarian).—No one can tell why your hive has not cast off a second swarm. Bees swarm more readily some seasons than others, and sometimes hives are prevented by weather from swarming when they are ready, or have young queens set. The queens have to be torn out, though the bees are clustering out all the time. Bear in mind that though first swarms are the progenies of full hives, second swarms are not. Frequently second swarms are obtained from hives that are not full of bees. The will of bees has to be considered in both first and second swarms; but in the case of the latter it is more the condition of queens than in first ones.

If second swarms are not obtained a few days after the young queens come to maturity, they will not be obtained at all, though the bees may hang out in a cluster as large as a man's hat. We advise you never to let bees waste their time long in clustering outside their hives. Either swarm artificially at the proper time, or enlarge your hives.

DRIVING BEES OUT OF A SUPER (Tipperary Subscriber).—By blowing smoke into supers rather vigorously bees run below. Sometimes a few decline to leave supers. The slightest touch of sulphur amongst the burning rage will make them go off; but it must be used with the greatest caution and moderation, for if bees are in strength it will kill the bees amongst the combs in an instant. Dead bees amongst honeycombs are all but immovable. The cure is worse than the disease. Drive all the bees you can out of the supers, take them off, place them in a cellar or room, and the bees will fly to the window.

SEPARATING HONEY FROM THE COMB (Idem).—We do not practise Langstroth's mode of boiling full combs to separate honey and wax by one operation, and we should not advise you to follow his suggestion. Better lay the combs, which have been some weeks without bees, in milk-pans before a fire till they are warmed a little; then run the honey by the usual process, but in warming the combs take care not to melt them by the heat of the fire. It is much better to run the honey from combs while they retain their natural heat.

MOTH IN FUN OF STAGS' HEADS (J. W.).—Sprinkle them thoroughly with diluted carbolic acid.

REMARKS.

8th.—Fair, but dark and hazy morning; fine pleasant day; and starlight night.

9th.—Very fine hot day; lightning in S.W. at night.

10th.—Very hot, rather high wind; lightning in E. and W. at 8 P.M.; thunder at 9 P.M.; thunder shower about 11 P.M.

11th.—Fine morning, but soon clouding over; very cloudy after 3 P.M.; thunder 2 to 5 P.M.; and lightning in E. at 4, and more or less till 7.30 P.M.; heavy rain 7 to 8 P.M.

12th.—Very fine throughout, though looking stormy about 8 P.M.

13th.—Rather hazy morning, very fine afterwards.

14th.—Fine, warm, summer day.

Warmest week this year, prevailing wind westerly.—G. J. SYMONS.

COVENT GARDEN MARKET.—JULY 15.

BRISK demand for and good supply of the usual sorts of hush fruit; a large quantity being taken to the north, so that the markets generally are kept cleared. There is again a large cargo of West Indian Pines of good quality on the market, and these have much reduced the demand for home-grown. Black and White Grapes are very plentiful, but do not reach the usual standard in appearance.

From observations taken near London during forty-three years, the average day temperature of the week is 74.4°; and its night temperature 50.5°. The greatest heat was 93°, on the 24th, 1853; and the lowest cold 34°, on the 29th, 1858. The greatest fall of rain was 1.48 inch.

PERPETUAL-FLOWERING CARNATIONS.

HERE is no more beautiful and sweeter flower than the Carnation, no plant so intractable as regards training, none so ungainly and uninviting in aspect. It is quite necessary to state this, for anyone attempting its culture must not expect to find in the Tree Carnation neatness of habit, nor need compactness be sought by an infinity of stakes, and twisting and twirling the shoots about them until a balloon or other form be secured.

The shoots are so brittle, so apt to snap at the joints, that very careful handling is at all times necessary. The best form of plant that I have tried is cylindrical, a few neat stakes, painted green, being placed all round the pot, and the shoots trained on them in a spiral manner; this tends to induce the plants to put out shoots near the base, whereas when the shoots are trained erect those for future flowering are put forth at the upper part of the plant, and the plants attain a height altogether disproportionate to the furnishing of the base. Even young plants from cuttings have the tendency to grow tall. Stopping will, of course, encourage the production of shoots from the base, but they are slow to appear, and after all will grow as tall as the shoots first stopped would do before throwing for flower. I like the plants, however, to have three or more—in fact, as many shoots as can be had before allowing them to run up; but then stopping for the production of side shoots must be practised for a considerable time before the desired result is obtained, and the number of flowers is not increased to such an extent as to warrant this course of preparation being followed. It will take two years, and in some instances three years, to form a plant well furnished at the base, the plants during that time requiring considerable attention in watering, and taking up in winter, when they must have protection, space that in many cases can ill be spared; whilst if we content ourselves with a smaller plant that may be stopped once or not at all, it will give us nearly as many, sometimes quite as many, flowers in twelve months as the plants two or three years old.

Young plants flower more freely, and have finer flowers than older plants; they take up considerably less pot room, less head room, and are passable in appearance, which is more than can be said of plants after the first year of flowering. I have not seen a really passable plant of a Tree Carnation or Picotee: I have heard of them, and should, indeed, be glad if anyone would let out the secret of forming a really handsome plant. I know some are of dwarf, I ought to say herbaceous, habit, the flower stems rising from the plant at no great distance from the soil, dying down after flowering, the young shoots not produced upon their stems, but rising from the base, and so preventing that legginess complained of in the Tree Carnation. Such, however, are not Tree Carnations; the flowers are not produced in succession, but all at a time, the flowering being then over for the season: hence they are not Tree nor Per-

petual-flowering Carnations, though they may be the offspring of plants having the Tree and Perpetual-flowering habit thoroughly fixed. It is noteworthy that seedlings from a Tree Carnation will afford both the Tree and the border type of plant; some will grow 3 or more feet in height without putting out a side shoot, and when they do so it will be at an undesirable distance from the base of the plant. This last is the true type of the Tree Carnation, and the only one exhibiting the Perpetual-flowering character. It does not flower in summer if the seed is sown in the April of the previous year, or not until late in summer, and the flowers are slowly and successively produced; the majority of such plants do not flower until late in autumn, and in a suitable temperature (50°) their blooming is prolonged until spring. These are the most valuable, they flower at a time when sweet-scented and useful flowers for cutting are scarce, and few are so enduring in a cut state.

The other kind, resulting from the seed of a Tree Carnation, has no claim to the name, nor to be considered Perpetual-flowering. It should be placed under a distinct head. Its merits are dwarfness of plant, profusion of bloom; the flowers are as sweet, but not so large as those of the Tree Carnation, having more the character of a Pink than of a Carnation, and having the toothed or serrated edge, showing the tendency to revert to the species, whilst many such seedlings have very fairly-formed flowers, though with narrow petals. The flowers are good for cutting, and more freely produced than in the florists' varieties. In this kind fresh shoots spring from the base of the plant, and do not extend upwards nearly so much as the others without flowering, the height varying from one foot to three or four. I have one that does not exceed a foot in height, with rather small flowers, smooth broad petals, and good in form, it being a Picotee with a white ground and maroon edge; another, rather tall (2 feet 6 inches), producing its shoots from the base, has large flowers 3 inches across the base or lower petals, it is a yellow ground with a carmine edge—a Picotee, of course, and a perfect half ball. There is also among some seedlings a pure white Carnation superior to The Bride, having the dwarf habit; and another of a monstrous character, white ground with purple edge, and measuring 4½ inches across. It is a sort of flower within a flower, not uncommon to the Rose, but, unlike the latter, forming a green centre, the Picotee having two perfect calyces, one inside the other, and what is most remarkable, the petals of the pod within the pod appear simultaneously, and so we have a large flower of many petals.

Allusion is made to these seedlings not with the view of praising them, for there are no doubt others vastly superior—though some of the best named varieties do not put them to shame—in colour and form; whilst for profusion of bloom I have no hesitation in pronouncing in favour of seedlings. They have not all double flowers, but the single are not more than a sixth, and even the single flowers are not altogether useless, nor wanting in scent. Seedlings are also freer in growth than plants perpetuated from cuttings, and come very true to character. Seeds in

separate colours may be had of our principal nursery and seedsmen in Self, Flake, Bizarre, and Fancy varieties, and Picotees of the Perpetual or Tree kind. After growing them anyone will not care so much about the named sorts, seedlings being for general purposes much more easily managed.

For plants to bloom late in the summer, and in the autumn and winter of 1873, prolonged into 1876, no time is so good for sowing as the middle of July. Seeds sown in March or April will produce plants which will flower in the May and June following and up to autumn. In either case all that is required is to sow the seeds in pots or pans of fine soil, covering about a quarter of an inch deep, and place in a frame, keeping the soil regularly moist. The plants will soon be up, and should be kept near the glass, and have air. When the second leaves are about an inch long, pot-off singly in 3-inch pots, and stand them on ashes in a cold frame, kept rather close and shaded until re-established, and then they cannot have too much air and light; only in the case of the seedlings raised in July rains should be guarded off. This may be done by tilting the lights. In winter the plants should have protection from frost, with air at every favourable opportunity, and when the weather becomes mild in spring well harden-off, and shift into larger-sized pots in April, $4\frac{1}{2}$ -inch pots being quite large enough. In May, after having been well hardened-off, they may be placed in a sheltered position on ashes outdoors, and be duly supplied with water. Early in June they should have 6 or 7-inch pots, according to their size, and be returned to the same position, fully exposed, but sheltered from winds. In potting, have the soil rather dry, and pot firmly. Keep duly supplied with water, and in September remove to a light airy house, with a temperature ranging from 45° to 50° . Neat stakes will be required to support the flowering stems.

The plants from seed sown in April will need to be potted-off when the first pair of second leaves are developed, and should be sheltered in a cold frame for a few days, keeping rather close and shaded, moist but not wet, then expose fully to light and air, keeping in summer in an open sheltered situation, and in September remove to a light airy house. The plants may be potted in 6 or 7-inch pots in September when the $4\frac{1}{2}$ -inch pots become full of roots. They need no further potting, and will, with due care in watering, flower early in summer, and continue to flower for months. After flowering they may be cut down to the young shoots, and be fresh potted, giving a slightly-increased size of pot, the sides of the ball being loosened. Moderate drainage will suffice, but it should be free, as also should be the compost, which, though made firm, ought to be of a gritty nature. Good, rather strong, fibrous yellow loam three parts, half a part leaf soil, half a part old, dry, cow or hotbed manure, with a sixth part the whole of old mortar rubbish, the whole broken-up small, but not sifted, form a suitable compost.

Named varieties are increased by cuttings, which, for winter-flowering, are best taken off in February; one good joint and the growing point will be enough. They may either be placed singly in small pots, which I prefer, as there is no fear of disturbing the roots in potting, or they may be inserted round the sides of a pot in sandy soil, placed in a mild bottom heat, and covered with a hand or bell-glass. If kept moist they will be rooted in a few weeks, and their being so may be known by their growing freely. Then admit air gradually, and withdraw to a cooler house, when they may be potted singly, or if in single pots, placed in those $4\frac{1}{2}$ inches in diameter. In June they may be turned out of doors after being well hardened-off, standing them on ashes in a sheltered position. It does not answer to plunge the pots, for though the plants grow more freely, the check consequent on removal is too great; at least, they do not flourish after removal. They ought to have 6 or 7-inch pots after the pots are full of roots, and before becoming pot-bound. These sizes of pots are sufficient for plants the first year. By the middle of September they should be housed and have a light airy position. To flower satisfactorily the temperature should not be much less than 50° from fire heat; the reason they do not flower in winter in ordinary greenhouses is solely want of temperature. As the plants advance the stems will need the support of neat stakes. When showing for bloom weak liquid manure may be given at every alternate watering.

Cuttings may be put in at intervals throughout the year, monthly if thought desirable, but three times will be often enough—namely, in February, June, and September. The February cuttings will give a late winter bloom, the June ones a summer one, and those put-in in September the best autumn

and winter-flowering plants. They will strike without heat under a glass in the greenhouse shaded, but the rooting is more speedy in bottom heat. Those having a few plants will do well to keep up the stock by putting in cuttings occasionally, as from some unknown cause the plants die after they are large. Large plants need not be potted oftener than once a-year, giving the least possible shift; but I have ceased to care for old plants, and intend growing young plants and cuttings.

To prevent the bursting of the "pod" of bloom place a ligature about half way up the calyx; the best is an india-rubber band, such as may be had of most stationers. Cut down the upper part of each division of the calyx to the band to enable the flower to open regularly.

A dozen of the best named kinds are—

Asot Yellow (Picotee), edged with crimson.	Prince of Orange (Picotee), yellow, edged crimson.
Empress of Germany, white, striped rose.	Princess Beatrice, bright rose.
La Belle, white.	Princess Christian, pink.
Le Grenadier, scarlet.	Queen of the Belgians, white, striped rose.
Marchioness of Westminster, deep rose.	Vulcan, bright red.
Monsieur Baldwin, scarlet.	Zouave, red.

—G. ABBEY.

LOVE AMONGST THE ROSES.

THE reason why no report appeared of the Exeter Rose Show in our last Journal was simply this: I reached home on Saturday evening, and on Monday evening left again for Birmingham, and so had no time. Although a report from a local paper, and a very good one, has appeared, yet I think that a gossiping report of

THE DEVON AND EXETER ROSE SHOW

will not be out of place. Devon is *par excellence* a Rose county. Do we not owe to it Devonensis, prettiest and best of English Roses? Do not some of our very best amateurs live there? Are not my very good friends, Mr. Baker and Mr. Camm, not only enthusiastic but liberal admirers of our queen? for they have testified to their zeal and liberality by offering a £20 prize for the best seventy-two Roses (and the competition for this formed one of the features of the Show). And not even Hertfordshire itself, with its rich fatty loam, can excel this county in its capability for growing the Rose; and yet, as I have already stated, nowhere have I seen more terribly the results of an ill-conditioned spring than in the soft and balmy climate of Exeter.

The Exhibition was held in the public grounds called the Northernhay, and under the able management of Mr. Gray and the exertions of a capital Committee all went smoothly. The arrangements were admirable, and there was no jarring or strife, there were no complaints of favouritism, and the harmony that prevailed was what ought to be ever seen at a flower show. I hope the time is rapidly passing away when discontent and jealousy are the order of the day. Politicians who can fire away finely at one another in the House can be the best of friends in private; the barristers who have been belabouring one another during the case can hobnob together at the bar mess afterwards; and florists (most of all rosarians) should be able to do the same, and if beaten bear no ill will. Nothing can be more unseemly than an infuriated exhibitor, or, what is as bad, the quietly cynical one who wonders what those Judges know about flowers.

I have never seen a closer fight than in the class for the £20 prize; and never have Judgea had a more difficult and responsible task enhanced than by the fact that there was a drop in the second prize to £5; and for the season a fine lot of blooms was staged, the competitors being Messrs. Paul & Son, Turner, Cranston, Keynes, Prince, and Cant—the very *crème de la crème* of our professional exhibitors. After a long and careful examination the first prize was awarded to Messrs. Paul & Son, their box of blooms being more even and better finished. In it were remarkably fine blooms of Etienne Levet, Charles Lefebvre, Centifolia rosea, Duc de Rohan, Louis van Houtte, Bessie Johnson, Cécile de Chabrilant, Souvenir de Paul Néron, Cheshunt Hybrid, Marie Baumann, Comtesse d'Oxford, Madame Lacharme, Louise Peyronny, Baronne Rothschild, and their own seedlings—Reynolds Hole, a very fine dark Rose, and which will worthily represent the rosarian whose name it bears; Wilson Saunders, a very fine flower of the Charles Lefebvre type, but free from any velvety shading; The Shah, a seedling from Duke of Edinburgh; and another

unnamed seedling, which promises to be a very fine garden Rose, brilliant in colour, and good in habit. I shall have more to say of these by-and-by, as I have visited them in their own home since the Show. Mr. Turner was a good second, and amongst his exhibits were Miss Poole; Le Havre, a truly beautiful Rose, brilliant in colour and good in form; Antoine Ducher, Devienne Lamy, Duchesse de Caylus, Edouard Morren, Ferdinand de Lesseps, François Michelin, Général Jacqueminot, Elie Morel, Marguerite Dombain, Marquise de Castellane, &c. Mr. Cranston and Mr. Prince were placed equal third. In 48's Mr. Turner was first, and Mr. Keynes, who has had to fight under great disadvantages, came second. His blooms wanted size, but that was not to be wondered at. The classes for new Roses were again disappointing, and no way altered my already expressed opinion that no great harm would be done to cut them out altogether.

In the classes for amateurs our enthusiastic friend the Rev. J. B. M. Camm came out with flying colours. He was near at home, and one's only regret was that the great loss sustained by Mr. Baker had not brought these two redoubtable champions into a closer contest. Mr. Camm was first in forty-eights and twenty-fours, and, as usual, was strong in Teas. His blooms of *Souvenir d'Elise*, *Niphetos*, *Souvenir de Paul Néron*, *Maréchal Niel*, and others are always a sight, and certainly tend greatly to enhance the beauty of his boxes; but we saw at Birmingham how one exhibitor had lost his chance by too great a predilection for Teas, putting in some blooms, because they were Teas, which had much better been left out. Besides these Mr. Camm had some fine blooms of *Alfred Colomb*, *Baroness Rothschild*, *John Hopper*, *Marie Baumann*, and other good Hybrid Perpetuals. Mr. Baker came in a very good second in the class for twenty-fours.

I must not omit a reference to the tent containing the entries for table decorations and vases of cut flowers for two reasons. First, because it gives me an opportunity of endorsing what my friend "C. P. P." said in the last Journal as to the extreme into which many have been led, owing to their desire to avoid overcrowding, to make their vases poor, forgetting, too, that as they have to be seen at night, the few flowers on which they do rely then fade into nothing; and secondly, because I have not seen, taking them all in all, a better collection of stands—far better, let me say, than those I saw at Birmingham in the following week. Those exhibited by Miss Harris, of Salisbury, which won the bracelet given by the Sheriff, were excellent; while the vases of wild flowers were admirably set up. The time was a fortunate one for those who exhibited in the class, as the scarlet Poppy (the only scarlet flower we have except the little Pimpernel) being in flower tended to relieve that dulness which is too often the characteristic of bouquets of wild flowers.

I hope the many kind friends with whom I was brought in contact, and to whose numerous invitations I was obliged to give an unwilling No, will let me say how cordially I thank them for the very great kindness, &c., with which I was received, and to say how greatly I prize that friendship which has been originated, and which will be, I hope, strengthened by our common loyalty and devotion to the queen of flowers.—D., Deal.

TURNIP CULTURE.

ALL gardeners know the importance of having an early crop of this desirable vegetable, but I think few save those who have to grow Turnips know the amount of anxiety attending their cultivation in the early season—that is, from March up to the beginning of July. From that period up to the end of the month, which may be considered a good time to sow the main crops, there is seldom any difficulty after the plants are fairly started, and if on well-managed ground a good crop may reasonably be expected. During the early season, however, when the Turnip is most scarce, and often most wanted or called for, there are many things which operate seriously against its growth, and render the condition of the crop very precarious.

In all my experience I have no recollection of such a peculiar season as the present for the growth of this particular vegetable. My first crop sown at the beginning of March all run to seed, not one fit for use. In other seasons more favourable I had a few dishes, though it is not a crop from which much can be expected, but I have never before been without having sufficient to be considered worth the trouble. My second crop, sown a fortnight later, came up well, and grew fairly till the

flea attacked the plants, and so ravenously that, notwithstanding all so-called remedies, it devoured it, and I only had about four dishes fit for table; the remainder, though of a fair size for the sort (Early White Dutch), were only fit for flavouring soups, &c. The next crop, sown the second week in April, consisted of three sorts—Early White Dutch, Early Stone, and White Globe. My object in sowing three sorts was to ascertain if the most vigorous would fare better than the dwarfed sorts under the difficulties that beset them; the Early Stone being a coarser grower than the White Dutch, and the White Globe much the coarsest of the three, though neither of the two so early as the White Dutch. I am glad to say that this is a better crop. Very few of the White Dutch were fit for use; they were hard and stringy. The Early Stone produced a number of even-sized Turnips, most of them fleshy and good, though not so large as usual, and the White Globe is the best of all; although I have had to wait some time longer for them than for either the other sorts, this is the one that pays the best. White Globe and the Early Stone appeared vigorous enough to grow out of the way of the attacks of the flea, but the leaves of the White Dutch were entirely eaten up by this little pest. At one time I almost decided to pull them up, but I thought of what a Scotch gardener once told me when I was serving under him in the kitchen garden—it was about a similar occurrence. He said, "By no means pull them up. Let this lot stand and save the others; for if you destroy these the flea will attack the other sort, and we shall be likely to lose all." There was, in my opinion, much truth in that. The Turnip flea has a preference for certain varieties of the plants which it attacks, and so it seems to have for the Early White Dutch Turnip beyond other sorts, so far as I have seen. Can others confirm that?

In some gardens with some sorts of soils, light and poor, or heavy and not well cultivated, early Turnips seldom turn out well; but in gardens situated somewhat low and moist, with a moderately rich well-cultivated soil, there is less difficulty in getting good early summer Turnips. Such gardens may not be so suitable for the generality of spring crops, but the Turnip likes a cool bottom retaining moisture to a good extent. At Chilstone Park, in Kent, there is a large pond running along the whole of one side of the garden, and this seldom suffers to the extent that others do in a dry spring or summer, because from its situation the bottom, after one gets down to the depth of 3 feet, is always cool and moderately moist. This garden turns out some of the finest spring and summer vegetables I have ever seen, and among them generally some excellent Turnips early in the season.—THOMAS RECORD.

NOVELTIES IN THE ROYAL GARDENS, KEW.

THE Victoria regia has commenced to flower, and will continue till the end of October. The bud opens between five and six o'clock in the afternoon; the petals are then pure white, and a delicious perfume is emitted. The flower closes in the morning; and when in the evening it again opens, the petals are tinged with red, and they then become reflexed. The plant is raised from seed every year, and sown about the 1st of January. It flowers in about twenty-six weeks; the leaves have then attained a diameter of 6 feet, and the plant fills a tank 36 feet in diameter. "D'Orbigny says, 'When I reached Corrientes . . . the inhabitants informed me that the seed is a valuable article of food, and being eaten roasted like Maize it has caused the plant to be called Water-Maize (*Maïs del Agua*).' M. Bonpland says the farina is not only superior to that of the Maize, but that it is preferred to the finest Wheat and to the flour of the white Cassava."—(*New Garden Guide*.)

Several Yuccas are in flower. *Y. recurvifolia*, between the New Range and the Palm house, is, perhaps, the most handsome, partly from the graceful habit of its recurved foliage. The others are near the Temperate house—*Y. filamentosa*, *Y. flaccida*, and *Y. gloriosa*. The different species are of the greatest value for town planting.

On the Rockwork, of interest and recently open, are *Sedum arborescens*, a distinct species apparently unpublished. It is a perennial of erect branching habit; the leaves are small and terete, or on the stouter stems shorter and of conical form; the flowers are white. *Mimulus cardinalis roseus* is a pretty variety with rose-coloured flowers. *Lilium philadelphicum* is a striking species about 1 foot high. The flowers are orange-coloured with dark spots. It has a distinct appearance, from the long claw of the perianth segments. According to Dr. Drummond the bulbs are eaten by the Indians. *Campanula Zoysii*

is a pretty new species, and one of the smallest. It is a native of central Europe. The leaves are produced in a tuft, from which rise the flower-stems, each bearing a few erect flowers; the corolla is light blue, tubular, narrowing to the top, and has small teeth that incline slightly inwards, and have on the inner surface numerous fine hairs, closing the mouth and evidently preventing the free ingress of insects. It is free-flowering and quite distinct, and should be added to every collection. *Echinopsis Eyresii*, which is hardy in the south of England, has a fine flower about 7 inches long and about 4 in diameter.

In the Orchid house in flower are two plants of *Oncidium lanceanum*, one of which has an extremely fine spike. The flowers are richly coloured with a lip nearly white. Two of the flowers at the top are united by their ovaries, and the union continues along the centre of the back of two of the sepals for about three-quarters of their length. There is otherwise no deviation from the structure. *Calogyne speciosa* is interesting from its curious brown lip, and is nearly always in flower. *Cypripedium Stonei* is very attractive. *Broughtonia sanguinea* is of a crimson colour rarely found among Orchids. It lasts in bloom a considerable time. Some cultivators have found it difficult to grow; a high temperature with plenty of moisture is what it seems to require. *Sobralia macrantha* is flowering on stems about 18 inches high. *Oncidium Wentworthianum* has a fine spike more than 7 feet long; *O. Schillerianum* has a long and slender tortuous spike with numerous small flowers. *Odontoglossum Lindleyanum* is scarcely worth cultivation. The bulbs are much like those of *O. Alexandræ*, for which it has been imported. *O. Schlieperianum* is also in flower.

In the Temperate house *Passiflora cinnabarina* has been in flower for a considerable time. It only requires an increase of breadth in the petals to be a valuable climber, and might repay the attention of hybridisers. It is of free growth, with large dark green leaves, producing the red flowers freely. If to the other qualifications could be added a well-formed flower of the same colour it would be a decided acquisition for the greenhouse. It is a native of Australia, and is figured in the "Botanical Magazine" of 1871. *Sollya linearifolia* is a delicate climber, with wiry stems, small leaves, and deep blue campanulate flowers. *Desfontainea spinosa* is a Peruvian shrub much resembling a Holly, and when in flower is very beautiful. The flowers are tubular, bright scarlet, with a yellow limb, and are freely produced. It is nearly hardy, and will stand out of doors in favourable situations. *Fuchsia fulgens* is very handsome planted out and in pots. *F. corymbiflora* is equally handsome, though quite different in style.

By the riverside two forms of *Colutea arborescens*, the Bladder-Senna, are very ornamental and attractive. The one has light-coloured flowers and pods, and the other dark. They are flowering freely, and have a large number of the curious bladder-like pods. Though a common shrub it is worth a conspicuous position; it is one in which few would fail to be interested. It may be increased by means of cuttings or seeds; the latter are freely produced. The leaves are recommended as answering all the purposes of Senna. "It is a native of the middle and south of Europe in hedger and bushy places, on Mount Vesuvius, even in the ascent to the crater, where hardly any other vegetable is to be found."

On the wall of the Herbaceous ground the interesting *Rubus biflorus* is bearing fruit, for which it might be cultivated. The strong white stems are very ornamental. It requires the same cutting-away of the old canes as the Raspberry. It has been distributed as *R. leucodermis*, a name it well deserves, but which it cannot hold, as a North American plant has prior claim. Among the Lilies, the white-flowered *L. longiflorum* and *L. longiflorum* var. *eximium* are very handsome and are deliciously scented. The latter is a form with large flowers and is the better of the two. *Gaillardia Amblyodon* is a new and very desirable species from Texas. The flower-heads are 2 inches in diameter, with ray florets of a rich cinnabar red. It was figured in the "Botanical Magazine" for February of this year.

In the Succulent house several *Fourcroyas* are throwing up flower-stems—a large plant of *F. gigantea*, two plants of *F. Selloa*, and *F. Commelyni*, which has not yet been figured.

CERCIS SILICUASTRUM.—Your correspondent, Mr. A. M. C. Jongkindt Coninek, on page 59, refers to three grand specimens of this curious yet beautiful plant, all of which he states are growing against walls in the Botanic Gardens at Leyden.

There is a specimen of this "plant," or, as I should call it, "tree," in this ancient borough (Guildford) growing quite in the open, which I have lately measured, and find that its height is 27 feet 6 inches, and the spread of the boughs 36 feet. The main stem is forked just above the ground, and each limb at 3 feet from the ground is 3 feet 6 inches in circumference. Frost does not appear to affect this tree.—X.

FLOWER GARDENS IN WINTER AND SPRING.

No. 3.

To *Leucojum vernum*, the Spring Snowflake, is assigned in this paper the prominent position of which its great, and, I regret to say, not-very-well-known merit, renders it worthy. It puts forth its abundant, pretty, and very sweet-scented white flowers in March, each one drooping singly from stems that are not more than 6 inches high. Like most other plants of this class, it thrives best in a light sandy soil that is well drained, as does *Puschkinia scilloides*, which is another dwarf and exceedingly lovely plant, but very little known, although it was introduced into this country from southern Russia upwards of fifty years ago. Its flowers are of a delicate bluish white colour, and it is nearly uniform in height with the Snowflake. The Italian Windflower, *Anemone apennina*, is another very valuable plant. It is perfectly hardy and most accommodating in its habit, thriving alike in shade or sunshine, its large flowers expanding with the earliest Snowdrops. Although each flower is borne singly on its stem, yet the dense-growing plants yield them in such rich profusion as to form perfect sheets of the deepest blue. Once planted it quickly becomes established, requiring no further care or special attention at our hands, and it is certainly most worthy of a prominent place amongst those plants which we regard as worthy of being permanent occupants of our gardens.

Turning now to what have come to be recognised as the legitimate bedding plants of spring, a perfect mine of floral wealth lays open before us. Most of the species included under this heading have several varieties, and as the number of these is constantly increasing, the work of selection assumes a proportionately difficult aspect to the beginner. Blossom is decidedly in the majority here, the number of plants that are valuable for their foliage alone being comparatively limited. The foliage of the Golden *Pyrethrum* assumes a deeper richer shade of yellow than it does in summer; it is certainly the most effective plant of its colour for an edging or front row in beds or ribbon borders. Golden Thyme, though not so bright, makes a neat and pretty edging. But it is in *Arabis lucida* variegata that we have the most charming combination of neatness and elegance; it is just one of those plants which one cannot have too much of. Conceive the effect of an edging of it 6 inches wide, with a similar band of the lovely little rich blue Siberian *Scilla* behind it; follow this with the sprightly pink *Saponaria calabrica*, then let there be a row of the soft grey *Santolina Chamaecyparissus*, composed of plants about half-grown—not with growth blended together, but with the rounded forms just touching each other; and what combination of any plants in any season could equal or at all approach this? I have never had enough of the peerless *lucida* in my hands to plant it in this way, but I am fully aware how exceedingly fine it would be. The more robust *Arabis albidis* variegata, with a pale yellow variegation, so pale that it is often termed white, is a very neat useful plant, far better known than *lucida*. Cuttings taken in October strike well in cold frames during winter. The handsome foliage of the golden-variegated *Vinca major*, borne in pairs upon the long, trailing, flexible growth, as well as the deeper green and rich yellow of the rigid erect-growing *Euonymus ovatus aureus*, are equally desirable for groups or beds of bolder type. *Euonymus radicans* variegatus makes a good silvery edging, but it requires some little time to become thoroughly compact. It may be propagated in spring in heat if cuttings are taken from pot plants growing under glass, or in summer under bell-glasses on open borders. *Ajuga reptans*, the common Creeping Bugle, is much valued for its dark-coloured foliage, which is very effective for geometrical designs or for edgings. Those who are unacquainted with this plant must not expect to find the refinement or richness of a *Colens* in it. I need hardly allude to this, however, for it must be patent to all that the texture of the foliage of plants which are so hardy as to withstand the severity of our hardest winters must of necessity be proportionately stout, and with a harsh and rugged surface. Of other fine-foliaged plants, *Antennaria tomentosa* is inter-

esting upon the sides and crests of ramps or other elevated positions. The *Cerastiums* are, of course, useful, and so are *Sempervivum californicum*, *Sempervivum arachnoideum* (the pretty little Cobweb Houseleek), and another alpine Houseleek, *Sempervivum montanum*.

The bright blue flowers of the alpine Gentian, *Gentiana verna*, are the first of its species that greet us in spring, but they are quickly followed by those of our old favourite *Gentianella*, *Gentiana acaulis*. Deepest and richest of blue flowers, its dwarf compact rosettes yield them in most glorious profusion during April, May, and June. It cannot be induced to do this in full perfection for a year or two after it is planted, and it is consequently more frequently grown in borders or upon rockwork than in the flower garden. None of the varieties of this genera appear to adapt themselves very readily to new quarters, and I have repeatedly experienced this in

transplanting the Marsh Gentian, *Gentiana Pneumonanthera*, from its wild haunts. The double red, pink, and white Daisies; all the *Hepaticas*; the self-coloured purple, blue, white, and yellow Pansies; all the varieties of *Primula vulgaris*, as *Primula elatior*—a bed of mixed kinds of *elatior* has a very brilliant appearance in April and May—the snowy-white *Arabis alba*; *Alyssum saxatile compactum*, of dwarf and compact growth, with bright yellow flowers; the brilliant little *Adonis vernalis*, having very large and striking yellow flowers; the fine old favourite *Viola cornuta*, so easily increased for the spring beds by cuttings taken in July; the pretty rose-coloured *Phlox subulata*, or *frondosa* as it is sometimes termed, and its white variety *alba* or *Nelsoni*, both charming little plants that are densely covered with bloom in April and May; *Lithospermum prostratum*, with its dense rich clusters of lovely blue flowers; and the fine old *Omphalodes verna*, with its brilliant

Fig. 23.—DESIGN FOR A CIRCULAR BED ON TURF.

No. 1.

1. Pink Daisy (double). Pink.
2. *Ajuga reptans rubra*. Deep crimson.
3. *Saxifraga hypnoides*. Grey.
4. *Viola cornuta*. Pale blue.
5. *Arabis alba*. White.

No. 2.

1. *Saponaria calabrica*. Pink.
2. *Arabis lucida variegata*. Yellow.
3. *Sempervivum californicum*. Green and black. The acroll to be slightly elevated.
4. Rich purple Pansy (*Cliveden Perpetual*). Purple.
5. *Cheiranthus Marshallii*. Clear yellow.

No. 3.

1. *Viola Lothair*. Indigo blue.
2. Double red Daisy. Red.
3. *Arabis alba variegata*. Pale yellow.
4. *Silene pendula*. Pink.
5. *Myosotis sylvatica alba*. White.

No. 4.—BULBS.

1. *Scilla sibirica*. Deep blue.
2. *David Rizzio Crocus*. Purple.
3. *Cloth of Gold Crocus*. Yellow.
4. *Tulip Rose Gris de Lin*. Rose tinged with white.
5. Mixed clump of *Hyacintha*.

spikes of deep blue nestling so prettily among the dark green foliage, are all worthy of attention, and are easily cultivated, the annual stock of most of them being obtained by division or cuttings taken immediately after the flowers fade.

If sufficient space can be obtained for nursery beds behind a north wall, it is preferable to a situation that is fully exposed to the midday sun, whose burning rays try the young offsets so severely before they are well established, that shading should be promptly applied when necessary. Once fairly

started, due attention to weeding and watering is all that is necessary till the plants are required for the beds in autumn. There is one rule in reference to the soil of such great importance that I do not hesitate to repeat it here. It is never to put spring-flowering plants of any description in soil that is of a close, adhesive, heavy texture, or that is likely to become waterlogged. Make the soil tolerably light, rich, and yet somewhat firm, with abundance of gritty matter; drain it thoroughly, elevate it well above the surrounding level, and it

will form the most favourable staple that can be had for the purpose, as will be clearly seen in the increasing prosperity and rare failures among sorts that have not answered well previously.—EDWARD LUCKHURST.

The accompanying design (*fig. 23*), is suitable for beds of 20 feet and upwards to 100 feet in diameter. If the dotted circle were left out, all the bed, except the scroll, carpeted with one colour, say grey, with the scroll of blue, and the little circles, 2, of crimson, the effect could not fail to be very striking.

MELON JUDGING.

MR. W. TAYLOR (page 47), does me the honour of criticism, which though upon the whole unfavourable to my views respecting Melon judging, to some extent coincides with them. I am glad Mr. Taylor so far agrees with me as to consider "a noble Melon is a great addition to the dessert;" but the following sentences of his second paragraph all go to show that a noble fruit is often disappointing, "not so good as it looked." I do not see how Mr. Taylor can reconcile such a statement as that in the second paragraph—viz., "A noble Melon, but not so good as it ought to be;" and in the third paragraph advance all at once to the contrary opinion, "The most perfectly-developed and highest-coloured fruit" are "also the best flavoured." This I also agree with except as to colour, which I submit is no criterion of flavour in a Melon. "Perfect development," as I accept the term, does not of necessity mean size, nor is "the smallest examples" a plant produces intended by me to have the highest flavour; but I do submit that a Melon plant with three fruit, or less, of not more than 3 lbs. weight each, will have them of better flavour than a plant of which the fruits weigh over 5 lbs. each, the kind being the same, the culture equal, and flavour the test of judging. High colour is not accompanied by high flavour. Some Melons are naturally high coloured—examples, Golden Gem, Golden Perfection, &c., which are good high-flavoured sorts; but we have others equally high in colour, as Paterson's Hybrid, which has been grown to, I believe, 21 lbs. weight, equal in colour to either, with a flavour no better than that of the Mammoth Gourd when ripe.

Grant "the most perfectly-developed and highest-coloured" Melon to be also the best flavoured, and I shall not complain of Melon judging, making no reservation, only that the highest-coloured fruit refers to the highest-coloured specimen of its kind, and not to Melons generally, to any and every kind alike, for they go in races as do Grapes; and to be guided by the colour irrespective of the kind, would be to arrive at an issue foreign to their quality.

"Culture is everything," says Mr. Taylor. No one can tell the quality of a Melon by the exterior, "to be judged correctly it must be cut and tasted." Why? Mr. Taylor tells us, "the most perfectly-developed and highest-coloured fruit of any given kind are the best flavoured." What is there in a Melon that causes such an uncertainty of quality? What is there to recommend the present system of judging Melons by cutting them, other fruits being exempted from so mutilating an ordeal? Simply nothing but prejudice arising from long usage. Were other fruits to be judged by the same test, that of flavour, I venture to predict the prize lists would be different from what they now are, our shows of fruit would be less imposing, few earring to send fruit to be plucked, cut, spoiled in appearance, and wasted.—G. ABBEY.

STELLARIA GRAMINEA AUREA.

Among the newer or least-tried bedding plants of the season this—known best, perhaps, by the name of Golden Chickweed—will, if I mistake not, have many admirers on account of its excellent qualifications as a plant remarkably well suited for use in many ways in the present style of bedding. I am unable to say how long it has been before the public, but last year it came under my notice, and I considered it was a treasure. This spring a friend sent me half a dozen plants in a match-box, with the advice to "take care of it; use all you can get for bedding, and you will like it;" and he is right. I do like it, and would ask others who grow it to let us know at the end of the season what they think of it.

I find it particularly suitable for carpet bedding; it does not exceed 3 inches in height, and it is of a far richer yellow than the Golden Feather Pyrethrum, which most people know very often carries a tinge of green in it, which rather detracts from its value; and though I think the latter plant will

not be dispensed with, yet I predict that where the Golden Stellaria can be procured they will not use so much of the other. A single line of plants will spread a foot or more wide during the summer, and it covers the ground as thickly as a mat, almost every shoot that comes in contact with the soil striking root. I have given my plants a rich soil and excellent drainage, and they seem to thrive with an abundance of water. I have used them in conjunction with *Lobelia pumila grandiflora* and *Alternanthera paronychioides*, and the effect is striking and good to those who look at it. It is increased by cuttings and division.—THOMAS RECORD.

DOUBLE PARASITISM—THE MISTLETOE GROWING ON THE MISTLETOE.

SOME time last year we called at Old Conna, the fine and most charmingly-situated residence of Phineas Riall, Esq., D.L., near Bray. Besides its situation, beautiful surroundings, and magnificent views, there is always here something to be found to interest the lovers of trees and plants, among the number of whom, we may remark in passing, few men have more claim to be classed than the genial, kind-hearted, and widely-esteemed owner of Old Conna. Whether the taste of the visitor lies among the Protean race of British Ferns (a class of plants of which Mr. Riall is an enthusiastic admirer, and of which he has about the most varied collection, both in and out of doors, to be found anywhere), or his hobby be Conifers, choice trees, shrubs, or Roses, he is sure to find at Old Conna something to interest, something to please, and not a little to instruct. But to return to the matter in hand. On the occasion alluded to, on inspecting a fine specimen of Mistletoe growing on an old Apple tree in the garden, and laden with its translucent pearly berries, many bird-sown seeds of itself were observed to be attached to the parasite. Several of these had germinated, and had apparently firmly attached themselves by means of the sucker or rooting end to the branchlets of the mother plant, but in no case then noticed had the plumule or ascending portion taken a vertical direction or developed further growth.

Being much struck with the fact, then patent, of the young Mistletoe plant rooting (if one may so term the process) in the parent tissues, we determined to keep the matter in view, and at a futuro day see what further progress, if any, was made by these partially developed little embryos. With this object mainly in prospect we called at Old Conna in the early part of the present month, and our attention was directed to what appeared to be a sturdy young Mistletoe growing on one of the internodes of the parent plant. Closer inspection left no doubt about the fact. Here was a stout young plant firmly established, which counted two or more years since it raised its little head aloft, and was then about making its third set of leaves. After admiring this tiny but to us at the time exceedingly interesting object, we proceeded to examine more closely the thicker or inner ramifications of the plant, and were rewarded by finding, growing midway on one of the thickest and smoothest internodes, a sturdy young plant three times the size of the preceding, full of health and vigour, with two principal bifurcations, four secondary branches, and five sets of its twin leaves, counting its age probably by some half dozen or more years. Here, then, we found established beyond cavil the interesting and, as far as we know, hitherto unnoticed, or at all events unrecorded, fact of the double parasitism.—(*Irish Farmers' Gazette.*)

SALT AS MANURE.

Various experiments have been made by M. Peligot and others to test the value of salt as a manure. The following summing-up seems to have been arrived at: Salt should never be applied other than in a pulverous state, and never employed on impervious, cold, and humid soils. The best manner to use it is to combine it with other manures, a dose of two hundredweight to the acre being sufficient. When selected to destroy insects, it should be applied before sunrise. In the case of cereals, salt strengthens the stems and causes the ears to fill better, and favours the dissolution and assimilation of the phosphates and silicates. It acts vigorously on Potatoes, and can be detected in their ashes to the extent of one-half of 1 per cent. Asparagus is a veritable glutton in the presence of salt. A dose of three hundredweight per acre acts without fail on Beet, injuring its value for sugar purposes, but enhancing it for the feeding of cattle. Colza has as marked a

predilection for salt as Asparagus; and in Holland, where the culture of Peas is so extensive, salt is something like a necessity. Mixed with hay in the proportion of a quarter of a pound to a hundredweight, the fodder is rendered more appetising; but the best way to feed it to animals is to allow them to enjoy it in the form of rock salt. It is calculated that a horse appropriates daily one-tenth of an ounce of salt, an ox one-half that quantity, and a sheep and a pig one-half that required by an ox.

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

CHRYSANTHEMUM CATANACHE. *Nat. ord., Compositæ. Linn., Syngenesia Superflua.*—Dr. Hooker says, "This, which is one of the most beautiful plants of the Greater Atlas, was discovered in 1871 by Messrs. Ball, Maw, and myself, in valleys of that range at elevations of 7000 to 9000 feet, flowering in May, and has since been cultivated both in Mr. Maw's garden and at Kew, where it flowered for the first time in April of the present year. In its native country it forms patches of a silvery green hue, and of considerable size, in rocky valleys, and on mountain slopes exposed to the sun. The [flowers are yellow and] broad white involucre bracts are conspicuous for their silvery whiteness, hyaline texture, and transparency, relieved by a narrow purplish herbaceous central band; their resemblance to the bracts of Catanache has suggested the specific name."—(*Bot. Mag.*, t. 6107.)

ERICA CHAMISSONIS. *Nat. ord., Ericaceæ. Linn., Octandria Monogynia.*—Flowers dark pink. "Many years ago the Cape Heaths formed a conspicuous feature in the greenhouses of our grandfathers, and in the illustrated horticultural works of the day, including this Magazine, wherein about fifty are figured. These have given place to the culture of softwooded plants—Geraniums, Calceolarias, Fuchsias, &c.; and the best collections of the present day are mere ghosts of the once glorious *Ericeta* of Woburn, Edinburgh, Glasgow, and Kew. A vast number of the species have indeed fallen out of cultivation, and a few easily-propagated hybrids for decorative purposes are all that are to be seen of this lovely tribe in most of the best establishments of England. No less than 186 species of *Erica* were cultivated at Kew in the year 1811, now we have not above fifty, together with many hybrids and varieties. Besides the fact of their going out of fashion, there have been two main causes for their present rarity; of these the first and most conspicuous is bad treatment. As with Australian and other Cape hardwooded plants, their culture is special, unknown to most gardeners of the present day, and they will not survive the promiscuous use of the water-pot and syringe, to which they are exposed if mixed-up with many other things. The second is, that very few collectors have been of late years in the Heath district of the Cape, which is almost confined to the narrow strip of country between the Western coast and the coast ranges, and where were the botanising grounds of the collectors sent out at the beginning of the century. *Erica Chamissonis* is one of the few Heaths that extend eastward in South Africa, being found near Graham's Town in the Albany district, about five hundred miles east of Cape Town, where it grows on rocky hills at an elevation of 2000 feet, flowering in October. Seeds of it were sent to the Royal Gardens by Mr. M'OWAN. The plant raised from these flowered in April."—(*Ibid.*, t. 6108.)

ROMANZOFFIA SITCHENSIS. *Nat. ord., Hydrocleaceæ. Linn., Pentandria Monogynia.*—Flowers white. "This very rare and interesting little plant, with the habit of a Saxifrage of the granulata group, is closely allied to the majestic *Wigandia* of our subtropical gardens, though so dissimilar in stature, habit, and general characters, and in coming from so different a climate and country. It is a native of a few distant spots over a very wide range of country in North-Western America, and has been gathered by very few collectors. First, by the late venerable Menzies, the naturalist to Vancouver's voyage (and introducer of *Araucaria imbricata*), in May, 1793, who discovered a small slender variety of it on hanging rocks at Trinidad, in California, lat. 41° 10' N.; next by Chamisso at Sitka in the then Russian, but now American territory of Alaschka, fully a thousand miles north of Trinidad, and by whom it was first described; more lately it was gathered abundantly by Dr. Lyall, on the Cascade Mountains, in lat. 69° N., in the bed of the Sallise river, and a large-flowered variety (*Regel's R. grandiflora*), on the same mountains, at an elevation of 7000 feet. Lastly, we have specimens collected in

South California (probably in the mountains), in lat. 35°, by Dr. Bigelow, surgeon to Lieutenant Whipple's exploration for a railway route across America in 1853-4; this is fully 1100 miles south of Sitka."—(*Ibid.*, t. 6109.)

IRIS OLBIEWSIS. *Nat. ord., Iridaceæ. Linn., Triandria Monogynia.*—"This belongs to a small group of dwarf *Iris*, which inhabit for the most part southern Europe, and of which the *I. pumila*, L. (tab. nost. 9, 1209 and 1261), may be taken as the type. It is a native of the south of France and North Italy, from Nismes eastwards, but apparently not advancing beyond Tuscany. It varies much in the colour of the flowers which [usually purple] are sometimes white. It is distinguished from *I. pumila* by the much larger flowers, which are pedicelled and less fugacious, as also by the shorter perianth-tube. The *I. italica* of Parlatore appears to be only a variety of it; and it is represented by *I. pseudo-pumila* in Sicily. It is very closely allied to, if not a mere variety of the *I. Chamaeciris*, Bertoloni, which has a wider range in France and Italy. The specimen here figured flowered in the Royal Gardens in April of the present year."—(*Ibid.*, t. 6110.)

CAMPSIDIUM CHILENSE. *Nat. ord., Bignoniaceæ. Linn., Tetrandria Monogynia.*—Flowers crimson. "This very beautiful climber is a native of Chili and the Archipelago of Chiloe, and was discovered on the island of Huaffo by Dr. Eights, an American voyager, who sent a small collection of Chilean and Fuegian plants to Sir William Hooker some fifty years ago, amongst which is this plant. It has subsequently been collected by many botanists, most recently by Dr. Cunningham, naturalist to the surveying expedition of H.M.S. *Nassau*, who gathered it as far south as Wellington Island, in lat. 40° S., where it would seem to be common. Its northern limit is probably Arique, near Valdivia, lat. 50° S., where it was found by Lechler. It is not a little remarkable that so beautiful a plant, and one found through so many degrees of latitude in Chili, should have escaped the observation of C. Gay, whose '*Flora Chilensis*,' published in 1845, does not include it. The equally conspicuous *Berberidopsis corallina* (tab. nost. 5343), which, like *Campsidium*, is a native of the neighbourhood of the maritime capital of Valdivia, was also unknown to that author, though he spent many years exploring that country for the Chilean Government. With Messrs. Veitch the plant flowered in April of the present year."—(*Ibid.*, t. 6111.)

PYRUS BACCATA.—*Nat. ord., Rosaceæ. Linn., Icosandria Dipentagynia.*—Flowers white, fruit crimson and greenish yellow. "This charming tree, though so long known in cultivation, has never before been well figured in this country. It has a very wide distribution; in Siberia it occurs in the eastern districts of Lake Baikal and in Dahuria; thence it passes by the Amur river north of China into Japan, whence we have numerous specimens. In the Himalaya it extends from the Indus to the Kumaon, at elevations between 6000 and 11,000 feet, entering the Tibetan region of Piti; and it was gathered by Dr. Thomson and myself in the Moflong woods of the Khasia mountains, at an elevation of 6000 feet. It varies very much as to the pubescence of its parts; the Siberian and Japanese specimens being almost wholly glabrous; the Western Himalayan having more or less pubescent calyces, pedicels, and petioles, and sometimes young leaves beneath; whilst those from the dry region of Piti, on the border of Tibet, are as glabrous as the Siberian; and those from the very wet region of the Khasia are the most pubescent of any. This correlation of humidity with pubescence is not unusual in the vegetable kingdom."—(*Ibid.*, t. 6112.)

RHODODENDRON—Duchess of Edinburgh.—"The beautiful varieties of the *jasmuiflorum* type of *Rhododendron* rank amongst the choicest of conservatory ornaments, being distinct in character, moderate in size, varied in colour, and without possessing a fragrance which is no small recommendation. The variation in colour is now extended, for to the white-flowered type, and Princess Alexandra, and the pink-flowered Princess Royal and Princess Helena, we have to add the striking novelty now represented, in which the blossoms are of a glowing orange-scarlet. This fine plant was raised by Messrs. Veitch & Sons, of Chelsea, and was shown at South Kensington early in March of the present year, when it was awarded a first-class certificate. The plant, which was raised between Princess Royal and Lobbi, is of the neat habit peculiar to this race. The leaves are elliptic, glossy, and coriaceous, about 2 inches long. The flowers grow in terminal umbels of from nine to twelve together, and have a comparatively slender curved tube 2 inches long, with an expanded limb of nearly equal obtuse segments, of a rich orange-scarlet

colour. It is, indeed, a gem of the first water, and thrives under the treatment usually given to *R. jasminiflorum*, that of a warm greenhouse."—(*Florist and Pomologist*, 3 s., vii. 145.)

PEACH—*The Barrington*.—"It is the one variety that is almost indispensable in the smallest collection. After the glut of the mid-season varieties, such as *Nehlesse*, *Royal George* and *Bellegarde* is past, then we find out the merits of this grand Peach, for were it not for the *Barrington*, a blank would almost ensue; with it, however, the supply is kept up till the *Late Admirable* and others come in. Moreover, as regards our exhibition-tables, the most magnificent dish of Peaches to be generally seen there is the *Barrington*. Like all other good fruits, the *Barrington* Peach has many synonyms. It is known as the *Buckingham Mignonne*, also as *Colonel Ansley's*. A few years ago it received another, having been exhibited before the Fruit Committee of the Royal Horticultural Society by Mr. Knight, of Halesham, Sussex, under the name of *Markly Admirable*, when from the wonderful excellence of its quality, and its fine appearance, it was awarded a first-class certificate as a new variety. This notion was, however, upon closer investigation dispelled by Dr. Hogg, who proved beyond question that it was nothing more than the true *Barrington*."—(*Ibid.*, 157.)

GRAVELLY HILL, BIRMINGHAM.

THIS place is the residence of J. Wright, Esq., and is about a mile and a half from Aston. The grounds are small, but beautifully situated, and well kept. There are beds of *Rhododendrons*, which are kept in good health by frequent waterings, and they must be very beautiful when in flower. The grounds also contain some nice specimens of the fine yellow-leaved *Holly* named *Lord Errington's*; but it was to see the *Orchids* that my visit was made.

There are three houses devoted to their culture. One for cool *Orchids* contains some healthy specimens. *Masdevallia Harryana* is here, as everywhere, the freest-flowering species yet introduced, and also the most beautiful. There are some of the varieties not so good as others, but the worst of them are well worth growing. One has very large flowers, and the colour lasts well, which is not the case with some of them. *Odontoglossum crispum*, in variety, is also very effective. The next house is for East Indian *Orchids* and all those requiring a high temperature, and here the same degree of health is not observable as in the cool department. The reason for this was soon apparent after a short investigation. All the *Vandas* and *Aërides* had been repotted last year in fresh sphagnum, and shortly after this was done an undesirable parasitical growth appeared at the base of the plants, and spread rapidly over the whole house. Specimens of this, which are kidney-shaped, and not larger than Turnip seeds, yellowish brown, and of a hard substance, were submitted to the Rev. M. J. Berkeley, and recognised by him as *Sphaerobolus stellatus*. The aerial roots formed above the sphagnum are attacked as soon as formed, and rot immediately. The only remedy for such a state of things would be to shake the plants out of the pots, and burn the potting material, using fresh pots, drainage, and sphagnum. The house would also require to be thoroughly washed-out with scapy water, and the walls lime-washed. Some of the plants attacked are of great value; amongst them are a large specimen *Saccolabium guttatum*, *Aërides Schröderii* with two growths and thirty-eight leaves, *Vanda suavis*, &c. In the Cattleya house I noted a fine *Broughtonia sanguinea* in flower, and being of a purplish crimson colour the flowers are distinct, and very effective in a collection; they are borne in clusters on stalks 18 inches long.—J. DOUGLAS.

PRESERVING THE PERFUME OF FLOWERS.

THE season is advancing fast for *Roses*, and the wind will scatter their spent petals and those of other flowers in all directions over lawns and walks, giving the gardener a great deal of trouble. I write to remind your readers that if they were to look over the flowers every morning when dry, and pick-off those most advanced in decay, they might preserve the petals of any flower which has an agreeable perfume by placing them between thin layers of cotton wool, dipping these into the finest olive oil, and sprinkling a small quantity of fine salt on the flowers alternately until an earthen or wide-mouthed glass vessel is quite full. Tie the top close with a bladder, and place the vessel in a south aspect exposed to the heat of the sun, and in fifteen days when opened a fragrant oil may

be squeezed away from the whole mass, little inferior, if *Roses* are made use of, to the dear and highly-valued otto or attar of *Roses*.—J. H., *Gardener, Bickley, Kent*.

[Your offer is accepted, and obliges us.—EDS.]

ALPINE ROSES NOT RHODODENDRONS.

AS no doubt many of your readers are meditating a journey to this delightful country (Switzerland), let me submit to their notice a correction of the prevalent popular error of calling the *Rhododendrons* Alpine *Roses*. A short time since a correspondent of the English-Swiss paper, "*Continental Herald*," stated therein that the real Alpine *Rose* was the *Rhododendron ferrugineum*. Upon which I addressed the following letter—

"Allow me to inquire upon what authority your correspondent states (as mentioned in your Monday's paper), that the *Rhododendron ferrugineum* is the true Alpine *Rose*. It does not even belong to the *Rosaceæ* family, but to that of the *Ericaceæ*. The calling it by this name is a mere popular error, as it is not a *Rose* at all. I have certainly seen at Sils Maria in the Engadine on a sign-board the *Rhododendron* painted, and underneath the words 'Alpen *Rose* Hotel.' This is all the authority I know. The real Alpine *Rose* is *Rosa alpina*, a very different flower. A specimen gathered here is enclosed. *Rhododendron ferrugineum* is very common in this neighbourhood (Chamouni), and among the Alps generally, and now coming into blossom. *R. hirsutum* is a brighter plant, but not so common. I have found it on the Wengern Alp, and it is also at the Gemni.—EDWARD COPLAND."

This elicited the following reply—

"The *Rhododendron ferrugineum* is certainly, as Mr. Copland asserts, not a *Rose*; but its beautiful flowers are known as 'Alpine *Roses*.' This is not from any resemblance to the *Rose* properly so called, but owing to the red colour of the flowers. Mr. Copland talks of a 'mere popular error,' as if the connection of the *Rose* with the *Rhododendron* was an error of modern date. Is he aware that his popular error originated in ancient Greece, when its poets adopted the word *Rhododendron*—a compound formed of *rhodon*, a *Rose*, and *dendron*, a tree, and thus *Rhododendron* signifies a *Rose* or *Rose-bearing tree*? But if we go farther and search for the derivative of the Greek word *rhodon*, we find that it means red; and so it is probable the original Greek meaning of *Rhododendron* was the Red Tree. There are many flowers and trees to which the term '*Rose*' is attached, but which no one—not even the simplest child—would mistake for veritable *Roses*. The '*Rose of Sharon*' is the popular name given to the gorgeous *Lily of Palestine*; and the probability is that the appellation has descended from a more remote era than even the days of Solomon, who 'in all his glory was not arrayed like one of these.' The *Rose of Sharon* bears no resemblance to the real *Rose*: the name originated in the red colour of the flowers. In England a common garden flower is popularly known as the *Rose Campion* (*champsagne*?), simply because it bears red flowers. Many similar instances might be adduced. The impropriety fades away if we will only consider the word '*rose*' to mean red, a colour connected with *Roses* in every oriental country. I only know two instances where *Rose* is not connected with red—viz., in the common *Hellebore* or Christmas *Rose*, and the *Guelder Rose* or *Snowball Tree*. The *Rosa alpina* is Alpine *Rose* of course, but it is not the Alpine *Rose*. To use the language of Obadiah in the play, I would say, 'Thy name may be Prim, but these art not that Prim!' The *Rosa alpina* is a mere botanical modern term to distinguish one of the numerous *Eglantine*s that grace the Alps. It has no affinity with the flowers of the *Rhododendron*, the only shrub whose blossoms are known in Switzerland and elsewhere as Alpine *Roses*.—T. H. DIXON, LL.D., *Member of the Swiss Alpine Club, &c., Lausanne*."

To which I rejoined—

"I am glad to have to meet such a learned opponent as Dr. Dixon, for I have no doubt he brings forward all that can be adduced in favour of that which I still term 'a mere popular error.' I can hardly call him an opponent, for he virtually admits what I have advanced. I asked for some authority; he gives none, but says I talk as if it was 'an error of modern date.' I do no such thing, for I am quite aware that it has long existed, and he may be right in saying 'it is probable it originated in ancient Greece,' and was caused by a poetical corruption (adoption) of words. I do not dispute that *Rhododendron* may mean the Red Tree, but that is very different from Alpine *Rose*. He quotes other popular errors, just as if two wrongs could ever make a right. I freely admit that there is a common garden flower in England called *Rose Campion*, because its colour is red, but that is altogether another thing to its being called a *Campion Rose*. The introduction into this discussion of Obadiah and the play borders on the ridiculous. It has about as much to do with it as the caricature of Obadiah and his wife. I therefore still contend with all due deference to the learned member

of the Murithian Botanic Society, that *Rosa alpina* is the only real Alpine Rose having a right to that name, and I deny that it is a mere modern botanical term. The worthy doctor can take us back to ancient Greece, but I think it will puzzle him to say when this pretty flower was first so named: I should rather think 'whereof the memory of man is not to the contrary.' In conclusion, I hope he will excuse my referring him to 'Wood's Tourist's Flora' for an accurate description of both these interesting plants.—EDWARD COPLAND, *Chamonix*.

The great interest of the subject to Swiss travellers must be my excuse for thus troubling you.—EDWARD COPLAND, *Hotel Mont Cervin, Zermatt*.

CALIFORNIAN BULBS.

In reply to your correspondent "G. S.," asking about the hardness, &c., of these bulbs, I can inform him and your readers that they have grown in the open ground at the York Nurseries for the last two years, and have not suffered in the least either from frost or rain. These bulbs in their native habitats are accustomed to be dried to such an extent that I understand the collectors to say that when collecting them the dust almost blinds them. This, of course, is after their growing season is over, for during that season they get abundance of wet. It was feared that these bulbs would suffer quite as much from our wet and dropping summers and autumns, but so far they have succeeded admirably. They are planted in light sandy loam prepared with well-decomposed manure. It is a good plan to dig the manure deep down quite below the bulbs instead of allowing it to surround them. They are planted from 3 to 4 inches below the surface.

I will now proceed to give a list of species I saw growing there, as above described.

Cyclobothra alba, *C. pulchella*; *Calochortus luteus*, var. *oculatus*, is an extremely handsome species, producing large golden-yellow flowers, with a purple-crimson blotch near the base of each petal. *Calochortus venustus* is white, with a dark blotch near the base of each petal. *Calochortus Gunnisoni*; *C. elegans* is an interesting species, about 6 to 9 inches high, flowers bluish white, beautifully fringed; *Brodiea coccinea*, *B. terrestris*; *Senbertia laxa*; *Allium cernuum*, *A. uniflorum*, *A. acuminatum*, *A. falcifolium*; *Erythronium giganteum*—this Dog's-tooth Violet thrives the best planted in a compost of one-third loam, one-third peat, and one-third river sand.—R. P.

DELPHINIUM FELIX POULET.

I MAY, perhaps, have casually noticed this fine border plant before, but it is certainly worthy of more prominence than it has received. The whole family of Delphiniums are beautiful, rich, and stately border plants. There are, no doubt, many fine varieties of this family that I am not acquainted with, but if any one of them is more strikingly attractive than that above-named, all I can say is I should like to see it. Felix Poulet was received from the nursery of Mr. Van Houtte, of Ghent, and is one of the best hardy plants ever sent across the water. It is a pillar of pure and dazzling blue, 7 feet high, with a spike as symmetrical as that of a first-rate Hyacinth. It is just one of those flowers that act the part of a garden magnet, drawing all eyes to itself. Standing amongst a dozen varieties it kills all by its clear intense colour. Those who have room for even only a few herbaceous border plants should never forget Delphiniums, and of them I advise them to especially remember Felix Poulet.—J. W.

CUCUMBER DUKE OF EDINBURGH.

As the grower of the Cucumbers sent to the Royal Horticultural Society (see page 53) by Messrs. Barr & Sugden as Messrs. Daniels' Duke of Edinburgh, and said to be the Marquis of Lorne, I can say there is a great difference between the two varieties. I have grown the Marquis of Lorne for two seasons before, and have it now; and I find the Duke a very free-fruited kind, which I cannot say the other variety is, and it is much larger. The Cucumbers sent were not grown one to a plant on purpose to be exhibited, but were all cut from one plant bearing other smaller fruit. The largest of them, although only 2 feet long, weighed 3 lbs. 8½ ozs.—T. REDLEY, *Cambridge*.

DAMP WALLS.—Mr. Robson can effectually cure damp walls, or, at any rate, the paper will not become discoloured, by covering the places affected with thin lead paper, the kind

generally used for lining tea-chests. The paper-hangers usually keep it in stock.—R. M.

PLANTS FOR THE SHADE.

How often we hear the complaint that our garden is so shady that we can grow nothing in it. To all these I would say, Grow hardy Ferns. They are not only easy to manage, but the diversity in the forms of the leaf to lovers of nature must afford as much pleasure as the most gaudy-painted flower. They can be planted in beds, lines, or clumps; and if a little attention is paid to the various heights of the leaves, &c., they will make quite as effective a show as Geraniums or Verbenas. With the aid of stones, mounds of rockwork can be formed, and when planted with Ferns have a very pretty effect. Many of them being evergreen can be grown in pots for window decorations during the winter, and not being so susceptible to the changes of the atmosphere often succeed better, and give more satisfaction than plants costing double their price.

Hardy Ferns are not at all fastidious as to the soil they grow in, being as often grown in one kind of soil as another; but they succeed best in light woodland soil or leaf mould, mixed with one-fourth sand, where they are planted as a permanency. The large-growing varieties should have at least 1 foot in depth of soil, and when wanted for winter decorations should be grown in well-drained 4, 6, or 8-inch pots all the summer. And among the hardy Ferns I know of none more suitable, or indeed more beautiful than our own native Ferns. A list of a few of the most popular for the purpose mentioned I give below, which are often to be found in our summer rambles:

Adiantum pedatum (Maiden-hair Fern), with its stems of rich dark brown colour, 1 foot in height, its fronds of spreading habit radiating like the spokes of a wheel almost circular.

Dicksonia punctilobula (Feather Fern).—It is among the most imposing of our native Ferns, its leaves often reaching 3 and 4 feet, and looking not unlike a feather dusting-brush in shape.

Cystopteris bulbifera, with dark brown stems and rich glossy green foliage, rising some 2 feet, and resembling the *Dicksonia* in growth.

Osmunda cinnamomea (Cinnamon Fern), in full time has rich brown masses of fruit, and its leaves, with distinct veinings, reach 3 to 5 feet when fully grown, and it is as often seen growing in the strongest sunlight as anywhere else.

Campylosorus rhizophylla (Walking Fern).—One of the most interesting of the family. The fronds, as they grow, taper into slender prolongations, which droop and touch the ground, and take root at the apex, from which another plant springs.

Polytrichum fumarioides (Copper Fern).—Rising some 4 to 6 inches in height, of a copperish red colour, the stems and leaves being of the one shade.

Lygodium palmatum (Hand Fern).—A most beautiful climbing Fern, with small leaves about 2 inches in diameter, resembling the open human hand. Succeeds best when grown in hanging baskets.

Aspidium acrostichoides.—Of a spreading habit; its fronds usually grow from 1 to 2 feet in length, of a dark glossy green, and it retains its colour all winter out of doors.

Polypodium vulgare.—Somewhat resembling the above, but not so compact in its growth—its leaves more upright, rising only 1 foot, of a rather pale colour.

Asplenium ebeneum.—This Fern is said to be found all over the north temperate zone; and though small is very pretty. Its fronds rise about 1 foot in height, of a bright green; its stems of a glossy black colour.

Asplenium Trichomanes.—A variety of the above, with even smaller fronds, and more difficult to cultivate.

The various kinds of Hydrangeas, Cannas, Pansies, Mimulus, Coleus, &c., will all do well in a shady or half-shady position. I have also had a bed of Vincas flower fine the whole season, where they did not get more than one hour's sun in a day. *Panicum variegatum* shows to best advantage when grown in the shade, as do also the different varieties of *Tradescantia*.—(*American Gardener's Monthly*.)

CONFERENCE ON THE REGISTRATION OF PERIODICAL NATURAL PHENOMENA.

THE Council of the Meteorological Society recently resolved to organise a system of observations of natural phenomena, connected with the return of the seasons, as well as of such branches of physical inquiry as tend to establish a connection between meteorological agencies and the development of vegetable life.

As a preliminary to carrying out this intention, they invited the various societies before which such subjects most naturally come, to nominate delegates to join a committee by whom the whole question as bearing upon agriculture, horticulture, &c., should be considered, and to whom also any written communications should be submitted.

The first meeting of this joint committee was held at the office of the Meteorological Society, 30, Great George Street, on Thursday, July 2nd, when delegates were present and promises of co-operation read from the Royal Horticultural, Royal Botanical, Royal Agricultural, and other Societies. After the subject had been fully discussed, the Rev. T. A. Preston, of Marlborough College, was requested to prepare a list of plants to be observed, and also to draw up a report on the same. Other gentlemen were requested to prepare lists of insects, birds, and animals.

PASSIFLORA CÆRULEA, THE COMMON BLUE PASSION-FLOWER.

We most willingly afford all the information we can obtain in reply to the inquiries of our correspondents; but "G. H."

Fig. 24.—*Passiflora cærulea*.

will appreciate that we could not "describe the Passifloraceæ," for the descriptions of the more than two hundred species would occupy most of the pages of one number of our Journal. However, as our correspondent (a lady) concludes with a more moderate request, we will reply to that fully.

The *Passiflora cærulea* was introduced by the Duchess of Beaufort, living in 1699. It was called the "Passion-Flower" by the Roman Catholic settlers in Brazil, who first became acquainted with the flower; for they appropriated its various parts to a symbolism of our Saviour's last sufferings—the circle of filamentous processes of the nectary within the

corolla, they said, represented the crown of thorns; the nail-shaped styles the nails of the cross, and the five anthers the five wounds of the crucifixion.

To propagate it you may now layer some of the young shoots, or next spring you may make cuttings of this year's shoots, or, which is the best mode, of pieces of the roots. To make it bloom freely, train the young shoots at full length, and in October of each year cut them back to within two joints of the older branches. Cover them in frosty weather, and they cannot fail. They are free bloomers after attaining three years of age. If the cuttings are taken from an old plant in April, they will produce flowers the following autumn in good soil against a south wall.

It is quite true, as you were informed, that you can raise this Passion-Flower from seed. In April place it for eight or ten hours previously in water about 90°, then sow in light sandy earth, and plunge the pot in a hotbed. When 2 or 3 inches high, pot the plants off separately, and place them in the bed; harden them after a week by giving more air, and by-and-by place them in a window or greenhouse, protecting them through the winter for the first year or two. If no hotbed, wait until April, soak the seed, sow as advised, cover the pot with a square of glass, and keep the pot not far from the fireplace until the plants are up, but taking them to the window afterwards.

DESTROYING WASPS.

NEVER was such a year for wasps' nests as this—at any rate in our neighbourhood. We find a most efficacious mode of destroying them to be this: Obtain a quart bottle half filled with turpentine, insert the neck in the wasps' hole late in the evening, and by the morning every wasp will be killed by the fumes. Of course for this mode to be successful the nest must be in the side of a bank.

Another mode, and equally efficacious, is to pour gas tar down the entrance.—H. W. S. C., *Ross, Herefordshire*.

The most simple and effectual mode of destroying wasps I have found is to put a little gas tar into an old watering pot, and after it is dark pour about a pint into their hole, and they will never come out again. "T. G.'s" plan may do very well if their nests run in a horizontal direction, such as in an old wall or bank; but even in this case, if you put the spout of the watering pot in the hole, and place a sod or a lump of clay round it, the tar will find its way to their nest; but as a rule we find the nests in a perpendicular direction.—O. ORPET.

NOTES AND GLEANINGS.

MR. STANDISH, of Ascot, who has for some years given his attention to improving the varieties of the GARDEN PEA, has succeeded, after careful and patient crossing, in raising a number of sorts which promise to be of great utility. One especially, which is called *CRITERION*, is well worthy of notice. It grows about 3 feet high, and has a pod similar in size and shape to Laxton's Supreme, and remarkably closely filled. The shells of the pod are very thick and fleshy, which enables them to withstand extremes of heat and drought better than others which have not this qualification. The colour when cooked is of a fine lively grass green, and the flavour very rich and sweet, while the texture is very delicate. We have tasted and examined this Pea, and consequently speak from experience when we say that, in addition to its other merits, it is a fortnight earlier than *Ne Plus Ultra*, and will be one of the most valuable Peas in cultivation.

—A good plant of *ARUNDO CONSPICUA* now in bloom in the garden of Mr. G. F. Wilson, of Weybridge Heath, reminds us that this noble Grass is not so much grown as an ornamental plant as it ought to be. The plant in question is like a great mass of Pampas Grass, and it has thrown up fifty-four panicles of flowers, the graceful drooping form of which is very beautiful. This plant blooms in summer, while the Pampas Grass flowers in autumn. Those, therefore, who are admirers of the Pampas Grass may have the same effect produced in their gardens in summer by planting the *Aruno conspicua*.

RUSTIC SUMMER HOUSE.

We have been asked to tell a correspondent, "R. H.," "the most desirable form of rustic summer house," and we are just as incapable of replying as the clergyman was when an un-

known writer asked, "What woman would you recommend me for a wife?" We reply as to the summer house what we published long since. Rustic structures are pleasing in reclusive portions of the pleasure ground, if this style be confined to the

FIG. 25.—A RUSTIC SUMMER HOUSE.

formation of either a seat or a cottage; but it is ridiculous if complicated, and elegant forms are constructed of rude materials. Thus we have seen a flower-box, intended to be Etruscan in its outlines, formed of split hazel stakes—a combination of the rude and the refined, giving rise to separate trains of ideas totally unassociable.

If our correspondent has a well-wooded, retired place in his garden, and that garden is moderately extensive, he may appropriately erect there a rustic structure such as that of which we now publish a woodcut, (*fig. 25*), and for advice relative to which he may apply to Mr. J. Caven Fox, Royal Horticultural Society, South Kensington.

NOTES ON VILLA AND SUBURBAN GARDENING.

Budding Roses.—The objects contemplated should be well understood before the work is begun. If it is intended only to make the performance subservient to the production of standards, then I would suggest the inquiry whether in the locality standards are desirable or not. A blind passion for a Rose tree with a tall stem and heavy head has been very prevalent of late years, and has often been indulged without regard to good taste or appropriateness. Now, it appears to me, that in itself a standard Rose is not so elegant as a common wall-trained bush, or a plant grown in the pillar fashion. A leafless stem requiring a strong stake for its support, as all standard Roses do, has certainly nothing of beauty or ornament in it, while a Rose growing on its own roots and trained pyramidally to the height of 5 or 6 feet, is a magnificent object when in bloom. We commonly see in small gardens a lanky Briar or two springing up from a lawn and making us wonder what such wild unsightly things can do there, till on inquiry we are told that the proprietor intends budding on them at the proper season. Now, in such cases, there are two chances to one that the budding does not succeed. If it succeeds, it will take two or three years to form a head; and when a head of first-rate character is produced, the whole affair does not embellish the garden half so much as a pillar Rose would have done, in some cases, in the course of one season. Standard Roses are only useful and desirable when a display is required above the heads of more lowly plants, and in such cases they may be introduced with fine effect. An avenue of standard Roses may be made a fine object when there is a good undergrowth of small productions; or single standards may be introduced with advantage when space is limited, since they allow of flowers being grown underneath. But even when standards are clearly desirable, the amateur should remember they ought to be placed in a finished state in the spots they are intended to occupy.

So much in reference to standards. But budding has other objects and higher claims upon our notice. It confers a hardiness upon Roses otherwise tender, so that many which would not endure our winter on their own roots, will resist it when receiving into their structure the more vigorous juices of the Briar. Then a more rapid attainment of the flowering state is in this way secured. For example: A friend gave me a cutting of the beautiful Bourbon Rose Paul Joseph in the month of August last year. I had only a choice of two courses to pursue with regard to it; one was to endeavour to make it produce roots as a cutting, the other to bud it upon a stock. Had I taken the first course it would probably have perished, as cuttings of fine Roses demand much skill for successful striking, and if it had lived it would scarcely have been strong enough to produce flowers in twelve months. I adopted the second course, and inserted the only two buds I had into a climbing Rose, which I cut down for the purpose. In June these buds were half a yard long, have produced flowers, and supplied me with buds enough to insert in about a dozen Briars. Expedition and certainty are therefore attained by budding, and on these accounts the art is highly important to all amateurs.

Greenhouse Pelargoniums.—Among the plants which now require attention preparatory to another season, Pelargoniums by almost universal consent claim the first place, for there are few persons who do not admire them, and not many plants which are more worthy of admiration. It may be said there is little skill required in growing a Pelargonium, and this may be true, but there is some little art in producing them in that style of excellence which is characteristic of the plants exhibited at the horticultural fêtes in the neighbourhood of the metropolis. It must be admitted that while there are plenty of gardeners who can produce luxuriant specimens, we have but few cultivators who can procure a head of bloom commensurate with the size of the plants. The reason of this is that in our desire to grow plants we lose sight of an important physiological law—namely, that whatever conduces to luxuriant growth is favourable to the production of flowers, and *vice versa*, and hence prize cultivators never allow their plants to become what they term "autumn proud"—that is, gross and luxuriant at that season. They keep them, by potting them in poor soil and supplying them moderately with water, in a healthy but no means luxuriant growing state. The effect of such treatment is the production of a great quantity of active roots and the storing-up of sap in a highly elaborated state, which, being brought into action by the increased light and heat of spring, is expended in the production of flowers instead of branches.

This is the theory of the cultivation of the Pelargonium exemplified in the best management of cultivators. To apply it

to practice, the plants that have done flowering must be turned out of the house and placed in the full sun under a south wall to ripen their wood previously to being cut down, and it will be well at the same time, if seed is not desired, to remove the whole of the flower-stems, but retaining as much of the foliage as possible. In cutting the plants down the amateur must be governed by circumstances, such as the size of plants he wants in the coming season, and the convenience he has for large specimens. As a general rule I would never recommend the growth of large specimens. Small ones in 32 or 21-sized pots are far more interesting, and there is as much merit in producing them as those of a larger size—that is, if grown as plants ought to be, with the branches depending over the sides of the pot. Some importance has been attributed to the quantity of old wood left in a plant at the time it is cut down, but the advantage of having a quantity of wood is, I think, to a considerable extent imaginary, though it cannot be doubted but it is a reservoir of nourishment for the branches in ease of need.—W. KEANE.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

The soaking rain which has been highly beneficial to flowers and vegetables has also produced good results on the fruit trees. So thoroughly dry had the sub-soil become, that Cherries shrivelled prematurely and readily parted from the stalks. Some of the earliest Pears and Apples have also dropped off mature, but they cannot be said to be ripe, as flavour is wanting. We have not managed to finish the summer pruning of dwarf and pyramid trees; usually they have been pruned much earlier, but it is a question whether it is desirable to prune them very early in the season, except when the trees are young, in which case the young growths may be stopped when they are long enough, so that a second, and, if the trees are vigorous, even a third set of growths may be produced. Trees treated in this way increase in size much more rapidly than those not summer-pruned. We have not yet succeeded in getting rid of the Apple maggot; a small proportion of the fruit seems to be attacked by it. There is no better way than to look over the trees and pick off all fruit that contains maggots, and all that falls should be gathered up daily and destroyed. This has been our way of dealing with the enemy, and so far it has been satisfactory.

It does not seem to be of much use growing Cherries on pyramids; the fruit sets and ripens very well, but the starlings have such a fancy to them, that unless the trees are securely netted, which is a very troublesome affair when large, we do not gather any ripe fruit, as it is all gone long before the last stage of ripeness has been reached. On the walls netting the trees is easy; the nets are merely nailed to the top and base of the wall, and stretched out by forked sticks 15 inches long.

Strawberries have not been large, as the best fruit was destroyed by late frosts; the crop has been excellent, and has kept well. The fruit gathered for preserving was in capital condition; Black Prince and Queens' Seedling are the sorts esteemed here for that purpose. Frogmore Late Pine cannot be too highly recommended for dessert purposes; of course it is Pine-flavoured and slightly acid, but it can be had after British Queen, Dr. Hogg, and other fine sorts are over. It is also a large fine-looking fruit. All the runners were layered by the 12th of the month; these have also been abundantly produced.

Raspberries.—Where a thicket of suckers had been thrown up they have been thinned out; it cannot be good policy to allow the young growths to smother each other during the growing season, to be thinned out in winter. Better to grow only as many canes as will be required for next year's crop, so that all the growing force of the plant may be usefully employed. Keep the ground free from weeds, and bear in mind that the Raspberry loves a deep rich soil and delights in moisture.

FRUIT AND FORCING HOUSES.

Vineries.—The early houses have been cleared of fruit, and as the ascending sap is not required by the bunches, lateral growths are freely produced; these have been stopped-back, and any other growths will be stopped at once. The leaves of the Vines, the walls and woodwork of the houses, have also been thoroughly washed with the garden engine. However carefully the Vines have been attended to, there is always a trace of red spider on the leaves, which multiplies very fast if it is not washed off. The weather was exceptionally hot at the time that Lady Downe's Grape was liable to scald, but owing to thorough ventilation only one or two berries on some of the bunches were scalded. During hot dry weather all late vineries, whether containing Muscats or not, should be well ventilated in the day, and the ventilators be left open a little at night. But as regards fire heat, our experience, gained north of the Forth in Scotland, and on the banks of the Thames in England, leads us to recommend the use of the heating apparatus in the north, and to dispense with its use in the south all the time that the Grapes are colouring. Even in unfavourable seasons

Gros Guillaume and Muscat of Alexandria have ripened perfectly with us in Essex, though no artificial heat was applied after the fruit was set. Mrs. Pince's Black Muscat ripens and finishes off well treated in a similar manner. At present, while the Grapes are colouring, the temperature of the houses, with air on at night, may fall to 65°, or in cold nights to 60°; but it is only for an hour or two, as the sun has an effect on the glass until late in the night, and is again having an influence on the temperature before five o'clock in the morning.

Peach House.—Whether there is any truth or not in the statement that the average heat of our summers is lower than it was twenty or thirty years ago, is a matter that may probably be ascertained by actual research. Certain it is that the crops of the finer stone fruits are much more uncertain than they used to be, those of Peaches and Nectarines especially so. Out of doors there is much difficulty in keeping the trees clean. Aphides and red spider are persistent in their attacks, and cannot so easily be overcome outside as they can under glass; and then the uncertain climate—rain, snow, or hail, and a freezing east wind. Not only in the "merry month of May," but even in June, doth the ice king hold sway. Under glass the trees are safe; light and air can be admitted to them at all times, and should the weather be dull and cold when the trees are in flower, artificial heat can also be applied. Free healthy growths are made one season, which will in due course produce well-developed blossoms the following year. The same treatment is necessary with early Peach houses as with early vineries: thoroughly cleanse the leaves from red spider, and dust with the syringe or garden engine. Indeed, the treatment throughout is so much alike that a good Grape-grower will also be a good grower of Peaches.

PLANT STOVE.

Potting and re-basking a large proportion of the Orchids. *Phalenopsis grandiflora*, *Schilleriana*, and *amabilis* are the most showy of the species, and should not be omitted from the most select collection. They are grown either in pots or baskets, and thrive best when the potting material consists only of growing sphagnum and potsherds. The most shady position in the house, and a moist warm atmosphere, are the conditions most favourable to their full development. During hot dry weather syringe freely at least every day. Many persons who grow Orchids are afraid to use the syringe. There are many species, of course, that would be much injured if subjected to continuous syringing, even during the summer months, notably *Vandas*, *Acrides*, *Saccolabiums*, many of the *Cattleyas*, and other allied genera; but during such hot dry weather as we have recently experienced any of the species would be benefited by being dewed overhead in the forenoon, so that the plants would be dry by the time the house is shut-up. *Cattleyas* that were potted required different treatment, but the major proportion of the species succeed best in pots filled three parts full of drainage, and in a compost of equal parts of turfy peat and sphagnum moss. Most of the smaller-growing species do best in baskets or on blocks; a few even of the larger-growing species succeed better in this way. *C. Dowiana* hung up in a basket or fastened to a block of wood will grow and flower freely; the same may be said of *C. superba*, which also requires more heat than some of the others. We had imported specimens of this fine species, which failed to give satisfaction when potted like *C. Mossiae*, *Warneri*, *Mendelii*, &c. After being shaken out of the pots and fastened to blocks of teak they are doing very much better. Then take *Dendrobiums*: Some of the species will not thrive unless they are potted in a good body of turfy peat and fresh moss; others would linger on a miserable existence under such treatment, and ultimately perish. We have potted *D. formosum* and *D. nobile* in the same way; the one made vigorous growths, and the other died; placed in a basket with very little material for the roots, the plants grew and flowered freely. *D. McCarthyi* makes the strongest growths when there is little else besides the basket for the roots to cling to. *Vandas*, *Saccolabiums*, *Acrides*, &c., have been potted in crocks, with a little fresh sphagnum near the surface mixed with them, finishing off the surface with live sphagnum. After the plants have been potted and basketed it is best to maintain a moist warm atmosphere for a few days, keeping the house rather close.—J. DOUGLAS.

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Books (W. J.).—London's "Hortus Britannicus," cannot be had in parts. Messrs. Longman & Co. are the publishers.

ROSE BUDS, &c. (*Nannie*).—They are sun-scorched. Thin the Grapes. Cut the Vine branches back to half their length.

DOUBLE PANSY (*R. Allan*).—The colour, rich dark purple, and the very double flowers, render it a desirable variety.

BLACK HAMBURGH GRAPES (*Silas Gange*).—The box and its contents were smashed flat, and not a caterpillar to be detected. Send again in a tin or wooden box.

VINE LEAF RUSTY-PATCHED (*J. S.*).—We can detect no indication of injury by a caterpillar. The brown patches are caused probably by deficient air-moisture.

SUSSEX ANCHOR HOOK (*Capt. B.*).—The maker is Mr. H. Hudson, Hayward's Heath, Sussex.

JOURNEYMAN GARDENER (*F. C.*).—The paragraph in London's "Encyclopedia" which you require is as follows:—"The period of apprenticeship being finished, that of journeyman commences, and continues, or ought to continue, till the man is at least twenty-five years of age. During this period he ought not to remain above one year in any one situation—thus, supposing he has completed his apprenticeship in a private garden at the age of twenty-one, and that his ultimate object is to become a head-gardener, he ought first to engage himself a year in a public botanic garden; the next year in a public nursery; that following, he should again enter a private garden, and continue making yearly changes in the most eminent of this class of gardens till he meets with a situation as head-gardener. The course to be followed by an apprentice intended for a tradesman-gardener is obvious; having finished his period in a private garden, let him pass through a botanic and nursery garden, and then continue in the most eminent of the class of public or tradesmen's gardens to which he is destined."

GERANIUMS FOR POT-CULTURE (*N. E.*).—Thomas Speed, Virgo Maria, M^r. Rendatler, Corsair, Ianthe, Lago, Rose Rendatler, Madame Mezard, Madame Rudersdorf, Miss Rose Peach, Warrior, and Eugénie Mezard.

SALPIGLOSSIS CULTURE (*Flycatcher*).—It is a curious and showy half-hardy annual, requiring to be sown in a hotbed early in April, and planted out in good rich light soil in May or early in June. You may now pot-off the plants singly, or two or three in a pot, in light loam and leaf soil or well-rotted manure, shading for a few days, and when the pots are full of roots shift into 7-inch pots for flowering. Keep the plants well supplied with water, and they will flower in the greenhouse in a light airy position at the end of summer.

VINES WITH FRUIT ON LATERALS (*A Subscriber*).—It is not good practice to allow fruit on other than the first shoots of the Vine; those on the laterals should be removed, which they would be if the laterals were stopped at the first joint or leaf, and the subsequent growth from them also stopped at its first leaf, and this throughout the season. The shoots of Vines on the short-spur or one-rod system should be stopped at the joint beyond the fruit, and any shoots, which are laterals, arising from these shoots or first shoots ought to be stopped at the first leaf, and each growth as produced stopped at the first leaf. The growth ought not to be confined to one joint only beyond the bunch, but each succeeding growth limited to one leaf. The mildew may have appeared on the Vines from a deficiency of air; but it may have another cause, as a wet and rich border, combined with too close and moist an atmosphere. It will not permanently injure the Vines, its progress, we presume, having been arrested by the application of flowers of sulphur. Admit air freely, applying gentle fire heat, and so secure the thorough ripening of the wood.

SPirea JAPONICA AFTER FLOWERING (*A Constant Reader*).—We should plant out in good, rich, rather moist soil, loosening the sides of the ball with a piece of wood; make the soil tolerably firm about the ball, and water well after planting and in dry weather. When the leaves have fallen you may take up the plants, divide the crowns if they are too large for the size of pot you wish to have them in, and keep them in a cold pit plunged in coal ashes to the rim until you wish to start them. A few pots introduced at intervals of three weeks from early in January to March will afford you a succession of flowers.

AZALEA LEAVES FALLING (*Julia*).—The leaves you sent us have the appearance of being scorched or injured by some solution. It would not be caused by the sulphur placed on the Vines, but if the sulphur was burned, or placed upon a hot surface so that fumes were given off, the Azaleas would be the first to suffer. It is hardly likely, however, that they alone would show evidence of injury without other plants in the greenhouse being similarly affected. An overdose of tobacco smoke would cause it, but we think the roots are not in a healthy state, and that the plants are dead at the collar.

CUCUMBERS DISEASED (*C. H. J.*).—The rind of fruit you have sent us is spotted and marked with an ulceration or gangrene, due in most instances to an over-rich moist soil, with a deficiency of bottom heat the shoots being crowded, so that the elaboration of the sap is very imperfect, and it finds outlet through the skin of the fruit. Thin-out some of the oldest and all yellow leaves, stop each shoot at the joint where the last fruit showing is visible, and afford additional bottom heat. If the heating medium is a dung bed, hue it, leaving a little air on at night for a few days after the application of the dung, and keep the atmosphere rather dry, the soil not so moist, watering only to keep the foliage from flagging, and we think you will soon be free of the disease. We could not distinguish the plant; the specimen sent us was destroyed by the post-office pouches.

MOLES (Y. T.).—The best mode of getting rid of these useful but annoying workers is to trap them; traps should be set in their main runs, or where they pass firm ground. You may free your flower beds of them by placing Elder leaves in the runs. The traps may be had of any ironmonger; if not in stock they could be had by order in a few days. Take them in the field; it is useless to endeavour to keep them from the garden so long as they exist in the field.

HEATING A SMALL GREENHOUSE (*H. W.*).—In your case we should prefer a hot-water stove boiler with hot-water pipes, and to keep out frost you will require a flow-and-return 3-inch pipe along one end and the front of the house. By a hot-water apparatus within the house you will utilise the heat of the stove, and it will only require attention after ten or more hours. You will see such stoves advertised in our columns. Write to one of those you think likely to meet your wants, stating what you require, and asking for an estimate.

BOX FOR HEDGEO (*Idem*).—The common round-leaved dwarf kind employed for edging beds and borders will in time form a hedge 3 feet high, but it does not grow nearly so quickly as the much-longer Tree Box, and that we advise you to procure.

GOOSEBERRY AND CURRANT CUTTINGS (A. P.).—The best time to take and plant cuttings of these is in November, or when the leaves have fallen. Both the Gooseberry and Currant will succeed trained espalier fashion, but the height ought not to exceed 3 to 4 feet for Gooseberries, and 6 feet for Currants.

EXCAVATION ON VINE LEAVES (J. M., M. D.).—If you abundantly water the roots in the inside border, and keep the air of the house moist, the excudation will not continue. Some Vines are exempt from the affection because they can endure drought.

ROSE-CUTTER BEE (Miss Allen).—We fear we cannot suggest any royal method for preventing the rose-cutter bee attacking your Geraniums. The only plan, and that will perhaps be a tedious one, is to watch the cutter bees to their nests, and pour gas far into their holes. They merely eat leaves, or as in this instance flowers, to line the side of their nest; but oddly enough, if once they begin on a particular leaf or flower, they generally continue to use the same kind of leaves or flowers for the rest of their nests.

ROSE-LEAVES BLOTCHED (Mrs. C.).—It is very rarely that Roses give good flowers with bad foliage. From your description your Roses seem to suffer from black mildew. Syringe with warm water with 1 oz. of soft soap to the gallon, and dust with flowers of sulphur while moist. Syringe again with clean water two days afterwards. Many of the leaves will fall, but you will have to secure a healthy second growth. Repeat if necessary.

CHERRIES ON A DOUBLE-BLOSSOMED TREE (G. A. M.).—It is very unusual, but will occur in any double-blossomed tree, in a flower (or flowers) that has returned to the normal single form.

SELECT GOOSEBERRIES AND CURRANTS (Laquirier).—Gooseberries—Red: Ironmonger, Red Warrington, Rough Red. Yellow: Early Sulphur, Ramballion. Green: Green Overall, Pitmaster Green Gage. White: Crystal, Snowball, and Whitesmith. Currants—Knight's Large Red, White Dutch, Black Naples.

VINES ATTACKED BY MILDEW (Firt).—Yours seems to be a bad case, and as you have no heating apparatus, it is not easy to destroy the parasite. However, there is no specific so sure as sulphur. You have done all that you can do now, except to ventilate freely both front and back. Insufficient ventilation is oftentimes the cause of mildew spreading. Dress the wood of the Vines in winter, after they are pruned, with the following mixture:—6 ozs. flowers of sulphur, 2 ozs. of soft soap, and half a pint of tobacco water to half a gallon of rain water, and add a little clay to thicken it; with this paint your Vines. See that your border is well drained, and also that the Vines do not suffer owing to want of water. It would do no good to plant young Vines.

GOLDEN CHAMPION GRAPE CRACKING (—).—This Grape should be treated in every respect as the Black Hamburgh until after the berries are stoned and have taken the second swelling, when the border should be kept drier, and a dry atmosphere maintained in the house. This is a grand Grape when well managed, but it has many faults.

VINES FOR SMALL VINERY (F. W. P.).—Three Black Hamburgh, one Dr. Hogg, and one Buckland Sweetwater.

VARIORS (E. M. P., Hampstead).—You may remove all the "unfruitful runners" from your Melons, and pinch off the tops of the others above the joint beyond where the fruit is setting. Leave the pruning of your Gooseberry and Currant trees till autumn. Your Strawberry plants will fruit next year. If you have need of the runners you may save them to make a new plantation, and if not, let them be removed.

LEAVES FALLING UNSEASONABLY (C. D.).—The fall of the leaves of your Robins and Silver Beeches is caused by the excessive drought. The fall of the leaves of other trees, especially of Limes, is similarly occurring. They have completed their year's growth, and consequently shed the leaves, whose "occupation's gone." If abundance of rain soon occur, it is probable that these trees will put forth fresh leaves, and be induced to attempt a second growth.

HEATING CUCUMBER AND MELON HOUSE AND STOVE (Hot Water).—You will need for bottom heat two pipes for each bed or border; but if you have them covered with drainage, and not in a chamber, one pipe to each bed will be sufficient, the bed not being more than 3 feet wide, of which width the side walls will take up at least 4 inches. You ought to have a depth of from 6 inches to 9 inches of drainage over the pipes, and a foot to 14 inches for soil; and the distance from this to the trellis ought not to be less than a foot, and it need not exceed that, the trellis being 15 inches from the glass. To maintain a suitable temperature for Cucumbers in winter, early Melons, and stove plants, you must have four rows of pipes for top heat, and we should have them about 6 inches above the level of the border on both sides of the path; or you may have one pipe all round the sides of the houses close to the walls, and the return-pipes in the paths, and raised so as to be on a level with those affording bottom heat to the borders. Four-inch pipes will be the most suitable. We should have the walk sunk, but that is quite immaterial if you have headroom without their being so. You do not say what is the width of your vineries, but if not over 12 feet, you will for the Muscat house require four rows of 4-inch pipes the length of the house, and for the other house of Black Hamburghs two rows will be sufficient.

STRAWBERRIES FOR CLAY SOIL (F. W.).—Sir Joseph Paxton, President, Mr. Hogg, Lucas, Cockcomb, and Frogmore Late Pine. The ground should be well and deeply dug and manured, but not at the surface; and the plants—well rooted runners of this year from fruitful plants—should be put in without delay.

HYDRANGEAS NOT FLOWERING (H. P.).—The plants, if not already showing for flower, will not do so this summer or autumn. The reason of their not flowering we are not able to explain from the insufficient data you give. It probably arises from the non-ripening of the wood. Give them less encouragement to growth, and expose fully to light and air, so as to insure the thorough ripening of the wood, and this effected it is likely the plants will produce next season some fine heads of flowers.

RETARDING PEAS FOR EXHIBITION (J. G.).—The present and late hot weather has brought on crops amazingly. Your Peas at present in flower will be much too forward for exhibition if the hot weather continue until September 1st. Your only mode of keeping them back is to have them always well watered, and shade them from sun during the day, removing the shading at night, or in the day when cloudy. It is likely by this process you may so retard the ripening as to have some pods fit to gather at the time you name.

NAMES OF PLANTS (D.).—1, *Senecio sylvaticus*; 2, *Hypericum montanum*; 3, *Sedum rupestre*; 4, *Erythraea Centaureum*; 5, *Teucrium Scutellaria*; 6, *Elycium europaeum*. (T. W.).—The Saxifrages are more or less hairy forms of

S. hirta; the *Sedums* seem both *S. anatum*. (J. Luck).—*Lilium excelsum*. No, there are many similar and better. (E. Don).—*Il. manthus panicus*.

POULTRY, BEE, AND PIGEON CHRONICLE.

UNION OF PHEASANTS WITH DOMESTIC FOWLS.

By the republication from the American "Fanciers' Journal," of Dr. James S. Bailey's very intelligent and interesting remarks relative to hybrid or mule birds, it appears that gentleman has fallen into an error, so far as regards Mr. Hewitt's opinion in reference to the cross of the Golden Pheasant cock with different varieties of fowls. It is not often the common wild Pheasant of our coverts will voluntarily associate on friendly terms with barndoor fowls, but occasionally they do, and I have myself known of such cases. In a wood adjoining the stables and poultry-yard at Thurnham Hall were plenty of Pheasants, and these birds were often on the meadow or paddock with the barndoor fowls, and the cocks of this breed were always driven off the ground immediately on the appearance of the other gang. The Pheasants and domestic hens became friendly indeed. Many of these hens' eggs were set, and from them hatched great numbers of half-bred Pheasants. They were exactly as those Mr. Bailey describes, "exceedingly wild, with heads devoid of combs, wattles, or deaf-ear, with tails approaching the conformation of the Pheasant, but not so lengthy." At one of the lodges on the Manor of Tawstock Court, in Devonshire, a few hens were kept by the occupier, one of which was often seen in company of a cock Pheasant. After a time this hen could be but rarely seen at the lodge, merely coming once a-day for a meal, but at last turned up early one morning with sixteen chickens unmistakably the offspring of her and the Pheasant cock.—A DEVONIAN, *Galeacre*.

PRESERVING EGGS.

For several years we have preserved eggs in dry salt, in jars or boxes, placing the eggs in layers, always allowing the salt to completely cover the top layer. They must be kept in a dry place. We found they kept best in a kitchen cupboard, a cellar being too damp. The eggs with very few exceptions were fresh and good when boiled or poached. I have heard that bran or sand will answer the same purpose, but have not tried these.—A. C., *Jersey*.

LINCOLN POULTRY SHOW.

If a fixed determination to make a show a success ever ruled the actions of a committee, most surely it did so at Lincoln, where every personal exertion was made to make the arrangements as complete as possible. The tent was a very commodious one, and also a most substantial structure of its kind, whilst the feeding and watering of the whole of the birds exhibited were constantly under the immediate supervision of one or other of the acting Committee. It is remarkable at this season of the year that so large an entry of poultry could be got together—the number, exclusive of Pigeons, reached to upwards of 550 pens. Nor was this large entry composed of anything but superior specimens; in fact, the two Judges stated it as their opinion that they had never seen so many first-class fowls together so soon after midsummer. Of course many of even the most notable of these fowls were getting into deep moult, which the excessive heat of the sun upon the canvas of the tent would no doubt very considerably expedite. We must mention that the Committee, with a forethought rarely equalled, supplied all the pens with fresh-gathered lettuces, which were indeed a luxury to the poultry generally, whilst some of the more vigorous breeds seemed to sanction the old axiom, "Done first, help the other."

It was indeed a treat to walk down the *Cochin* classes, a constant succession of the best of birds arresting the eyes of both Judges and visitors. It would be difficult to name a better competition, many of these varieties being shown in as faultless a condition as at a Christmas meeting. *Dorkings* of every variety were well supported, some of the Silver-Greys being far better than generally met with. In *Spanish* the Show was excellent, the hens more especially, the first-prize hen of this breed being also the general cup-winner. *Polish* fowls of both the Spangled varieties have rarely if ever been excelled. Undoubtedly the best of the classes for *French* fowls were the *Crêves*, though some excellent *Houdans* were exhibited. The Lincoln Show proved also notable for its *Brahmas*, both Light and Dark-feathered; some of the best of Dark chickens being shown in the chicken class, and such as cannot do otherwise than raise still higher the fame of the party breeding them. In the chicken class, so ample was the entry, and so thoroughly first-rate the competition, that the Committee at once resolved, without any solicitation, to increase the number of prizes from three, as advertised, to five, and even a dozen more prizes

could justly have been awarded, so good were all the birds. The prizes were awarded to five different varieties in the following order—viz., Dark Brahmas, Black Hamburgs, Grey Dorkings, Black Red Game fowls, and White Cochins, eleven pens being highly commended and three others commended. It is just to say very rarely has such a variety of good matured chickens been seen together so early in the season; in fact, the class proved one of the gems of the Show. In Game Brown Reds proved the best of any, though there were some good Black Reds; but the Duckwings were not so good as those shown here last season. Many of the Ducks were remarkably fine, and the Variety class was a study for any naturalist or poultry-breeder. *Hamburgs* were of superlative merit, and many of the oldest exhibitors had now some difficulty to hold their accustomed position, so closely trying was the competition, and most of the birds were in capital feather. In the class for any variety of single cocks a grand Malay as to character, but sadly out of feather, was first, and La Fliche and another Malay second and third; in the Variety class for hens the first and second went to Malays, and the third to an Andalusian, but she was much bleached by the sunshine.

There was a very large show of Game *Bantams*, but a goodly number were sadly out of condition by being so much over-shown. Of other Bantams the Silver-faced were very fine in the ground colour, but require breeding-down in size, especially the cock, he more particularly being far beyond the standard proportions. Several pens of "little beauties" the Black Bantama came in for considerable notice; and a pen of very heavily booted White Bantams (single-combed), were penned in first-rate show condition.

With a Show so admirably conducted it is not difficult to secure public support, and in all probability future years will witness even an increased entry.

POLISH CLASSES.

(From a Correspondent.)

The first and third prize cocks were splendid Silvers; grand crests, beautiful colour, and well marked both in breast and wings. The second-prize bird was a very large-crested Golden, rather light in colour, but well marked. Mr. Silvester's is a large-crested bird, but the crest seems rather flimsy; he is too dark on the breast. Mr. Dean's was a nice-coloured Golden, but a little high in the back. Mr. Feast's was also a well-marked and good coloured Golden bird, but too small in crest. In hens first was a splendid Silver, although the highly commended one belonging to the same exhibitor looked the better of the two; second a Golden, of very rich colour, well marked and fine crest; third a Black with a capital crest. Mr. Silvester's hen's crest seemed quite chafed away; she is a very fine-coloured Golden. Mr. Dean's was a young Golden, which will make a capital bird after moult. Mr. Feast's was a good-coloured Golden hen—too small, however, in crest. Mr. Boothby showed a good pair of Golden in the local class. The hen is a rich colour, well marked, and has a fine crest. The cock was a capital bird, well marked on the breast and wings, good crest, but not so good as the hen.

COCHINS (Cinnamon or Buff)—Cock—1, Henry Lingwood, Barling, Needham Market. 2, S. R. Harris, Usborne, St. Day. 3, A. Darby, Bar-church. *hc*, W. H. Beldon, Levenshulme; J. B. Woodford, Cheltenham; W. A. Barnell, Southwell, Notts; G. A. Stephens, R. P. Percival, Northampton, Manchester. A. Darby. *Hen*—1, W. H. Crabtree. 2, Henry Lingwood. 3, R. P. Percival. *hc*, J. Bloodworth.

COCHINS (Partridge)—Cock—1, T. Stretch, Ormalkirk. 2, W. H. Crabtree. 3, H. Beldon, Bingley. *Hen*—1, T. Stretch. 2, T. M. Berry, Gedgey. 3, W. H. Crabtree. *hc*, W. H. Crabtree; J. K. Fowler, Aylesbury.

COCHINS (Any other variety)—Cock—1, R. S. S. Woodgate, Pembury, Tunbridge Wells. 2, Mrs. J. Harrison, Leicester. 3, W. Whitworth, jun. 4, Long-sight. *hc*, W. A. Parnell. H. Beldon; J. Walker, Rochdale. *c*, G. W. Hibbert. *Hen*—1 and Cup, R. S. Woodgate. 2, W. Whitworth, jun. 3, J. Bloodworth. *hc*, J. Walker; Mrs. Williamson; H. Beldon; A. Darby. *c*, Mrs. Williamson; W. Whitworth, jun.; W. A. Barnell.

BRAHMS (Dark)—Cock—1, W. H. Crabtree. 2, Horace Lingwood, Creting, Needham Market. 3, T. Raines, Sterling. *hc*, W. H. Crabtree; J. F. Smith, Sheffield. *Hen*—1, W. H. Crabtree. 2 and 3, T. F. Ansell, Coveley Mount, St. Helen's. *hc*, W. H. Crabtree; Horace Lingwood; R. P. Percival. **BRAHMS** (Light)—Cock—1, P. Haines, Diss. 2, Mrs. Williamson. 3, M. Leno, Markyate Street, unstable. *hc*, Mrs. Williamson; J. Bloodworth; Horace Lingwood. *Hen*—1, P. Haines. 2, R. P. Percival. 3, W. H. Crabtree. *hc*, Mrs. Williamson; Horace Lingwood.

DORKINGS (Coloured, except Silver-Grey)—Cock—1, T. Raines. 2, Henry Lingwood. 3, J. Walker. *hc*, R. Cheesman, Westwell, Ashford; W. Morritt; T. C. Barnell. *Hen*, J. W. H. Harrison, Leicester. 2, L. Pilkington, Gateacre, Liverpool. 3 and *hc*, A. Darby.

DORKINGS (Any other variety)—Cock—1, L. Wren. 2, J. Robinson. 3, W. Roe, jun. *hc*, H. Feast, Swinsea. *Hen*—1 and 3, O. F. Crosswell, Early Wood, Ragshot. 2, L. Wren, Lowestoft. *hc*, T. Raines (2); J. Robinson.

SPENCER—Cock—1, R. Newbitt, Epworth. 2, J. Leeming, Broughton, Preston. 3, H. Beldon. *hc*, J. Barry, Bristol; J. F. Dixon, Cotgrave. *Hen*—1, 1 Cup, and 3, J. Leeming. 2, A. Darby. *hc*, W. Nottage, Northampton; J. Th. Bradst. (2); R. Newbitt.

PULLED—Cock—1, 2 and 3, H. Beldon. *hc*, A. & W. H. Silvester. *Hen*—1 and 2, H. Beldon. 3, A. Darby. *hc*, T. Dean, Keighley; H. Beldon.

CREVE-COEURS—Cock—1, R. B. Wood, Uttewater. 2, G. W. Hubbard, Godley, Hyde. 3, J. Robinson. *hc*, W. H. Crabtree; R. B. Wood; Rev. C. C. Fawcett, Langford Vicarage. *Hen*—1, J. J. Mallen, Biggleswade. 2, Mrs. Cross. 3, W. G. Patchett, Southwell. *hc*, W. H. Crabtree; E. Lautour; R. B. Wood; J. K. Fowler.

HINDS—Cock—1, J. Swan, Stonefield, Lincoln. 2, G. D. Harrison, Datchet. 3, W. Dring, Faversham. *hc*, F. Brayer, W. H. Coppleson; W. O. Quibell, Newark. *Hen*—1, R. A. Boissier. 2, K. Coney, Alford. 3, W. Dring.

HAMBURGERS (Black)—Cock—1 and 3, H. Beldon. 2, J. Long, Bromley Common. *hc*, J. Robinson. *Hen*—1, Stott & Booth, Huntley Brook, Bury. 2 and 3, H. Beldon. *hc*, J. Robinson. *c*, Capt. Mason, Lincoln.

HAMBURGERS (Golden-spangled)—Cock—1 and 2, H. Beldon. 3, J. Long. *hc*, G. & J. Duckworth. *Hen*—1, T. Dean. 2 and 3, G. & J. Duckworth, Church. *hc*, P. Hanson, Stonehouse; T. Walker. *c*, H. Beldon.

HAMBURGERS (Silver-spangled)—Cock—1, H. Beldon. 2, Ashton & Booth, Mottram. 3, J. Long. *Hen*—1, Cup and 2, H. Beldon. 3, J. Long. *hc*, S. R. Harris; Ashton & Booth; J. Robinson; T. H. Turner, Sheffield.

HAMBURGERS (Golden-pencilled)—Cock—1, H. Beldon. 2, J. Long. 3, H. Feast. *hc*, J. Rhodes; W. Speakman. *c*, G. & J. Duckworth. *Hen*—1, W. Clayton, Keighley. 2, H. Beldon. 3, J. Long. *hc*, J. Smith; W. Speakman.

HAMBURGERS (Silver-pencilled)—Cock—1, J. Long. 2 and 3, H. Beldon. *hc*, H. Beldon. *Hen*—1, J. Kibson. 2, J. Robinson. 3, J. Long.

GAME (Black-breasted Red)—Cock—1, Miss M. J. Nelson, Cockshaw, Ickham. 2, W. J. Pope, Biggleswade. 3, S. Matthew, Stowmarket. *hc*, J. Mason, St. John's Worcester. *Hen*—1, S. Matthew. 2, W. J. Pope. 3, D. Harley, Edinburgh. *hc*, Hon. and Rev. F. Dutton, Windrush Vicarage.

GAME (Brown-breasted Red)—Cock—1 and Cup, D. Harley. 2, R. Asbley. 3, C. Brierley, Middleton. *hc*, S. Matthew. *Hen*—1, C. W. Brierley. 2, F. Sale, Crowle. 3, S. Matthew. *hc*, R. Asbley, Nantwich. *c*, Rev. H. W. Hutto, Lincoln.

GAME (Duckwing or Pile)—Cock—1, R. Walker, Gomersal. 2, S. Matthew. 3, J. A. & H. H. Staveley, Driffield. *Hen*—1, S. Matthew. 2, F. Sales. 3, J. A. & H. H. Staveley.

ANY OTHER VARIETY EXCEPT BANTAMS—Cock—1, Rev. A. G. Brooke, Shrawardine (Malay). 2, Rev. N. J. Ridley (La Fliche). 3, Lady D. Yeoman, Whitby (Black-breasted Red Malay). *c*, A. A. Vander Meersch, Tooling (Sheffield). *Hen*—1, Rev. A. G. Brooke (Malay). 2, Rev. N. J. Ridley, Hollingdon, Newark (Malay). 3, Rev. R. Hart, Stamford (Blue Dun Game).

ANY VARIETY—Cockrel and Pullet—1, Horace Lingwood (Dark Brahma). 2, H. Robinson, Baidon (Black Hamburgh). 3, R. Cheesman (Coloured Dorking). 4, B. Mollett, Balham (Black Red Game). 5, J. K. Fowler (White Cochins). *hc*, J. J. Maldon (White Cochins); E. Ellis, Early (Dark Brahma); W. Croft, Gainsborough (Light Brahma); T. Breden (Coloured Dorking); O. E. Cresswell (Silver-Grey Dorking); W. Dring (Creve-Coeur and Hondan); G. D. Harrison (Hondan); W. H. Cupples, Louth (Hondan); J. K. Fowler (Hondan); Dr. A. Cameron, Brentwood (Brown Red Game). *c*, F. G. Wilman, Newport, Lincoln (Buff Cochins); W. A. Wright, Birkdale, Southport (Dark Brahma) (2).

SELLING CLASS.—Price not to exceed £2.—1, J. Leeming. 2, R. Walker (Pile Game). 3, Miss M. J. Nelson (Brown Red Game). *hc*, Mrs. Cross, Appleby Vicarage, Brigg (French); Capt. Mason (Black Hamburgh); W. A. Barnell (Buff Cochins); J. Swan (Hondan). *c*, F. & W. Livesley (Buff Cochins).

LOCAL CLASS.—For residents in the County of Lincoln—1, R. Newbitt. 2, G. W. Boothby, Louth (Golden Poland). 3, E. Wastow, Lincoln (Buff Cochins). *c*, T. & W. Livesley (Buff Cochins).

DUCKS—Aylesbury—1, Cup and 2, J. Walker. 3, J. K. Fowler. *hc*, S. R. Harris; J. K. Fowler. *Rouen*—1, J. K. Fowler. 2, Capt. R. Swan. 3, J. Walker. *Black*—1 and 2, G. S. Sainsbury, Devizes. 3, F. P. Carver. *Any other variety*—1, 2, and 3, H. B. Smith, Broughton. *hc*, J. Walker; Dr. H. J. Buck, Newport, Essex; W. Leno; H. Reid, Smith.

GAME BANTAMS (Black-breasted Red)—Cock—1, Cup and 3, W. F. Addie, Preston. 2, G. Anderton, Accrington. *hc*, G. Hall, Kendal; Miss M. J. Nelson; W. F. Edwistle, Westfield, Bradford. *Hen*—1, Mrs. E. Newbitt. 2, Miss M. J. Nelson. 3, W. F. Edwistle. *hc*, G. Hall; J. P. Mansell, Lincoln; W. F. Addie; J. Eaton; J. R. Robinson, Sunderland.

GAME BANTAMS (Duckwing or Pile)—Cock—1, Mrs. E. Newbitt. 2, J. Eaton, Grantham. 3, S. Beighton, Farnsbury. *hc*, S. Beighton. *Hen*—1, S. Beighton. 2, J. Eaton. 3, W. F. Edwistle. *hc*, Miss M. J. Nelson.

GAME BANTAMS (Any other variety)—Cock—1, S. Beighton. 2, R. Rooksby, Stamford. 3, J. Long. *Hen*—1, S. Beighton. 2, 3, and *c*, W. F. Edwistle.

BANTAMS (Black)—1 and 2, R. H. Ashton, Mottram. 3, J. H. Bradwell. *c*, J. Watts.

BANTAMS (Any other variety)—1 and 2, M. Leno. 3, R. S. S. Woodgate.

PIGEONS.

CARRIERS (Black)—Cock—1, R. Fulton, New Cross. 2, P. R. Spencer, Hereford. *Hen*—1, R. Fulton.

CARRIERS (Any other colour)—Cock—1, R. Fulton. *Hen*—1, R. Fulton. **POUTERS** (Blue)—Cock—1, R. Fulton. 2, R. Raston, jun, Chatteris. *Hen*—1, R. Fulton. 2, W. Nottage, Northampton. *hc*, R. Raston, jun.; H. Yardley.

POUTERS (Any other colour)—Cock—1, R. Fulton. 2, W. Nottage. *Hen*—1, R. Fulton.

TUMBLERS (Almond)—Pair—1 and Cup, H. Yardley. 2, R. Fulton. *hc*, R. Fulton; J. Ford, Monkwell Street, London.

TUMBLERS (Any other variety)—Pair—1, J. Baker, Kew Bridge. 2, R. Fulton. *hc*, H. Yardley; A. A. Vander Meersch.

ANTWERPS—Pair—1 and *hc*, H. Yardley. 2, W. Slater, Gravelly Hill, Birmingham.

BARDS—Pair—1, R. Fulton. 2, H. Yardley.

DRAGONS (Blue or Silver)—Pair—1, W. Smith. 2, R. Fulton.

DRAGONS (Any other colour)—Pair—1, R. Fulton. 2, H. Yardley. *hc*, J. Baker.

FANTAILS—Pair—1, H. Yardley. 2, J. F. Loversidge, Newark. *hc*, R. Fulton.

JACOBS—Pair—1 and 2, R. Fulton. 2, J. Baker.

OWLS—Pair—1 and Cup, R. Fulton.

TRUMPETERS—Pair—1, R. Fulton. 2 and *hc*, A. A. Vander Meersch.

TERRITS—Pair—1, J. Baker. 2, R. Fulton. *hc*, H. Yardley.

ANY OTHER VARIETY—Pair—1, H. Yardley (Hondanettes). 2, A. & W. H. Silvester, Sheffield. *hc*, A. & W. H. Silvester; H. Yardley (Pillbacks); Rev. A. G. Brooke (Burmese).

SELLING CLASS.—single or Pairs.—Price not to exceed £1 1s.—1, J. Walker (Fantails). 2, F. K. Spencer. 3, H. Yardley.

CAGE BIRDS.

NORWICH (Clear, Ticked, or Evenly-marked Yellow)—1, W. Richards. 2, J. Adams, Coventry. 3, E. Orme, Derby. *hc*, J. Bexson, Derby. *hc*, J. Read, Market Rasen.

NORWICH (Clear, Ticked, or Evenly-marked Buff)—1, J. Bexson. 2, W. Richards, Bulwell, Nottingham. 3, J. Adams.

GREENS—1, J. N. Harrison, Belp. **BELGIANS**—1, J. N. Harrison. 2, R. Hawman, Middlesbrough.

MANCHESTER (Coppys or Plain Heads)—1, 2, and *hc*, Evans & Smethurst, Lower Broughton. 3, L. Belk, Dewsbury. *hc*, J. N. Harrison.

LIZARDS (Golden or Silver-spangled)—1, J. N. Harrison. 2, L. Belk. 3, T. Green, Gainsborough.

CRESTED—1, R. Hawman. 2, J. Bexson. 3, Evans & Smethurst. *hc*, L. Belk; G. Dorman, Nottingham.

ANY OTHER VARIETY—1, J. Bexson (Cinnamon). 2, J. Adams (Cinnamon). 3, and Extra 3, L. Belk (Evenly-marked Yorkshire and Evenly-marked Cinnamon). *hc*, E. Orme (Vari-gated Cinnamon).

MILES—1, J. Adams (Goldfinch). 2, J. Bexson (Dark Jongue Goldfinch). 3, R. Hawman (Goldfinch). *hc*, Evans & Smethurst (Mealy Goldfinch); J. Smith, Lincoln (Linnet). *hc*, G. Butts, Lincoln (Goldfinch).

BRITISH BIRDS (Goldfinches)—1, R. Hawman. 2, T. Green. 3, J. N. Harrison.

HARTER BIRDS (Any other variety)—1, V. White, Lincoln (Bullfinch). 2, J. S. C. F. J. Marshall, Lincoln (Bullfinch). 3, S. White, Lincoln (Green Linnet).

FOREIGN BIRDS—1 and 2, W. Wilcox, Lincoln (South African Love Birds and South Australian Shell Parrots). 3, T. Harrison (Virginian Nightingale).

SELLING CLASS.—Price, including Cage, not to exceed 15s.—1 and 3, L. Belk (Belgian and Copy). 2, T. Green (Yellow Norwich).

RABBITS.

LOF-FEARED.—Duck or Doe—1, F. Banks, Doughty Street, London. 2, R. A. Boissier, Penshurst. *hc*, H. Gübert.

SILVER-GRAY.—*Buck or Doe*.—1, Miss Mortimer, Ross. 2, J. Hallas, Huddersfield.
HIMALAYAN.—*Buck or Doe*.—1, W. Whitworth, jun. 2, J. Hallas. *hc*, R. A. Boussett, W. Doukin, Driffield; C. Marshall, Scotchbarn, Lincoln.
ANY OTHER VARIETY.—*Buck or Doe*.—1, H. Swetnam, Falford (Angora). 2, M. Marsland, Gooite. *hc*, 3, Marsland; C. Marshall (White Spanish).
SELLING CLASS.—*Buck or Doe*.—*Price not to exceed £1*.—1, J. E. Piggin, Hinchley (Himalayan). 2, F. Baeks. 3, J. Bowman, York (Lop-eared Grey).
JUDGES.—*Poultry*: Messrs. E. Hewitt and R. Teebay. *Pigeons and Rabbits*: Mr. F. Esquilant. *Cage Birds*: Mr. G. J. Barnesby.

DARLINGTON BIRD SHOW.

THE Ornithological Nest Feather Society held its second annual Exhibition of Canaries, Mules, and British Birds, in the nest feather only, on the 11th inst. There was a grand collection of young Canaries. The arrangements were all that could be desired, and carried out by an able Committee.

NORWICH.—*Clear Junque*.—Goblet and 1, J. & T. Cleminson, Darlington. 2, A. Upton, Derby. *hc*, J. & T. Cleminson; B. Castelow, Sunderland; J. Adams, Coventry. *c*, R. E. Triffett, York.
NORWICH.—*Clear Buff*.—1, 2, and Extra 2, J. & T. Cleminson. 3, R. Wrightson, Eastbourne, Darlington. *hc*, R. Harrison, Darlington; W. Russell, Darlington; J. Gooite, Leicester. *c*, R. Harrison.
NORWICH.—*Evenly-marked Buff or Yellow*.—1 and 2, J. Adams. 3, J. & T. Cleminson. *hc*, J. Calvert, Bootham, York.
NORWICH.—*Ticked or Unevenly-marked Junque*.—1, J. & T. Cleminson. 2, J. Adams. Extra 2, Petty & Cass, York. 3, J. Calvert. *hc*, R. Wrightson; A. Upton; R. Pearson, Whitby.
NORWICH.—*Ticked or Unevenly-marked Buff*.—1, J. & T. Cleminson. 2, W. & C. Burniston, Middlesbrough. *hc*, J. & T. Cleminson; J. Adams.
NORWICH.—*Junque-crested*.—Silver Medal and 1, R. E. Triffett. 2, J. Gooite.
NORWICH.—*Duff-crested*.—1, J. Gibson, Bishop Auckland. 2 and *hc*, R. E. Triffett. *c*, F. Lindsley.
LIZARD.—*Golden-spangled*.—1 and 2, R. Ritchie. *Silver-spangled*.—1, J. & T. Cleminson. 2, R. Ritchie. *hc*, G. Dunn, Barnard Castle.
LIZARD.—*Gold or Silver-spangled, with Broken Cap*.—1 and 2, J. & T. Cleminson. *hc*, R. Ritchie.
CINNAMON.—*Junque*.—1, J. Calvert. 2, G. Wallace, Darlington. *hc*, J. & T. Cleminson; J. Adams. *Buff*.—1, J. Adams. 2, T. Tenniswood, North Auckland, Middlesbrough. *hc*, T. Abbott, Darlington; G. Wallace. *c*, R. Stockdale, Spennymoor.
YORKSHIRE.—*Clear Yellow*.—1 and 2, W. Howard, Harrogate. *hc*, W. Iddison, Darlington (2). *Clear Buff*.—1, Earle & Swainston, Darlington. 2, T. Tenniswood. *hc*, W. Howard; E. Moan, North Ormesby.
YORKSHIRE.—*Ticked or Unevenly-marked*.—1, G. Cooper, Darlington. 2, R. Pearson, Whitby. *hc*, J. Baker, Cockerton; J. & T. Cleminson. *c*, R. Layfield, Darlington.
CANARY.—*Any other variety*.—1, W. & C. Burniston. 2, J. Adams. *hc*, T. Tenniswood.
CANARIES.—*Cage of Six*.—1, J. & T. Cleminson. 2, J. Adams.
SELLING CLASS.—1, J. & T. Cleminson. 2, W. T. Hampton, Darlington. *hc*, W. & C. Burniston.
MOLE.—*Any variety*.—1 and 2, R. Stockdale. *hc*, R. Layfield.
BRITISH BIRD.—*Any variety*.—1, W. & C. Burniston. 2, T. Armstrong, Great Broughton.

Mr. J. Bexson, Derby, was the Judge.

OUNDE POULTRY SHOW.

THE following awards were made at this Show, held on the 15th inst.:—

DORRINGS.—*Cock*.—1, 2, and 3, R. Wood, jun., Clapton. *c*, Rev. E. Bartrum, Berkhamstead. *Cockerel*.—1, F. E. Bayard, Gwernydd, Berriew. 2, R. Wood, jun. *hc*, L. B. Calcott, Oundle.
DORRINGS.—*Hens*.—1, 2, and 3, R. Wood, jun. *Pullets*.—1, T. C. Burnell, Micheldever. 2 and *hc*, Rev. E. Bartrum. *c*, F. E. Bayard; H. Wyman, Conington; L. B. Calcott, Oundle.
GAME.—*Cock*.—1, C. Chambers, Oakham. 2 and 3, H. Lotan, Oundle. *hc*, W. Bearpark, Anderby Steeple; Howard & Patenell, Wellingborough; Mrs. Deacon, Folebrook Hall; E. Winwood, Wroeseter. *c*, H. E. Martin, Sculthorpe, Folebrook. *Cockerel*.—1, T. Dyson, Hahfax. 2 and *c*, B. Mallet, Batham, Surrey.
GAME.—*Hens*.—1 and 2, H. Lotan. 3, H. Howe, Wellingborough. *hc*, H. E. Martin; E. Winwood. *Pullets*.—1, T. Dyson. 2, Howard & Patenell.
SPANISH.—*Black*.—*Cock*.—1, T. Boulter, Clerkenwell. 2, W. Nottage, Northampton. *hc*, T. W. Haliham, Whitwick, Leicester. *Hens*.—1, M. Brown, Abertilly. 2, J. F. Parker, Northampton. 3, W. L. Bull, Newport Pagnell. *hc*, E. Winwood. *Chickens*.—1, W. L. Bull.
COCHIN-CHINA.—*Cock*.—1, E. Winwood. 2, T. Sear, Aylesbury. *hc*, H. Feast, Swadsea; H. Yardley, Birmingham; W. A. Burnell, Southwell. *Hens*.—1, E. Winwood. 2, H. Yardley. *Chickens*.—1 and 2, W. A. Burnell. 3, H. Feast.
BRAMMAS.—*Dark*.—*Cock*.—1, H. Lingwood, Creeting, Needham Market. 2, T. F. Ansell, Cowley Mount, St. Helen's. *hc*, R. A. Boissier, Penshurst. *c*, J. S. Clarke, Oundle. *Hens*.—1, T. F. Ansell. 2 and *c*, J. S. Clarke. *hc*, H. Wyman. *Chickens*.—1, H. Lingwood. 2, J. S. Clarke.
BRAMMAS.—*Light*.—*Cock*.—1, Mrs. Peel, Sharnbrook. 2, H. Lingwood. *hc*, M. Leno, Dunstable. *Chickens*.—1, H. Lingwood. 2, Mrs. Peel. *c*, S. Lucas, Hitchin.
HAMBOURG.—*Gold and Silver-pencilled*.—1, J. Ward, Ashby-de-la-Zouch. 2, W. Tickner, Ipswich. *Gold and Silver-spangled*.—1, J. Ward. 2, W. Tickner. *BANTAMS*.—1, R. Wood, jun. 2, M. Leno.
ANY OTHER DISTINCT BREED.—1, W. Bearpark, 2, H. Feast. 3, W. Cntlack, jun., Littleport. *hc*, R. A. Boissier.
SELLING CLASS.—1, H. Lotan. 2, A. F. Faulkner, Thrapstone. *c*, E. V. Snell, Baffwden; W. Taylor, Glapthorn; J. S. Clarke. *Hens*.—1, J. T. Parker, Northampton. 2, T. Love, Kingsthorpe, Northampton. *hc*, T. Boulter. *c*, A. Checkley, Wellingborough.
GEES.—1, Mrs. Deacon. 2, M. Kew, Market Overton, Oakham.
DUCKS.—*Aylesbury*.—1, Mrs. Deacon. 2, T. Sear, Aylesbury. *hc*, H. Wyman. *Rouen*.—1, R. Wood, jun. 2, T. Halmshaw, Earlsnewton, Dewbury. *Any other variety*.—1 and 2, M. Leno.
TURKEYS.—1, M. Kew. 2, Mrs. Deacon. *hc*, J. B. Underwood, Warmington.

PIGEONS.

CARRIERS.—1, W. Nottage, Northampton. 2, J. E. Palmer, Peterborough. *hc*, H. Yardley, Birmingham.
FOUTERS.—1, L. Watkin, Northampton. 2, J. E. Palmer. *hc*, W. Nottage; H. Yardley.
ANY OTHER VARIETY.—1, H. Yardley. 2, J. E. Palmer. *c*, J. F. Loversidge, Newark; J. Coote, jun., Wellington; T. Chambers, jun., Northampton (2).

RABBITS.

HEAVIEST.—J. Rev. H. H. Gillet, Wadenhoe, Oundle.
LOU-SARD.—1, G. Wood, Clapton. 2, W. E. Dolby, Oundle.

SILVER-GRAY.—1, Rev. H. H. Gillet. 2, A. W. Whitehouse, Northampton. *FANCY*.—1 and 2, G. Mault, Lowick.
JUDOE.—Mr. Tegetmeier.

THE POULTRY-KEEPER.—No. 12.

THE DORKING.

COCK—GENERAL CHARACTERISTICS.

Of a noble deportment, though of a rather rounded form, stout and large, covered by abundant plumage. Hackle thick;

Fig. 26.—Dorking Cock.

tail of medium length; comb single; wattles and ears very long; five toes to each foot; bones fine and light (fig. 26).

Weight.—At full age from 7½ lbs. to 8½ lbs.

Flesh.—Abundant, very white, very fine, and easily disposed to fatten.

Shape.—In all cases the bird should be of ample size, yet proportioned to its height, and never long and narrow.

Fig. 27.—Dorking Cock's Head.

Head (fig. 27).—Strong, upon a neck apparently thick on account of its very abundant hackle.

Comb.—Single, high and large, prolonged behind, as straight as possible, and regularly and largely toothed. The comb is sometimes double and granulated, especially in the White variety.

Wattles.—Long, large, and hanging.

Checks.—Covered with small, short, white feathers.

Ears.—Rather long, red at the ends, of an azure blue, and peepily near the ear passage.

Beak.—Strong, and curved downwards; black and yellow.

Eye.—Iris, dark red; pupil, black.

Foot.—Of medium length, strong, fleshy, and good pinkish white; soft, and of a very fine texture.

Fig. 28.—Dorking's Foot.

Fig. 29.—Dorking's Foot, under side.

Toes.—Strong, well-jointed, five in number, and of the same characteristics as the foot (figs. 28 and 29).

Plumage.—The Grey Dorking, which is the most noted and characteristic variety, has the hackle and the long saddle feathers of a beautiful straw colour, thickly marked with small black spots. The shoulders are of a deep yellow. The feathers which cover the wings are of a fine black, with very bright purplish iridescence; the large flight feathers white; the breast brilliant black; the sides, thighs, and abdomen of a dull black; the large tail feathers black; the covert feathers of the tail and the sickles black, with green and bronze iridescence.

The cock is very beautiful, and of a very sedate aspect. Its head, wattles, and thick hackle give it a very patriarchal appearance.

SHEFFIELD POULTRY AND PIGEON SHOW.

MANY shows have been started at Sheffield, yet there has been none in that important centre of industry which has been annual, most of them having failed owing to want of public support. Whether that which we now report will become a fixed event remains to be seen, but while we were there on the first day (July 18th) the visitors were not at all numerous. The schedule was an attractive one, many extras in useful Sheffield ware being given besides substantial money prizes, and the entries amounted to about a thousand in all. The management was in the able hands of Mr. Hawley, of Gillingham, Bradford, and the only drawback was that on some account Messrs. Turner were disappointed of some of their pens which had been in use at other exhibitions, and this threw the penning of the birds somewhat behind, so that the arbitrations were not commenced till some time later than was intended. Very large and excellent tents were provided.

Black Red Game cocks were first, but did not show well. The first-prize bird, though a grand fellow, was duck-heeled; the second, though stylish, had lost one spur, and the third was a little flat-shinned. Most of the class were rather shabby in feather. In hens the first was large, stylish, and good in hand, but rather coarse, yet fine in feather; the second of high quality but out of condition, while the third also was of good quality. The piece of plate was awarded to Mr. Matthew's well-known Brown Red, the second being a stag of great promise. In hens an excellent Brown Red was first, closely run by a good Pile. **Dorkings**—cocks were fair, and in hens a splendid chicken was first, second good, but the third a little faded in colour. **Cochin** cocks were a little shabby as a rule, Lady Gwydyr's large old Buff coming second to a good light Buff, which, however, was a little mealy in tail. In hens the first and extra prize went to a very grand Buff pullet, the second and third to hens. In Dark **Brahma** cocks the cup was awarded to a Sheffield bird of great size and good shape, the breast being slightly mottled; second a grand bird in all points, but rather yellow; third a good bird, but smaller. In hens the first was good in shape and well pencilled, also of Sheffield; second very large, but not equal in pencilling and shape—a really good pullet. In Light **Brahma**

a cock of great merit, but a little yellow, was first; and in hens a model pullet.

Spanish cocks were a grand class. First a large-faced and broad-dropped bird; second good in face, but narrower in drop; and third a smaller-faced bird, but by far the best in quality. The extra prize went to the first-named cock. Good as were the cocks, a treat was awaiting us in hens, and we do not hesitate to say this was the best class ever seen at this time of year, and we leave the award to particularise the quality respectively. **French** were poor, the winners excepted, la Flèche taking the plate.

In Golden-spangled **Hamburghs** the birds were mostly good, but one or two rather old for the show pen. The first, a thoroughly well-marked bird, had lost one sickle. Hens were very good; the first, one of the best-marked we have seen of late, and sound in colour, but rather broad in comb; second not so bright in ground, but well spangled; third also a thoroughly good hen. In Silver-spangled the first was a model bird, but the second and third failing in spangles on the tail buckle. No. 165, shown by Mr. Long, was almost equal to the first, but sadly broken in feather either at or in transit from Lincoln. Hens good, but not quite up to the Golden. The whole of the winners in Golden-pencilled cocks were good in colour and tails, and, if we are rightly informed, are the produce of one yard. In hens the first was a model of his kind, the second only losing a little in tail, while the third was exceedingly bright in colour, but bad in comb and tail, and a little mossy, and yet at first sight she appeared the best. The winners in Silver-pencilled were good; the first a model bird in all respects. The next class contained some good hens, though, to our liking, rather smaller than is desirable; the third a good pullet. Black **Hamburgh** cocks were good in all points, and the cup for **Hamburghs** was given here, but the hens pressed closely, the first being perfect.

In **Polish** Silvers won in both cases, while **Golden** were second and third; and in the Variety class good **Sultans** were first, **Scotch Greys** second, and **Redcaps** third.

Bantams came next, Black Red cocks heading the list, the first and extra prizes going to a grand old cock rather thick in neck and broad in sickle, while the colour was superb; second and third were good styish birds, one rather broad in head and out of feather, and losing in colour, and the other a similar bird, but the shafts of the sickles red. In hens the first was a grand pullet in both style and colour; second a good hen, and third also a hen. In the following class a Pile was first, Duckwing second, and a very pretty Pile cockerel third. We do not know a better Pile hen in the fancy than that to which the first prize for Any other variety of hen was awarded; style, colour, and condition were perfect. Second came a grand Duckwing, and third a Pile pullet. Black **Bantam** cocks were very good, but not so the hens, excepting that which took the first prize. The piece of plate for these classes went to the Black cock. The **Sebrights** in the next class were not in the best bloom, although we doubt not that when in feather they will be good. In hens a Pekin was first and a Golden-faced second; the third, a Silver Sebright, was quite patchy in marking and needing moult.

There were six Selling classes, and all well filled—in fact, quite a little show of themselves, and the winners were in most cases birds fit for any competition.

PIGEONS formed a fine display, and the classes were well filled. The cup for the greatest number of points was won by Mr. Taylor. In **Blue Pouter** cocks two birds in prime condition were first and second, the third-prize one also being good. In **White** cocks Mr. Nottage won both prizes with good birds, the second losing only in leg-feathering. **Carriers** were not numerous, but some were good, Mr. Yardley's Black cock winning very easily, as also his hen in the following class. The first-prize **Almond** cock was far ahead of the second in head properties, but was closely pressed in point of colour and marking. **English Owls** were one of the best classes; the first, a Silver hen, almost perfect, and second a really good Blue. In **Turbits** Mr. Jones showed a grand Silver cock, to which the piece of plate was justly awarded; and in **Dragoons**, Blue or Silver, the extra prize was given to a Blue cock with the right style of head. **Antwerps** were good classes, the cup going to a Short-faced cock.

RABBITS.—Most of these were placed too high to be easily seen, but these were not the Lops. In **Lop** bucks the first was a Fawn in fine order, 22 by 4½ inches in ear; second a Black-and-white, 21 by 4½ inches. In does the first was a Black-and-white, 21½ by 4½ inches, large, well marked, with an enormous dewlap, and awarded the piece of plate; second a grand Grey, good in colour, 21½ by 5 inches; and third a Tortoiseshell, rather small, and not in the best order, 21½ by 4½ inches. **Silver Greys** came next, but these did not prove good, except the first-prize doe, and this needs a little more time to bring out the silvering; second also a doe not in such good order as we have seen her; and third a buck rather darker than is desirable, but very fair for a buck. Some of the best Rabbits in this class were in full moult. Of **Himalayan** there were only three in the pens, the first large and good in head, but only moderate in feet; second very fair in points, but small and rather mousey; the

Dorkings had seven entries, the first being of the Dark variety and good in all respects, while second came a good Silver-Grey with a poor hen. *Cochins*, Buff were poor, the winners young; but the pen of Whites that took the first prize in the next class were shown in the best possible trim, second being Partridge, and the cock very good. Light *Brahmas* were bad, but the Dark very good, the three pens running uncommonly closely upon each other. Of *Red Game* there were eleven entries, forming a fine class; first coming a very stylish pen of Brown Reds, second one of the same colour, but the hen not so good, while a good pair of Black Reds were awarded the third prize; the latter, however, were out of feather. In the next class there were three entries of Duckwings, old birds coming first, a very stylish pen of chickens being second. *Hamburghs*, though mixed classes according to the schedule, produced only Golden in the Spangles; but these were one of the best classes, five out of the seven pens being noticed by the Judges, and all containing birds of the right stamp. In Pencilled only the first-prize Golden was good, but these were a nice pair. *Bantams* had but one class, the first a grand pen of Blacks, and second Black Red Game; the hen very good, but the cock rather stumpy. Eight pens were noticed in the Variety class out of ten entered, the first being such a pen of White-crested Black Polands as we have not seen of late, and which reminded us of days gone by. The price put upon them was only £5 6s.: hear ye this, ye Poland fanciers! Second were grand Black *Hamburghs*, and third *Silkie*s.

DORKINGS.—1, W. Bennett, Barton-on-Trent. 2, J. Watts, Birmingham. *hc*. W. Bennett; M. M. Cashmore, Loughborough.
COCHIN-CHINAS.—*Cinnamon or Buff*—1 and 2, E. J. Draper, Barton-on-Trent. *c*, J. Watts. *Any other variety*.—1, Dr. Hall, Swallowcliffe, Barton-on-Trent. 2, M. M. Cashmore. *hc*, G. M. Cooper, Barton-on-Trent. *c*, S. W. Hallam, Whitwick; *c*, R. Hall.
BRAHMAS.—*Light*.—1, J. Watts. 2, Dr. Hall. *Dark*.—1, Dr. Hall. 2, J. Watts. *hc* and *c*, G. M. Cooper.
FRENCH.—1, W. Williams, Woodville, Barton-on-Trent.
GAME.—*Black or Brown Red*.—1, E. Staley, Swallowcliffe, Barton-on-Trent. 2 and 3, W. Harvey Midway, Barton-on-Trent. *hc*, Dr. Holme, Lichfield. *hc*, E. Bell, Barton-on-Trent; G. Fumes, Barton-on-Trent. *Any other variety*.—1, W. Harvey. 2, E. Bell. *hc*, R. Staley.
HAMBURGERS.—*Golden or Silver-spangled*.—1 and *hc*, C. Dawes, Newhall. 2, S. W. Hallam. 3, M. M. Cashmore. *c*, J. Watts. *Golden or Silver-pencilled*.—1, Dr. Hall. 2, M. M. Cashmore. *c*, C. Dawes.
BANTAMS.—1, R. H. Ashton, Mottram. 2, E. Bell. *hc*, W. Harvey; J. Watts. *c*, R. Staley.
ANY OTHER VARIETY.—1, Dr. Hall (Poland). 2, M. M. Cashmore (Black *Hamburghs*). 3, M. Buxton, Bretby, Barton-on-Trent (Silkies). *hc*, Dr. Hall (Black *Hamburghs*); J. Watts; J. Ward; S. W. Hallam (Spanish); Dr. Hall (Minors).

The Judges were Messrs. Lowe, of Comberford, and Hutton, of Pudsey.

CLECKHEATON POULTRY SHOW.

The sixth annual Show was held on the 18th inst., and as regards the attendance of visitors proved a great success. The Show at Sheffield seemed to have affected the entries very much, as in some classes there were only as many birds as prizes. *Game* came first, Mr. Brierley winning first in both single cocks and pairs of Reds with good birds. In *Game*, any other variety, we may be pardoned if we differ from the Judge, for the second were undoubtedly best, the first being very coarse. In *Cochins* the winners were Buifs, two good pens of Whites being highly commended. *Spanish* were very fair, and the *Brahmas* good; while in the three classes of *Hamburghs* there were some good birds shown.

In *Game Bantams* the first was a really good pen, the Piles and Duckwings in the next class proving only poor. In the Variety class the winners were Gohl and Silver Polands respectively. The class for chickens was good, almost all of them being noticed; the first being capital Dark *Brahmas*, and second Golden-pencilled.

Ducks and *Geese* were good. In the Variety class Teal Ducks were first, Kasarkas second, and Pintails third.

PIGEONS were not numerous, Mr. Horner, who seems to prefer an easy competition, winning most of the prizes with a capital stud of birds. In Carriers a good Black was first, Dun a good second. Pouters were, first Blue and second Reds. *Dragoons* were a good class. A capital Blue was first, and Yellow second; but in Jacobins No. 1, unnoticed, ought to have been first. Antwerps were very strong, good Duns winning in both cases.

RABBITS.—Of these there were twenty-six entries. In Lop-eared bucks Greys were first and second. Two good Silver-Greys won in the Variety class for bucks; the first in does being Angora, and second a small and neat Dutch.

GAME.—*Any variety*.—Single Cock. 1, C. W. Brierley, Middleton. 2, J. Fortune, Morton Banks, Keighley. *Black or Brown Red*.—1, C. W. Brierley. 2, J. W. Thornton, Bradford. *hc*, W. Bentley, Scholes; H. Beaman, Bradford. *Duckwing, Blue or Grey*.—1, H. C. & W. J. Mason, Drighlington. 2, E. Holland, Ovenden. *Any variety*.—1, E. Walker, Gomersal. 2, H. C. & W. J. Mason. *hc*, H. Walker, Gomersal; C. W. Brierley.

DORKING.—1, J. Walker, Rochdale.
COCHIN-CHINAS.—1, W. H. Crabtree, Manchester. 2, C. Sidwick, Keighley. *hc*, W. Whitworth, jun., Manchester. *hc*, H. Beldon, Bingley. *c*, E. Winwood, Worcester. 3, F. W. Shackleton, Bradford.

SPANISH.—Black. 1, J. Thresh, Bradford. 2, H. Beldon.
BRAHMA POULTRY.—1, T. F. Ansell, St. Helen's. 2, W. H. Crabtree. *hc*, W. H. Crabtree. 3, H. Whitson, Earby. 4, H. Beldon. 5, T. F. Ansell.
HAMBURGERS.—*Gold or Silver-spangled*.—1 and 2, H. Beldon. *Gold or Silver* spangled. 1 and 2, H. Beldon. *c*, W. Kellett, Birstal.

PIREASANT.—Black. 1, T. W. Holmes, Baildon. 2, H. Beldon. *hc*, H. Beldon; C. Sidwick; J. Smith, Calverley.
GAME BANTAMS.—*Black or Brown Red*.—1, G. Noble, Staincliffe. 2, S. Smith, Northtram. *Any variety*.—1, J. Sugden, Swindley. 2, S. Smith. 3, F. Holt, Staincliffe.

BANTAMS.—*Any variety except Game*.—1, W. H. Robinson, Keighley. 2, E. J. Hingworth, Hightown.

ANY OTHER VARIETY.—1 and 2, H. Beldon. *hc*, W. H. Crabtree.

SELLING CLASS.—1, J. Powell, Bradford. 2, E. Clayton. *hc*, H. Wilkinson; T. Williamson, jun., Cleckheaton; C. Carr, Wilsden.

ANY VARIETY.—*Cochins*.—1, H. Beldon. 2, E. Clayton. *hc*, C. Sidwick; E. Holland; J. Mitchell, Birkenshaw; J. Walshaw, Ratley; W. Scholesfield, Birkenshaw; R. Lord, Rochdale; J. Smith; E. Aykroyd, Eadeshill.

GESE.—1, J. Walker, Rochdale. 2, J. White, Wintley, Netherthorpe. *hc*, F. E. Rawson, Halifax.

DUCKS.—*Aylesbury*.—1 and 2, J. Walker. *hc*, J. Newton, Silsden. *Rouen*.—1, J. Newton. 2, J. Walker. *hc*, T. Halmshaw, Earlsheaton. *Any other variety*.—1, J. Walker. 2 and *hc*, W. Binnis.

PIGEONS.

CARRIERS.—*Single Bird*.—1, P. R. Spencer, Hereford. 2, E. Horner, Harewood, Leeds. *hc*, P. R. Spencer; E. Horner. *Pair*.—1 and 2, E. Horner.

POUTERS OR CROPPERS.—1 and 2, E. Horner. *hc*, H. Yardley.

FANTAILS.—1 and *hc*, J. F. Liversidge, Newark. 2, E. Horner.

DRAGONS.—1, E. Horner. 2, W. Binnis. *hc*, E. Burnhill, Cleckheaton.

JACOBS.—1, E. Horner. 2, H. Yardley.

NUNS.—1 and 2, E. Horner.

ANY OTHER VARIETY.—1, W. Ellis, Leeds. 2, E. Horner. *hc*, W. Lund, Shipley; H. Yardley; W. Ellis; T. Foster, Bingley.

SELLING CLASS.—1, S. Anderson, Mirdfield (Owl). 2, R. Schofield (Dragoons). *hc*, W. Lund (Turbits); E. Horner (Jacobins).

RABBITS.

LOP-EARED.—*Duck*.—1, W. Miller & S. Adams, Bradford. 2, G. S. Burton, Leeds. 3, T. Williamson, jun.; G. S. Burton. *Do.*.—1, G. S. Burton. 2, A. Miller, Bradford. *hc*, F. ea her & Mitchell, Keighley; J. Armstrong.

ANY OTHER VARIETY.—1 and 2, J. Hallis, Huddersfield (Silver-Greys). *Do.*.—1, G. S. Burton (Angora). 2, W. Miller (Dutch). *hc*, S. Ball, Bradford (Angora); A. Atkinson, Huddersfield (Angora); A. W. Whitehouse, Northampton (Silver-Grey).

The Judges were Mr. James Dixon, of Bradford, and Mr. Esquilant, of Brixton.

BRAMLEY POULTRY SHOW.

The following awards were made at this Show held on the 20th and 21st inst. Owing to want of space we are reluctantly compelled to postpone our reporter's comments until next week.

SPANISH.—1, H. Beldon, Bingley. 2, Pallister & Hawkins, Topcliffe. 3, J. Powell, Bradford. *hc*, H. Beldon; W. F. Pickard, Thurner.

COCHINS.—1, H. Beldon. 2, W. Mitchell, Birkenshaw. 3, R. J. Raworth, Harrogate. *hc*, Mrs. C. Outley, Bramley.

BRAHMS.—1, H. Beldon. 2, W. Scholesfield, Birkenshaw. 3, T. Dobson, Kirby Morside. *hc*, W. Mitchell. *c*, A. Atkinson, Armley.

GAME.—1, J. W. Thornton, Bradford. 2, E. Holland, Ovenden, Halifax. 3, Wingfield & Andrews, Worcester. *Cock*.—1, J. W. Thornton. 2, J. Andrews, Worcester.

POLISH.—1 and 2, H. Beldon.

HAMBURGERS.—*Gold-spangled*.—1 and 3, H. Beldon. 2, J. Long, Kent. *Silver-spangled*.—1 and 3, H. Beldon. 2, T. Fawcett, Baildon.

HAMBURGERS.—*Gold-pencilled*.—1 and 3, H. Beldon. 2, T. Fawcett. *Silver-pencilled*.—1 and 3, H. Beldon. 2, J. Long, Kent. *Black-pencilled*.—1, H. Beldon. 2, T. W. Holmes, Baildon. 3, J. Moore, Pudsey. *hc*, Popplewell Bros., Bramley; J. Long.

GAME BANTAMS.—1, G. Noble, Staincliffe. 2, W. F. Entwistle, Westfield, Bradford. 3 and *c*, Wingfield & Andrews. *Cock*.—1 and *hc*, W. F. Entwistle. 2, G. Noble. 3, E. Jennings, Allerton. *hc*, J. Roberts, Bramley.

BANTAMS.—*Black*.—1, Wells & Sherwin, Ripon. 2, R. H. Ashton, Mottram. 3, Wingfield & Andrews. *Any other variety*.—1, H. Beldon. 2, Wells & Sherwin.

DUCKS.—*Rouen or Aylesbury*.—1 and 3, T. Halmshaw, Earlsheaton. 2, Dr. Binnis, Pudsey. *Any other variety*.—1, 2, and 3, Dr. Binnis.

CHICKENS.—1, H. Beldon. 2, W. Scholesfield. 3, W. Mitchell.

ANY VARIETY.—*Cock*.—1, F. W. Shackleton, Bradford. 2, W. F. Erth, Birkenshaw. 3, H. Beldon. *hc*, C. Carr, Wilsden, Bingley.

LOCAL CLASS.—*Free not to exceed 30s.*.—1, J. J. Powell, Bradford. 2, H. Beldon. 3, Popplewell Bros. *hc*, Wells & Sherwin. *c*, H. W. Hingworth, Idle; C. Carr.

PIGEONS.

CARRIERS.—1 and 2, E. Horner, Harewood. 3, Miss F. Seaton, Leeds. (The whole class highly commended).

POUTERS.—1, Cap. and 2, J. Hainsine, Hall. 3, E. Horner. *hc*, Wells & Sherwin; E. Horner.

ANY OTHER VARIETY.—1, C. A. Pearson, Liverpool. 2 and *hc*, R. Woods, Mansfield. 3, Dr. Binnis. *hc*, G. P. & R. Hackett, London; E. Horner.

OWLS.—*English*.—1, Dr. Binnis. 2, Miss F. Seaton. 3, H. G. Poole, Bradford. *hc*, Dr. Binnis; J. Thresh, Bradford. *hc*, J. Bailey, Bramley; J. Dye, Haxham. *c*, E. Horner.

TURBOTS.—1, 2, and 3, H. G. Poole, Bradford. *hc*, F. Pickard, Pontefract. *hc*, W. Daniels, Rugby. *c*, Popplewell Bros.; W. Daniels.

JACOBS.—1 and 2, J. Powell, Bradford. 3, Dr. Binnis, 3, A. Blakeborough, High Harrogate. *hc*, E. Horner.

TAUMPERERS.—1 and 2, E. Horner. 3, J. Pickard.

TUMBLERS.—*Long*.—1, 2, and *hc*, Dr. Riddiough, jun., Bradford. 3, J. Dye. *hc*, Dr. Riddiough, jun.; E. Horner. *c*, Wells & Sherwin. *Short*.—1 and 2, E. Horner. 3, J. R. Barnes, Bramley.

FANTAILS.—1, 2, and 3, J. F. Liversidge, Newark. *hc*, J. F. Liversidge; E. Horner.

BARDS.—1, Miss F. Seaton. 2 and 3, E. Horner. *hc*, A. Blakeborough; Miss F. Seaton (2); H. Jennings, Allerton.

ANY OTHER VARIETY.—*Long*.—1 and *hc*, W. Lund, Shipley. 2, H. Jennings, Allerton. 3, Dr. Binnis. *hc*, R. Mison; J. Dye. *Short*.—1 and *hc*, W. Lund. 2, Dr. Binnis. 3, E. Horner. *Medium-faced*.—1, Dr. Binnis. 2, W. Lund. 3, H. Jennings. *hc*, W. Bates, Rugby; J. Lister, Keighley. *hc*, B. Rawnsley, Bingley. *c*, Miss F. Seaton.

MAGPIE OR NUN.—1 and 2, Miss F. Seaton. 3, S. Machell, Bramley. *hc*, S. Machell; Dr. Binnis; E. Horner. *c*, Wells & Sherwin.

ANY OTHER VARIETY.—*Long*.—1, Miss F. Seaton (Pain lech). 2, E. Horner. 3, Wells & Sherwin (Swallow); R. Woods; Miss F. Seaton (Pigmy Pouter). *hc*, Wells & Sherwin (Icel). *hc*, Miss F. Seaton (Spangled Icel). *c*, R. Woods (2).

SELLING CLASS.—*Free not to exceed 25s.*.—1, W. Lund. 2, A. Blakeborough. 3, Wells & Sherwin; W. Lund. 3, A. Atkinson, Armley; C. G. Java, Spalding. *hc*, Dr. Riddiough, jun. *hc*, S. Machell; Miss F. Seaton (Tumbler and Magpie).

LOCAL CLASS.—*Long-faced Antwerps*.—1, W. Sutcliffe, Bramley. 3, A. Batty, Bramley. *c*, J. Watson, Bramley.

CANARIES.

YELLOW.—1, S. Hainsworth, Farsley. 2, J. P. Busfield, Farsfield.

MASS.—1, B. Keighley, Farsley. 2, D. Hingworth, Horsfield.

MIXED.—1, W. Cleary, New Witley. 2, J. Heald, Bramley. *hc*, S. Briggs, Bramley. *c*, R. Webster, Bramley.

NORWICH.—1. W. Smith, Birmingham. 2. W. Clegg. *vhc.* J. Benn, Bramley.
 BELGIUM.—*Marked*.—1. G. Gott, Shipley. 2. P. Horn, Farsley.
 LIZARD.—1. D. Illingworth, Hertsford.
 MULES.—1. D. Illingworth.
 SELLING CLASS.—*Price not to exceed 12s. 6d. with Cages*.—1. P. Horn. 2 and 3. W. Smith. *hc.* W. Clegg.

PARROTS.—*Grey*.—1. W. Clegg. *Any other variety*.—1. J. Booth, Armley. 2. G. Longbottom.

RABBITS.

LOP-EARED.—1. G. S. Burton, Beeston Hill. 2. J. Blakey, Driffeld. 3. J. M. Mander, Wakefield. *vhc.* J. Bowman, York; T. Myton, York (2). *hc.* F. Banks, London; G. S. Burton; J. Armstrong, Leeds; J. M. Mander.

SILVER-GRAY.—1 and 3. R. H. Glew, Wakefield. 2. S. Ball, Bradford. *hc.* G. C. Hutton, Bradford; T. H. Dows, Boston.

HIMALAYAN.—1. B. Newsome, Holbeck. 2. J. Firth, Bramley. 3. H. White, Rochdale. *vhc.* A. Atkinson, Huddersfield. *hc.* S. L. Firth, Bramley; B. Newsome.

ANGORA.—1. A. Atkinson. 2. G. C. Hutton. 3. S. Ball, Bradford. *vhc.* J. White, Bramley. *hc.* J. White; T. Garner. *c.* G. S. Burton.

ANY OTHER VARIETY.—1. T. Garner. 2. T. H. Dows. 3. M. Marsland, Goole; G. P. & R. Hackett, London. *hc.* H. E. Gilbert, Rugby. *c.* R. Lund, York; T. H. Dows.

ANY VARIETY.—1. T. Myton. 2. G. C. Hutton. 3. T. H. Dows. *vhc.* F. Banks T. Myton. *hc.* J. Armstrong.

Mr. Hutton, of Pudsey, was the Judge.

THE FANTAIL.

THE Fantail is one of the most attractive of the fancy varieties of Pigeons. In fact, it is almost as well entitled to the cognomen of high fancy as the Pouter, it being as difficult to produce a fine tail and style as a large crop and size. Some writer detractingly says, "Fantails were intended to be trifled over by women and children." He certainly could have had no experience in breeding them. It has been one of my favourite varieties from my earliest Pigeon-fancying, and a few years ago I discarded all others for the sole purpose of experimenting upon the development of a strain of certain colours. Few persons know what a fine bird is; they have become so used to the ordinary shovel-tails, that they are to a measure correct in the idea that the Fans are of but little importance.

The demand for fine birds is, however, increasing, and the dull, vacuous bird, with its bedraggled look, will ultimately disappear before the improvement in good taste. While nothing can be more common and ugly than an ordinary Fantail, so there can be nothing more striking in the Pigeon realm than a small, stylish, high-bred bird. There are several classes of Fantails and fanciers. In the first place, there is as much difference between two of the strains as there is between the strains of Tumblers: one strain being large and coarse, with immense tails; the other, small, refined, and exceedingly stylish. The English partake of the first, the Scotch of the latter characteristics, though in both countries there are individuals who may have preferences for certain of these points. There are also other distinctions beside large and small. The birds may be long-necked or short-necked; the first are the so-called Calcutta Fans, the latter the German variety. Then there are the pointed and the plain-headed. Of these, the pointed are most popular in America, and the smooth heads in England.

Thus we see there are two strains, large and small, and each of these may be subdivided into long and short-necked birds, with or without points in the heads, with large tails and moderate style, or with grand style and moderate tails.

As so much is possible, what is preferable? Many of the most successful breeders pay all attention to the tails, and we see dozens of birds "bowed down beneath the weight of woe," caused by a heavy tail overtopping them, and bearing their breasts towards the earth, like a boat too heavy forward; or else the tail is carried backwards at an angle of 45°, and the bird loses what style it might have by trying to balance itself upon its feet. Other and equally successful breeders go for style, and sacrifice all else for that. These seem to be the two extremes, and our preference is for the latter. Style, by all means; without it the tail is nothing to speak of, though every Fantail must, as a matter of course, have at least twenty feathers in the tail.

Those fanciers who like large tails are not content with less than thirty, and with some thirty-six is the minimum. We have seen a few birds with over forty feathers, and have heard of and read of fifty and fifty-six being counted; and though we have no reason to doubt the report, and deem the thing possible, yet we were not present at the numbering, and, under some circumstances, seeing is believing.

Probably if we had seen we might have learned something, as we did from the fellow who always beat us 3 or 4 inches in the measurement of Pouters. We never could imagine how he did it, until we saw him carefully draw the tape from the point of the beak along the breastbone, and so between the legs to the tip of the tail. We outlived him afterward. With birds of the finest style there are seldom more than thirty feathers in the tail. That number makes a tail of good size and weight, and is easily carried.

The feathers are of two varieties—long and narrow, and short and wide. The longest belong generally to the long-necked birds, the broadest to the short thick ones. The short and broad make the best tails, as there is more probability of their

being well spread, and the birds to which they belong are mostly short-backed specimens.

The feathers of the tail, no matter how many in number, must form about seven-eighths of a circle, and must be so arranged that when the tail is cut off it will lie flat upon the table, preserving its circle without being weighted down. The under tail coverts must be smooth, even, and perfectly straight in position, looking like a leaf placed upon the posterior surface of the fan. The carriage of the fan is of the highest importance, and it should be carried so that the tips of the middle feathers will be directly over the centre of the feet, and touching the head. The fan must not deviate from a right line either towards the right or left, as the slightest lopping is detrimental.

The feathers, above twenty, are set in a double row—that is, it takes about twenty to form a circle, the feathers being a little closer together towards the middle of the tail; after that the extra number go to form the second row. Sometimes a third row is also intimated.

When the birds are bug-infested, the tail feathers are broken down, or caused to look rigged, by the birds picking themselves. A description of the style is very hard to put on paper; there is so much goes to make it up, and there is a vitality about it that dies beneath the point of the pen. To be stylish, the bird must be small; that is imperative. To be large, in proportion to the average size of anything, is to be gross; and in nothing is this more applicable than among Pigeons, especially among Fantails; therefore, it must be small as the Almond Tombler, if possible, and then it outstyles that variety. If it is large it is common, thereby vulgar; but small and stylish, it is a gem, and fit for "women," as the diamond is among stones.

The preferable neck is long and graceful, curved as the letter S reversed. It must ascend from a full, round breast, as symmetrically as the Swan's, and it must be continually in motion. The head is the head of a Dove, with the eye of Venus, for there is an expression about the eye of a Fan that is not observable in the eyes of any of the others; we presume, on account of the incessant motion of the neck, which has obtained for the variety the name of Shaker.

The neck, surmounted by the head, inclines backward, resting against the anterior surface of the tail, or rather just touching it; for if it presses too hard it passes between the feathers, and it becomes a deformity. The incessant shaking is a trait produced by cultivation; it is necessary to good style, and becomes extravagant in well-bred birds when driving to nest. The large-tailed birds do not have it to a great degree, nor do the short-necked German cast of birds; many of the shovel-tails do not have it at all, and when they do it is a burlesque upon good behaviour.

A good idea of what the relative positions of neck, tail, and body should be may be gained by drawing a triangle, the base of which will represent the body of the bird, and the two sides the neck and tail, meeting at the apex. The wings are carried close to the side, the tips meeting behind, beneath the tail, just touching the floor; the feet, coral-red; the eyes, hazel in white birds, pearl in the coloured. The back is an item that must not be neglected; the shorter it is the better, and the more likelihood of the carriage being fine.

The standard colour is white, a pure white with purplish lustre about the neck when shaking in the sunlight. We have spent a number of years in experimenting upon the colours of Fantails, and have bred them of all colours, shades, and combinations. Much can be done with a little care; by forming an idea in one's mind and breeding to it, any composition can be fixed. Thus we have bred black birds with white tails, and white birds with black tails, white birds with red tails, saddle-backs, magpie, &c.; but such birds never equalled in style the pure white. We have seen, and at times have owned some of the solid colours that were equal to the best whites, but they have been very few in number, and are very hard to obtain, especially yellows and blues.

One of the prettiest combinations of colours we have ever seen was in a bred bird from black-tailed stock; it was a pure white with undertail covert deep black.

When we were breeding Fantails our standard was as follows:

1. Style: nervous; bird always on tip-toe; continuous shaking of the neck.
2. Size: small.
3. Tail: Feathers evenly and broadly spread; well carried.
4. Back: short.
5. Feet: coral red.
6. Eye: hazel in white; pearl in colours.
7. Neck: long.
8. Head: plain.
9. Colour: white.

This is an epitome of the points we kept in view. The number of feathers in the tail was a matter of indifference, some of our best birds having but twenty-six and eight. Many were pointed-headed, though the plain were preferred by ourselves; the majority of observers, however, admire the points.

A pair of so-called Calcutta Fans were once sent us. We

placed them in our loft, but were unable to tell any difference between them and the commonest of our point heads.

A way to refine a good strain of Fans is to judiciously interbreed them, culling out the coarsest and largest young ones. One of the finest strains we ever obtained was by matching a rarely good male to his own daughter, and her son to herself. We kept the strain true for several generations by matching odd nests, and then introduced the old bird again; and by crossing his progeny with the established strain, produced far better birds than the originator of the strain. Whenever such a strain shows weakness in points or constitution, care must be taken to invigorate it by the introduction of fresh blood.

Fantails are as good breeders and nurses as any of the varieties. For us they averaged a pair of young every seven weeks all the year round; the loft being heated by a register stove during the winter. Their boxes must be large, 18 by 18 inches, no fronts except a strip 4 inches high along the lower part of the box, to prevent the young from falling out.

There must be nothing against which the tails may be broken. Water to wash may be allowed twice a week; the floor kept sanded; a piece of rock salt (slum salt) where the birds can get it, and plenty of mortar broken into bits smaller than peas. A piece of salt codfish is also considered quite a delicacy by the birds, and they will pick at it for days together.

Fig. 30.—THE FANTAIL.*

The Fantails become exceedingly familiar, and we have had to push them out of the way, when cracking mortar with a hammer, to prevent cracking their heads. We also had a pair build a nest and hatch a pair of young in a corner of the desk behind the inkstand, which the writer was obliged to use daily during their incubation. A favourite position of the unoccupied bird was upon the shoulder of the person at the desk. It is said that familiarity breeds contempt, but in this case it was the reverse, as the birds were very well-behaved birds, and took as much interest in the writing of articles as any of the readers could have done in the perusal of them, and they enlivened many a weary hour of a very weary winter.—Dr. W. P. MORGAN, Baltimore.—(*Pet Stock, Pigeon, and Poultry Bulletin*.)

[The above, taken from this month's New York "Pigeon Bulletin," is, perhaps, the very best article on the Fantail which I ever had the pleasure of reading. It is clearly written from experience, and there is also a freshness about it which is not always to be found in descriptions of Pigeons, authors too fre-

quently following each other in forms of expression. Dr. Morgan speaks of the two heads, point and smooth; as regards England this matter is settled, and a point-headed Fan would never obtain a prize, we deeming that the point utterly spoils the gracefulness of the head. As to the two varieties, the English and Scotch, something has been done recently, for I have lately seen prize birds in England with evidently Scotch blood in them. This I approve, for although the graceful little Scotch bird does not in its entireness find favour south of the Tweed, yet an admixture of Scotch blood would be highly beneficial to the large-tailed English bird. Motion would be added to, style would be given, and the size diminished, with the full tail preserved. Never yet have I seen an engraving which did justice to this bird. Even Mr. Ludlow's pencil has been less happy with this variety than it usually is; but I look for him to do better than as yet he has done, and that he will produce a graceful portrait of this the most graceful of all Pigeons. The Carrier is noble; the Pontre grand; the Fantail graceful. I do not think it well to picture the tail feathers ragged and broken at the end, though we know they mostly are in an exhibition pen; but I have had Fantails for months without broken or rough

* This illustration is copied without acknowledgment from our No. 512, published January 19th, 1871, and is repeated here.—Eds.

tail feathers; but they had roomy boxes, and their full liberty. I agree with Dr. Morgan that white is the best colour by far, and that neither neck nor tail should be coloured, but saddle-back Fans are very pretty, and in them neck and tail are, of course, pure white.—WILTSHIRE RECTOR.

IS THIS A HONEY YEAR?

We have not yet obtained accounts from distant places, but from all I have seen and heard, I believe that 1874 will be better for honey than any of the six preceding years. March and the first half of April were very unfavourable for bees in this part of the country, also the whole of May. This, together with the weak state of the hives, made swarming late generally. In June the weather took a more favourable turn for bees, which have been doing moderately well ever since. From a bee-keeping point of view, rain is much wanted in this locality; we have had one shower only for many months, and that shower did not penetrate more than 3 inches deep. Here we have a thin peaty soil resting on 12 or 15 feet of white sand and gravel. Hence the fields are parched, and white clover is not yielding honey so plentifully as it usually does in similar hot weather. On heavier land where clover is more plentiful bees are doing better. Still all are moving onwards; swarms are filling their hives, and old stocks that yielded them are now pretty well filled with honey. We have turned-out a lot of ours from which we get about 20 lbs. per hive of excellent honey. Though honey-dew appeared on sycamore and oak trees the bees fortunately did not touch it this year. I am encouraged to believe that the honey harvest will generally be large throughout Great Britain and Ireland. Apianists should take notes of observations and results, and send them to the Editors. The practical work of the bee-master is now to prevent swarming, by giving his bees room enough in ekes, supers, and nadsirs.—A. PETTIGREW.

OUR LETTER BOX.

SPANISH COCKEREL'S FACE (*Resurgam*).—If it be true that the bird you name is from really white-faced birds, it will be too soon to condemn him. It is, nevertheless, quite true that the young cocks show the white face long before the pullets, and the bird in question should show it now. The white should first show on the lower part of the face, and then gradually increase. The last spot that remains red is immediately over the eye. This is the same in cocks and pullets.

INFLUENCE OF THE WEATHER (*Doubtful*).—We prefer the extreme heat to either long-continued rain or east wind. We do not believe this late weather to have been injurious. Our chickens have done well all the time. The only inconvenience is they want their water frequently renewed. We think water that has become tepid from standing in the sun is very bad for chickens. We have it renewed four times per day, and the remainder thrown over the grass. Nothing is gained if the vessel is only filled up.

BANTAM CHICKENS CHILLED (*G. W. R.*).—The chickens ought not to suffer from the storm if you will give them some bread and ale night and morning for a few days. If it does not cure them you must give them a strong decoction of camphor to drink, and let them have no other water. If they are ripped in a damp place move them to a dry one, and, above all, choose a spot well exposed to the sun.

POULTRY FARM (*S. G.*).—There is no farm devoted to poultry in all England. Visit Lady Gwydyr's poultry-yard near Ipswich.

DISTILLING LAVENDER AND ROSE WATER (*X. Y. Z.*).—Freshly-picked lavender flowers, 1 lb.; rectified spirit, three pints; macerate for two days, and distil by the heat of a water bath. A few drops of essence of ambergris may be added. For rose water mix 5 lbs. of rose petals with 3 fluid oz. of proof spirit and one gallon of water. Distil one quart only from the mixture.

LINNETS (*Ignoramus*).—When intended to be reared by hand, they should be taken from the nest when about ten days old, or when the tail has begun to sprout. They may be fed on sopped bread mixed with mawseed (poppy seed), and a little hard-boiled egg. Some persons use rapeseed; but if this is employed it should be first scalded and then well-washed to deprive it of its pungency. Rapeseed, however, we regard as much too pungent and oily to be a wholesome food for birds in confinement. Hempseed, of which all birds are very fond, is also too fattening and exciting, and should only be used medicinally. The young, when hungry, will stretch up their heads and gape open their mouths, when the food may be put in a small lump at a time by means of a flattened stick or cut quill. They require feeding often, and care must be taken that their food is never sour. You should have "The Canary and Other Song Birds." It contains fuller directions. For twenty postage stamps you can have it post free from our office.

LEADS ORNITHOLOGICAL SOCIETY.—"May I, as exhibitor at this Society's Show held three months ago, ask, Are we to have our money either for prizes or birds sold? As the latter applies to my case, I shall be glad to know when we may expect value for our property disposed of."—W. G. HENRY."

TAKING HONEY FROM A HIVE (*A. F.*).—The story you have heard about turning up an old hive, placing it upside down at a little distance from its stand, and setting a new one on the board, and that if this be done all the bees will leave the old one and go to the other, is a very foolish one, and should not be believed. The queens of hives thus treated would not leave them, and all the bees that forsook the old hives would be lost. Your better way will be to drive the bees out of the hive into another at once, as the season is far advanced, and help the bees to fill their new hive by a little feeding. The price of one-third of the honey in the old hive will buy sugar enough to enable the bees to fill a new hive with fresh beautiful combs.

LOSING SWARMS (*B. S. H.*).—Your friends in Kent have been very unfortunate in losing five swarms from six stocks, and these stocks are now so full that the bees cover the front of their hives. Probably the hives and supers on them are well filled with honey, and there is but little scope for breeding in them. Your friends should either enlarge their hives by eking,

or drive the bees wholly out of them into empty hives, and then take the honey. No bees should be allowed to hang about the doors in clusters for any length of time. If the bees were driven into empty hives now, and fed a little, they would soon fill them with combs, and become another year more eligible for stocks than the present ones, if permitted to go on as they are. There is no time to lose; the sooner the bees have more room, the better it will be for them and their owners.

BEES' BREEDING SEASON (*C. H.*).—In answer to your inquiry, we have to say that bees generally continue to breed as long as they gather honey. About three weeks after honey-gathering ends most hives will be without brood, and where bees are not taken to the moors, honey-gathering generally ends early in August. If you wish the bees in the old hive to fill the new one with combs, your better way will be to drive them at once, and sacrifice the brood in the black combs. Feeding the swarm in the new hive will cause the bees to build combs, and fill them with brood. If you object to the sacrifice of the brood, one-third of the bees could be left in the old hive to hatch it, then unite to these in the new hive.

HIVES DESERTED (*F. K. L.*).—There is no way of accounting for your bees deserting their hive, if not from caprice. The other day a swarm of ours readily accepted a hive, and at once commenced to build combs in it. It continued at work in this hive for two days, and then deserted it. They swarmed on a bush again, from which they were shaken into another hive, and are there doing well. The deserted hive and combs were gladly accepted by another swarm. It is vexatious to lose swarms from whimsical notions on their part, and this is not an uncommon thing. Many fugitive swarms are seen in this locality, and during this hot weather going in all directions.

HONEY CANDYING (*A. Fisher*).—It is natural for all good honey to crystallise and become solid. The honey gathered from some flowers solidifies sooner than that from other kinds of flowers. If you prefer to eat it in its liquid state, you have only to put it in a oven or on the fire for a few minutes. This will destroy its grittiness for a month or more.

BEES DYING (*A. F. Godward*).—Your account of your bees is quite unprecedented. You say you had "two unusually large swarms of bees on the 9th and 10th, which you hived into Neighbour's cottage hives, and found both swarms all dead on the following morning." We can only suppose one of two causes: Either they were suffocated by the entrances not being open (could this be the case?), or else the hives themselves were poisoned in some way. So extraordinary a circumstance is worth careful scrutiny. We sympathise with your misfortune deeply. Can any of our readers throw light on the cause of this fatality?

BEES IN BAR-HIVE (*West Cheshire Subscriber*).—We find it advisable in using bar-framed hives to affix a piece of comb to every alternate bar. The "Woodbury-bar" has the lower angles rounded-off, with a central rib an eighth of an inch in breadth and depth. This is smeared with melted wax, and generally answers well. It is a good plan also to save old bars which have had the combs regularly worked along them. The foundation of the comb should be left always on these bars. A judicious alternate arrangement of these with new bars in a new hive will secure great compactness in the building of the combs. Half an inch is a good distance from bar to bar, the bars themselves being $\frac{1}{4}$ inch in width. If you write to Mr. Pettigrew, Sale, Manchester, he will, no doubt, gladly show you his apiary.

REMARKS.

15th.—A very fine warm day, rather stormlike, with wind about 6 P.M., but fine afterwards.

16th.—A much more pleasant day than lately, from there being more air and less heat.

17th.—A delightfully pleasant day, and starlit night.

18th.—A very fine day, as, though the sun was hot, there was a cool breeze.

19th.—A very fine hot day, but from there being very little movement in the air the heat was rather oppressive.

20th.—Rather hazy morning, followed by the hottest day this year; towards the evening there was more wind, and the night was much cooler.

21st.—A very fine day, though there was a very short shower at 0.30 P.M., and a cloudy evening, the temperature falling so much as to feel quite fresh and pleasant.

Another week of splendid summer weather, but without those thunderstorms and that rain which usually accompany high temperature. On several days there were indications of the existence of storms in the neighbourhood, but none reached this station.—G. J. SYMONS.

COVENT GARDEN MARKET.—JULY 22.

HEAVY supplies are to hand now in consequence of this bright sunny weather, especially of bush fruit. The demand is also good, and prices have advanced for some descriptions during the last few days. English Pines are now in excess of the demand, and we have to report the arrival of two more cargoes of West Indian fruit. Hort-hose Grapes are very plentiful, but there are very few among them approaching first-class. Very large arrivals of Potatoes, but very little alteration in price.

From observations taken near London during forty-three years, the average day temperature of the week is 75.3; and its night temperature 50.5. The greatest heat was 92, on the 2nd, 1854; and the lowest cold 31, on the 2nd, 1861. The greatest fall of rain was 1.23 inch.

THE DROUGHT, AND ITS LESSONS.

ALL of us have had some lessons to learn this season, and some of us have had to pay rather dearly for the instruction given. One thing that has been taught more clearly than most others is the comparative inutility of superficial watering. Even the rain we had a few weeks ago, which merely damped 2 or 3 inches of the surface, proved this more clearly to my mind than artificial watering has ever done.

During March and the first week of April we had nice rains which thoroughly satisfied most plants, and started them growing freely till they were checked by the frost. When the rain ceased we suddenly had hot weather, which lasted about a fortnight, and which caused a small portion of the surface soil to become dust-dry. A close observer would see that, although the soil appeared very dry, plants grew very freely without any watering or any special care. The fact is that the soil had dried quickly on the surface, and had become a perfect nonconductor of moisture; and although the atmosphere was very much drier than usual, the soil below the surface was astonishingly moist, and was quite capable of supplying the wants of all but the shallowest-rooting plants. But everybody wanted rain, and after ten or eleven weeks the rain came, enough to satisfy most people—some, in fact, began to be afraid it was too much, but it merely damped the surface-soil 2 or 3 inches deep, and the result was that when the sun shone again away went the recently-received water into the air, and it took with it a large portion of that which was previously locked-up in the earth: and in my humble opinion we were ten times worse off after the rain than before it. And so it is with all superficial watering: if enough is not given to thoroughly wet the soil where the principal roots are, it will always do more harm than good, for, besides the reason I have given, the roots will be attracted to the moistened soil, and will be burned up the first hot day.

Of course it has been found impossible in most gardens to water everything that was thought to require it, and many schemes have been put to the test for economising the water, while some things have of necessity been left to take their chance. It is surprising in some cases what a small amount of difference there is between the health of those plants which have been left to take their chance and that of those which have been carefully tended, and there are cases in which the neglected ones have come off victorious.

Everybody, I suppose, knows that after watering plants, sprinkling a little dry earth over the wet surface prevents evaporation to a wonderful extent. I have had this plan and many others in practice, but the best of all, to my mind, has been covering the surface thinly with chopped wheat straw. I have had most of my flower beds covered in this way for the last month, and they have never required any water since. The plants are growing more luxuriantly than I ever knew them do before. It cer-

tainly looks a little unsightly, but it will soon be all concealed by foliage, and it might if necessary be covered with soil. The grass, too, which was beginning to turn sadly, has been top-dressed with fine soil, which prevents its getting parched, and the first good shower will wash it out of sight. There has been little mowing to do this season.

Rosarians, too, have had something to learn. I hear there are many thousands of plants that will die altogether, and many I have seen look extremely sick. I am not a rosarian, but I grow a few thousand plants on Briars and on their own roots to cut from, and I am thoroughly convinced that Roses on Briars like clay quite as well as they do dung. I have about three hundred, budded last year, and grown in little else than yellow clay, that have not been mulched or watered, and they are the best one-year-old plants I have ever seen. The Briar grows in the stiffest clay in the hedgerows, why should it require light soil and a lot of manure as soon as its roots are chopped-off, and it is brought into the garden?

Speaking of Briars, the seedling Briar is the best, and naturally enough it should be so; it can be planted without much injury to its roots. Flowers cut from the seedling Briar have much greater substance, and last longer after being cut, than those grown in the ordinary way.—WILLIAM TAYLOR.

FLOWER GARDENS IN WINTER AND SPRING.

No. 4.

BRIGHT and fresh and pure is every budding tree and plant in spring-time, when Nature covers the bare-limbed trees with her universal mantle of delicate greenery, when every fertile valley and wooded bank grows daily in beauty, acquiring a fulness and softness of aspect which more than atones for the harsh asperities of the winter, and the pretty simple wild flowers twinkle among the springing grass and dense undergrowth, imparting a finish and charm such as flowers can only do—when everything in animated Nature appears so lovely that one feels the full force and beauty of the poet's exclamation—

"O earth! is heaven more fair?"

It is then that a really good collection of shrubs skillfully arranged exhibits its rich and varied beauty in perfection. The fulness and warmth which passed from the wild woodlands with the winds of autumn has never been wanting here: hence it might first of all appear that a shrubbery would be most admired in winter, and it was probably owing to this that old shrubberies are so frequently found to contain such a superabundance of ever-green forms as to present a tame monotonous appearance. Very little enjoyment is to be derived from long stretches of Laurel, Bay, Box, Yew, and shrubs of a similar character. Shelter and seclusion are, doubtless, more cared for by some peculiarly constituted minds than tasteful forms and pleasing variety: but then this may always be obtained without rendering a scene unpleasantly dull and flat, and wherever shrubs are introduced the fine-flowering kinds should certainly be as conspicuous and

numerous as those having only a symmetrical growth or handsome foliage to recommend them. When this is well done, especially in all groups or belts in or near the flower garden, there is a constant succession of gay flowers throughout the months of spring and early summer, so that when the plants in the flower beds respond to the animating appeals of the warm showers and sunny skies of spring, and assume the freshness and beauty that belong solely to spring flowers, however lovely they may appear, they form but the centre—a most fitting one certainly—of such a scene of floral beauty as can be had at no other season of the year. There are the deep, rich, golden clusters of *Berberis Darwinii*, the lovely pale yellow flowers of *Berberis stenophylla*; *Mahonia Aquifolium* so glossy, bright, and compact in growth, foliage, and flowers; the whole of the splendid varieties of *Rhododendrons*, from the pretty little dwarf *Alpine Rhododendron ferrugineum* upwards to the stately majestics; *Kalmia*, *Ledum*, *Daphne*, *Cytisus*, *Laurel*, *Crataegus*, *Mespilus*, *Arbutus*, *Deutzia*, *Spiraea*, *Weigela*, *Ribes*, *Syringa*, and *Pyrus*, all contributing to the charming display. Some may be arranged in bold groups in or near the garden itself, others standing out singly upon the lawn in all the dignity of select specimens, while the shrubbery borders stretching away in graceful curves converge from the wide expanse of the lawns which they enclose till they literally form avenues of flowers, conveying a lesson which I think those who are content to make long walks pass between low flat "ribbon borders" would do well to study. Yes, study is the proper term, for I am convinced that very little is yet known of the real value of shrubs for decorative purposes, much as they have been used.

All large flower gardens should have some choice shrubs introduced as permanent features in the design, whether it be severely geometrical or otherwise. Whole beds might be filled with dwarf evergreen shrubs that are always ornamental, and which blossom profusely in spring. Take for example the early-flowering *Andromeda floribunda*, with its dense clusters of white Heath-like flowers; followed by the bolder *Andromeda Catesbaei*, with long narrow leaves of a deep bronze colour, and large pendant spikes of white flowers; the pretty but not very common dwarf *Kalmia rosea*, *rubra*, and *nana*, forming neat little compact bushes that in spring are bright with deep pink flowers; the pale lilac blossom of *Ledum latifolium* compactum; *Daphne Cneorum*, with its sweet-scented pink flowers; the white wax-like clusters of *Pernettya angustifolia*; the deep purple bells of *Menziesia polifolia*, contrasting so charmingly with its white variety *M. polifolia alba*; the cheerful and never-failing *Erica carnea*; the *Alpine Rhododendrons*; *Skimmia japonica*, with its clusters of deep crimson berries; *Gaultheria Shallon* and *procumbens*, the first with purple and the last with scarlet berries; the *Berberis* which have already been named, with *E. dulcis*, having its berries suspended from the branches singly by long slender thread-like stalks, arranging the plants carefully in circular beds, surrounding them with a ring of the neat little *Erica Foxii*, planted just far enough apart to exhibit the exquisite symmetry of form for which it is so remarkable. If the bed were upon turf I would fringe the outside with a permanent colony of *Scilla sibirica*; or it might have an edging—and a lovely one it would be too—of French *Gromwell*, the deep blue-flowered *Lithospermum prostratum*. *Cotoneaster microphylla* kept trimmed and pegged also makes a neat edging.

Almost all the foregoing shrubs make fine clumps or beds of themselves, but where the space is limited mixed beds are best; and well arranged with a variety of such interesting plants, they worthily rank amongst the most important of the permanent features of any garden.—EDWARD LUCKHURST.

SPHEROBOLUS STELLATUS.

PERHAPS amongst the whole tribe of Fungi there is not one more singular than *Sphaerobolus stellatus*. It is not uncommon on sawdust, rotten stick, &c., and is sometimes very abundant in Orchid houses on the sphagnum in which the plants are packed. Some years since a certain degree of consternation was excited in Scotland from the walls, labels, &c., being studded with brown specks, the appearance of which seemed incomprehensible; and one of our correspondents has lately reported a case in which the Orchid leaves were similarly studded, each brown speck being the source of disease. In the former case we suggested that the sphagnum should be examined, and it was, as we suspected, the birthplace of hosts of this curious fungus; in the latter case we were not left to

mere conjecture, as we had an opportunity of seeing the little brown balls which caused the spotting.

The fungus at first consists of a globose body, made up of three layers—an external one, an inner delicate whiter membrane, and an intermediate coloured stratum. In the centre is a brown globular body, which contains the reproductive spores. When the fungus is mature the outer coat, to which the inner coat is attached above, splits in a stellate manner; the inner coat is then suddenly inverted, sending out the globose sporangium with great force, which adheres to any substance on which it may chance to impinge. If the size of the sporangium is taken into consideration, the force with which it is ejected is quite surprising. A good figure will be found in Greville's "Scottish Cryptogamic Flora," tab. 158. The intimate structure, however, of the sporangium was not ascertained at the time when that plate was published.—M. J. B.

A MODEL ROSE GARDEN.

DURING the past few weeks I have, as the columns of the Journal testify, been far and wide to see the queen of flowers. I have seen Roses in lordly halls and in exhibition rooms; seen them where they were grown by the acre by those who cultivate for sale, and in the garden of the amateur, whose chief enjoyment they are; have seen them where crowds of admiring devotees were conning over their beauties, or connoisseurs disputing about their qualities. But as I look back on those scenes of enjoyment there comes in some way back to my memory one visit that I paid to a Rose garden that I saw, and which seems to me to deserve the name that I have prefixed to this article; and for many who value the Rose a brief notice of it may serve as an encouragement, and embolden them to attempt what, perhaps, they have hitherto been deterred from doing, owing, as they imagine, to want of space, or time, or money. The garden I allude to was not that of an idle or a wealthy man. He is not of those who have only to say, "I must have a Rose garden," and forthwith the thing is done: some one part of the lordly domain is appropriated to it, and the order goes to Paul, or Turner, or Keynea to supply the flowers; although, as a rule, in large places one sees the Rose not half so well cared for as in the garden of the amateur, nor does the noble owner have a tithe of the pleasure that the possessor of, it may be, a few rods square. It is the garden of a busy man, and its beauty and excellence are owing to the care given in those times which can be snatched from the demands of business. It is the garden of my friend Mr. Mount, who, in the quaint old metropolitan city of Canterbury, himself conducts his business as a chemist, and whose leisure hours are thus given to the pursuit of a hobby which, above all others, is calculated to lighten the cares of business.

Dear old Canterbury! how many associations of one's early days hover round its quaint and quiet streets, its noble cathedral, and shady Close; and how pleasant it is, now when one is descending the hill of life, to again find a pleasure in one's old haunts. Yet is not Canterbury a flower-loving city. It holds no important exhibitions; societies have arisen and fallen, for they have met but scant encouragement; and he who follows the pursuit of floriculture there does it for the love of it, and without meeting much of that true floral sympathy so dear to the amateur; and so the Rose-grower who would like to visit the garden I speak of will, perhaps, find the person he interrogates as ignorant of it as was a York-hire youth of whom I inquired the way to the parish church at Doneaster, who informed me he didn't know, but who, perhaps, could have told me who won the last St. Leger. Not, then, in the aristocratic quarters of the Cathedral Close or the New Road is Mr. Mount's garden to be found, but close by the side of what, at any rate in Canterbury, is not the clear and silver Stour, and in a quarter of the city which, albeit it lies near to the King's School, is not calculated to invite a closer investigation of its peculiarities. Wending one's way through narrow lanes we come to some garden ground close by the river, and there is what I call a model, perhaps some would call it a miniature, Rose garden. The whole space occupied by the garden is but 20 perches, but in that 20 perches there are nearly eleven hundred Roses. The laying-out of the garden is very simple: There is a broad walk which intersects the ground from the entrance to the river—this and the walk by the river are 5 feet 6 inches wide; and on each side of this walk are twelve beds meeting it at right angles. These beds are 3 feet wide and about 60 feet long, divided from one another by walks about 20 inches wide; this allows sufficient

space for getting amongst the growing plants. In each of these long beds there are two rows of dwarf Roses on the Manetti, and occasionally between them, so as to break the uniform height of the plants, a few as standards. It will thus be seen that they are not very large plants; but as each is attended to, they are kept in good shape, and nothing can be better than the foliage. Mr. Mount is very careful as to giving them proper soil, and renews it annually, giving them some fresh nourishment to feed upon, besides affording them a liberal supply of cow manure in the autumn. I saw no trace of orange fungus, and he suffers little apparently from mildew. Although the river runs at the bottom of his garden, he very wisely, I think, does not rely on it for his supply of water, for tanyards and such other abominations do not tend to improve its quality; he has water laid on, and can consequently syringe and water freely.

It would be useless and tedious for me to enumerate the varieties of Roses that Mr. Mount grows. As a careful amateur he will not spend his money on plants of the merits of which he is ignorant; but all the well-known and approved varieties are to be found there, and also many novelties. I saw, for instance, Reynolds Hole in good flower, although it was early in the season, while Alfred Colomb, Mrs. Rivers, which does exceedingly well there, François Michelin, and all the leading sorts were well represented. Along the fence which surrounds it on one side were trained Maréchal Niel and other Noisette and Tea Roses; while a small greenhouse, 20 feet by 12, at one corner had been erected especially in honour of the same class of Roses; and from the fine plant of Maréchal Niel, which is rapidly filling the house, had been gathered over five hundred fine blooms in May. Surely no Rose has ever been so honoured as this has been.

I was particularly struck with the colouring of Mr. Mount's flowers, and this, too, in a season which has not been favourable for high or delicate colouring. He informs me that when they are showing colour he gives them a watering of guano, 1 oz. to the gallon, and a quarter of an ounce of sulphate of ammonia. This, with a good dressing of cow dung in the winter, he considers the best stimulant; he also gives a second watering when the flowers are forming for the second crop, and adds that he should probably do it oftener but for the expense.

Let me add that one great charm of this garden is that it is kept scrupulously clean; not a weed is to be seen, the paths are in good order, and flowers are cut off as they decay; and if in thus giving a brief description of this model Rose garden I can in any way encourage a struggling amateur, I shall not have written this short notice in vain.—D., Deal.

IN AND OUT OF ABERYSTWITH.—No. 1.

NEVER was place more appropriately named than this. *Aber*, the mouth, and *ystwyth*, winding, being descriptive of the situation and of the river; and what a bay that mouth opens into! Cardigan Bay is the Bay of Naples enlarged. And then the mountains, whose feet come up to the wall of the garden where I am writing! Noble and, unlike the Neapolitan, numerous and *not* volcanic. From my window I can see to the south the Strumble Head of Pembrokeshire, and to the north the Silurian rocks of Towyn, and within 100 yards there are many nymphs bathing; these last are more attractive than the distant boundaries, and render it more difficult to write sedately as becometh a reporter of THE JOURNAL OF HORTICULTURE.

However, having moved from the window, let me tell that this morning I set forth to the mother church of this place—Llanbadarn Ffawr. There are 458 places in Wales the names of which begin with *Llan*, which originally meant only a sheep-fold, but was most appropriately transferred to any place having a church. Then *Badarn* is a corruption of *Padarn*. St. Padarn, or St. Patarnus, came here from Brittany and founded a college here in 524. *Ffawr* is glorious, so the parish name is Glorious Church of St. Patarn; and though it does not deserve that title now, it once did, for it once was a bishopric, and its bishop was at the Council of St. Augustine in the year 603. The church has been destroyed by Danes and others many times, and the present structure is not of earlier date than the twelfth century. Over that and its monuments I must not linger for your pages, nor over its ancient churchyard crosses, and its seated Lich-gate. Yes, I will pause here to observe that the path beneath the Lich-gate is ingeniously grated with iron bars, so that when the gate is open straying cattle are afraid to walk over it. Around the churchyard are

unsurpassed fine specimens of Ash trees; and this tree is a usual ornament of the Welsh "God's Acre," it being esteemed in the days of our forefathers a barrier not to be passed by evil spirits. Nor is the prevalence of this tree confined to the churchyard, for it is so prevalent that it may be said to be always found near old residences.

I wandered round the village, and noted that though the Apple crop has failed much in England, it is most abundant here. The Apples cluster down the branches as Onions are roped, and so growing are suspended in the fruiterers' windows in Aberystwith. The Green Gages on standards are also most abundant, and even in the shops here are sold for a halfpenny each.

The market is moderately supplied with all the fruits and vegetables in season, and would be more largely if it were not that the village growers of garden produce come in every morning with basketsful of their commodities.

In returning from Llanbadarn I was overtaken by a sudden rainfall, such as is only imminent in mountain districts, and whilst under shelter I noted the high-crowned-batted women with their baskets of eggs, Potatoes, Beans, Cabbages, and fruit plying to market, whilst some who came from far rode the probably only horse of their homestead, for the farms are either very small arable, or somewhat larger pasture holdings. An old relative of mine, who resided many years not a hundred miles hence, used to tell of the farmers of his early days who rode to market, one with a bushel of Oats, another with the same measure of Wheat, and others with divers kinds of farm produce. They had no money, but wrangled at an ale-house door who should pay the reckoning, and he to whose lot it fell always rode back home another way!—G.

A VISIT TO SCAWBY HALL.

In out-of-the-way gardens of small extent and unknown to fame, one often, indeed nearly always, sees something worthy of note—something good in itself, or a clever hit making it so. All such hits are instructive. I for one have often found in quite small places gardening fully as good and oftentimes better than in the Duke of So-and-so's great place; yet the man who does a little in a large place is in popular parlance a "great gun," while he who does much in a little one is a very "small potato." But the place under notice is not a small garden if it is not a large one. It is the seat of one of the old families of Lincolnshire, the honoured name and title of which have lately become extinct—viz., that of Nelthorpe. Were I to jot down all recollections of Scawby Hall, the successes and failures, the ins and outs, the ups and downs, it would be a very mixed dissertation—in this page a guide, in that a warning. It must be so in any garden in which a man has spent the first seven years seeking knowledge. Such places are never forgotten, and all life long they possess an interest which time cannot obliterate.

My feelings on revisiting the garden were mixed. To see the Roses in their glory, clean, massive, and fine, aroused the latent enthusiasm, and I recognised the very spot where I put in the first Rose-bud. I put it in by stealth, wrong end upwards. Never mind, it grew. And now for the first note on just one Rose, and that Princess Christian. It is a gem of the first water, in form almost perfect, in colour exquisite, in perfume it has only one equal, and that the old Provence Cabbage. Yet this Rose is not popular, it is not seen everywhere; and why? Because it does not bloom freely and with certainty. Ordinarily it did not bloom at Scawby, but instead of the orthodox pruning, the gardener tied down the shoots, and then came the flowers. But the heads became unwieldy, and to some extent unsightly. They must be reduced. They were cut boldly into the old black wood, apparently as innocent of eyes as rusty wire, yet they broke freely, but instead of producing long shoots to tie down again they made medium growth a little over a foot long, and at the top of each a grand Rose. "That's the way," said the gardener, "to prune Princess Christian," and in truth the example was very convincing. But one more note on Roses. In most places of any extent there is a man generally looked to in special matters. Jack was the Rose man. Jack was only a labourer, yet hard to beat at Roses. I have seen him many times bud Briars in his own garden in early summer, tend them into fine heads the same autumn, and sell them for 12s. per dozen. Well, Jack and his master were bothered with a favourite *Gent des Batailles* in a conspicuous position. It would mildew in spite of doctoring and washing. We will presume they put their heads together

to conquer the mildew. They succeeded in a very common-sense manner. They took a trench out round the roots, removed the old soil, and refilled with a barrowful or two of rich manure and fresh soil. The Rose has never been mildewed since.

In tree and shrub planting a great deal was done twenty-five years ago. It fell to my lot to carry them in bundles at the heels of the gardener and drop them into the holes as directed, he mixing the kinds with much care and, as he thought, foresight. How common, in spite of care, to see mistakes in planting trees and shrubs! They look well for a time and give pleasure; but by-and-by—say in twenty years—the error of indiscriminate mixing is seen, and the real difficulty commences of making that look right which was planted wrong. The plan in question is an example, and noble shrubs in the finest health have to be chopped up and mutilated because they are in the wrong places. Many in the background ought to be in the front, and *vice versa*, simply because the planter did not fully comprehend what the effect would be twenty-five years a-head of the date of laying out. If there is one thing more than another demanding thought and care, and, what is more, an intuitive penetration into an effect which can only be realised by the growth of years, it is shrub-planting. It is enough to create a feeling of dejection to see hundreds of shrubs in which one takes an interest, and which had for years looked so well, now, when just in the zenith of vigour, altogether out of place, giving an effect an once sombre and monotonous, and they must get worse year by year or be cut away. That is just what I saw, and it must be confessed I felt and no doubt looked dejected. The feeling, however, was succeeded by elation in observing the case was not a hopeless one. The gardener has worked out a sample of improvement which, if carried out with the same success throughout the shrubbery, will change the scene from what was at once sad and depressing to one of cheerfulness and interest. A thicket of foliage restricting the line of vision by its irregular evenness to a few yards on either hand, is giving way to an infinitely wider scope; and beauty of form, tint, and character is presented to the mind by judicious treatment in the matter of thinning.

Assuredly shrub-thinning is a work of great importance, only a degree less so than planting. It is nothing without a plan and system well thought out before the removal of a single plant or branch. It is necessary to see through several trees at once, and have in the mind a clear impression of what the effect will be when the work is done. If the operator cannot fully see and appreciate the work when it is done, even before a stroke is made, he had better leave things as they are and submit to a great muddle, lest he should make one still greater. Shrubby-thinning, to be successful, demands the exercise of various qualities. The mind must be able to take a wide grasp of the work in hand, and a capacity to single-out of the wilderness certain specimens marked for permanent effect—key-notes to which all the rest are subservient; that is a first condition. There must be discriminating taste sufficient to mark the right ones, and decision of action in removing those not wanted. A dillying resulting in the leaving of two trees where one only ought to stand, ends in the ruin of both. A want of decision in this matter is common to many minds, and to this is traceable much overcrowding and numbers of ill-shaped trees and shrubs. Shrubby-thinning, too, is a work in which by no means too many people must be permitted to dabble; that will inevitably be fatal to any satisfactory finish. It is always an advantage that if a good man commences a work, be it what it may, that same man should accomplish it with as little let and hindrance as possible. Change often ends in chagrin, as it is, unfortunately, not always that the unfinished work of one man will have justice done to it by another. That is a fact well worth being remembered by any prone to change.

Shrub-thinning is generally begun at the front first, and it is frequently a matter of regret on the part of the owner to see one plant after another uprooted, and the whole place thrown, as it were, into confusion for an unpleasant length of time. The practice here would seem to have been just the reverse. A steady preparation was made in the background. Suitable specimens at proper distances were tended as to shape, working towards the front. This might be the steady work of two or three years or more. In the meantime the front row remained nearly the same, and the general aspect of the shrubbery from the carriage-drive was unaltered. Eventually, when the time was suitable, up came what was not required in the front row, other and more suitable specimens being in readi-

ness to put in. This is done quickly, and instead of an impenetrable thicket, an array of single specimens, each having room to show itself, is opened out, the ground between them is turfed, and the transformation is complete. Fancy driving for years between lines of Yews and Laurels grown into something approaching a hedge; go again another year, and see handsome and stately plants not seen before, each one giving effect to the other, and the line of vision increased at the least tenfold. It is a surprise and a success which cannot be gainsaid. It is the steady preparatory work in the background, little or nothing seen going on in the front, to which the success is mainly due. This little example is worth noting, showing, as it does, in a practical manner, how miles of uninteresting drives may be transformed into enjoyable groves, and this in a quiet systematic way, with a minimum of disorder as the work goes on, and giving a maximum of pleasure by, as it were, the suddenness and completeness of the change effected. It is just a question of means and the taste of an able man being permitted scope whether the hidden beauties of many a place shall be brought out and its latent resources turned to account and enjoyed, or remain as in the past—hidden, buried, as if they had no existence.

I cannot dwell at length on other things in this good garden, considering mere description, unless some useful hints are evolved, time not well applied. I would, however, venture to hint on the unwisdom of visitors being hypercritical. Amongst gardeners it is of no use mincing the matter, it is too much the rule. There is too much proneness to find fault, to denounce without taking into account, or troubling to think of, special circumstances or requirements. For instance, Pine Apples are not large here, simply because small fruit are required. But of this fruit I may note one curiosity. A plant refused to "show" last year. In January of this year it was cut off level with the pot and planted again as a cutting. In March it "bolted," and at the end of June ripened a Queen of over 4 lbs. weight. Of the Vines an exhibition grower would say, "too much wood;" but the Grapes are not grown for exhibition, and the fruit is of a character that satisfies, and more need not be said. Here, I believe as everywhere, the more foliage Mrs. Pine carries, the more and better fruit it gives. Midresfield Court ripens admirably in an intermediate house, well up in colour and flavour. What a fine Grape it is! Peaches under glass were abundant; on walls from want of glass the trees have been ruined.

It is particularly pleasurable to contemplate on the presence of old faces in old places. Something, yea a great deal, more than "commercial principles" tie master to man, and man to master, amongst the nobility and gentry of our country. The grey hairs of an old servant or labourer are an honour to the place on which he has spent his strength. Happily they are not always the signal for his being cut adrift. If by advancing years there is less of animal strength and activity, there are the counterbalancing qualities of faithfulness, trust, reliability, and an experience in anticipating wants seldom present in youth. Many an old garden labourer knows infinitely more in kitchen-garden affairs than a freshly furnished and accomplished young gardener just "out of the houses." Well it is for these old men who have won respect, who have been fairly dealt with, and have dealt fairly, and who have no real cause to loosen the existing confidence by listening to the seductive eloquence of those who, by ambition, selfishness, or a yearning after popularity, would (let us hope unintentionally) sow seeds of discontent where content has long prevailed, and in their efforts for good create evil, by holding out hopes which cannot be fulfilled.

The garden, I must add, reflects much credit on Mr. McGillivray.—J. WRIGHT.

LOOK TO THE POTATOES.

I HAVE to-day (July 21st) been through the late-keeping Potatoes, and find the whole of them vigorous in growth, perfectly healthy, and without a trace of disease. The baneful effects of the drought are distinctly visible in the smallness of the tubers, and I am afraid the crop is advanced too far for us to hope for much increase either in weight or bulk. There will be frequent inspections during the ensuing three weeks, and judging from its forward condition, the entire crop will probably be taken up and stored by the second week of August. Last season's experience increased my confidence in the great value and importance of early lifting. The Victorias that were lifted on August 14th and 15th last year continued perfectly

sound and excellent in quality until the end of June in the present year. Myatt's Prolific Ashleaf, Royal Ashleaf, Rector of Woodstock, and Yorkshire Hero are all perfectly sound, and they are already taken up, and the seed put on end in single layers upon the store-shelves, where it will remain undisturbed till next planting season. These shelves are in tiers 9 inches apart, one above another, and as the bottoms are of laths half an inch apart, the air circulates freely among the seed. Let me here repeat an important piece of advice, Never leave seed Potatoes laying out of doors to become green, but always put them on the store-shelves immediately after they are lifted. To this may be added another that is even more important, Lift your Potatoes early, and defy the blight.—EDWARD LUCKHURST.

ROSE HEDGES IN THE SOUTH OF FRANCE.

M. ANDRÉ writes as follows in the "Illustration Horticole":—"On our last excursion from Marseilles to Genoa we were greatly struck, as anyone seeing them for the first time would be, with the magnificence of the Roses all along the Mediterranean shores. The Rose hedges, and the espalier Roses especially, offer an indescribably gorgeous sight. Under the genial influence of the warm sun of Provence, from the Corniche to the extremity of the Riviera di Ponente—that is, as far as the Gulf of Genoa, and protected to the north by the mountains, which gradually slope down to the seacoast, Roses attain the size of Pæonies, and develop a depth and brilliancy of colour and a richness of fragrance of unusual intensity.

But this is in part due to another cause, or rather two other causes, which lead to the same result, the main point being the choice of suitable subjects for stocks to graft upon.

These stocks are *Rosa Banksia* and *Rosa indica major*.

The Banksian Rose presents three varieties—namely, White Banksian, producing a profusion of small white flowers, scarcely so large as those of the double-flowered Cherry, and of a most delicious fragrance; Yellow Banksian, with still larger clusters of small, nankeen-yellow, scentless flowers; Chinese Thorny Banksian, flowers less numerous and about three times as large as in the two preceding, and of the most grateful odour. These three forms attain an unsurpassable vigour in this region. In two years one plant will cover an immense wall, the gable of a house, or climb to the top of a tall tree, from which its branches hang like flowery cascades, embalming the air around with a rich perfume during the months of April and May. Now, if these be taken for stocks upon which to bind some of the choicer Teas, Noisettes, and Bourbons, the growth of the latter will be prodigious. The stock should be two years old, having well ripened though still smooth wood. In this way such varieties as *Gloire de Dijon*, *Maréchal Niel*, *Lamarque*, *Safrano*, *Chromatella*, *Aimée Vibert*, *Le Pactole*, and all the Teas, attain such dimensions as to be no longer recognisable.

Rosa indica major is almost naturalised throughout the whole of this region. It possesses the additional claim to favour of flowering nearly all the winter, forming beautiful hedges of dark green shining foliage, from which thousands of clusters of lovely flowers rise, of a tender delicate transparent pink, or almost pure white, with a brighter tinge in the centre and at the tips of the petals. This Rose is an evergreen, and makes an excellent stock for grafting or budding.

It is either planted in nursery beds, where it quickly throws up a stem suitable for standards in the same way as we employ the Dog Rose, or in hedges, and left to its naturally luxuriant growth to produce its own charming flowers in rich profusion; or rows of cuttings are put in where it is intended to leave them, and subsequently budded with some of the varieties of the diverse tribes we have named.

We admired it most when treated in the manner last indicated. In the gardens of the Villa Lizerbe, Nice, the residence of M. Cazale, we saw three or four long hedges reared in this way; and on the 6th of May they presented a most gorgeous feast of flowers. To give only one instance, we plucked at random a flower of *Gloire de Dijon*, which measured $5\frac{1}{2}$ inches in diameter, or $16\frac{1}{2}$ in circumference; and it would not have been difficult to find even larger flowers.

This is how the intelligent head gardener, M. Guichard, obtained such splendid results: The soil where the hedge was to be made having been moved to the depth of more than 3 feet, was planted towards the end of winter with cuttings of well-ripened wood of *Rosa indica major*, about 9 inches apart. They were left to grow as much as they would, and not cut back at all. In August they were budded nearly close to the

ground, and in the following year already they formed a hedge producing flowers abundantly. Iron wire stretched upon slender bamboo stakes is sufficient to support the branches. Pruning is only resorted to to keep them in shape, remove exhausted branches, and shorten gross shoots. This Rose is also easily propagated by pegging-down long branches or slightly covering them with earth, cutting them asunder at the joints when rooted, and thus obtaining as many plants as there are joints.

By this very simple process M. Cazale has succeeded in raising his Rose hedges of incomparable beauty. From these hedges waggon-loads of flowers might be cut every year. It is the varieties which flower in winter, amongst which *Safrano* is the very best, that are here propagated on a large scale. We particularly noted *Souvenir de la Malmaison*, *Chromatella*, *Gloire de Dijon*, *Général Jacqueminot*, *Maréchal Niel*, *Safrano*, and *Gloire des Rosomômes*. A large number of others grew and flowered equally as well as the foregoing. In conclusion, we recommend *R. indica major* as a stock wherever the winters are not very severe, and where earthing-up or covering around the base is sufficient protection to secure the advantages of this vigorous-growing species for this purpose.

PROPAGATION OF HARDY TERRESTRIAL ORCHIDS.

A CORRESPONDENT, "B. B. B.," wishing for information, we sent it to a good authority, and he replies:—

"I should be very pleased if I could inform your correspondent how to propagate the Bee Orchis, or, as I suppose he means, *Ophrys apifera*. It is what I have never been able to accomplish myself; but it will sometimes propagate itself by two new bulbs in one season instead of one, and that I believe is the way in which it increases itself in its natural state—by small spawn. I have never yet found a seedling, nor can I get it to vegetate from good seed, although you get good pods from most of them. Some terrestrial Orchids will make three, and I have known *Ophrys bombyflora* make four bulbs in one season; but there are very few (under cultivation) that make more than one. When time permits I shall be happy to send you an account of my method of growing them."

[Pray do.—EDS.]

LARGE VINE AT THE VICEREGAL LODGE, DUBLIN.

It is now some years since we first noticed and detailed the history of what is now widely and familiarly known as "The Large Vine at the Viceregal Lodge." The life story of this very remarkable Vine was then a short one; for he it remembered that though a wonderful Vine, it is very far from being an old one. In fact, a decade had not then nearly passed from the time Mr. Smith took it—a poor sapling, struggling for life—in hand. Even then it was a horticultural wonder, filling a curvilinear lean-to house, some 70 feet in length and 15 wide, and carrying a magnificent crop of Grapes, quite a picture to look at. Since that time the house has been made a half-span, and has had its breadth thereby considerably increased. Large increase of space was thus afforded for further extension, and so skilfully was the Vine educated to avail itself of it that it soon entirely occupied it; and the long lines of luscious clusters hung as thickly there as in the older portion of the house. It may be as well to mention here, for the information of those who have not seen this Vine or remember the particulars previously given, that the stem enters at one end of the house, and from this seven main rods are conducted horizontally and equidistant from one another, in perfectly straight lines, till further progress is arrested where they reach the opposite end of the house. The wood of these main rods is about the thickness of a ship's cable, and the spurs on either side disposed with the utmost regularity, each rod forming a perfectly straight and strongly-defined line fringed with a double row of beautiful stout green foliage, from among which depend on either side, as if strung with almost mathematical accuracy, the long lines of sable pendants which are the crowning glory of the Vine.

It is now just about eighteen years since Mr. Smith undertook the education of what was then a weakly plant, and is now a giant in its way, and we are inclined to think, taking it all in all, one of the finest examples of successful Vine culture, and perhaps the very best example of what is called the extension system

to be met with anywhere. Year after year, without a single blank, it has borne splendid crops of highly-finished fruit, and the present year's crop forms no exception save in one respect, and that is that as regards size of bunch, berry, and aggregate weight it will be the finest which this noble Black Hamburgh has yet ripened. The bunches number probably four hundred, or thereabouts, many of them we calculate will weigh 3 lbs. or so, and the average will be 2 lbs. or over; the aggregate weight of crop, we suspect, little short of 7 cwt. The bunches are just now colouring, and by-and-bye, when they put on their full sable habiliments and rich bloom, the big Vine will be a sight worth looking at—a triumph of cultural skill, upon seeing which he would be cold and phlegmatic indeed who would withhold from Mr. Smith his warm appreciation of his skill, and the remarkable results of it before him.—(*Irish Farmers' Gazette.*)

CITY OF LONDON FLOWER SHOW.

Few people would suspect that in the immediate neighbourhood of the Royal Exchange, where a foot of ground commands the price of an acre elsewhere, there exists a large space which has been in the possession of the Drapers' Company for the last three hundred years or more, and which is kept as a garden. Here with grass growing, fountain playing, and shading trees, was held on the 23rd inst. the City of London Flower Show, an exhibition of window plants grown within the limits of the City, and which had been in the possession of the exhibitors three months before the Show. Prizes were offered for such subjects as are commonly grown in windows, as Geraniums, Fuchsias, Nettle Plants (*Coleus fruticosus*), Myrtles, Musk Plants, Creeping Jenny (*Lysimachia Nummularia*), Begonias, Ferns, Orange trees, also for window boxes and Fern cases, &c., the whole divided into twenty-five classes, in most of which the competition was very creditable, and he it noted some of the best plants were those which had been longest in the possession of the exhibitors. Thus, Mr. John Moss, who, we believe, belongs to the City police, came in first for Fuchsias with a plant which he had had for five years, taking also a like position for a Geranium. There were some nice little plants of Musk and Creeping Jenny from several exhibitors; a few Myrtles, and Orange trees reared from pips, which were five and six years old, while the contents of the Fern cases were in all the pride of health, a circumstance, however, which must be partly ascribed, not so much to the care of the owners as to the exclusion of the smoke. The Royal Horticultural Society's silver medal was given to that from Mr. C. Shackel, eight years in the exhibitor's possession, whilst a larger one owned by Mr. Brooks for six years was an excellent second. Dahlias in pots from Mr. Rose gained a bronze medal, and a like award was made to Mrs. Weeden for Houseleek. The plants shown for competition were mainly confined to one tent; some, however, were placed in another, which Messrs. Paul, of Cheshunt, and Mr. Turner, of Slough, rendered quite brilliant with fine collections of cut Roses, and along with these was a very ornamental group of ornamental-foliaged plants. A third tent was reserved for H.R.H. the Marchioness of Lorne, who distributed the prizes. It is a matter of surprise that so large a piece of ground as the Drapers' gardens in the very heart of the City, should have escaped so long the invasion of bricks and mortar, to be in which most of the open spaces about the metropolis have had to give way, and many will regret that it is likely to share the same fate; but this little Show has drawn an amount of attention to the existence of these gardens, and the probability of their destruction, which would never otherwise have been given, so there is some likelihood of their being preserved for the public benefit.

CHELONE PATEATA ANTIWERPENSIS.—This fine old herbaceous plant is now seldom or never seen, but it is one that would give satisfaction everywhere. It is a summer-flowering plant of long duration, and has fine handsome spikes of scarlet flowers, which are produced in abundance in a good heavy soil. The plant requires dividing and replanting every other year in fresh soil, like most other hardy plants.—H. KNIGHT, *Floors.*—(*Florist and Pomologist.*)

WILDERNESS ROSES.

For this idea I am indebted to Professor Owen, who, wishing to ornament a wild part of his ground full of thorns, grass, and weeds, adopted the following plan, which, I am inclined to think, is quite worthy of record. Large sewer-tubes, rejected on account of flaws in the enamel lining, were sunk vertically in the pure gravelly soil to within an inch or so of the surface, and filled-in with loam and manure, and a Rose planted in the centre of each. The soil in the tube was kept free from weeds, and the running grass and other weeds outside were prevented making their way into such good quarters. To give

the Roses extra vigour, some manure water was given to them occasionally in the summer. The effect of Roses growing in the highest state of luxuriance in a wilderness was most charming. The inside diameter of these tubes is 16 inches, their length 30 inches, so that they go below the roots of weeds, which would otherwise soon devour the rich compost in which the Roses delight.—(*Rivers's Rose-Amateur's Guide.*)

FUCHSIA CULTURE.

To cultivate successfully a few nice specimens of the Fuchsia is almost invariably the humble ambition pervading all who can find means to accommodate them. No matter what social position of life they belong to, the love of flowers exerts a magical influence which sways these likings in all alike. And the Fuchsia, seemingly, is especially endowed with attractions which have both secured our fond regard, and gained for itself the position of a general household pet.

The Fuchsia is a native of Chili, and was introduced into this country in 1788. The only species in cultivation at that period is still known as *F. coccinea* (the Scarlet Fuchsia); later on, in 1796, appeared *F. lycioides* (the Boxthorn Fuchsia); and the next to succeed it was *F. gracilis*. For a number of years subsequent to their introduction little improvement took place by means of hybridising these species, and their proper culture was but indifferently understood, the custom then being to raise plants from seed to take the places of worn-out ones, and the treatment practised to winter them in the hottest part of the bark stove, which practice is the very opposite to that we now follow.

Propagation by Seed.—Under this head little need be said. Sow in July in well-drained pots, and place in a cold frame. Keep moist and shaded, without superabundance of air, which retards germination by drying the soil, nor is there anything gained by repeated waterings. All that is required is to keep the soil constantly but moderately moist, and, to prevent sudden evaporation, cover with a hand-glass until the seedlings appear above the soil, when the glass should be gradually raised, a little more each succeeding day, until it is considered safe to remove it altogether. By the middle of August the plants will be in fit condition to plant singly in small pots. After potting, they ought to be returned to the frame, or put on a shelf in a greenhouse near the glass, and well attended to with water. Little more is required of the cultivator except shifting them into larger pots when they require more root room, until the succeeding February, when they should be partially freed from the old soil and repotted into larger pots. Such an aspect and situation as a shelf just recommended is a suitable place to winter them, seeing they would suffer, if not die, in a cold frame in winter.

Culture from Cuttings.—The proper method to follow to secure strong early cuttings is to cut-back in the autumn the old plants, leaving a spur with an eye on each lateral shoot of the preceding year's growth. Place these in January in a bottom heat of about 65°, and keep close and moist until they break. Encourage the early growth by dousing daily with the syringe, and keep their roots rather moist than otherwise, until the shoots intended for cuttings are matured. Then the stoutest should be taken, neatly dressed, and inserted singly into thumb-pots in a compost of leaf mould that is well reduced and silver sand in equal proportions, adding a little sifted loam to afford consistency to the mixture. The old plants may be moved to a cooler house, and their late quarters appropriated for these cuttings. Leave no time to have them plunged closely and neatly in the bed, and water them frequently; have no fear of their damping, but shield them from excessive sunshine by means of light shading.

In the course of a fortnight, most of them will have rooted; but let them have time to show their roots round the ball before repotting is performed. The soil to be preferred for all subsequent pottings should consist of three parts friable loam, the more turfy the better, one part partially dry and well-decomposed cow droppings, and a little silver sand; sift through a half-inch sieve, and shift them into 4-inch pots.

Potting.—There is much difference observed in the operation of potting. Some leave the soil loose, comparatively speaking. My principle in potting, generally, is to drain well but not rather firmly, and my reasons for so doing are two important ones. First, it is natural to suppose, when compost in a pot is left loose, that the moisture is more suddenly exhaled; and it is as reasonable to conclude that when these rapid exhalations take place, the waste therefrom must be sus-

tained by frequent supplies of water, to prevent the plant suffering. These frequent, and at times immoderate waterings, tend both to wash the strength out of the soil, and to create too succulent a growth. The second reason bears upon the waste from severe evaporation; but both evils very much depend upon the nature of the material in which the pots are plunged—should that be sand the evil is the greater; while leaf mould, or any other material containing organic matter that is constantly undergoing decomposition, balances the waste by the amount it throws into the atmosphere, and what penetrates by the pores in the sides and bottoms of the pots.

When the potting is accomplished, replace them as they were, and attend to them in a similar way as before. The habit of the plant will by this time commence to exhibit itself by laterals appearing, in some cases regularly disposed on the upright growth.

Those plants whose appearance proclaims them to be dwarf and inclined to branch freely must not be pinched, but rather endeavour to get them into height; others which indicate a contrary tendency should be checked by pinching-out the extreme point. These varieties that are shy growers may be thrown to the rubbish heap. There are plenty with good flowers, and other desirable properties, without them.

Continue thus to nurse the young plants by supplying larger shifts of pots when each succeeding size is filled with roots; afford fresh air by ventilation when the weather outside is mild enough to allow of airing. Shower water over the floors on sunny days to prevent aridity in the atmosphere, which is favourable to red spider, and withering in its effects on the tender leaves of the plants; and further, to maintain humidity, syringe their foliage in the evening after hot sunshine. Thus tended until the end of May, fine plants will repay the attention, and they will now be in a condition to be transferred to a situation less heated, there to harden their wood so that flowers are formed.

The greatest success, as regards the amount of flowers produced, occurring with the writer, was accomplished by this means: After having managed the plants up to the latter end of May as described, they were then stationed in a deep frame, and stood on boards to prevent worms from getting into the pots. The entire frame was next raised on pots 12 inches above ground, which at the time was done to raise the sashes above the tops of the plants, with great fear and regret that we were obliged to do so, not supposing that it would turn out to the benefit of the plants; but it did. I have never had such a profusion of flowers on any occasion when this plan was not carried out. After having arranged the plants in the frame, the sashes were put over them close down, and the remaining attention they had from our hand was water when necessary, adding to the water manure as soon as they had rallied from the temporary shock occasioned by the rather extreme change of quarters; and in the hot days of June the sashes were raised, so that the air was allowed to float amongst the plants at will. Early in July these plants were staged, where they soon opened their flowers, and an uninterrupted supply was sustained on the plants up to Martinmas. We have had larger plants produced, and with greater pretensions to finish in form in the same time it took to grow them, but never had better flowers or more of them.

Having thus shown that abundance of air united to the unshaded sun's rays is the effectual means towards the end required, let us conclude by hinting that staking the plants as soon as they incline to droop from their own weight must be seen to, and that the leading or main growth should be constantly tied as they progress, and any unruly straggling shoots cut back before the plant is hurt by their rankness of growth, as is sometimes the case. Finally, as the plants get worn-out and advance to ripeness, gradually withdraw the supply of water, and ultimately withhold it to what is merely sufficient to keep the plants fresh, and store them in a corner of a cool house where frost is kept out. Now they are safe to show returning signs of action in February or March following, at which period they require to be shaken out and their roots pruned back, and repotted in fresh soil, to prepare them for a new season's duty.

SELECTIONS OF VARIETIES.

DARKS.—*Avalanche*; this has a most handsome habit of growth, and requires no pinching; flowers double, rich carmine, red tube and sepals, corolla dark velvety. Champion of the World should be grown for its immense well-proportioned flowers, but its habit is no recommendation; double. Henry

Williams cannot be surpassed as a dark double *Fuchsia*, either for habit or quality, in its blossoms. *Exquisite*, another double, whose qualities quite sustain its name; tube and sepals shining deep crimson, corolla purple, streaked red. *Gipsy Queen* is an exceedingly telling dark double, every way deserving a place. *Marksmen*, a dark double of great merit, both in flower and as a grower. *Beacon*, tube and sepals shining rose, with rich carmine corolla; fine single. *Crown Prince of Prussia*, habit dwarf, vigorous, flowers dark glossy, of extra form and substance; a single of the foremost merit. *Enoch Arden* still ranks in the van, and is distinct from its peculiar double corolla. Generous, this is a worthy variety, very distinct; its sepals, tube, and corolla are all about one shade of rose, inclined to pink; its corolla is of the lightest hue. *Killiecrankie* cannot be dispensed with, its beautiful almost black satin corolla gives it first distinction. *Roderick Dhu* is another that will stand criticism, and is likely to live in favour; its sepals are salmon-marked and tinted red, and its corolla of light blue is, to say the least, striking to look on. *Weeping Beauty* is a modest flower, drooping in habit, but of excellent build; sepals coral red, corolla bluish purple, of extra expansion.

WHITES.—*Arabella*, tube and sepals white, corolla rose. *Elegantissima*, old, but not likely to be rejected for some time to come; its neat habit, and delicate flowers provided in such profusion, make it proof. *Enchantress* has a double white corolla, and is quite a beauty. *Rose of Castille*, fine. *Fairest of the Fair*, white tube and sepals. *Leah* has very large drops, tube and sepals glossy white, corolla purple crimson. *Heather Bell*, a neat flower; tube and sepals white, corolla rose-tinted lake. *Minnie Banks*, a lady which is too good to be forgotten.

SINGLES WITH WHITE COROLLAS.—*Delight*, this is one of last year's, and is not easily surpassed; sepals coral red, broad, waxy, and well reflexed; corolla expansive, deep, regular, and of pure white; habit neat, of moderate vigour. *Conspicua* is conspicuous for its vigorous growth, good habit, as well as the multitude of pretty flowers it produces; sepals deep red, corolla white. *Mrs. Ballantine* is a flower of great beauty, produces flowers almost continually all the summer and autumn months, but the habit is weak, though in form no complaints must be uttered against that. *Lurline* has its white corolla tinted violet; good. *Picturata* is also good; so is *Princess of Wales*, but its white corolla is double, like *Empereur des Fuchsias*.

VARIEGATED SORTS.—*Cloth of Gold*; a lovely variegation of golden yellow divides the leaf of this variety; it is rather difficult to grow. *Pillar of Gold* is more vigorous and compact in habit, though not so bright in its variegation. But the cream, as a variegated sort, is *Sunray*; it may be called a tricolor, having as many distinct shades, which are white, russet, crimson, and bronze; habit splendid.—A. KEAR (in *The Gardener*).

NOVELTIES IN THE ROYAL GARDENS, KEW

THE flowers are opening on the magnificent panicle of *Agave americana* that made its first appearance four months ago in the Succulent house. It is now high above the roof on the outside, and is a conspicuous object from the surrounding lawns. From the base of the plant to the apex of the panicle measures 22 feet, and from the lowest branch 9 feet 4 inches. Its diameter is $4\frac{1}{2}$ feet. The leaves that once spread 12 feet from tip to tip are now shrunk and hang down, the sap having gone to the inflorescence. Its exact age is not known; it is, perhaps, between seventy and one hundred years old. It is a slight deviation from the usual form of *A. americana*. A most important beverage is obtained from this species in Mexico. The inner leaves are cut out just when the flower-stem is ready to rise. The juice thus obtained is fermented, and called pulque. It is agreeably sour, and those who can overcome its disagreeable smell of putrid meat are said to prefer this to all other liquors. From it is manufactured a very intoxicating brandy. Another important product is the fibre obtained from the leaves. In the Museum are various articles manufactured from this material. It is very tough, and is used for making twine, ropes, and paper. Humboldt mentions a bridge in Quito of more than 130 feet span, of which the main ropes, more than 4 inches in diameter, are made from the *Agave* fibre. The roots are diuretic and antispyllitic, and are even brought to Europe mixed with sarsaparilla. The juice of the leaves evaporated to a thick consistence, is said to be an excellent substitute for soap. *Pedilanthus tithymaloidea* var. *variegata* is a new plant, and though of stiff erect habit, may

doubtless be managed so as to be of considerable value. It was imported from India, where it is largely used for table decoration. The leaves are broadly ovate with a wavy margin, sometimes inrolled; the larger proportion of the leaf is creamy white; the green part is irregularly disposed in the centre, or, as frequently happens, on one half only. The plants should be grown in well-drained loam. They may be cut back so as to produce branches. It is also a useful practice to pot a few rooted pieces together, and thus make a good specimen. Cuttings of any convenient length strike easily. The ends should be allowed to dry before insertion; each one should have a small pot, be placed on a shelf near the glass, and receive but little water until roots are produced. *Pedilanthus* is closely allied to *Euphorbia*. It is chiefly distinguished by the involucre assuming the form of a shoe; hence the generic name. At the cool end of this house a plant of *Arundo donax*, "the largest Grass of New Zealand," is extremely handsome (see page 78 last week). It is in a 16-inch pot, and has sixteen panicles. It is more graceful and delicate than the Pampas Grass, and may be considered to take its place in the conservatory, for the decoration of which it must not be forgotten. It lasts many months in beautiful condition. Potted in rich turfy loam it does well. When growing it should stand in a pan of water.

In the Cape house in flower is the new and curious *Gladiolus dracocephalus*. The perianth measures about 2 inches across; it is yellow, and very thickly covered with small reddish purple spots; the three lower and smaller segments are green towards the base. The scape is about ten-flowered. *Ornithogalum thyrsoides* is a good species for conservatory decoration. It bears a fine thyrsoid raceme of large white flowers, with dark ovaries. One bulb only should be grown in a pot. The soil should consist chiefly of loam. *Ixia retusa* is very neat and pretty. It bears numerous small flowers on slender branching stems. They are pale pink, with a ring of darker colour in the centre. *Sparaxis pulcherrima* bears pretty white and pink bell-shaped flowers, pendulous from a tall stem.

In the Orchid collection the beautiful *Dendrobium sanguinolentum* is flowering freely; one of the clusters is composed of fifteen open flowers. They are light yellow. Each segment is tipped with deep rose, forming an elegant contrast; in a few days the yellow changes to pure white. It flowers almost continuously, and should be more cultivated than at present. *Mesospiridium vulcanicum* reminds one of *Odontoglossum roseum*; it is very similar in habit and colour. There are three representatives of the beautiful and extraordinary genus *Stanhopea*:—*S. inodora*, with yellowish-white flowers, excepting the orange-coloured base of the labellum; *S. tigrina superba*, which is larger and finer-coloured than the species; and *S. bucephalus*, with large richly-coloured flowers, orange with dark wine-coloured spots. *Ionopsis paniculata* has a graceful panicle of bluish flowers, with rose-coloured lines on the labellum. *Promenaea xanthina superba* is very pretty. It is about 4 inches high. The leaves are greyish, and the flower similar in colour to *Cattleya citrina*. It is about 2 inches across. *Sarcanthus rostratus* is interesting, with pendulous spikes of small prettily-marked flowers. The buds resemble the head of a bird having a large broad bill.

At the Rockwork the South African *Berkleya* (*Strobilaeus*) *purpurea* is very striking. It is a handsome composite 3 feet high, with a single stem bearing several pale lilac or purple capitula 4 inches across. The leaves are narrow, with numerous prickles on the sinuose margin, decurrent, covering the stem with longitudinal wavy plates, also prickly. It is, perhaps, not quite hardy, but will do well with frame protection. Seeds offer the only ready means of propagation. *Campanula Raineri* is a rare and beautiful species from Italy. It is about 3 inches high, bearing large dark blue flowers, one on each stem. They are similar in size and form to those of *C. carpatica*. The Himalayan *Androsace lanuginosa*, considered by many difficult to grow, is here flowering freely. From its long trailing stems and silky leaves it is quite distinct from the other species in cultivation. The inflorescence, both in colour and form, much resembles that of *Primula farinosa*. It perhaps does best so planted that the stems trail over stones, and not in contact with soil. *Xiphion filifolium* is a rare species from Spain. In this instance the colour is a beautiful blue, like some of the tropical *Nymphaeas*.

ROYAL HORTICULTURAL SOCIETY.—Now that the London season is rapidly approaching a close, we record with satis-

faction that since the May meeting no less than thirty-three new Fellows have been added to the Society's roll of members.

FLOWERS FOR OUR BORDERS.—No. 37.

SKIMMIA JAPONICA.—JAPANESE SKIMMIA.

SKIMMIA JAPONICA was first discovered by Thunberg in Japan, but it is found also in China and the Himalaya. According to M.M. Siebold and Zuccarini, it grows throughout Japan among the mountain forests, but always in scattered specimens; from which circumstance it is comparatively rare. It was found by Siebold near the port of Nangasaki, about 1200 feet above the level of the sea. In the wild state it scarcely exceeds 4 feet, but the cultivated plants are said to attain a greater height. It is of very compact growth, the lower branches being somewhat procumbent. The foliage is thick and fleshy, of a rich deep green colour, 5 or 6 inches long by 1½ broad, pointed and tapering at both ends, smooth on both sides, and disposed in tufts of three or four each. They are said to remain attached to the plant three or four years, and their age may be distinguished by the length of the interval between the different groups.

Fig. 31.—*Skimmia japonica*.

The flowers, which appear in April and May, are of a pale greenish yellow tint, and are disposed in dense terminal panicles; occasionally the buds have a pale tinge of rose just before expansion. They are deliciously fragrant, especially in the evening, the odour resembling that of the *Daphne indica*. The same plant produces both perfect and imperfect flowers—that is to say, flowers containing both stamens and pistil; others producing stamens only; and a few in which these are abortive, the pistil alone being perfect. The berry is at first fleshy, but afterwards becomes a dry four-celled fruit, with cartilaginous cells, each containing one pendulous seed. The berries are ripened in October, and remain attached to the plant during the greater part of the winter, rendering it a highly ornamental object, whether cultivated in the open ground or in pots for the orchard house and conservatory.

It may be increased without difficulty by cuttings under a hand-light, as well as by seeds, which should be sown as soon as gathered. It flourishes best in a mixture of peat and loam but does not refuse to grow in ordinary garden soil.

Though hardy in average winters, it is said to suffer in severe ones, unless planted in a northerly exposure; the influence of the sun's rays being more fatal than frost.

Skimmia japonica is one of Mr. Fortune's numerous introductions, having been sent by him from the north of China to Messrs. Standish & Noble, of Bagshot, on his second visit to that country.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

THE HERBARIUM.

HAVING noticed that several correspondents have recently asked for information with regard to the mode of collecting, spreading-out, pressing, drying, and otherwise arranging plants for the herbarium, I have thrown together the following hints, trusting that the querists will derive more satisfaction from their perusal in a connected form than they would had I sent them in so many detached replies.

To begin from the beginning, I must impress on everyone who would gather plants for the herbarium, to attend to the following points—viz., 1st, All plants gathered should be as perfect as possible, showing root, leaves, flowers, and seeds, and where these are not all present on the same plant at the same time, a return should be made at a future period, to secure such parts as may be missing at the first visit. 2nd, Particular care should be taken to carry the plants home in such a manner as to prevent them from becoming flaccid through evaporation. This is best attained by placing them on gathering in a long tin box with a hinged lid, something like a large sandwich-box. This may be slung across the shoulder with a strap, thus leaving the hands free. Besides this box the collector should be provided with a small book of blotting-paper, in which he will do well to place such plants as shed their blossom easily, as, for example, the *Veronica Chamædrys*. 3rd, A note should always be made of the locality in which the plant was found; and mention of date of finding, and time of flowering, &c., is also recommended. A short, strong, steel trowel or spade is a very necessary companion, in order to uproot plants without injuring their roots. Those who intend to include the *Conferve* in their collections are advised to carry with them a few sheets of gutta-percha tissue, in which the gelatinous *Alge* can be rolled-up, without injury to themselves or other plants.

The next things to be provided are those connected with the pressing and drying of the specimens. The point to be aimed at is, to spread-out the plants in such a manner as to display their foliage, roots, stems, flowers, &c., to the best advantage, without stiffness or artifice; and to dry them off as rapidly as possible, under pressure, so as to cause them to retain, as far as is in our power, their natural and distinctive colour and form. To this end, different collectors make use of different appliances, some using a screw-press, others weighted boards, others again being satisfied with old books. As, however, the amateur is liable to become confused when many methods are described, I shall limit myself to one, which I have always found to work well, and which is well adapted to those whose means are limited.

Two pieces of board are to be procured, each 1 inch thick, by 18 inches long, and 12 inches wide. In order to prevent warping, these boards should be made with crossed pieces at the ends. About 150 sheets of old newspapers are then cut out to the same size as the boards—viz., 18 inches by 12 inches. Eight new bricks are then each neatly enclosed in glaze lining covers, to serve as weights. All things being now in readiness for pressing, the plants are to be taken from the tin box; dead and withered leaves having been removed, the roots are carefully cleared from all adhering soil (if possible without washing, but if washing be absolutely necessary, drying carefully before placing on the paper), and notice is taken of the natural disposition of the foliage, &c. One of the boards is now laid on the floor, or table, where it is to remain, and a half-dozen sheets of paper placed squarely over it. The plant is now placed in the centre of the top sheet, or, if small, several plants may be placed on the same sheet, and the branches laid out as naturally as possible. The leaves should be so placed, that when covered with the top board they should lie flat and without folds. This may often be insured by pressing the leaf-stalk (petiole) strongly with the thumb, at the point where it is united to the stem. The same care must be taken with regard to the flowers, roots, &c. Should the plant be very thick in its stem, it is advisable to split the main stem and remove half; the same may be done with thick tuberous,

bulbous, or cormous roots. If the plant is very succulent, or is aquatic, it will be well to place immediately above and below it a sheet of paper which has been soaked in paraffin or stearine. The plant having thus been "set," three or four sheets of paper are to be placed over it, the number depending on the size and succulence, or moisture, of the specimen; the more moisture it contains, the more paper will it require. A second specimen may now be placed on the paper, and arranged as before, and so on until ten or twelve specimens, each interleaved with six or eight sheets of paper, have been "set out." The second board is then placed over all, and loaded with bricks in such a manner as to obtain an equable and sufficient pressure. The plants are allowed to remain under pressure for about twenty-four hours, when the top board is to be removed and placed on the floor. Half a dozen sheets of paper are then placed on this, and the partially-pressed plants removed from the old damp sheets. The plants will now be found to be much more flaccid and obedient to the hand, so that any little defects made in setting may easily be remedied. Of course, care must be taken not to handle roughly, and to place a sufficient number of sheets of paper between each specimen to insure the moisture drying off rapidly. When all the plants have been shifted, the board which was formerly at the bottom is now placed at the top, and weighted with bricks as before. These operations are repeated day by day, until the plants are sufficiently dry and rigid to permit of their being affixed to paper, and placed in the herbarium. With regard to the herbarium itself, a few words respecting the size of sheets, &c., are necessary here, as upon these apparent minutie depends a great deal of the value of the collection.

The sheets will be found most convenient if cut to the size of 17 inches by 11 inches. The paper should be white, as that colour shows-up the specimens better than others; but the exact thickness or consistence is not very material. Common demy is as good as any for the purpose. With reference to the mode of fastening the plants down to the paper, the neatest mode is certainly to sew the main stems down in two or three places, by passing the needle through the paper at one side of the stem from above, and then out again at the other side of the stem, the needle again coming out above. The cotton is then knotted over the stem. This method allows of easy removal of the specimens without injury, if it is necessary to exchange or examine them from below. The next neatest method is to fasten the plants down by means of narrow gummed paper straps, about one-eighth of an inch in width by three-quarters of an inch long. What must be avoided, is to gum the specimen itself to the paper, as by so doing it becomes useless for reference. With regard to labelling, I found it extremely convenient to use detached labels 2½ inches long by 1¼ inch wide, on which I write the names, &c., and which I stitch down at the right-hand bottom corner of the sheet. I prefer to stitch it down, as I can remove and change the label at any time, if necessary through mistakes or change of name occurring, without injuring the plant by removal from its paper. A few words may now be said with reference to the information furnished by the label. First, then, we ought to have the Latin name of the genus to which the plant belongs, then the name of the particular species. Directly after this name should be placed the name of the authority from which that name was taken (this is often left out, and more often abbreviated); then should be written-in the English name (if the specimen has one); to this should follow the Linnean class and order to which it belongs; then the natural order; and last, but not least, the locality and epoch at which the specimen was gathered, together with such information as may be deemed important.

Annexed is a form of label which we should use for the Traveller's Joy:—

Clematis Vitalba.—*Lin.*

Traveller's Joy.

Polyandria. Polygynia.

N.O. RANUNCULACEÆ.

Wallington, July 5, 1874.

LE HAVRE ROSE.

In answer to your correspondent "P." as to *Le Havre Rose*, it is a French variety, and was sent out in the autumn of 1871, a year which was as prolific in good roses as 1872 was the reverse; for in that year we had of *Teas Comtesse de*

Nadaillac, Madame Jules Margottin, Mlle. Cécile Berthod, Marie Van Houtte, and Souvenir de Paul Néron; and in Hybrid Perpetuals, besides Le Havre, André Dunand, Auguste Rigotard, Lyonnais, François Michelon, Madame George Schwartz, Madame Lefebvre Bernard, Etienne Levat, Richard Wallace, and Baron de Bonstettin. In colour Le Havre is a vermillion red, bearing some analogy to Alfred Colomb, but different in shape, being not so globular, and more between that and Madame Charles Crapelet. I am afraid it is an uncertain Rose; but unquestionably the bloom exhibited by Mr. Turner at Exeter was one of the most beautiful flowers I ever saw, and I should have called it the premier flower of the Exhibition.—D., Deal.

SANDRINGHAM HOUSE.

THE SEAT OF H.R.H. THE PRINCE OF WALES.

Two years since we published an historical notice and description of the gardens of this residence. Our illustrations,

with the exception of the flower-garden beds and the walk to the church, were applicable only to the old mansion, and we have but little to add as an accompaniment to the view of the west front of the modern residence which we now publish.

It was erected from designs by Mr. Humbert, was commenced in 1869, and finished in 1871. We could dwell long, and much to our own satisfaction, upon the garden before the west front of the house, the view towards it across the lake, upon the admirable kitchen garden, and the model labourers' cottages, which a high engineering authority declares to be unsurpassed; but we described most of these features in our pages during 1872.

The early history of the Sandringham estate was published by us in the year already mentioned, but we may add that from the Henley family it was purchased by Mr. Motteux, who devised it to the Hon. C. Spencer Cowper, and in 1861 he sold it to the Royal Family for £220,000. The estate includes the parishes of Sandringham, Babingley, Appleton, Wolferton,

Fig. 32.—SANDRINGHAM HOUSE.

West Newton, and part of Dersingham, amounting altogether to about 7000 acres.

The walk to the church has now an object of additional interest. Not the least pleasing of our recollections connected with Sandringham will ever be with that church, not only because of the taste yet simplicity which characterise its interior, but because there is the noble lectern given by the Princess as a record of her gratitude for her husband's restoration. The church nestles among trees, and the churchyard is a pattern of neatness. Only one grave is conspicuous, and that is of sufficient interest to deserve depicting. It is of white marble, is enclosed by a very low iron rail, blue picked out with gold, inscribed on the base of the cross at its head with the tender words, "Suffer little children to come unto Me, for of such is the kingdom of heaven;" and around the marble slab, "Alexander John Charles Albert, third son of Albert Edward Prince of Wales and Alexandra Princess of Wales. Born April 6th. Died April 7th, 1871." There are two edgings of marble around the slab; and between the two edgings, and between the inner edging and the slab, is a narrow border, each border planted with very dwarf Geraniums and Verbenas (see fig. 33). It is beautiful without being obtrusive, and a most fitting tribute of parental feeling.

Whilst there at the commencement of the present month we were informed, and regretted that we should not attend, that at its close there is to be held "The Sandringham Cottage Horticultural Society's Show." It is held annually in the park, and is only one of the very many themes which the neighbours delight to quote of the kindness of the Prince and Princess. It is heart-gladdening to see the improvement which these and other agents have effected in cottage gardening generally, from the window flowers to the Potato crop.

WHAT IS AN AMATEUR?

A CORRESPONDENT writes as follows:—

"At our show some dispute has arisen as to who is an amateur, and if anyone employing a gardener occasionally, say one day in a week, is one or not—that is, would be legally admitted to compete at any of our shows against any amateur? Your opinion would be greatly valued as to what constitutes an amateur."

Any person who cultivates a garden not for commercial gain is an amateur. No matter how many gardeners he may keep,

From a photograph by Mr. McClean, of Hunstanton.

he is still an amateur. The restriction of the term to a person who does all the gardening himself without the aid of paid labour is a very arbitrary one, and cannot be justified. In framing schedules where the class is confined to "amateurs," and it is intended to encourage any particular class, there ought to be such distinctions as—Amateurs employing a professional gardener or gardeners, amateurs employing a gardener occasionally, and amateurs having no garden assistant.—Ebs.

HEREFORD ROSE SHOW.

I HAVE been requested by the Honorary Secretary to send you an account of the West of England Rose Show held at Hereford. This Show took place in the Birmingham week, and consequently suffered thereby; but there was no help for it, as the Rose-fixtures come so close together during our brief season that some must clash. Besides, the Hereford people felt that it was a most unconscionable proceeding on Mr. Quilter's part to appropriate a whole week for his show, at a time when Roses are at their very best, and so they preferred to run the risk of a poor show than to put it off a week later, when most men's Roses would be over. I could not bear giving up the Birmingham Show, but as I could not show at Hereford as well as Birmingham, I preferred the former: first, because I never enjoy any day so

much as the day spent at the Hereford Rose Show; secondly, because I was asked to judge there; and lastly, because I had accepted the invitation of my friend Mr. Cranston, and would not have missed paying that visit for any amount of Birmingham shows.

And now as to the Show itself. To tell the truth I was very disappointed with it, but I was not surprised. Knowing as I did what a bad season it had been for Roses, and also for the reason I have stated above, I was not, I say, surprised to find it in comparison with other years a very poor show. Cranston, Mitchell, Paul, and Davison, were the only nurserymen who put in an appearance, and Cranston's were the only stands which came up to one's idea of what a great nurseryman's Roses should be. But who can wonder at this? The nights before the Show had been close to a degree I never experienced before in the early part of July. Certainly my own blooms never travelled so badly as they did to Hereford, and I drove twenty-seven miles in order to catch the night mail for Gloucester. And here I should be very glad if some of your readers would give their opinion as to the desirability of driving a long distance in order to get a night train. Does the road journey more than undo the good gained in travelling by the night mail?

There was very little competition in the amateur classes. Indeed, Mr. Arkwright and myself divided most of the first prizes. My friend Mr. Baker has been completely knocked out of

FIG. 33.—THE INFANT PRINCE'S GRAVE AT SANDRINGHAM.

competition this year, and I should have been the same if I, like him, had all my eggs in one basket—*i.e.*, all my trees planted together. In some parts of my gardens the trees have been decimated. I lost at least seven hundred Manetti Roses. Indeed, I hardly lost any standards. But what a year for Teas it has been! I cannot understand how people can say Teas are tender. My experience tells me that they are a great deal harder than most Hybrid Perpetuals on the Manetti. I do not think I lost a Tea, except six *Maréchal Neils* which were removed too soon in the autumn. *Souvenir d'Elise* (to me the finest Rose in cultivation) has been most glorious. I have it now perfectly superb against a dwarf south wall, and my plants that served me for the early shows are all in bud now, and will be ready for the autumn ones. Tea Roses bloom much more freely a second time than do any other Roses. Always the last Rose blooming in my garden is a darling Tea, and yet there are only about twelve which are worth growing. Indeed, it is a difficulty to show twelve really good Teas. I wish more prizes were offered for Tea Roses at the shows. The Royal Horticultural Society at South Kensington is, I believe, the only Society which has a class for amateurs' Teas. There ought to be a class at every show, with prizes as good as are given for Hybrid Perpetuals, and then we should have men cultivating them more, and judges would be more just when judging a stand of forty-eight, and give, as I maintain they ought to do, points for fine Teas.

But (forgive this digression on the Teas) to return to the Show. If the Roses as a rule were not up to the average, the company was above it, and I rejoice to say the receipts were larger than our friends had had for many years. And what friends they are at Hereford! What hospitality, what kindness, what courtesy! I could have spent a week there, and then not have overstayed my welcome. I would not miss a Hereford show for anything that this world can offer. I think the only thing which would make me less enthusiastic about it would be the terrible event of my stand of Baroness Rothschild being

beaten in the class for twelve blooms of any Rose. For three years in succession at Hereford I have won this prize with the Baroness, and when she fails me I shall indeed be brought low.

By staying with Mr. Cranston I enjoyed the great privilege of going over his nursery at my leisure, and how I availed myself of this I need not say. I saw one hundred thousand trees in full bloom! I could walk upwards of a mile through exquisite Roses! I saw Sir Garnet Wolseley, Mr. Cranston's grand seedling, in bloom, and feel confident that here we have a novelty which will make the French raisers hide their diminished heads. I had seen it at the Show the day before, where its production created a *furor* only second to its namesake's appearance in the Sheldonian Theatre. I saw one thousand plants of *Madame Lacharme*, and a greater take-in I never had the misfortune to buy. I have worked that Rose, and bought it, and petted it, and tended it, and it has repaid me by giving me dirty ragged blooms, inferior to *Mille Bonnaire* or any other white abomination. How *Lacharme* could send it out with such a flourish of trumpets, I cannot understand. All the great nurserymen have thousands of plants, and I do not believe we shall find the Rose in the catalogues in 1878. But I saw here and at Salisbury one really fine Rose of 1873, and that was *Souvenir de John Gould Veitch*. That is a real prize, and, of course, with my usual luck it was the only one, though I ordered it, that I did not get last year. As to all the rest of the 1873 Roses, they are not worth the paper on which I write. The hardships, Messrs. Editors, of having to buy these "pigs in pokes," these miserable little plants of new Roses every year, at 3s. 6d. each, or else lose the chance of having a prize (and then, as in my case, not getting it), is a very great one. Four pounds did I pay for these wretched little starvelings that had been run-up in great heat, and are joined to a weak Manetti stock, and so loosely united that you can almost blow them asunder. And yet every year there are scores of new Roses with descriptions appended to their names in the catalogues which make your mouth water, and your eyes long with an eager longing to see them. Cannot

something be done to correct this evil—the nurserymen suffer as much or more than we amateurs—and save the pockets of poor persons like myself, who cannot afford to throw money away, but yet cannot bear to run the chance of missing a good thing? And now I must bring this long yarn to a conclusion by telling you that I returned home by way of the Wye, past Tintern Abbey, and on to Chepstow and to Bristol, and had one of the most delightful trips I ever had in my life.—J. B. M. CAMM, *Monkton Wyld*.

NOTES ON VILLA AND SUBURBAN GARDENING.

Winter Vegetables.—Bear in mind the value of a good supply of wholesome vegetables for autumn and winter; it is yet good time to plant Savoys, Kales, Broccoli, Leeks, Celery, Lettuces. Sow some Cabbage for late winter and spring use, and prepare a healthy piece of ground for the seed beds for spring and summer Cabbage, which should be sown two or three different times between the 25th of July and the 12th of August. A small border or warm corner should also be prepared and worked into a sweet pulverised condition for Winter Spinach, which should be sown about the 10th or 12th of August. This is also a good time for sowing the hardy kinds of Lettuce for standing the winter. Celery already established should have applications of liquid manure in a diluted state, not to be applied too strong while the plants are small. Now is a good time for getting in fall crops of Turnips for use throughout the winter. Allow no waste Cabbages, Greens, Cauliflower leaves and stumps, or Pea haulm to remain, but give all such refuse to the pigs, if any are kept, and if not, it should be trenched at once into the soil as manure, to assist in producing other crops; it is to some extent returning to the soil what has been taken from it, together with what has been absorbed from the atmosphere. Continue to dredge the young Turnips, Cabbages, and other seedling plants with dry charred dust while damp, or early in the morning.

Budding Roses.—The desirability of budding Roses being decided upon, the selection of proper stocks is the next subject for consideration. Every gardener should keep a small stock of Briars in some retired place ready for use when the buds of valuable plants come into possession, and these, of course, require winter treatment, which need not now be explained. If you have Briars examine them immediately, and see how many are in a proper state for budding. The long drought this year has been unfavourable, having checked the growth of young wood and hardened prematurely that which was produced. Unless the bark rises quite freely do not attempt the operation. It has no chance of succeeding if a succulent juicy state is not manifest on cutting the stem, and this will only occur in young wood. New shoots are now being produced, which will be fit for working in about a fortnight, and I would recommend that the Briars be cut down to these shoots, and all the hardened branches be removed. An opportunity will thus be afforded for budding before August is closed, and, although rather too late, success may be expected. But if you have no Briars budding may be advantageously performed on other stocks. Boursault Roses, climbers such as *Adelaide d'Orléans*, and many others of free growth, generally throw up fine shoots from the root, and if all the old wood is cut away these may be budded on with every prospect of success. I have found more certainty attending the operation with this class of stocks than any other; and when you have common climbers you may easily replace them with good Roses in this way. Inferior Hybrid Chinas also make good stocks, *Céline* for instance; and as these Roses throw up wood freely, the gardener will easily find shoots for his buds if he has anything of a collection. I budded *Paul Joseph* on *Céline* in this way a few weeks back, and the buds have shot half an inch. There is another economical mode of securing stocks which I will mention, having found it of great service myself. Briars which have been budded on will often throw up suckers at a little distance from the parent stem, so that they may be cut off in the winter with a portion of the root. Bud on these and carefully remove them in the proper season. As, however, trees well established in the ground throw up their suckers very luxuriantly they must be watched, and all new shoots carefully stopped after the budding is performed. If this is neglected the strength of the shoot will run away with the juices necessary for the bud, and it will perish.

A damp dull day is preferable for budding, but not necessary; still, precautions must be taken to counteract the effects of heat and drought. Bud on the north side, if possible, and with the shade of some neighbouring foliage. Even the ends of the tape with which the bud is tied on may be made to hang over it so as to shade it from the direct beams of the sun. In all these matters a common-sense view of the affair in hand must be taken, and this will lead to the adoption of the best methods of securing the object. We do not transplant in hot sultry weather if it can be avoided, but if it be necessary at such seasons to remove anything we shade and water more carefully. Now, if it is remembered that in budding a wound is inflicted, and that the part inserted is very thin and delicate, it will be evident that success cannot be expected in the absence of thoughtfulness,

similar to that which transplanting requires. Budding requires the nicety of touch and perception of mechanical adjustment which surgery demands; like that, too, it is an operation performed on a living body. Many clever people could never had well from an inability to perform any nice operation. Are you able to bind-up a cut finger well, tenderly, neatly, and securely? Then you can bud, and may proceed with the hope of success.—W. KEANE.

DOINGS OF THE LAST AND PRESENT WEEKS.

The heavy thunder showers hardened the surface of the ground, and also caused a good crop of weeds to appear in the vegetable quarters. In such a case no time should be lost in running a hoe over the surface of the ground, so that the weeds may be destroyed, and what is also of great importance, the ground loosened. There is some difference of opinion amongst gardeners as to the best form of hoe to use in the kitchen garden. We use the Dutch and the awn-neck form of the draw hoe. The Dutch hoe is best adapted for working amongst salads and small vegetables in borders, &c., as it leaves the neatest work; but amongst Cabbages, Potatoes, rows of Peas, and similar crops, it is much better to use the draw hoe, and especially so if the ground is heavy, as the tilth can be worked so much deeper with it.

Early Potatoes, Peas, and Strawberry plants have been cleared-off sundry quarters, and the ground has to be prepared for winter crops, such as White and Sprouting Broccoli, hardy Greens, Scotch Kale, and Leeks, or to sow with Onions if very large specimens of these last are to be produced by midsummer. More or less of the above-named vegetables will, of course, be planted according to the requirements of the family, and the capability of the soil to bring them to perfection. In our ground it is sheer waste of seeds and labour to try to grow Broccoli, and if Leeks were planted they would not be used. Indeed, every district has its own favourite vegetable; even amongst the labouring class this is noticeable to a greater extent than it is in larger gardens. One seldom sees a kitchen garden in Scotland without its bed of Leeks. I have visited gardens of all sizes in the south of England, and have not observed this wholesome vegetable at all. The most profitable crops for us are Coleworts and Sprouting Broccoli. These supply us with vegetables all through the winter and spring. A bed of White Stone Turnips sown now will come-in late in the autumn, and will continue in use all through the winter.

FRUIT AND FORCING HOUSES.

Pines.—There are certain disadvantages attending Pines planted-out in beds, but there are also certain advantages; and the question sometimes arises, whether in some instances the planting-out system may not be the more desirable method. Mr. Perkins, of the Gardens, Stannore Priory, has shown us what can be done with the planting-out system in the way of producing large Pines, and also of doing so in a shorter period than has yet been done with potted plants. There is also but little danger to be feared from under or over-watering. We have put-in a batch of suckers in pots, and as soon as they are established one of the beds will be prepared for them and they will be planted out. Whether it is intended to grow the Pines to the fruiting stage in pots, or to plant them out in a prepared bed, it is desirable to place the suckers first in pots from 6 to 8 inches in diameter, according to the size of the suckers. The pots should be plunged in a bottom heat of about 95°, when roots will very readily be emitted. The plants must also be repotted before they are anything like pot-bound. No better material can be recommended for growing Pines than turfy loam—not sandy loam, but what might be called medium clay. About one-fifth part may be rotted stable manure, and an 8-inch potful of crushed bones may be added to each barrowload of the compost. Pines require careful watering at all times. The pots are usually plunged in tan or some other heating medium, and it is not easy to ascertain the state of the roots. When the fruit is colouring water ought to be withheld. Careless watering is the frequent cause of Pines not swelling-off well; the stalks die prematurely, and the fruit is consequently much depreciated in quality.

Orchard House.—The fruit is swelling rapidly on such early varieties as Early York and Early Grosse Mignonne Peach, and just a word in favour of the last-named sort. It is a splendid early Peach; the fruit is little, if at all, inferior in any respect to Grosse Mignonne, and it ripens almost with Early York. Hunt's Tawny and Rivers's Lord Napier are the earliest Nectarines, and they ripen in the order named; they do not come in quite so early as the early Peaches, but they follow them very closely. As soon as the fruit is nearly ripe on the earliest trees a change of treatment is necessary; previous to this the house had been shut up between four and five o'clock in the afternoon, and the trees at the same time were thoroughly engined overhead with water of the same temperature as the house. This treatment continued would cause the fruit to be watery and poor in flavour. The trees with ripening fruit should not be syringed, and, for convenience, all the trees bearing fruit of one stage of

ripeness should be placed together. A little air should also be kept on at the highest part of the house all night.

It will now be seen how necessary it is to have the trees thoroughly free from insect pests. Red spider increases with the most amazing rapidity as soon as they can obtain a dry footing on the leaves. When the fruit is ripening-off, the trees must be looked over once at least every day, and the fruit carefully gathered and placed upon cotton wadding, one deep, in the bottom of a flat-bottomed basket or box.

Cucumber and Melon Houses.—At one time we used greatly to prefer dung-frames for growing Cucumbers in summer, but we would only use frames now if the supply from the Cucumber house were not equal to the demand. When the plants are making rapid growth it is necessary to look over them once every week to cut out any exhausted old growths, and to tie-in the young bearing shoots in their place. But little heat is necessary from the heating apparatus, unless very fine specimens are required for exhibition purposes. Syringe the plants in the morning at 7 A.M., and in the afternoon when the house is shut up.

It has been recommended to take a second crop of Melons from the plants that were raised in January, and which bore a crop of ripe fruit in June. The plants are watered, some of the old leaves cut off, and the young growths trained to the wires. If the plants are sound at the neck, which is not always the case, a number of female blossoms will be produced, and the second crop sets more freely than the first. This method of procedure involves less labour than clearing out all the old soil from the house, and replacing it with fresh in order to turn out young seedling plants. Whichever system is adopted, it will not be necessary to resort to the heating apparatus either for bottom or top heat. The house should be shut-up in the afternoon, and otherwise treat the plants the same as Cucumbers.

GREENHOUSE AND CONSERVATORY.

At this season the good old-fashioned Fuchsia, and, what is even more useful for decorative purposes, the Zonal Pelargoniums, single and double, are usually the occupants of our greenhouses. Few plants are more easily grown, and few more thoroughly repay the little trouble required to train them into handsome decorative specimens; but too however useful and beautiful they may be, we may have too much of them, and their free-growing properties may be injurious to more slow-growing and tender exotics placed amongst them. Indeed, a very large proportion of the New Holland and Cape hardwooded plants are spoiled if it is necessary to grow them in the same house with rapid-growing succulent-leaved plants.

A plant which is now in flower with us, and which may be recommended for its colour and otherwise distinct character, is *Lisianthus Russellianus*. This is a good old biennial, and well worth all the care necessary to bring it to perfection. Some instructions were given as to the culture of it in No. 692. Possibly the greatest difficulty will be to obtain seeds of it. Nearly all the principal seedsmen can supply it, but either from being imperfectly ripened or some other cause, it very seldom vegetates. It may be that the fault has not always been with the dealer, but that the grower was to blame. It requires great watchfulness from the time the seeds are sown until the plants are ready to pot-off. The same treatment that applies to *Calceolaria* seeds will answer for those of *Lisianthus*.

Reported Auriculas and placed the plants in a shady position where they will remain until the end of September, when a frame facing south will be the best place for them. We do not use large pots for any of the plants, the largest being 4 and 5-inch, and for smaller plants 3 inch pots are sufficient. Moved pots of Carnations and Picotees out of doors. The sooner they are removed-out after flowering the better. The grass becomes drawn and the future plants much weakened, if they are kept too long in the house before they are layered.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

TRADE CATALOGUE RECEIVED.

W. Henderson, 86, Hamilton Street, Birkenhead.—*Select Catalogue of Dutch and other Flower Roots.*

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

BOOKS (W. J. GERRON).—The new edition of "The Greenhouse," in the series of "Manuals for the Many," is the book you require. It treats exclusively of the plants and their culture, and the constructive part which was in the former edition has been discontinued. Price 9d. (W. P.)—W. Paul's "Shilling Book on Roses." Any bookseller can supply you with it.

MERCURY FOR COOKING (An Old Subscriber).—The leaf you enclosed is of the right kind, *Chenopodium Bonus-Henricus*.

LARVA ON PEAR LEAVES (F. E. R.).—Dusting with quicklime is the effectual remedy. The larva is popularly called "The Slimy Grub." It is produced by the *Tenthredo alniplumata*, a four-winged fly. Drawings and full relative notes are in our No. 678, published June 19th, 1873.

AMERICAN BLIGHT ON APPLE TREES (An Old Subscriber).—We have pretty well got rid of this pest on our trees by using boiled oil. This is applied to the affected parts with a painter's brush, rubbing it well into the cracks.

GRAPES ATTACKED BY A MAGGOT (F. H.).—This is rather an uncommon occurrence, and no other remedy can be suggested than to pick out the maggots and destroy them.

LEAF MOLD (H. J.).—Judging by the sample you have sent it will do very well mixed with silver sand to strike cuttings in to stand the winter.

LILITH AURATUM OFFSETS (Co. Antrim).—The plants should be repotted when they die down, turning them out of the pots, removing the old soil over the bulbs, and picking the soil from amongst the roots. Preserve the healthy roots, with any portions of soil occupied by them, and after removing the offsets repot in fresh clean pots, which may be three times the diameter of the bulbs, and place these so that when just covered with soil the pot will be little more than three parts full. The offsets may be potted singly in 5, 6, or 7-inch pots, according to their size, and in the same way as the larger bulbs, only just covering them with soil, make firm around them, and leave a space of an inch or two below the rim for top-dressing. Good drainage must be provided, and a little of the rougher parts of the compost should be placed over it, the compost not being sifted, but well mixed and broken-up fine. It may consist of two parts fibrous light loam, one part each leaf soil and sandy peat, half a part well-rotted manure, and half a part in equal proportions of silver sand and nodules of charcoal. The potted bulbs should be wintered in a light airy position in a cool house or pit safe from frost, and sufficient water given round the sides of the pot to keep the soil moist. Fill the pots with soil to the rim, allowing for watering, when roots show from the stem just over the bulbs. The amount of water should be increased with the growth and lessened after flowering.

MELON PLANTS DYING (X. Y. Z.).—From the stem enclosed to us we consider you have the disease attacking the Cucumber and Melon, for which neither cause nor remedy has been found. The plants will most likely die. The only thing we have found of service is to keep up a good brisk heat by lining the bed, which encourages root-action; admit air freely, securing the requisite temperature, and water only to keep the foliage fresh, shading from bright sun if the leaves are disposed to flag. Attacked as yours are, the plants rarely recover.

COVERING FOR FRUIT WALL (C. Y.).—Your border being so narrow we should not advise your going to the expense of upright sashes. We should raise the wall to say 9 feet, and have a lean-to house of about 7 feet 6 inches wide. If you could not conveniently raise the wall, we should have it with 7 feet 6 inches, and the front of the lean-to part wood and glass—i.e., 2 feet of boards, the upper one being hinged and opening outwards the entire length of the house, and 2 feet of glass fixed. For the front you will need posts of yellow deal 5 inches by 3 inches, which should be let into the ground 2 feet, they being 6 feet long. The part placed in the ground should be first charred, and then coated with boiling gas or coal tar. The posts may be 4 feet apart, and firmly fixed upright. At the height of 14 inch thick, grooved on the under ground, you will need a sill 5 inches by 14 fixed between the posts with a half-inch incline outwards to allow of the water running off, the groove preventing the water running down the face of the boards. Upon the posts have a plate 4 inches by 3 inches, on which the rafters are to rest, the plate being nailed on to the posts. The back wall will need to have a plate or board 1½ inch thick, secured to the wall with nails, the wall plugged so as to admit the

nails where required. The wall plate may be 6 inches wide, and should be notched, so as to receive the rafters, which may be 4 inches by 1½ inch, and fixed narrow side upward, they being ploughed half an inch wide and deep so as to receive the glass. The rafters must be cut off slanting, so as to rest on the front plate, the rebate exactly corresponding with the front top edge of the front plate, and exactly over the posts, they being securely nailed to the plate. You will thus have a house with rafters 4 feet apart; between them fill-in with rafters or bars 2½ inches by 1½ inch, and 1 foot apart. You will need a bevel-piece at bottom to form the rest for the glass (it need not exceed an inch wide), and a nose-piece grooved on the under side to run off the water; this ought to project an inch, and the glass should cover the joint, it being "planted" on the front of the front plate. At the back you will need a strip of wood half an inch wide, and nailed on level with the rebates in the rafters and bars. The roof will then be ready for the glass, but we have not provided for ventilation. We will there put in a piece of wood lengthwise of the house 1½ inch thick and the depth of the rafters, and between every alternate rafter, the bars being let into it. These to be 18 inches down the rafters from the top, and for these openings you will need 2-inch lights, and so as to rest on the rafters, extend to the cross piece, and be hinged to the plate against the wall. These lights may be raised by a flat piece of iron fixed at the bottom in the middle, and an iron peg in the cross piece to fit into the holes. The ventilators, with the board in front, will give plenty of air. The front part will need to have bars corresponding with the roof, and the posts to have strips of wood nailed on to receive the glass. The part below the glass in front to be covered with three-quarter-inch boards, the upper one hinged, as before stated, so as to let down the whole length of the house. It may be glazed throughout with 15-oz., better 21-oz., thirds sheet glass. The ends will need to be formed so as to correspond with the front, and doorways provided. The advantages of a house of this kind over the one you name are great. You will be able to have trees on the back wall, and if you have it in two divisions you could have in one two Apricots against the wall, and in front a row of trees in pots of Plums or Pears, or both, with Cherries if you wish. In the other you could have two Peaches and a Nectarine against the wall, with Peaches in pots in front, or Vines trained lengthwise of the house, and so that the shoots do not extend further than to leave 4 feet clear of the upper part of the glass. The Vines might be trained to wires 16 inches from the glass, or grown in pots. Along the front you could have a shelf for Strawberries in pots, and the house would be useful for many purposes. A path way along the back, resting on brick, would serve you. A house of this sort would cost very little more than the coping with sliding sashes you describe, but would afford far greater advantages. No shading would be required. By applying to some horticultural builder and describing what you require, you would probably obtain at a cheap rate the house ready for fixing.

DECOMPOSING NIGHT SOIL (X. Y. Z.).—The best material is dry earth, a shovelful of the earth being used every time, and the whole could then be emptied without offence to labourers, and mixed with four times its bulk of dry earth. Kept under cover it is a very valuable manure, and may be applied to ground for vegetable crops in about one-fourth the quantity of farmyard or stable manure. Treated in this way and dug-in, it is not offensive.

DELT FOR SPRING GARDENING (Item).—The seed should not be sown until late in May or early in June, and the plants thinned to 2 inches apart. In October, or as soon as the ground is cleared, they should be moved with all the soil that will adhere, and planted so as to cover the root, giving a good watering if the weather be dry.

ACHILLEA MILLEFOLIUM ON LAWN (W. W. B.).—The Yarrow is a fast-spreading plant, which endures drought well, and gives a patchy appearance to a lawn. Dry weather does not bring the plant, but makes it appear more conspicuously from the bad effects of the drought upon the grasses. The Achillea should be removed, for, instead of dying, when wet comes it will grow more freely, overpowering the grass, which should be encouraged.

VINES INFESTED WITH THRIPS (T. P.).—The leaves are much infested with thrips, and from their eggs will issue another generation. Choose a calm evening when the foliage of the Vines is dry, the floor wet, and the sashes shut-up closely, then thoroughly fill the house with tobacco smoke. Keep the house closed the following day if possible, dull weather being best, and frequently sprinkle the paths, &c. The next night but one after fumigation fill the house again with smoke, keeping as close the following day as is consistent with the safety of the Vines, and in the evening syringe thoroughly, and daily every evening until the Grapes change colour. If they are colouring the syringing must not be practised, but the floor and every available surface should be wetted morning and evening. The fumigation ought to be repeated in a week after the first application, and afterwards a good look-out should be kept for the re-appearance of the pests, and when any are seen fumigate.

ATREBETIA ORFEOA, GOLDEN-FEATHER PYRETHRUM SOWING, &c. (C. C. M.). The *Atrebetia* should be sown in May or now, the seedlings being kept over the year, the latter being the best plants. Golden-Feather Pyrethrum should be sown in April, and the Forget-me-not in June. They should be pricked-off when large enough, and be moved in October to the beds when these are cleared. The *Fansies* should be planted in autumn. Double *Daisies* should be divided as soon as the flowering is over, planting the division in good, rich, light soil in a shady border, and keeping moist. They should be planted in autumn along with all other spring-flowering plants as soon as the beds are cleared of the summer plants.

WATERING (E. H. R.).—The best time to water during hot weather is in the evening, from 5 to 9 P.M., or later. It is not advisable to water when the sun is powerful, especially when the foliage of the plants must be wetted. When this is the case the watering is best done early in the morning or evening, preferably the latter. Watering plants of large size at the roots may be done at any hour of the day.

WATERING STEPHANOTIS WITH LIQUID MANURE (W. C. D.).—If the border is full of roots, and the plants growing freely, weak liquid manure may be applied at every alternate watering during growth and flowering, care being taken not to have the manure water strong, or it may injure the roots. Liquid manure collected in a tank from stables and a pigsty is of too uncertain strength to be applied to plants without considerable dilution with water, judgment alone determining its strength.

SOWING ACILEGIA GLANDULOSA (E. H. W.).—Seed of this sown now will not produce plants for flowering next spring. It is rather slow-growing, and is best cultivated in pots, or at the foot of rockwork, in a compost of equal parts loam, sandy peat, and leaf soil, with a sixth of sand, and good drainage. The seeds should be sown in April or May, and placed in a cold frame or house, shaded until the young plants appear, then give air and light freely,

and pot singly when the rough or second leaves are showing, affording slight shade until established. They should have a position somewhat shaded in summer, and sunny or open in winter, with free ventilation, shifting into larger pots as the pots become full of roots, always keeping moist, but avoid making the soil sodden. The plants will not endure "pushing."

FUCHSIA AND GERANIUM LEAVES BROWNED (Amateur).—There were no insects on the leaves sent us, but evidence of red spider having been upon the Fuchsias. This enemy is best overcome by syringing with a solution of 2 ozs. of soft soap to the gallon of water, the plants being laid on their side and the solution forced against the under sides of the leaves; afterwards keep well syringed. The Geranium leaves are scorched from having been watered overhead or syringed when the sun was shining powerfully upon them, combined with inefficient ventilation. They will recover outdoors, but will no doubt lose all or most of the old leaves.

ANNUALS FOR SPRING BEDDING (R. W.).—The best pink is probably *Saponaria calabrica*. The seed may be sown in the first week in August, or not later than the second week, and the seedlings pricked-out, when large enough to handle, about 3 inches apart in light rich soil. The white variety, *S. calabrica alba*, is equally good. A deep rose or red is *Silene pendula*, which should be sown at the end of July or early in August, and should be pricked-out like the *Saponaria*. *Silene pendula alba*, white, makes a fine mass. *Myosotis sylvatica* is the best blue; the seed should have been sown in June. *Nemophila in-luvis grandiflora* will meet you for blue, the seed being sown the last week of August, pricking-out, and having the planting bed well raised to prevent wetness of soil, or the plants may die off. *Collinsia verna grandiflora* sown the second week of August is a good pretty blue. *Limnanthes Douglasii*, straw colour, may be sown in the first week of September. *Lasthenia californica*, yellow, sow the third or fourth week in August. All the plants mentioned are best pricked-out in good, rich, light soil, and should be shaded and daily watered until established. They should be planted in the beds as soon as these are cleared of their summer occupants, and be put in rather thickly, say 4 to 6 inches apart, and some plants ought to be kept in reserve, to fill-in with if necessary in spring. The plants should be moved carefully, and with little balls of soil. Could you not employ some red-leaved Beet and Golden-Feather Pyrethrum?

BUCKLAND SWEETWATER GRAPE (A Young Beginner).—This is a round white Grape.

CAMELLIAS (J. H. Mason).—By the account you give of the Camellias they appear to be doing very well indeed. Perhaps they may be a little too forward in bud, but not much; that is of little consequence so long as they have improved so much.

PANSIES MILDEWED (J. Kilston).—The mildew is attributable to the long-continued dry weather, and the plants will no doubt recover themselves when it has ceased.

THRIPS ON VINE LEAVES (A Subscriber).—Your Vines are covered with thrips. See answer to "T. P." in the next column.

NAMES OF PLANTS (Mrs. W.).—Send us a single bloom in a small box with damp moss, and with the aid of the drawing we shall be able to make it out. (*Chen. Bryonia*—*Styrax arifolia*. (S. G.)—*Combretum purpureum*. (J. C.) 1, *Begonia Pearcei* (*Bot. Mag.*, t. 554); 2, *Begonia*, perhaps insignis; but you send no female flowers, upon the structure of which the groups largely depend. (Mary Pole).—*Polypodium pustulatum* or *Billardieri*; native of New Zealand.

POULTRY, BEE, AND PIGEON CHRONICLE.

GRANTHAM POULTRY AND PIGEON SHOW.

POULTRY formed a division of the Lincolnshire Agricultural Society's Grantham meeting, held on the 22nd, 23rd, and 24th inst., which though not a very extensive show, outnumbered its predecessors. The arrangements were very carefully carried out, and the whole proved a well-merited success.

Duckings were one of the best-supported classes in the Show, a really well-shown pen of the fashionable dark colour being first, and the other three prize pens (for there were four prizes for this class) ran each other very closely for their respective places. *Game* (to which also four premiums were allotted by the prize schedule) were not by any means a first-rate entry, each entry of Brown or other Reds taking a prize; and in the next class, for Piles or any other light-coloured Game fowls, though first and second prizes were given, there actually was not any entry at all for the third premium. *Cochins* were a well-filled class, all colours being in competition, the now-so-well-known Partridge Cochin cock of Mr. Crabtree, mated to a good-feathered hen, being first; Mr. Woodgate's equally-noted Whites second; whilst the third was taken by a good pen of Buls sent by Mr. Winwood, of Worcester. There was also a really capital hen shown by Mr. Lievesley, of Lincoln, in pen 20, but her male companion was much her inferior. The *Brahmas* were shown together, both Light and Dark ones, Mr. Crabtree and Mr. Kendrick taking first and second with Dark ones; but the hen in Mr. Crabtree's other Light-feathered pen was so sadly ruptured, the third prize was withheld. All the *Spanish* fowls were in bad show-trim, and the prizes only were awarded. Such was the want of merit in the Silver *Hamburghs* that a third prize only was reluctantly given, both the others being withheld. Both *Houdans* and *Cree-Crees* were better than might have been expected: in point of fact, far better than are seen at the majority of poultry shows. Mr. Boothby, of Louth, well deserved his first prize in the *Poland* class with an excellent pen of Golden-spangled; but all the other pens proved empty. *Game Bantams* were good, though many were on the moult, and not a few were passed over for being "trimmed" excessively about the head until it bore the appearance of being actually shaven.

Another pen, in which the wings had been pulled off the cock, was "disqualified" altogether; and it is worth mentioning that the Judges would have given him a third, if not a higher prize, had he been left alone. In the variety Bantam class Blacks stood first and third, and White-booted ones second, in a good competition. In the class for Any other distinct variety of fowls, Black Hamburgs took first, La Flèche second, and Silkie third, all being very good birds. In the Selling class the prizes were taken as follows:—Silver-Gray Dorking, Dark Brahma, Grey Dorking, and Golden Poland. Here again "trimming" had been resorted to, and a Dark Brahma cock was disqualified, the hocks being dexterously both cut and plucked, and his tail feathers likewise. Trimming has of late again become so prevalent that strong efforts are needed for its restraint, and should simply disqualifying not have the desired effect, it is worthy of consideration by committees whether withholding all prizes already won by any exhibitor proved guilty of trimming in the same show should not be a punishment that possibly would prove a deterrent in most, if not all, cases.

Grand Geese and Turkeys are most worthy of note, especially the latter, than which it is barely possible to obtain a better competition than was the case at Grantham. Aylesbury Ducks were very fine and well-bred, and of Rouens the plumage was mostly of high merit, but the generality of them proved quite too small for show Ducks of the present day. A very nice pen of Carolina Ducks in breeding plumage, though so late in the season for this feather, had the race all to themselves, for empty pens were their only rivals. Guinea Fowls were a nice class, and a pair of admirably-shown White ones stood pre-eminent. A "miscellaneous Selling class, open alike to Swans, Pea Fowls, Turkeys," in fact anything in the shape of poultry, with five prizes, ranging from £2 10s. down to 2s. 6d., strange to say, was quite a failure; a pen of Rouen Duckings, and another of Golden Polands, taking the third and fourth, whilst the first, second, and fifth prizes were entirely withheld.

Of Pigeons the entry was small indeed, but of fine quality, Mr. Yardley making a walk-over for the bulk of the prizes.

The Show was well attended, and the poultry well provided for.

(From a Correspondent.)

This was a Show of about 180 pens, and although the competition was very limited, and the quality of the birds shown was not first-rate in some of the classes, yet other classes brought out a fair entry of good birds. The first-prize Dorkings were very fine, and the second-prize pen contained a very large and most excellent hen. The Game classes were rather limited in numbers, not containing so many pens as there were prizes offered. There was a good entry of *Cochins*, comprising nice Buff, Partridge, and White birds; but although there were several pens of Blacks, none either merited or received the notice of the Judges. In *Brahmas* Mr. Crabtree's were good, and the first-prize *Spanish* were a long way ahead of the others in quality of face. The first and second Golden-spangled *Hamburgs* were nice birds. The first-prize *Houdans* were very good, and showed the genuine Houdan comb. The first-prize pen of *Crève-Cœur*s proved also a very nice pair of birds, and in good plumage. In the *Poland* class only one prize was awarded to a good pen of Golden, going, however, into moult very fast. The Game *Bantam* class was a numerous one, but not many of the birds were meritorious. In the next class were some capital Blacks and Booted Whites. The Variety class was not a large one; the winners, however, were good. The first-prize Dorking cock, and the first-prize Brahma hen in the Selling classes, were good. The *Geese* were capital, and the Aylesbury and Rouen *Ducks* fine. The first prize in the Variety Duck class went to a pair of very handsome *Carolinans*. *Turkeys* were large, and Guinea Fowls better than usual.

Mr. Yardley's Carriers, White Pouters, Almond Tumblers, and Black Barbs were almost the only good Pigeons shown.

DORKINGS.—1, J. Walker, Rochdale. 2, H. Marshall, Cropwell Butler, Birmingham. 3, J. Hornsby, Grantham. 4, J. G. Jebb, Ketterick. 5, A. Garth, Southern, Lincoln.

GAME.—Red or any other Dark color.—1, F. Sales, Crowle, Doncaster. 2, H. Marshall. 3, E. Winwood, Worcester. 4, R. B. Duckering, Kirtlington, Wey. White, Pale, or any other Light color.—1, F. Sales. 2, E. Winwood. 3, No competition.

COCHINS.—1, W. H. Crabtree, Levenshulme, Manchester. 2, R. S. S. Woodgate, Rembury, Tonbridge Wells. 3, E. Winwood, *loc.* J. Walker; T. M. Derry, Godney. 4, W. Whitworth, Jan., Lonsight, Manchester.

BRAHMAS.—1, W. H. Crabtree. 2, E. Kendrick, Lechlade. 3, Withheld.

SPANISH.—1, E. Winwood. 2, M. Brown, Ab Kettleby, Melton Mowbray. 3, S. W. Hallam, Whitby, Leicester.

HAMBURGERS.—Silver.—1 and 2, Withheld. 3, W. Lappage, Spittlegate, Grantham. Gold.—1, S. W. Hallam. 2, J. Ward, Ashby-de-la-Zouch. 3, W. Holmes, Jan., Grantham.

FRENCH.—Houdan.—1, G. W. Hubbard, Godley, Hyde, Manchester. 2, J. Elgar, Newark. 3, H. V. Storey. 4, *Crève-Cœur*.—1, W. Cutlack, Jan., Littleport. 2, G. W. Hubbard. 3, Mrs. Cross, Bright. *loc.* W. H. Crabtree.

POLANDS.—1, G. W. Boothby, Lenth. 2 and 3, No competition.

BANTAMS.—Game.—1, 2, and 3, *Disqualified*. J. Eaton, Grantham. 3, J. Mayo, Gloucester. *loc.* C. Pole, Grantham. 4, J. Waters, Elsham, Drigg. Any other variety.—1, J. Walker. 2, R. S. S. Woodgate. 3, J. Mayo.

ANY OTHER VARIETY.—1, W. Cutlack, Jan. (Black Hamburgh). 2, Rev. N. J. Elgar, Newark. 3, R. S. S. Woodgate (White Silkie).

SELLING CLASS.—Cock.—1, W. Roe, Newark (Silver-Gray Dorking). 2, J. Waters (Black Red). 3, J. Hornsby, Grantham (Dark Dorking). 4, G. W. Boothby (Poland). *Disqualified*, J. Walker. *Hens*.—1, J. Waters (Black Red). 2 and 4, J. Hornsby (Dark Dorking). 3, R. E. Duckering (Game). 5, C. J.

Hornsby (Dark Dorking); G. W. Boothby (Poland); C. Millhouse, Wootton Bassett, Grantham (Dark Dorking).

GREYS.—1, J. Walker. 2, F. M. Derry, Godney. 3, M. Kew, Oakham.

DUCKS.—Aylesbury.—1 and 2, J. Walker. 3, J. Hornsby. Rouen.—1, J. Walker. 2, R. Swan, Lincoln. 3, T. Halmshaw, Earlsheaton, Dewsbury. Any other variety.—1, J. Walker. 2 and 3, No competition.

TURKEYS.—1, Rev. N. J. Ridley, Newbury. 2, E. Kendrick. 3, J. Walker. *loc.* M. Kew.

GUINEA FOWLS.—1, R. S. S. Woodgate. 2, W. H. Young, Great Driffield. *loc.* W. Dunning, Howell, Stamford; E. Smith, Barrowden, Stamford.

SELLING CLASS.—1, 2, and 3, Withheld. 3, W. Roe, Newark (Rouen Drake and Duck). 4, G. W. Boothby (Golden Poland).

EXTRA STOCK.—C, R. E. Godfrey, Grantham (Gold-faced Sebrights).

PIGEONS.

CARRIERS.—1, H. Yardley, Birmingham. 2, J. Elgar, Newark.

POUTERS.—1, H. Yardley.

TUMBLERS.—1, H. Yardley. 2, No competition.

ANY OTHER VARIETY.—1, H. Yardley (Black Barbs). 2 and 3, A. Pick, Grantham (White Dragons).

Mr. Edward Hewitt, of Birmingham, and Mr. Tegetmeier, of London, were the Judges.

TONG AND DUDLEY HILL POULTRY SHOW.

The fourteenth annual Show took place on the 25th inst. at Dudley Hill, and, the day being fine, there was a numerous attendance of visitors. The entries were not good in some classes, which is a matter of surprise to us, for the management is very good.

Spanish were very good, the hens especially. In *Cochins* Buifs were first and Whites second, both pens being good. In *Game* Brown Reds won in the first class and were well placed, the second pen not matching well in legs; and in *Duckings* the first were a grand pen. There were nine single hens, and most were good; the first a well-developed Silver Poland, and the second a good *Spanish*. In *Hamburgs* Mr. Beldon had it to himself with the exception of one entry, as also in *Polands*, where the prizes were rightly placed on Silver and Golden respectively. In *Brahmas* the first were young and well grown; while the second, which were old birds, were very large, especially the hen. *Guine Bantams* were very good, the first a nice stylish pen of Black-breasted Reds, second Piles; and in other varieties the first were a good pair of Black chickens. In single cocks were six entries, the first a Gold Poland, and second Brown Red Game.

In *Ducks* only the first-prize pen of Rouens were of any quality; but these, though in the middle stage of moult, were very good.

Pigeons mustered pretty well considering the classes, and the quality of the birds shown was very good, but the whole of Mr. Horner's pens were empty.

There were two classes for *Rabbits*, but we had a difficulty in understanding the classification, the first class being for *Spanish*; and here a Belgian Hare was put first and a Silver-Gray second, and in the next two splendid Lops were placed first and second. We would advise a reconstruction of the whole of the schedule.

SPANISH.—1, H. Beldon, Bingley. 2, J. Thresh.

DORKING.—1, H. Beldon.

COCHINS.—1, Shackleton & Irving, Bradford. 2, H. Beldon.

GAME.—Black-breasted or other Red.—1, E. Aekroyd, Ecclesall. 2, H. Beldon, westgate Hill. *loc.* W. Fell, Adwalton. Duckwinged or other Grey or Blue.—1, H. C. & W. J. Mason, Birstal. Black, Brass-winged, or Pale Game.—1, R. Walker, Goumsall. 2, H. C. & W. J. Mason.

ANY BREED.—Hen.—1, H. Beldon. 2, J. Thresh.

HAMBURGH.—Golden-spangled.—1 and 2, H. Beldon. Silver-spangled.—1 and 2, H. Beldon. Golden pencilled.—1 and 2, H. Beldon. Silver-pencilled.—1 and 2, H. Beldon.

POLISH.—1 and 2, H. Beldon.

BRAMA POOTRA.—1 and 2, H. Beldon.

BANTAMS.—Game.—1, G. Noble, Dewsbury. 2, A. Sugden, Cleckheaton. *loc.* A. Sugden, G. Noble; A. Smith, Northwain. Any other variety.—1, A. Smith.

2, C. & J. Hingworth, Birston; J. Waddington, Grimsley.

ANY BREED.—Cock.—1, H. Beldon. 2, H. Beaman.

DUCKS.—1, J. Ward, Drighlington. 2, J. R. Pollard, Wibsey.

GEES.—Rouen.—1, F. Halmshaw, Earlsheaton. 2, J. R. Pollard, Wibsey.

PIGEONS.

CARRIERS.—1, J. Hawley, Gillingham. 2, B. Rawnsley, Bingley.

TUMBLERS.—1, F. Clayton. 2, J. Hawley.

DOUBLES.—1 and 2, J. Hawley.

J. HAWLEY.—1 and 2, F. Holt. *loc.* J. Hawley; E. White, Manchester.

EXTRAS.—1, R. White. 2, J. Hawley.

CARRIERS OR POUTERS.—1, J. Hawley. 2, E. Horner.

ANY OTHERS.—1 and 3, F. Clayton. 2, J. Hawley. *loc.* B. Rawnsley.

NOSES.—1 and 2, J. Hawley.

OWLS.—1, B. Rawnsley. 2, R. White.

ANY OTHER VARIETY.—1, J. Hawley. 2, W. Tetley, Birkenshaw.

DRAGONS.—1, B. Rawnsley. 2, F. Clapham.

RABBITS.

SPANISH.—Duck or Doe.—1, J. Thorp, Birkenshaw. 2, G. S. Barton, Beeston, Leeds. *loc.* C. L. Saclie, Tong; S. Adams, Bradford; J. Chapple, Dewsbury Moor; W. Miller, Bradford; A. Cutler.

COMMON.—Duck or Doe.—1 and 2, G. S. Barton. *loc.* W. Gibson (2).

The Judge was Mr. James Dixon, of Bradford, assisted by Mr. Joseph Walker, of Birstwith, Ripley.

ROCIDALE POULTRY SHOW.—The poultry classes are for single young birds, with the exception of Ducks, Geese, and Turkeys, which are in pairs. There is a special extra prize for the best Dorking cockerel. For Pigeons there are twenty-eight classes, four of which are for Carriers, Barbs, Antwerps, and Dragons bred in 1874. There are five silver medals as extra prizes given

by one or two local amateurs. There are eight classes for Rabbits, and one silver medal as an extra prize.

SELBY POULTRY SHOW.

The first attempt to hold a show of poultry at Selby was made on the 23rd inst., and we are glad to say with unexpected success, the entries being so good that the Committee will, doubtless, add to their next schedule Pigeons and Rabbits, and thus provide for various tastes. The attendance was very good. Turner's pens were used, and the attention to the birds was an example for more extensive societies.

Dorkings had four entries, and the birds were good. The first prize went to a remarkably well-moulded pen; while in *Cochins* the birds were also very fair. In *Spanish* Mr. Thresh stood first and second, Mr. Wilkinson coming in a good third; but we were surprised to find that Messrs. Newbitt did not show, being so near Epworth. Of *Brahmas* there were thirteen entries, and a fair lot; while of *Game* we were sorry to see so few. *Hamburghs* were mixed classes, which we will again pronounce a mistake fatal to success in entries. *Game Bantams* were poor, while the first-prize Blacks were very good. Cross-bred or other fowls were very good in both classes; the chickens numbering sixteen entries.

The *Geese* and *Ducks* were pretty fair; but of *Turkeys* there were no entries, which surprised us, this being purely an agricultural district.

DORKING.—1 and 3, W. Morfitt, Goole. 2, T. P. Carver, Langthorpe.
COCHIN.—1, Copley, Holmes, and Pardon, Driffield. 2, F. Horsman, Borough-bridge. 3, H. Bleasby.
SPANISH.—1 and 2, J. Thresh. 3, H. Wilkinson, Skipton.
BRAHMA.—1, H. Wilkinson. 2, W. Middleton, Longgate. 3, U. Brookshank.
GAME.—1, Copley, Holmes, & Pardon. 2, G. Roberts.
HAMBURGH.—*Gold and Silver-spangled.*—1, Copley, Holmes, & Pardon. 2, T. P. Carver. 3, Mrs. Newton, Epworth. *Gold and Silver-pencilled.*—1, G. W. Gibbs. 2, F. Kelsey. 3, Copley, Holmes, & Pardon.
CROSS-BRED.—1, W. H. Young, Driffield. 2, Mrs. Webster, Burn. 3, J. Hawcroft, Womersley. *hc.* R. Adams, jun., Selby; A. Wright, Selby; J. Grace, Selby.
ANY BREED OR CROSS.—Chickens.—1, Dr. Cameron, Epworth (Brown Red Game). 2, J. York (Dark Brahmas). 3, E. Clayton, Keighley (Gold-pencilled Hamburgs). Equal 2 and 3, T. P. Carver, *hc.* Mrs. Houfe, Broughton; Copley, Holmes, & Burdon; U. Brookshank, Driffield; Gates; G. W. Gibbs; Dr. Cameron (Brown Red Game); W. G. Waters, Elsham Bridge (Dorkings).
ANY VARIETY.—Cock.—1, Copley, Holmes, & Pardon. 2, F. Kelsey (White Cochins). 3, J. Houfe (Game). *hc.* H. Staniland (Brahma); T. P. Carver.
SEEDLING CLASS.—1, J. Gladwin, Bulwith (Dorkings). 2, J. York, Gateforth (Brahmas). 3, T. P. Carver. *hc.* W. Morfitt (Dorkings).
LOCAL CLASS.—1, J. Houfe (Black Red Game). 2, W. Dransfield, Brayton. 3, J. Howcroft, Burn (Golden-spangled Hamburgs).
GESE.—*Any Breed.*—1, O. A. Young, Driffield. 2, J. B. Hepworth, Hatfield. *hc.* J. York, Gateforth; — Abbott, Cliffe; T. Balderson, Bellby.
DUCKS.—*Aylesbury.*—1, T. P. Carver. 2, Mrs. Backhouse, Burn. *Route.*—1, T. P. Carver. 2, O. A. Young, *hc.* T. Hainshaw, Karsheaton; T. Balderson. *Any other Variety.*—1, T. P. Carver. 2, J. J. Brown, Althorpe (Muscovy). *hc.* Mrs. Parker, Selby; J. Hawcroft, Womersley (White Spanish).
GUINEA FOWLS.—1, Mrs. J. Barker, Cambleforth.

JUDGES.—Messrs. Cannan and Sales.

SOUTH MOLTON POULTRY SHOW.

This was held on the 23rd inst., when the following awards were made:—

BRAHMA POULTRY.—*Dark.*—1, H. Feast, Swanssea. 2, E. Sanders, Chittlehampton. *hc.* Mrs. Arundell, Lifton, Devon; W. Huxtable, Whiddon, Barnum. *Light.*—1, H. Feast. 2, Mrs. J. T. Holmes, Bath. *hc.* J. Gaydon, Newport, Barnum.
COCHIN-CHINA.—1, C. H. Braddam, Barnum. 2, H. Feast. *hc.* Mrs. J. T. Holmes; F. Denner, Yeo, Marionsleigh. *hc.* Mrs. Arundell.
DORKING.—1, H. Feast.
FRENCH.—1, H. Feast.
GAME.—Black-breasted Red.—1, J. Westacott, Barnum. 2, J. Boyles, Barnum. *hc.* R. Wilkinson, Brillwater. *Any other variety.*—1, W. Huxtable. 2, J. Westacott. *hc.* H. Feast. *c.* F. Laxton, South Molton.
HAMBURGH.—*Gold-spangled and Pencilled.*—1, H. Ascott, Tiverton. 2, H. Feast. *Silver-spangled and Pencilled.*—1, H. Feast. 2, H. Ascott. *hc.* S. Spilard, Chittlehampton; G. Westacott, Chittlehampton. *c.* J. Bebb, Bath; S. Osmond, South Molton.
MALAY OR INDIAN GAME.—1, W. Huxtable. 2, W. Joint, Larnstaple. *hc.* F. Davills, Filton. *hc.* *hc.* and *c.* T. Joint.
SPANISH.—2, H. Feast.
ANY PURE BRED.—Cock.—1, W. Clarke, South Molton. 2, W. Sanders. *hc.* H. Feast.
BANTAMS. *Game.*—1, Coon, Bros., St. Austell. *Any other variety.*—1, R. L. Hole, Hannaford. 2, J. Bullen, Newport.

PIGEONS.

CARRIERS.—1, J. Bullen.
BARRIS.—1, T. L. Smyth, Newport. 2, G. H. Gregory, Taunton. *hc.* J. D. Mohr, Exeter. *c.* C. Watts, Chittlehampton.
POULTRY.—1 and *hc.* G. H. Gregory. 2, G. Parkham, Exeter.
FANTAILS.—1, J. L. Smyth. 2, G. H. Gregory. *hc.* F. Toogood.
TOUMBLETS.—1, G. Parkham. 2, J. Bullen.
ANY OTHER VARIETY.—1, G. Parkham. 2, J. L. Smyth. *hc.* J. Bullen (2); J. L. Smyth (2); J. P. Mills, Exeter.

LOCAL PRIZES.

BRAHMAS.—1, J. Vickery, Chittlehampton. 2, W. Sanders. *hc.* H. Mogridge, South Molton. *hc.* G. Frideaux, South Molton.
BAUNDOCK.—1, W. Mogford, South Molton. 2, W. Ayre, Pillavens, Bishops-sympton.
DORKINGS.—1, W. Blackford, South Molton. 2, F. Moore, South Molton.
FRENCH.—1, J. Bawden, South Molton.
GAME.—Red.—1, F. Huxtable, South Molton. 2, W. O'Neil, Bishops-sympton. *hc.* R. S. Brann, South Molton (?); J. Huxtable. *hc.* W. O'Neil. *c.* F. Rodd, Bishops-sympton. *Any other variety.*—1, W. Baker, South Molton. 2, W. Sanders, South Molton. *c.* J. Bawden; J. Lee, Bishops-sympton; F. Toogood, South Molton (2).
MALAY OR INDIAN GAME.—1, F. Moore. 2, S. C. Blackford, South Molton. *hc.* W. G. Smyth, South Molton; F. Moore; W. Clarke, South Molton (2).

MINORCAS.—2, R. Allen, Filleigh.
SPANISH.—1, S. Osmond, South Molton.
BANTAMS.—Game.—1, Miss M. Gould, South Molton. 2, E. Lethbridge, South Molton.

THE POULTRY-KEEPER.—No. 13.

THE DORKING.

HEN—GENERAL CHARACTERISTICS.

The principal characteristic of the Dorking hen is its bent comb, of middle size, and sometimes double and denticulated, but then rather small. She has a small round body, the tail rather thin, short feet, and five toes on each foot. The eye and the nature of the foot are the same as in the cock. In weight, shape, and walk, she is much like the Crève-Cœurs. She lays well and early, sits well, and her eggs are of medium size.

PLUMAGE.

The head feathers and the hackle are whitish at the edge, black in the middle, and form a marked line which is very distinct from the body (fig. 31). The edge of the cheeks and round

Fig. 34.

Fig. 35.

the neck to under the beak are covered with small, short, black feathers, forming a kind of collar, but not joining behind is more like the gorget of an officer. The tuft is of a clear pale grey. The top of the back is of a grey chestnut brown, which becomes russet on the shoulders and the coverts of the wings. The large feathers of the shoulders are spotted, the large flight-feathers brownish-black. The breast is of a clear chestnut-red; the thighs deep greyish-red; the rump grey; the large tail feathers brownish black. All the plumage is of a very bright colour, occasionally passing and mingling with that of the adjoining part. The feathers are often bordered, which gives a scaled appearance to the whole plumage. But the most characteristic is a white line, almost pure, which marks the whole length of the visible part the shaft of each feather (fig. 35). This bright hue is very apparent on the back, the shoulders, and the coverts of the wing, losing its intensity at the lower parts and extremities.

Much variety occurs in this breed in regard to plumage, which may be found almost of every colour, from pure white to black.

GENERAL CONSIDERATIONS.

The Dorking is very precocious and of very fine flavour. The flesh is white, juicy, and retains the fat well in cooking. Trussed it is of good appearance. Its food is thick dough of barley meal or oatmeal, varied with ground maize and whole barley; but the maize must be used sparingly, as it is too fattening.

local competition only; and in Pigeons there are eight classes, the prizes being 10s. and 5s.

KEIGHLEY POULTRY SHOW.

THE thirty-second annual Show was held at this busy thriving centre of industry on the 24th inst., being fully one month earlier than in former years, and so arranged to meet the wishes of the employers of labour, who are very numerous in this locality. This may answer the purposes of these gentlemen, who thus wish to throw the two holidays—viz., the Feast and the Show, together; but we question very much the policy as regards the Society, for at this time the exhibitions are very numerous, and the entries in all sections suffer to some extent; though those of which we write were much better than we expected, having suffered less than the agricultural department, the most marked difference being that the chicken section did not contain birds so well developed as we have generally found them. The pens were on Turner's principle in some parts, and in others substantial wooden ones belonging to the Society were used. The weather was not all what we could have wished, as very heavy thunder showers fell, and so wetted the birds that the classes not previously judged presented that bedraggled appearance that is so unwelcome to those who arbitrate.

In poultry we found some good stock, many old acquaintances in old birds coming to the front. The noticed pens in Buff *Cochin* chickens contained grand pullets, but the cockerels had a rather young and raw appearance. In any other colour of chickens Mr. Sidgwick showed good Partridge, and a pen of Blacks from Mr. Feast showed some progress in this breed. In *Brahmas* Mr. Ansell's first were very good and well merited their position, and that gentleman's chickens were a credit to the yard, several other pens being good. In *Light Brahmas* both first prizes fell to the lot of Mr. Beldon, the chickens, especially the pullet, being very good in colour and marking. Adult *Spanish* were of moderate quality, but most of these birds want rest; but in young ones we were surprised to find such forward birds. Of *Silver-pencilled Hamburgs* there were only two entries, but there were five pens of chickens, the pullets proving much better than the cockerels. Old *Silver-spangled* were good, and the winners in chickens choice. In aged *Golden-spangled* the first-prize cock appeared to be the best, but we think the merits of the second-prize hen far outweighed him in points; but the pens were wet when we looked them over. Young were, first a grand forward pen; but second, though of the right stamp, nowhere in age. *Gold-pencilled* were, first a good even pen, the second lacking little of the first. Young had eleven entries; the cockerels good, but the pullets too open in marking. Adult *Black Hamburgs* were very good, and so were the young birds, these being forward and in good trim. *Polish* were—*Silver* first and *Gold* second, and in young the winners were *Silvers*. In young *Dorkings* the awards must have gone on the wrong pens, for the second were as good in points, and by far the largest. The whole class showed well for the time of year. *Red Game* comprised a fine pen of *Brown Reds* in prime order first; and second a grand pair in full moult; *Brown Reds* winning also in young. In adult *Game* of any other kind *Duckwings* won, and in chickens the first were *Duckwings* and the second *Piles*. In adult *Game Bantams* the winners were *Black Reds*, smart in style and good in colour; and in chickens were the best pair of *Piles* we have seen this year, the second also being *Piles*. The *Black Bantam* chickens were poor if we except the first-prize winners, and *Black* won in both cases in the next class. In *Ducks* Mr. Walker stood first in both classes, Mr. Newton coming in a good second in both cases.

PIGEONS.—The Pigeon schedule is not the most attractive that can be desired, but we believe this defect will be remedied at future shows. The silver cup for the best pen was awarded to a *Black Carrier* cock of good points; four out of the five being *Carriers*, and all birds of merit. In *Pouter* cocks, first was a long, slim, stylish *Blue*, but rather short of marking; second a good long-limbed *White*, all the others being noticed; and in hens the first was *Blue* and second *Red*. *Carrier* cocks were: First the above-named *Black*, and second a *Dun* in fine condition; Mr. Yardley's *Long-faced bird* being highly commended. In hens the first was *Black*, the second *Dun*. In *Almond Tumblers* Mr. Yardley won with a smart cock, good in head properties, style, and carriage; and in the next class Mr. Horner's *Yellow Mottle* was a little gem; the second, a *Kite*, had a very good head. Of *Bulls* and *Beards* there were only two entries, and of *Owls* only four. If the classification had been better there would doubtless have been a dozen at least. *Turbits* were: First a neat *Yellow* and second *Red*. In *Jacobins* both were *Red*, good alike in hood, chain, and colour, while a very neat *Yellow* was highly commended. *Fantails* carried off the honours to Newark again in both cases, and in *Barbs* Mr. Hawley out-distanced all competitors with two capital *Duns*. *Dragoons* were a large class, and the competition very keen. Two extra prizes were awarded. The first, third, and fourth were

Blues, and the second *Red*. *Maggies* were good, the first *Yellow* and the second *Red*. *Archangels* were a fair class. *Antwerps* were very good, the first prize in this class going to a bird known as a good *Red Chequer Short-faced*, which was known and practised with when most of the present fanciers were boys, and withal an extraordinary bird. Second a *Red Chequer Long-faced* hen, such as is rarely seen. A very pretty *Fairy Swallow* won in the *Variety* class, a good *Nun* being second, and a *Spangled Fairy Swallow* third.

RABBITS had four classes. The first in bucks was a grand young *Fawn*, 21 by 1½ inches in ear, in fine bloom. Second a *Tortoise-shell*, 22 by 13, but in the worst possible order—so bad, in fact, that we hesitated as to withholding the second award altogether. In does the first prize went to a *Fawn*, 21½ by 1½ inches, from the same exhibitor—viz., Mr. Myton, and was well shown, the second being only 18½ by 4. *Black-and-white Bucks*, Any other variety, were first a *Silver-Grey*, and second a *Belgian Hare*. The awards in the doe class were made in a similar manner, the first-prize doe being a grand specimen of her kind.

COCHIN CHICKENS (Buff).—1, W. H. Crabtree, Levenshulme, Manchester. 2, W. A. Taylor, Manchester. 3, J. Walker, Rochdale. 4, Sidgwick, Keighley. *Chickens*.—1 and 2, C. Sidgwick. 3, H. Beldon, Goldstock; W. A. Taylor. 4, J. Naylor, Oakworth, Keighley.

COCHIN CHICKENS (Any colour).—1, W. Whitworth, jun., Longsight, Manchester. 2, W. A. Taylor. 3, H. Beldon. *Chickens*.—1, W. A. Taylor. 2, C. Sidgwick. 3, C. Sidgwick; H. Beldon. 4, Feast, Swansea; W. Mitchell, Birkenhead, 5, H. Wilkinson, Earby, Skipton.

BRACHAS (Dark).—1 and 2, F. F. Ansell, Cowley Mount, St. Helen's. 2, W. H. Crabtree. *Chickens*.—1, F. F. Ansell. 2, R. P. Perival, Northenden, Manchester. 3, W. H. Hodgson, Keighley; H. Beldon; W. Schofield, Birkenhead; W. A. Wright, Birkdale.

BRACHAS (Light).—1, H. Beldon. 2, J. Mitchell, Mosley, Birmingham. 3, W. Whiteley, Clough Bank, Sheffield. *Chickens*.—1 and 2, H. Beldon. 3, J. Mitchell.

SPANISH (Black).—1 and 2, J. Leeming, Broughton, Preston. 2, H. Beldon. *Chickens*.—1, H. Beldon. 2, J. Roberts, jun., Silsden. 3, J. I. Booth, Silsden; 4, J. Spence, Silsden.

HAMBURGS (Silver-pencilled).—1 and 2, H. Beldon. *Chickens*.—1, H. Smith, Keighley. 2 and 3, H. Beldon.

HAMBURGS (Silver-spangled).—1 and 2, H. Beldon. *Chickens*.—1, T. Fawcett, Baildon. 2, H. Beldon. 3, H. Beldon; F. Fawcett.

HAMBURGS (Golden-spangled).—1, G. & J. Duckworth, Church, Accrington. 2, T. Dean, Keighley. 3, H. Beldon. *Chickens*.—1, T. E. Jones, Wolverhampton. 2, T. Dean.

HAMBURGS (Golden-pencilled).—1, H. Beldon. 2, G. & J. Duckworth, H. Beldon; W. Clayton, Keighley. *Chickens*.—1, W. Driver, Keighley. 2, E. Clayton, Keighley. 3, H. Beldon (2); F. Fawcett; W. Clayton. 4, J. Walker, Birstwith, Ripley.

HAMBURGS (Black).—1 and 2, H. Beldon. 3, C. Sidgwick; T. W. Holmes, Ruscroft, Baildon. *Chickens*.—1 and 2, C. Sidgwick. 3, H. Robinson, Westgate, Baildon (2); H. Beldon. 4, H. Shackleton.

POLISH (Any variety).—1 and 2, H. Beldon. *Chickens*.—1, T. Dean. 2, J. Fowler, Keighley.

DORKINGS.—1, J. Walker. 2, T. Briden, Cononley, Leeds. *Chickens*.—1 and 2, S. Brierley, Ending, Rochdale. 3, R. W. Richardson, Meanx Abbey, Beverley; T. Briden (2).

GAME (Black, Red, or Brown).—1, C. W. Brierley, Middleton, Manchester. 2, J. Fortane, Morton Banks, Keighley. 3, J. W. Thorntun, Bradford. 4, E. Aykroyd, Eccleshill, Leeds. *Chickens*.—1, E. Lard, Cuddingworth, Bingley. 2, F. Dyson, Halifax. 3, W. Thorton, Coates, Barnoldswick; J. Carlisle, Earby, Skipton; E. Aykroyd.

GAME (Any other variety).—1, J. A. & H. H. Staveley, Driffield. 2, R. Walker, Gomersal. 3, J. Mason, Worcester. *Chickens*.—1, Wilson & Hodgson, Ilkington, Halifax. 2, J. W. Thorntun, Bradford. 3, Wilson & Hodgson; J. Jowett, Clayton, Bradford.

BANTAMS (Game).—1, G. Hall, Kendal. 2, A. Smith, Northwram, G. G. Hall; G. Anderson, Accrington. *Chickens*.—1 and 2, W. F. Entwistle, Westfield, Bradford. 3, Noble, Stanchfield, Dewsbury; G. Hall.

BANTAMS (Black).—*Chickens*.—1, H. Beldon. 2, S. Milner, Keighley.

BANTAMS (Any other distinct breed).—1, W. H. Robinson, Long Lee, Keighley. 2, W. Moore. *Chickens*.—1, J. Walker, Rochdale. 2, W. Richardson, York.

DUCKS (Rouen).—1, J. Walker. 2, J. Newton, Silsden.

DUCKS (Aylesbury).—1 and 2, J. Walker. 3, J. Newton.

DUCKS (Any other variety).—1 and 2, H. B. Smith, Brooklands, Broughton. 3, J. Walker (2); H. B. Smith.

PIGEONS.—1, H. Beldon. 2, D. Sharp, Bingley. 3, W. Driver; F. Beutley, Bradford; H. Wilkinson. *Hens*.—1, H. Beldon. 2, J. I. Booth, Silsden. 3, J. Thresh.

EXHIBITOR OF THE BEST PEN.—1, J. Hawley, Gillingham.

POUTER OR CROPPER.—*Cock*.—1 and 2, J. Hawley. 3, E. Foster, Bingley; E. Horner, Harewood, Leeds (2). *Hens*.—1, J. Hawley. 2, E. Horner. 3, J. Hawley; E. Horner.

CARRIERS.—*Cock*.—1, J. Hawley. 2, E. Horner. 3, J. Thompson, Bingley. 4, H. Yardley, Birmingham; E. Horner. *Hens*.—1 and 2, E. Horner. 3, H. Yardley.

TUMBLERS (Almond).—1, H. Yardley. 2 and 3, J. Hawley. 4, E. Horner.

TUMBLERS (Any other variety).—1, E. Horner. 2, J. Hawley. 3, J. Hawley; J. Lister, Keighley; E. Horner.

BALD OR BEARDS.—1, H. Yardley. 2, W. Fawcett, Baildon.

OWLS.—1, E. Horner. 2, H. Yardley. 3, J. Mitchell, Keighley.

TURBIS.—1, H. Yardley. 2, T. Foster. 3, J. Hawley; E. Horner. 4, T. Foster.

JACOBINS.—1, J. Hawley. 2, J. Thompson, Bingley. 3, J. Powell, Bradford. 4, E. Horner; J. Powell.

FANTAILS.—1 and 2, J. F. Loversidge, Newark, Notts. 3, J. Thompson; J. Hawley.

BARBS.—1 and 2, J. Hawley. 3, H. Yardley. 4, F. Dean, Keighley; E. Horner.

DRAGONS.—1, R. Brotherton, Rakebank, Keighley. 2, J. Thompson. 3, H. Yardley. 4, A. Smith; J. Rushworth, Keighley; E. Horner; J. Smith, Keighley. 5, T. Smith, Keighley.

TRUMPETERS.—1, E. Horner. 2, H. Yardley. 3, J. Hawley.

MAGPIES.—1, H. Beldon. 2, E. Horner. 3, H. Beldon. 4, J. Hawley; E. Horner.

ARCHANGELS.—1, H. Yardley. 2, E. Horner. 3, J. Hawley; J. Thompson.

ANTWERPS.—1, S. Lister. 2, S. A. Lister, Keighley. 3, F. Lister. 4, H. Yardley. 5, T. Foster (2); J. Rushworth. 6, E. Horner.

ANY OTHER BREED.—1, J. Thompson. 2, J. Lister. 3, J. Hawley. 4, H. Yardley. 5, H. Beldon; H. Yardley; J. Hawley; T. Foster, Bingley; E. Horner.

SELLING CLASS.—1, H. Beldon. 2, E. Laycock, Keighley. 3, H. Beldon; J. Thompson; T. Foster; T. Rushworth. 4, E. Brown, Bingley.

RABBITS.

LONG-EARED.—*Duck*.—1, W. Miller & S. Adams, Bradford. 2 and 3, T. Myton,

York. *Doe*.—1, T. Mylon. 2, J. Moore, Keighley. c, Mitchell & Feather, Keighley.

ANY OTHER VARIETY.—*Buck*.—1, S. Ball, Bradford. 2, M. Marsland, Goolb. *he*, B. Swaro, Morley. *Bingley*. c, F. Brook, Morton Banks, Keighley. 1, Waterhouse, Willow Bank, Keighley. *Doe*.—1, S. Ball. 2, M. Marsland. *ch*, A. W. Whitehouse, Northampton. c, A. Broos, Morton Banks, Keighley; G. W. Riley, Keighley.

JUDGES.—*Poultry*: Mr. R. Taobay, Fulwood, Preston. *Pigeons*: Mr. E. Hutton, Pudsey, Leeds.

ALFORD POULTRY SHOW.

This well-conducted Show is only the second that has been held at Alford, and it is a pleasure to say that the entries proved in number more than double those of last year, a proof, if any were wanting, that both exhibitors and the public generally always hold in proper estimation the care and attention of the Managing Committee in reference to everything conducive to the welfare of the Society. No doubt exists but that it will progress with even more rapid strides than it has done. The Show took place on the 28th inst. under two of the best tents we can call to recollection, each being 160 feet long by 45 feet wide, and the ventilation of these immense tents was absolutely perfect.

Grey *Dorkings*, both cocks and hens, were so good as to receive in both classes an extra prize, which was as fully deserved by the birds as it was spontaneously given by the Committee as soon as they were made aware of the excellence of the competition. The Buff *Cochins* were also fine classes, but some few were deeply moulting. Messrs. Darby and Tomlinson were the chief prizetakers. In an open class for *Cochins*, any other colour except Buff, a grand White cock stood first, the property of Mr. Woodgate, and Mr. Crabtree's Partridge-coloured cock second. In hens the first was again a White, and an unusually fine Black *Cochin* stood second, now the property of Mr. Alfred Darby. Strange to say, *Brahmas*, though forming large classes, were not nearly so good as might have been anticipated, the prize birds excepted. The grandest pair of Dark *Brahma* chickens, shown by Mr. Lingwood, were however to be seen in the class for chickens, and proved one of the gems of the Show. Some very heavily-faced *Spanish* fowls were shown, but mostly of far coarser character of face than is desirable. Mr. Julian, of Hull, sent some admirably-shown *Game* fowls, and was successful in this division of the Show. The Brown Red hens are worthy also of special mention. *Houblers* were large entries, but, excepting the prize birds, were not specially noteworthy. On the contrary, *Cree-Cours* were generally good. *Polish*, both Golden-spangled and Black ones, were far better than common. Messrs. Boothby and Darby here dividing the spoil. *Hamburghs* throughout proved capital, some of the Pencilled ones being shown in extraordinarily fine plumage, and health. A few very fine specimens of *Game Bantams* could be selected out of well-filled classes, and here Mr. Newbitt was the most successful winner. Many of the *Bantams* were, however, fast falling into moult. The class for *Barn-door* fowls brought together admirable specimens for the table of cross-bred birds. *Leghorns* were superior, both Brown and White competing. *Silkes*, for which a class was specially appointed, were good, but a general fault of shortness of leg-feather prevailed throughout the whole of them.

Rouen *Ducks* were very fine, and the only pen shown of Ayresburys was praiseworthy. In the Variety class for Ducks, Vidua Whistling Ducks and common Whistling Ducks were the winners, both being shown in admirable plumage. *Geese* and *Turkeys* were also most creditable, but with a limited entry. We congratulate the Committee on the weather proving most favourable, and the Show a great success.

Mr. Edward Hewitt, of Sparkbrook, Birmingham, judged the poultry. Appended are his awards, but those for the Pigeons and Cage Birds had not reached us at the time of going to press.

DORKINGS.—Cock.—1, A. Darby. 2, J. Walker. 3, W. Moritt. Hen.—1, J. Walker. 2 and 3, W. Moritt. 3, A. Darby.

COCHINS.—*Cinnamon* or Buff.—Cock.—1, A. Darby. 2, H. Tomlinson. *he*, F. Winwood. 3, W. H. Crabtree. Hen.—1, H. Tomlinson. 2, W. H. Crabtree. *he*, J. Walker. A. Darby.

COCHINS.—Any other variety.—Cock.—1, R. S. S. Woodgate. 2, W. H. Crabtree. *he*, W. Whitworth, jun. A. Darby. Hen.—1, W. Whitworth, jun. 2, A. Darby. *he*, T. M. Berry. 3, S. W. Woodgate. 3, Darby.

BRAHMAS.—*Buck*.—Cock.—1, H. Feast. 2, Horae Lingwood. 3, J. Watts. Hen.—1, J. Watts. 2, W. H. Crabtree. 3, T. Dobson.

BRAHMAS.—*Light*.—Cock.—1, M. Leno. 2, Horae Lingwood. 3, W. H. Crabtree. Hen.—1 and 2, J. R. Marriott. c, W. H. Crabtree.

SPANISH.—Cock.—1, R. Newbitt. 2, L. Hibbit. Hen.—1, R. Newbitt. 2 and 3, W. Woodhouse. *he*, A. Darby.

GAME.—*Black Red*, or any other Red.—Cock.—1, H. M. Julian. 2, F. Sales. Hen.—1, F. Sales. 2, H. M. Julian. *he*, Miss G. B. Lister. 3, W. Hutton.

GAME.—Any other variety.—Cock.—1, H. E. Martin. 2, F. Sales. Hen.—1, F. Sales. 2, H. E. & I. A. Stately. c, F. G. Parkes.

HOUDBERS.—Cock.—1, J. W. Hibbit. 2, W. Dring. *he*, R. Coney. Hen.—1, W. Dring. 2, R. A. Boissier. *he*, J. W. Hibbit. 3, F. H. Atkinson. c, R. Coney.

POULTRY.—Cock.—1, G. W. Boothby. c, A. Darby. *he*, H. Feast. Hen.—1, G. W. Boothby. 2, A. Darby. c, T. C. Newbitt.

HAMBURGERS.—*Gold* or *Silver-spangled*.—Cock.—1, G. Robinson. 2, J. Robinson. *he*, I. W. Hargall. 3, J. Long. Hen.—1, J. Long. 2, J. Robinson. *he*, J. Pilkington. W. Hall.

HAMBURGERS.—*Gold* or *Silver-spangled*.—Cock.—1, J. Long. 2, J. Robinson. *he*, B. Compton. Hen.—1, W. Clayton. 2, J. Smith. *he*, J. Long. c, M. Leno.

BANTAMS.—*Black Red*, or any other Red.—Cock.—1, A. C. Bradbury. 2, J. Walker. *he*, J. Mayo. Hen.—1, Mrs. E. Newbitt. 2, J. Walker. *he*, A. C. Cauty; J. Wells; Dr. G. Walker; A. Darby.

BANTAMS.—Any other variety of *Game*.—Cock.—1, Mrs. E. Newbitt. 2, J. Mayo. *he*, A. Darby. Hen.—1, A. Darby. 2, A. Darby.

BANTAMS.—Any variety except *Game*.—Cock.—1, R. H. Ashton. 2, M. Leno. 3, J. Walker. *he*, C. Reel; J. Mayo. c, J. Watts. Hen.—1, M. Leno. 2, J. Walker. 3, J. Watts. *he*, R. H. Ashton. A. Cauty.

BARNDOOR, OR ANY CROSS-BRED FOWL.—1, G. Pounder. 2, J. Ireland. *he*, H. W. Boutoff. c, W. H. Young; R. Coney.

LEGHORN, OR ANY OTHER AMERICAN VARIETY.—1 and *he*, Miss Jacobin. 2, A. Kitchen.

SILKES.—1 and 2, R. S. S. Woodgate. *he*, A. Darby.

ANY PURE VARIETY.—1, W. Cuthbert, jun (Cr. Co. Co. Co.). 2, M. A. Mason.

SELLING CLASS.—1, Miss Jacobin (Dark *Brahma*). 2, Mrs. Cropper (Partridge *Cochin*). *he*, — Filkes (Cree-Cours); J. M. Atkinson (Polish). c, G. G. Cave (Cochin); S. Brown (Silver-spangled *Poland*).

DUCKS.—*Rouen*.—1, J. Walker. 2, W. Bygott. *he*, S. Saul. *Aylesbury*.—1, J. Walker. 2, No competition. Any other variety.—1, M. Leno. 2, J. Walker.

GESE.—1, J. Walker. 2, T. M. Berry.

TURKEYS.—1, M. Kew. 2, C. Lewis.

CHICKENS.

BRAHMAS (Light or Dark). *Cochins*, or *Dorkings*.—1, Horae Lingwood. 2, G. F. Hulme. 3, B. Dawson. c, R. E. Foster.

ANY OTHER VARIETY.—1, E. Winwood (Game). 2, W. Dring (Houblers). 3, M. Leno (Laced *Bantams*). *he*, T. Dyson (Brown Red Game); R. Coney (Houblers).

BRAMLEY POULTRY SHOW.

We are happy to record an unexpected success on the part of the Bramley Committee, one of the most spirited Committees of those who conduct the Yorkshire shows. The Exhibition at Sheffield was unfortunately arranged for the same date, and yet the entries far surpassed those of any previous year. And not alone were the entries good, but the quality quite startling to those who expected an easy victory; and we should fail in our duty if we did not speak of the energy and perseverance of the Committee and the Honorary Secretary. Through some irregularity on the part of the railway company the pens were not delivered till long after they ought to have been put up, and this retarded the judging so much that it did not commence till after one o'clock, and yet with nearly five hundred entries the awards were completed before four o'clock. The tent was a grand erection, and the birds well fed and watered.

Spanish were first, and a good class, the winning cocks showing great quality. In *Cochins* the first were Whites and second Buffs, both being very fine. *Brahmas* were all Dark and very good. The second-prize birds were chickens, and the third a little too grey on the fluff. *Game* were poor in all cases, save as regards the first-prizewinners. The *Hamburghs* proved good, and the cup for the best pen in the Show was given to Golden-pencilled, this pen containing such a cock as it is seldom our lot to see. *Game Bantams* were good entries. In pairs the first were good Black Reds and second Pile. The Blacks were grand. In *Ducks* Rouens won all the prizes in the first class, and in the following Mr. Binns had no less than seven entries—more for a show than ought else; and among the lot was one splendid pair of African Gallinules, which excited great admiration.

Chickens were very good and well-grown *Brahmas*; and the second, also of that kind, were very good. In single cocks the first were Buff *Cochins*, second White *Cochins*, and third Gold *Polands*.

PIGEONS.—A magnificent Blue *Pouter* cock won the cup, hard run by a good Black belonging to the same exhibitor. The Carriers proved a good class, with Duns first and second, and Blacks third. *Dragons* were very good, the first a grand Blue, second Silver, and third Yellow. If the cup had not gone to the *Pouter* there is no doubt but that the English Owl would have been the recipient, this being a grand bird of his kind. The second prize went to Blue, and the third to Powdered Blue. *Turbits* were a great credit to one yard; the first and third Yellow, and second Red. *Jacobins* were good, the first two Yellow, and the second Red. *Trumpeters* were of moderate quality, but Tumblers (Long-faced) good; the first Red Mottle, second Blue Bald, and third Black Mottle. Tumblers (Short-faced), were first Red Mottle, second Almond, and third an Agate. *Barbs* were good; the first rather dirty, but quite a model Red, and second and third Blacks. The Antwerps in all classes were good, the winners in all sections very good, and the classes well filled. In Nuns and Magpies the first was a Nun, second and third Magpies. The Variety class contained good birds; the first a Pigmy *Pouter*, second a Foreign Owl, and three third prizes were awarded. The Selling class contained very cheap and good birds.

RABBITS were in great force, and almost all in Lop-ears were noticed, the first going to a Fawn-and-white buck in grand order, 21 by 14 inches; second a Tortoiseshell buck, young and rather small, but full of bloom, with good carriage, 21 by 14; the third being an immense Tortoiseshell doe, 20 by 14 inches. Silver-Greys were of moderate quality, the winners even in colour; and Himalayans fair. The cup for Rabbits was given to a grand Angora faulty only in ears, which were a little too large, but of such quality and quantity of wool as is rarely seen. The Variety class was a most interesting one to people not acquainted with Rabbits, the first award going to a good Blue Dutch; second to a Belgian Mare, large and good in most points; and third to a Black Dutch. An extra third prize was taken by an immense Patagonian.

There was a moderate show of Cage Birds, the winner of the cage being a well-marked Norwich bird. We published the awards last week.

DOGS.—No. 3.

OFFICIAL DOGS.

LEAR.—Thou hast seen a farmer's dog bark at a beggar?

GLOUCESTER.—Aye, sir.

LEAR.—And the creature run from the cur? There thou might'st behold the great image of authority: A dog's obeyed in office!—*Shakespeare.*

THERE are dogs that may be so called who have less than four legs. If you ever have occasion, good reader, to pay a visit to the office of a London lawyer you will understand my meaning. May that visit be only to inquire about a heavy legacy; and even then, under those fair circumstances, you will get an alarm—almost a bite, from an official dog. In your innocence you will examine the names on the drab-painted doors on the staircase, you will read "private" and pass on; read "clerks," and feel, I hope not haughtily, that your visit is not for them. You will read "Messrs. Grubb & Soap," and knock with a smile, remembering that legacy, and expect to hear a cheery "Come in," such as you hear at the office door of your country legal friend when you make a like tapping. You will image the kind face of the lawyer inside, and his warm grasp and congratulation upon that heavy legacy, and be prepared to pardon his "Well, my dear sir, I must say that I begged my late excellent client to remember his distant relatives;" when lo! to your great surprise there will spring out on you on that dingy oak landing the official dog—the office boy—a horribly precocious youth of fourteen winters, with lank greasy hair, bulging forehead, white face, and black body and legs. He will keep you as effectually from entering that door as the Bull-terrier near your own back kitchen door keeps the wandering beggar. He will make you confess to name and business, and perhaps allow you to come again "to-morrow at 10.30 sharp." That is the official dog who really ought to be muzzled. Will he be Attorney-General another day, and be down fiercely upon future Claimants? or will he be a partner of that firm to whom he is now the office dog? or will he in fifteen years be like that quiet, business-like, writing clerk within, who has a small house at Camberwell, and a small wife and three small children, for whom he lovingly works, and whose company makes him happy? Well, I know not, and I cannot read the fates; but what that sharp-eyed, sharp-featured, sharp-voiced lad is now is—the official dog; and "the dog's obeyed in office."

Next to speak of four-footed official dogs. We are told upon the highest authority that the dog when wild does not bark at all, and that gradually he, when domesticated, learns to bark. See we not here the wisdom of the great Creator, Who adapts the horse for man's service, and adapts also the domesticated dog for his use? The great usefulness of the dog to man lies in his bark: as an official dog herein lies his benefit to man. Not once in many thousand times is the dog wanted to bite. When, indeed, the midnight thief actually breaks in, when the blackened-faced and disguised burglar is actually inside our home, then we want the good, and powerful, and plucky house dog to be at the throat of one burglar while we send the bullets of the revolver into the others. At all other times the bark is enough, and the resolute look which a good house dog shows to the tramping vagabond to assure him that not only he can, but that he *will* bite.

Now, although I do not in the least agree with what Mr. Darwin would have me believe in his noted or rather notorious book on the Origin of Species—viz., that men came from monkeys, I do not believe with Mr. Darwin that—

"Man was an ape in the days that were early;
Centuries after, his hair it grew curly;
Centuries more gave a thumb to his wrist,
Then he became a man and a positivist."

I do not believe this, because I know Who says that "He made man in His own image," not in the image of a monkey. Yet Mr. Darwin is a very close observer of the habits of animals, and has recorded his observations in clear ringing English. Upon the subject of dogs barking says this close observer, "With the domesticated dog we have the bark of eagerness, as in the chase; that of anger; the yelping or howling bark of despair, as when shut up; that of joy, as when starting for a walk with his master; and a very distinct one of demand or supplication, as when wishing for a door or window to be opened." These observations are correct enough, but I think Mr. Darwin has omitted one very frequent bark of a dog which for the sake of plainness of expression I call "the bark of funk"—of sheer fear, often ludicrous fear. The dog, one of a timid variety, or a young dog, is frightened at something. I have known a bit of rag blown by the wind frighten a dog, and the creature will bark and back, back and bark, with his tail between his legs, though not always this; and his bark is simply "the bark of funk," shown by his going backwards while barking. I am inclined to think that this is a frequent cause of a dog's barking, as in the little timid lap dog, notably a Flenheim Spaniel. But dogs in

which there is the least cross of Bulldog blood in them never bark in this cowardly way save when young. Thus, in well-bred Fox-terriers there is a slight touch of bull blood, or pluck there would be none; and these dogs after puppyhood (all children are at times timid), are never guilty of the bark of funk, but every mongrel is, and especially small pet dogs, who back and bark instead of standing their ground and barking, or, better still, advancing upon the enemy while barking.

Poets, save Shakespeare, are rarely accurate in their observations on natural history. Thus, for instance, Lord Byron speaks of, I quote from memory—

"Tis sweet to hear the watch dog's honest bark
Bay deep-mouthed welcome as we draw near home."

Now, a dog when he recognises his master does not bark at all, but gives forth a whine of affection. When a dog barks at a sound of one coming, but finds it is his master, he changes his bark at once to a whine; and as to baying, that is the sound given forth by a dog when pursuing game; and one has heard of a dog baying at the moon, but he never bays at his master.

But to return to official dogs. A good dog seems always proud to be a protector: he is up at any suspicious noise, gives forth his bold bark, and seems to take for his motto, "Ready, aye! ready." A lone house should always have its canine protector, a dog on whose head a solitary servant can lay her hand and say to the threatening tramp, "Now you be off, or I will let this dog loose, and at you," and verily that dog will be obeyed in office. Such a dog is also a meet companion for children when out walking in the country without an elder. I think it is a great point to place a dog in office. Let him feel that he is in an official position, and he will act up to the full the duties of that office.

If you want to see a dog who thoroughly knows his official duties, go to the first carrier's cart that you see on a market-day standing in the inn-yard. That cart contains many things of value, at least to their possessors. This parcel for a farmer's wife, that handbox for the farmer's wife's maid servant, who is longing for its contents—a smart bonnet, with which she will be armed for conquest on the next Sunday! That parcel of books for the village curate; that hamper of goods for the village shopkeeper, &c. Now, the carrier is busy in the town, and leaves his cart and all in it, and leaves it all with a feeling of full security. Why? Because on his great coat, that old weather-stained garment, he has left his dog lying, usually a coarsely-bred Bull-terrier. Coarsely-bred he may be, but more like the dogs of Bewick's day, with some hair on him to keep himself warm and healthy. Not the shivering Bull-terrier of the show-bench, or of Birmingham streets, but a much more useful animal, although the judge would despise him. Bless me! why, the homely and useful are generally despised in this stuck-up age. There, in the carrier's cart, I say, lies the official dog, blinking, winking, now and then almost dozing; but let the light-fingered thief creep near on ever such light footsteps, and he will be wide awake and ready for his throat. I respect those carriers' dogs; bridle-patched, red-eyed, common-looking they may be, but they are as much dogs of utility as the high-bred, silky-coated Setter. Then, has not worthy Dr. John Brown immortalised one such, that glorious old "Rab," of whose "Friends" too, the good doctor has also written so feelingly as make every reader of his little book shed more than one tear? I may notice also, that although I have seen many a dog in office, I have never seen him act the part of "a Jack-in-office;" that part he leaves to weak men. He fulfils his duties, but does not inflate himself; he leaves that to

"Man, proud man,
Dress'd in a little brief authority."

The more sensible dog leaves that part

"For every pelting, petty officer."

He, because not condescending to be a Jack-in-office, is always obeyed in office.—WILTSHIRE RECTOR.

(To be continued.)

WHITE MICE.

THESE smallest of four-footed pets seem to have been totally neglected by writers on the subject of animals kept for amusement; yet, I venture to say, there is hardly a person who has not during some period of his boyhood had a few of them. Boarding-schools are rarely without some of them, kept by the students; indeed, this is such a noticeable fact, that Dickens, in his story of David Copperfield, mentions the school at which young David spent his early youth as celebrated because of this. Nor is there a pet possessing more elegant proportions, displaying more agility, or wearing a handsomer coat than this same little white mouse. Their gracefully-shaped limbs and body, and the beautiful shade of pink colouring in their eyes and ears, are surpassed by no animal kept as a pet. They are intelligent, and recognise the step of their feeder, setting up loud squeaks at his approach. With very little trouble they can be taught

innumerable tricks and antics. I heard of one being kept in a cage with a Canary, and the two remained on very excellent terms, eating and drinking from the same dishes, at the same time, without ever quarrelling. When I was nine or ten years of age, I remember quite distinctly of a white mouse that escaped from its cage, and for a long time would, every night, scamper up and down my mother's bed after she had retired, keeping her awake a good part of the night. Many efforts were made to effect its capture, but all were vain, till one night it was discovered behind a trunk. Crack, crack, crack went its poor little bones, as the trunk was pushed back against the wall, and unfortunate mousey, now a shapeless mass, was thrown into the street to make a dainty meal for some homeless pussy.

Generally the first pets kept by children, they are soon neglected for the more highly-prized Rabbit and Pigeon. Their great deterrent to popularity is their "mousey smell." Of course they smell "mousey." It is their natural odour, which no degree of domestication will ever remove. A recipe to subdue this objection I now give: Take an empty tin baking-soda box, pierce it with holes by means of an awl, and fill it two-thirds full of chloride of lime or carbolic disinfective powder; nail the box to the upper part of the cage, and I will warrant no bad odour will ever be perceived as long as this remains in their cage. This same recipe will effectually neutralise the bad odour emitted by any animal.

White mice are very prolific, producing from four to twenty young at a birth, and having litters monthly.

A good cage for them may be made out of an empty starch box, fitted with a second storey, connected with the first by means of stairs. I once saw one made entirely of tin, and a very beautiful cage it was, with its little tin apartments tenanted by mice of all ages, from the hairless babe to the grey-coated grandfather.

The best food on which to feed white mice is wheat flour and cracker dust, given alternately, with oatmeal once or twice a-week. Occasionally give a crust of stale bread, oats, canary seed, &c. Raw meat fed to them just before littering will satiate their appetite for fresh flesh, and often prevent them from devouring their young. Milk is in every way preferable to water as a drink, and should be given altogether or as often as possible.

As soon as a female shows unmistakable signs of being with young, she should be immediately removed from the common cage and placed in a small box by herself. Leave her and the young in quiet for three weeks, and then replace them in the common cage. If one exhibits cannibalistic habits, and devours the young, give her an ounce of oak wood administered on the back of the head.

A very beautiful variety of mice are produced from the union of the brown and white mouse. The manner in which to effect this is to allow a female her liberty in a place infested by common mice. After running at liberty for a few nights, confine her in a box separated from the rest, and await the issue. This plan generally proves successful at the first trial; indeed I have never known it to fail, though sometimes the progeny, instead of being "pied," are brown, and in every way resemble the common mouse. Be sure and clean their cage once a-day.—(*American Fanciers' Journal*.)

NADIRING.

Nothing is more astonishing than the confusion which seems to prevail in the minds of our bee-authorities on the subject of nadirs. Mr. Pettigrew only recognises the nadir which is made the stock hive. Mr. Pagden in his little book only recognises the nadir put under the stock hive, just as the super is put above it. "B. & W.," if my memory serves me right, recommends coaxing the bees into a nadir and then making a super of it. Mr. Payne in your useful manual, and Mr. Pettitt in his "Management of Bees," do not recognise any kind of nadir; nor does Mr. Filleul in his "Profitable Bee-keeping," a book dear to cottagers, of which I hope we shall soon see a new edition. The only writer I know of who draws a clear distinction between the two kinds of nadirs is Mr. Taylor in his "Bee-keeper's Manual." Speaking of the nadir put under the stock hive he says, "This mode of applying the nadir, or rather nether principle, must not be confounded with the usual plan of disturbing the stock hive for the purpose of placing an empty one beneath it, with a new entrance in the latter for the bees. Under such circumstances the queen will commonly descend and breed in the nadir, which is converted into the stock, occasioning much subsequent inconvenience."

I must leave your more learned correspondents to discuss the relative advantages of the two kinds of nadirs. My own humble experience leads me to think with Mr. Pettigrew that the kind which Taylor condemns offers many advantages in good years, whilst I have also found the other kind (the nether, as he calls it), answer fairly well. The greatest objection to the latter is the difficulty the bees have in finding their way out. Mr. Taylor wisely recommends "a small aperture at the bottom or side of

the nether as a mode of exit for the prisoners, to be closed at pleasure."—E. H. R.

THE HONEY HARVEST.

For several years, including last, I have taken an average of about 25 lbs. from each hive. This spring I started with three hives all in first-rate condition, with a great number of bees in full activity, but the cold weather in May appeared to paralyse all their energies, and they have done nothing during the summer. There are plenty of bees, but they appear as if they had no spirit in them, and I do not think that the three hives will give me a pound of honey between them. It is just the same with one of my neighbours, though another not far off has taken three small glasses. I observe that her bees have a touch of the Ligurian in them. I do not know whether that can explain the difference.—H.

I HAVE been a bee-keeper for fifty years, and never have witnessed such an occurrence, I may say phenomenon, as the following. I had a swarm from a hexagon hive on the 2nd of this month, and in a fortnight from that date they had filled the stock or parent hive weighing 22 lbs., and a super weighing 7½ lbs., with honey of the most delicate colour I think I ever saw, and from that I conclude it has been a most productive season, but now at an end, in the way of honey-getting.—T. GARDY, *Nelson Place, Kew Bridge*.

My present stock consists of ten 16-inch, five 18-inch hives, one 20-inch Pettigrew straw hive, and one fancy hive made of wood and glass. Four of these I had not the opportunity of weighing on the 20th inst—viz., my 20-inch hive, it being about three miles from home in the midst of abundance of white clover, two of my best 16-inch hives working beautiful glass supers, and my fancy hive.

The past fortnight has been very favourable for honey-gathering in this district, it being dry and warm, and had there been a few slight showers to have given a little moisture, we should very likely have been astonished at the gatherings of our little favourites. As it is, I have great pleasure in sending you an account of work done during the last seventeen days by thirteen of my stocks, being an average gain of nearly 26½ lbs. per hive during that time.

	Size.	1874.	July 3rd.	July 20th.	Gain.

The above are nett weights—that is, the weight of hive and floor-board deducted.—THOS. BAGSHAW, *Longnor, near Burton*.

BEE PHENOMENON.

IN THE JOURNAL OF HORTICULTURE of July 16th you inserted a paragraph from me under the above heading. The two queens were first seen on the 28th of June, and since then I have frequently visited the hive. On the first occasion the queens were on adjacent bars; on another visit, I found them on opposite sides of the same bar, and Mr. Boulton's opinion was, that should the contiguity continue, and the queens meet, the destruction of one or the other would result. This morning (July 17), however, we found them working together on the same side of the bar within 2 inches of each other, both they and the bees in the greatest possible harmony.—J. R. R., *Ulverston*.

IS THIS A HONEY YEAR?

WE bee-keepers in the Yorkshire dales have had favourable weather for our busy subjects. There has been a fair amount of dews and rain. Perhaps the balance may, however, lean a little in the favour of dryness, but on the whole we have been highly favoured, and the heather is already in bud and will soon be out; it is early this year. To give one instance of the weather we have had: On Sunday evening, June 28th, our bees were working at 8 P.M., as at midday; the air was warm with a good deal of moisture. "B. & W." also speaks of his stocks being in

a miserable condition at the close of the winter. Our stocks and the stocks of those who manage their apiaries on the best principles, were very healthy and strong at the close of the winter, whilst our neighbours, who give neither thought nor care to their bees, lost many of their hives; and although I think they deserved to lose them, I do not infer that "B. & W." lost his hives from neglect. It was a great pity that such fine supers as he speaks of should have been sacrificed for feeding purposes. I think sugar-syrup would have been better, and also much cheaper. If "B. & W." would try sugar-syrup next time he feeds he will see the advantage it has over honey-feeding, more especially over good super honey.—W. C.

HONEYDEW.

Your able correspondent, "B. & W.," is fond of breaking a lance with Mr. Pettigrew, but he cannot surely intend doing so on behalf of honeydew; and yet, to the astonishment, I doubt not, of many of your readers, he speaks of "extensive honeydews" as among the blessings which have been denied him this summer. I have long come to Mr. Pettigrew's conclusion, that the blight called honeydew is "a great nuisance to bee-keepers," and that "it is a great pity that bees touch it at all." To this I may add that I have observed it to have an exciting and almost intoxicating effect upon bees, making them extremely quarrelsome.—E. H. R.

HOW TO MAKE A BEE HIVE.

TAKE inch plank, let it be smooth, 28 by 18 inches square, for the bottom; saw out of the centre a piece 6 inches square; cover this with wire cloth. Make a slide for the under side, so as to give ventilation according to the weather. Let the side pieces be the same length, 12 inches wide, and set these on the bottom. Nail from the under side, letting one be 1 inch from the edge. This is for the bees to have a place to light on. Make an entrance under this for the bees to go in. Take strips, 2 inches wide, and nail on the outside at top on the side board, extending above 1 inch. Hang the frames inside of this on the top of the side board. For frames, take strips three-quarter by 1½ wide, 10 inches long; for the end pieces, for bottom and top, 1 inch wide; bottom piece 15 inches long; top piece 2 inches longer, extending 1 inch over each end piece, when nailed together. Nail through the top into the end and through the end into the bottom piece. For a guide, take a triangular piece, tack it on the under side of the top piece. Cut out end boards 12½ inches wide, and hang on just like the frames.

Next is a covering for the top; put this on with hinges on the front side, and fasten on the other with a latch, or a weight on the top will do. When complete, the frames should be a quarter of an inch smaller than the hive inside, giving room for the bees to pass around. When you wish to open this hive, unfasten the latch, raise the lid, slip off the end boards, and all is open to inspection.

To put a swarm in this hive raise the lid, put one end board in place, then seven frames, and then the other end board. Put a board or cloth on the top of the frame, raise up one end board 3 inches, empty the bees close to this opening as you can. When they all go in, let down the end board, take the board or cloth off of the frames, let down the lid, and you have them. As they fill up, put in more frames. You can make frames larger or smaller, according to your fancy. The principle is the same as Mr. B. M. Quinby's, but the hive differently constructed.—R. H. PITTLE.—(Prairie Farmer.)

OUR LETTER BOX.

RABBITS (E. Emlyn White).—Your Rabbits are suffering from too much watery food, or it may be from damp hutchies. Give more solid and less watery food, and season it with salt. Employ condiments composed of leaves of heather, juniper, sage, wormwood, thyme, and green parsley, dried and powdered. If the hutchies are damp they must be made drier.

LEEDS ORNITHOLOGICAL SOCIETY.—"I was also an exhibitor at Leeds, where I showed a pair of Pouters, which were old, but I have not received any money for them, though I have made several applications for it.—H. W. WARR, *Syl. plum.*"

MOVING BEES TO THE HEATHER (J. W. F. Gerald).—We are pleased to hear you succeeded so well in driving the bees from your hive on the twenty-fifth day after warning, and that you made 120 lbs. of honey. If you remove the bees to the heather they will, weather permitting, gather stores enough for the winter. Our bees are about two miles from a set of heather, but they do not go to it. If you want honey in quantity we advise you to remove the bees to the heath at the end of July; if you merely wish to have good stock hives they may remain at home, and flies that are not heavy enough for winter should be fed in September.

BEES CLUSTERING OUTSIDE HIVES (Lia Old. *Syl. plum.*).—We consider it at all bees cluster outside a hive and in large numbers before the month of July, is not good for either the bee-master or the bees; and where this clustering is permitted to go on for weeks a great loss is sustained. The Sommer system of artificial swarming is so simple and so easily carried out, that mere novices succeed whenever they make an attempt. For bees

should have been swarmed artificially three weeks ago. It is now too late for swarming; we therefore advise you either to cke the hives, and thus give the bees room and a stimulus for work, or drive all the bees into empty hives and take the honey from the old ones. A few pounds of sugar given to the swarms or turnouts will enable them to fill their hives nearly full of combs, and these combs with brood. The old hives are probably so full of honey that there is little brood comh in them. We have known bees hang outside their hive till almost every cell of every comb was filled with sealed honey. Why they sometimes do this no one can tell. The sooner your bees get new houses, or additions to their present ones, the better. When smoke is used it is blown in at the doors of hives.

BEES NOT FILLING LARGE HIVES (E. F. W.).—The season must improve greatly to enable your bees to fill the large hives with comh this year, when so late as the 18th of July they had not half-filled them. Should they not store a sufficient quantity of honey you will have to feed them; but if well fed before winter, we do not think you need fear their dying of cold.

REMARKS.

- 22nd.—Fine morning; the day rather dull, and much cooler than it was a day or two since.
23rd.—A very pleasant day, though there were two sharp short showers, one in the forenoon, the other about 5 P.M.; fine evening.
24th.—Fine morning; thunder between 1 and 2 P.M., and several times in the afternoon at a distance; occasional showers; fine evening.
25th.—Rather cloudy all day, but cool and pleasant.
26th.—Rain early, but fine before 11 A.M., and continuing so all day, though not very bright; stormlike between 8 and 9 P.M.
27th.—Dull morning, occasional showers, but by no means a wet day; sun at times very bright.
28th.—Very wet morning; thunder at 9.30 A.M., and frequent heavy showers all the forenoon; afternoon very bright and fine.

Frequent showers, falling heavily and suddenly like thunder showers, though there was but little thunder heard here, and nothing either of that or rain to be called a storm. The cloudy sky and frequent showers have lowered the temperature very considerably, the maximum of the week being only 75.5.—G. J. SYMONS.

COVENT GARDEN MARKET.—JULY 29.

A good business is current, and fair prices generally are obtained. Large importations continue, and comprise Apricots, Green Gages, Peaches, and Nectarines, with Grapes from the Channel Islands. West Indian Pines are plentiful, at prices ranging from 1s. 6d. to 2s. 6d. each.

From observations taken near London during forty-three years, the average day temperature of the week is 74.7°; and its night temperature 50.5°. The greatest heat was 94°, on the 10th, 1842; and the lowest cold 33°, on the 11th, 1851. The greatest fall of rain was 1.11 inch.

STAG'S-HORN FERNS.

THE Ferns popularly known by the above name belong to the genus *Platyceerium* (literally Broad Horn); they form a very natural group of plants, and were originally united with *Aerostichum*; but to my mind they have nothing in common with the species which represents that genus in our ferneries.

Platyceeriums are characterised by their large sterile fronds, which are entirely different in shape from the fertile ones; they are sessile, and grow erect and flat, overlapping each other as they increase in numbers and in size. The fertile fronds are stalked, standing out erect or horizontally from the barren fronds (or shields, as they are not inaptly called in a popular way); they rise from the little depression at the base of the sterile fronds, and are many times dichotomously forked, having more or less broad and obtuse segments, which are thick and leathery in texture, and clothed with a dense covering of peculiar stellate scales, which give the young fronds the appearance of having been dusted over with a white powder; the veins are somewhat indistinct, but are coarsely anastomosed; whilst the receptacle is irregular, but usually occupies the greater portion of the apices of the under side of the segments.

Platyceeriums grow naturally upon the trunks and branches of forest trees, and are most successfully grown under cultivation when treated as epiphytes, and placed upon blocks of wood or in baskets. I have grown them in pots; but I do not recommend that system, because the peculiar habit and beauty of the plants cannot be developed under such treatment, not even in cases where pots are made specially for them.

In providing blocks of wood for these plants the operator must not go to work with a narrow mind; for although the plant may not now have shields or barren fronds more than a few inches in diameter, it will, if properly treated, soon produce others, which may probably attain some 12 inches or more in breadth, and if a block sufficiently large is not provided, the shields will clasp round it instead of being kept spread open as they would be if upon a broad block, and thus in the case of the small block half the beauty of the plant is lost. This is a point too often overlooked by Fern amateurs, and therefore I would specially draw their attention to it.

Having selected a block of wood of sufficient dimensions, first fasten the plant upon the block with some fine copper wire, and then take some living sphagnum moss and rough peat from which all the fine earthy particles have been beaten out, and pack down behind the barren fronds so as to make the plant quite firm; give it a good soaking in a tub or pan of water, and nothing more remains to be done but hang it up in the desired position, and keep it abundantly supplied with water from the syringe. Care must be taken to prevent a lodgement of either thrips or scale, for if either be suffered to gain a footing they will speedily turn the fronds from

their lovely green colour to a nasty, dirty, rusty brown, which will present quite the reverse of the effect desired; therefore examine them occasionally, and promptly remove any of these pests should they put in an appearance. I do not recommend the sponging of the fronds if possible to avoid it, as by this means the covering of stellate scales is removed, and thus, to my mind, the plant becomes disfigured.

There are but few species of *Platyceeriums* known to science, and nearly all of them have been introduced to cultivation; but doubtless we have more species or varieties yet to receive which will lend an additional charm to our ferneries. This much can be said of those we have, that they are all so entirely distinct that a block or bracket may be found for each in even a small Fern house, without producing a sameness or monotonous appearance; whilst their habit is so peculiar and extraordinary that no Fern house should be without them.

P. ALICORNE.—Some idea may be formed of this species by the accompanying illustration (*fig. 36*, page 114). I before mentioned baskets as being suitable for the growth of *Platyceeriums*, but this is the only one to which that style of culture is applicable. The shields or barren fronds are small, and as it throws up innumerable young plants from its roots, in the course of a few years it forms a large globular mass, producing fertile fronds from all parts of its surface. It is not the most beautiful of the genus, but is specially deserving the attention of those having only a greenhouse fernery, as it succeeds admirably under cool treatment; moreover, in a young state, and for several years, it may be grown with advantage by those who have only a Fern case to indulge their tastes. In such a position the half of a cocoa-nut shell forms a capital basket, and when suspended from the roof of the Fern case does not present an unsightly appearance. This species is widely distributed through the islands of the Indian Archipelago, and is also common in Australia.

P. ALICORNE MAJUS.—As its name implies, this is a large form of the original type, and as such it is well deserving the attention of Fern-growers. Although it may be grown in a basket, the large size of its barren shields and the more forked character of its fertile fronds induce me to give preference to a large block of wood. It has been introduced from Australia.

P. INFORME.—This species is a native of Burmah and various localities in the Indian Archipelago, and must be treated to stove temperature. The sterile fronds are somewhat broad, whilst the fertile ones are long and pendulous. The sori in this species are not produced near the apex of the segments, but upon a scutiform lobe near the first divisions of the fronds. It is at present a rare, but at the same time it is a most beautiful, species.

P. STEMMARIA, known also in collections by the name of *P. æthiopicum*, is a very distinct plant, but is not such a general favourite, because the barren shields die and turn brown every season. This, however, should not deter or discourage the amateur from finding a place for it in the fernery, as each year's growth completely cloths the old ones. The shields are large, and densely clothed

with stellate scales, which give them a somewhat glaucous aspect. The fertile fronds are broad and short, several times forked, and very leathery in texture. Native of Western Africa.

P. GRANDE.—This truly beautiful species never fails to excite the admiration of all beholders (some idea of its appearance may be obtained from fig. 37, for which we are indebted to the courtesy of Mr. B. S. Williams, of the Victoria Nursery, Upper Holloway). This species must be provided with a large and broad block of wood, or half its beauty is lost. The sterile fronds are erect, the upper edge variously forked, but plain and rounded below. Fertile fronds from 1 to 3 feet in length, coriaceous in texture, dichotomously forked, and light green in colour. Too much cannot be said in praise of this charming plant. It must be grown in the stove fernery. Native of Australia and the Malay Archipelago.

P. WALLICHII.—I have left this species until last, because it is at present so very rare and so very little known in cultivation; it will, however, when it assumes its proper character, become as general a favourite as the preceding, which, indeed, it much resembles, but is larger and altogether more massive. Unfortunately but few plants are as yet to be found in collections. It has been frequently sent to me from Borneo, but hitherto I have not been fortunate enough to receive it in a living state.—**EXPERTO CREDE.**

THE GLADIOLUS.

This year I added to my stock some £12 worth of imported bulbs of the best kinds I had met with, a few seedlings from the Messrs. Kelway, and, thanks to Mr. Banks, also several hundreds of his much-prized seedlings. As last year, I again manured freely with new cow manure, laying it some 10 or 12 inches deep, and commenced planting my bulbs in the open ground in the first week of March, some with sand around the bulbs, and some without; but as my land was light, I thought this trouble was superfluous, and I really now see no difference. Having been early planted of course they came up early, and then, as with horticulturists generally, I had to contend frequently against severe pests. Over the most valuable beds for several weeks I propped-up some old frame lights, and soon after I had reason to see how much better it would have been had this system of protection been extended to the whole. Those protected remained green and healthy-looking, whilst the rest had just as much as they could do to keep themselves erect; in fact, some gave way after the severest nights, and then speedily died-off altogether. But these early frosts also damage the outer shell-like haulm, and then when it from the first continues to decay, a nasty little insect gets in between this outside and the more healthy foliage, and frequently eats its way into the spike from the surface down to the bulb. Mulching the surface with manure too near the plants likewise encourages these pests—so

much so, that I am now beginning to think that it is as well to refrain from mulching altogether.

I have no reason to complain of misses this year among my French bulbs, and unquestionably they are the most level lot I have, though quite two-thirds of both Mr. Banks's and the Messrs. Kelway's are quite their equal in robustness. I have before complained of expensive French bulbs not growing. Those of my own saving have done worse, a feature in growing the *Gladiolus* which I can only ascribe to the fact that, like the Potato, it needs a change of soil. I have not lost one by wireworms, on my still somewhat new soil—the sixth year after being broken up from a very old pasture. I attribute

this good fortune to the free use of nitrate of soda. Some few—say a tenth—have shown signs of disease, but when they turn yellow I now at once pull them up, and then at least they are a source of no further annoyance. With me the disease is still all in the roots, which, after I pull them up, I find to be quite soft; and after pulling them through the fingers they have much the appearance of a mouse's tail minus the skin, or at least the skin of the root leaves the fibrous part much in the same way. I find that it is no matter whether the land is rich or poor, for this disease amongst a portion is all the same; and I am afraid that I must speak of the total cure as a thing of the future.

As a whole my collection of *Gladiolus* never, I think, looked so well; and this day (July 30th), I find that the first six spikes are in bloom, and some hundreds more are throwing up their heads. After expending so much money, the prizes offered for *Gladioli* in this neighbourhood are simply contemptible; and it is more than likely, with one or two excep-

tions, I shall show them only to those who visit my little garden at home. For a sovereign outlay you may cut and come again at Dahlias, but after spending £2 a-dozen for *Gladiolus* bulbs you are fortunate if you can show four blooms on the day you want them; and for effect, what comparison can Dahlias bear to equally well-grown *Gladioli*?

I think I ought to say that though situated by a public foot-way in the midst of a colliery district, and though I have one or two fine young Apple trees which bore well last year, and several berries, my garden gate has never been locked night or day, is free to all, and up to the present I never knew one enter to injure either fruit or flowers. So much for the people of a village in the populous county of Durham.—**JOSEPH WITHERSPOON, Chester-le-Street.**

Fig. 36.—*PLATYCLERIUM ALCHICORNE.*

THE BEDFORD HILL PLANT SALE.—The collection of plants belonging to J. Brand, Esq., of Bedford Hill, Balham, was sold by Mr. J. C. Stevens on July 21st and 22nd. Fine plants of *Phalenopsis Schilleriana* realised from £3 5s. to £10 10s.; *Odontoglossum pulchellum majus*, £10 10s.; *Epidendrum*

vitellinum majus, £5; a fine plant of *Dendrobium nobile cerulescens*, £9; *Aurides Fieldingii*, £5 10s.; *Angræcum sesquipedale* with sixteen pairs of leaves, £18 18s.; a very fine plant of *Anthurium Scherzerianum*, £15 15s.; *Phalenopsis amabilis*, £8 8s.; a very fine plant of *Lapageria rosea*, £7; *Camellia Valtevarado*, 10 feet high, £13 13s.; a pair of *Seafortia elegans*, 10 feet high, £17 6s. 6d.; and *Eucharis amazonica*, in the culture of which Mr. Howard, Mr. Brand's skilful gardener, is eminently successful, brought according to size from £5 for pot plants to £11, £12, and £16 6s. for those in tubs.

NOVELTIES IN THE ROYAL GARDENS, KEW.

IN the Succulent house there are many. *Asparagus con sanguineus* is new and extremely beautiful. The entire plant is very delicate, and light green in colour. The leaves are capillary, and the branches are disposed in a frond-like manner. The value of the common *Asparagus* for mixing with flowers is well known; here is a greenhouse species in condition all the year, and much more suitable from the convenient form of the branches. When covered with bloom it must be very charming; there are now only a few flowers, small and white. It is a climbing species, grows freely, and is cultivated without difficulty. There are three flowers on the *Leuchtenbergia* (before mentioned), one of which will open in a few days, and the others in succession. *Stapelia polita* is new and very choice. The flowers are about the size of a shilling, dark red brown, without marks, and it shines like no other species. The corolla is sharply depressed from the centre, and the teeth curve up; between which, low down, are a few hairs. It is very floriferous; eight flowers are to come on two small branches. A plant of the new *Decalvone elegans* has an advancing bud. A species of Black boy (*Xanthorrhæa quadrangulata*) still retains the spike thrown up some months ago, the first produced in this country. Black-boy gum is used as cement. In Museum No. 2 is a stone hammer composed of two pieces united by its means. From the general appearance no one would suppose it to belong to the Liliaceæ, to which it is usually referred. Le Maout and Decaisne place it in Xerotidæ in company with *Dasyllirion*, *Kingia*, *Aphyllanthes*, &c. The large *Agave* is now in full flower.

A fine specimen of *Mussehia Wollastoni* is flowering in the Cape house. It is a peculiar member of the Campanulaceæ from Madeira. The stem is erect, does not branch, and supports a crown of leaves with a large terminal panicle of yellow flowers. The corolla is curious from its long, linear, recurved segments. After flowering it dies, and must be reproduced from seed. It requires loamy soil, and should be grown on without check. *Juanaltoa parasitica* is a rare plant of the Solanæ, flowering in the stove. It has ornamental flowers; the corolla is tubular, 2 inches long, dark orange, and almost enclosed within a calyx of the same colour. It is a native of Peru. *Tabernaemontana coronaria flore-simplici* is very pretty, with numerous white flowers. For several years it has been sold as *Coffea benghalensis*, from which it may be distinguished by its milky juice and want of stipules. *Rivina flavesens* is worth the attention of those who grow the more common red-berried *R. lavis*. It would be useful as a companion plant,

from the berries being yellow. Among the Orchids in flower, for rarity and beauty combined there is nothing to equal *Saccolabium Cruikshankii*; it has an erect spike of rose-coloured flowers with a white lip. The effect of the two colours is very pleasing. *Lalia xanthina* is an interesting species with yellow flowers. *Polycyrenis lepida* is extremely curious. *Dendrobium Pierardi* is still in beauty; plants have bloomed in succession for the last eight months. It is said not to meet with ready sale. How that can be is surprising; everyone admires it.

Among the numerous plants in flower at the Rockwork are *Androsaco lactea*; is a very pretty species with white flowers. In foliage it somewhat resembles *A. eximia*. The white variety of the British *Malva moschata* is very showy. *Stachys coccinea* is a diminutive species, with slender stems, small leaves, and white flowers. *Polygonum capitatum*, from the north of India, is not quite hardy, but is worth planting on rockwork in summer. It is also useful for baskets in the greenhouse. It has a neat trailing habit. The leaves are ovate or elliptical, and marked with a dark band. The flowers are pink, and produced in round heads.

Argemone hispida is flowering in the Herbaceous ground. It is a new species, discovered in New Mexico, and has large pure white flowers. In habit and foliage it is similar to

A. mexicana. *Impatiens glanduligera* is tall-growing and robust, producing red flowers freely. It sows itself, but does not become a weed. *Psoralea macrostachya* is rarely met with. It has erect stems 5 feet high, pinnately trifoliate leaves, and racemes of purple and green flowers. It is a native of Nootka Sound on the north-west coast of America, and is quite hardy. It is worth a place in all collections. *Pentstemon heterophyllum* is very handsome, with blue flowers, and is very distinct.

Lysimachia clethroides is new to cultivation. It has broad leaves and pretty racemes of pure white flowers. *Sonchus palustris* is almost extinct as a British plant; here are two good clumps in flower. *Scabiosa Parnassa* covers the ground with a dense mass of growth.

The leaves are small and grey, and the flowers pinkish white, produced in great abundance. It deserves extensive cultivation.

Solanum jasminoides is flowering on the walls. There are two forms, one pure white and the other tinged with purple. It is an extremely beautiful hardy climber, in bloom all the summer. A variegated variety is sometimes met with. Propagation is best effected by means of small rooted branches taken from the base of the plant. *Thladiantha dubia* is a rare and very handsome hardy perennial Cucurbit from North China; valuable for covering walls, &c., in summer. It appears to be little known. The leaves are heart-shaped and not divided. Flowers are freely produced. *Fremontia californica* and *Chimonanthus fragrans* are bearing fruit.

VEGETABLE IVORY.—This curious hard material is the store of food laid up by the plant for the nourishment of the embryo, or young plant contained in the seed. It corresponds to the white in the egg of the hen, and has been consequently called the albumen of the seed. In its early condition this ivory exists as a clear, insipid fluid, with which travellers allay their thirst; afterwards, the liquor becomes sweet and milky, and

FIG. 37.—*PLATYCODON GRANDE*.

in this state it is greedily devoured by bears, hogs, and turkeys; it then gradually becomes hard. It is very curious that this hard mass again returns to its former soft state in the process of germination. The young plant for some time is dependent upon it for its food, and if the seed be taken out of the ground after the plant has appeared, it will be found to be filled with a substance half pulp and half milk, on which the plant lives until it is old enough to obtain its food on its own account. From the small size of the seed—the largest not being more than 2 inches across their greatest diameter—the Vegetable Ivory can be employed in the manufacture of only small articles, such as beads, buttons, toys, &c. What is wanting in size is, however, often made up by the skill and ingenuity of the workman, who joins together several pieces so as to make a long object (especially when such articles are made by the turning lathe, when it is easy to hide the joints from view), or make a lid from one seed, and the box from another. In some years, as many as 150 tons of seeds have been imported into England, and they have been sold in the market at the rate of a thousand nuts for 7s. 6d.—(*Cassell's World of Wonders for August*.)

IN AND OUT OF ABERYSTWITH.—No. 2.

Just when sitting down to commence this bulletin I received a letter, of which the first sentence is, "I hope you like the place;" to which and to your readers the reply is—Certainly I do, for the inscription to be read at another Welsh town is quite as applicable to this—

"Vinum bonum, pisces, carnes,
Chickens, chaises, horses, harness,"

are all cheap, and everything else in proportion, from Beans up to Bath chairs. The hens here lay fresh eggs at a penny each, which they do not in London, and their young roastable progeny are only 3s. 6d. per couple. Then, again, the rain, which is said to amount to 60 inches annually, falls as travellers like it to fall, unless they are out in it with their umbrellas at home—namely, it pours and soon finishes; verily, I have seen two showers which seemed to be at the rate of an inch in the hour. I will conclude the aquatic aspect of my subject at once.

The water is of the softest, and the supply from reservoirs in the mountains abundant. Its softness indicates its purity; its softness is six times superior to that supplied to London, and seven times superior to that supplied to Bristol. Its purity is superior to that of most spring waters, for Mr. Herepath found in a gallon of it only three grains and an eighth of a grain of salts. The same purity characterises all the streams of the mountains, and they are many. Plynlimon is the birthplace of five springs which become noted rivers, and pertaining to them is this specimen of the Cambrian legends. There were five mountain nymphs, sisters, born at Plynlimon, and they agreed one summer evening to pay their father, old Ocean, a visit, but each was to pursue a different path. Vaga (the Wye) was most prompt in leaving, and she wandered down a beautiful southern valley. Labrina (the Severn) starting rather later took a northern yet beautiful course. Rheidol, commencing her journey, later corrected her delay by rushing directly westward to her father at Aberystwith, where her sisters Llyfrant and Dulas had to follow.

Being thus led to the sea I will add a few words about its weeds. All the British Fauna are found here, but I will only note that among them are the finest specimens of the crimson *Ocellseria* that can be collected. The Laver, *Plocamium*, once so urged upon consumptive patients, is also found here. In addition to what was stated in a previous communication relative to the uses of seaweeds, let it be added that some are sent to London in large trusses for packing purposes, and that in America they are converted into artificial clay. The process consists in first treating the plants for two hours with dilute sulphuric acid, then drying and grinding them up. To sixty parts of this product, five parts of liquid glue, five parts of gutta percha, and two and a half parts of indiarubber are to be added, the latter two being first dissolved in naphtha; afterwards ten parts of coal tar, five parts of pulverised sulphur, and five parts of pulverised resin are added, and the whole heated to about 300° Fahr. When cooled, a mass is obtained which in colour, hardness, and capacity for receiving a polish, resembles ebony, and is much cheaper. This material is now made on a large scale, and used for nearly all the purposes to which ebony can be applied.

Not many of your readers will resort to that process, but

many of them will be glad to know how best to store seaweeds in the herbarium; so I copy, with some additions, the following furnished by an adept to that excellent local authority, Morgan's "Guide to Aberystwith and its neighbourhood":—"Gather the seaweeds either that are growing in the pools left by the tide or that it recently has thrown on the beach. The best time for collecting seaweeds is during very low tides, and they should be carried in an oilskin-lined basket. Many of the delicate *Floridæ* and *Ceramie* require great care, and must be laid out as soon as possible, first ascertaining by the aid of a magnifier whether the plant is in fruit, and if so whether it is capsular or granular. Before laying down specimens wash them in fresh water, cut a piece of paper to the desired size, place it in a dish containing fresh water, and spread out the plant by the aid of a good-sized camel-hair pencil—never use a pin for this purpose, for it destroys the natural fall of the branches. Gently raise the paper, holding it slantingly until the superabundant water has run off, and then place the paper in the press. This is made of two pieces of board or paste-board. On the first board place two sheets of blotting paper, on that place the paper with the specimen, on that put smoothly a piece of muslin or linen, then two sheets more blotting paper, and on that another board. The blotting paper and muslin should be carefully removed and dried daily, and then replaced. When sufficiently dried gum the specimen on a page of a scrapbook, or fix the sheet of paper on the page as drawings are fixed, by making four slits, into which one of each corner of the page of paper may be inserted. This mode is preferable, because it admits of the easy removal and rearrangement of the specimens. The name, locality, and date, are best appended in pencil for a similar reason."

On no coast have I seen such an abundance of seaweeds cast up by the waves, as well as growing upon the slaty bolds that of all forms and sizes girdle the shore. There those weeds remain and grow and decay unused. No farmer avails himself of this natural costless mine of fertility. His excuse may be that there are no roads to approach the shore readily, and that is true, but if farmers duly estimated the manurial value of seaweeds they would soon construct roads. The weeds are not neglected because they are not needed, for the soil near the coast is miserably poor, and the few corn crops grown are wretchedly thin, and tell of the soil's poverty.—G.

THE FRUIT SEASON IN QUEENSLAND.

At the close of the fruit season it would be both interesting and profitable for orchardists and cultivators in different districts to record their experience for the public benefit; and as the variety of the different fruits imported into, and now bearing, in Southern Queensland is so great, there is abundant choice for planters in all parts to select from.

In this neighbourhood (Milton, near Brisbane) the *Peach* crop was not so good as in former years. The spell of dry weather in spring, suddenly succeeded by abundant rain, rendered them in most cases a partial failure. Mowbray's China, however, maintained its character, as did also two other seedlings of the Flat China—the one a round pale freestone; the other a large, flat, high-coloured clingstone. These seedlings from the Flat China and their progeny open a boundless and very promising field for Peach-growers; they sport so freely, varying in size, shape, colour, quality, and time of ripening, and withal being generally so good, we ought, from this race alone, to obtain first-class sorts to furnish fruit through the entire season. We have several trees now under observation.

Figs have not been successful; the rains have damaged the fruit, and the foliage has suffered from insect depredators. We need some lynx-eyed entomologist to look after these gentry.

Grapes.—The *Oidium* (mildew) has not been nearly so destructive this season. Many European varieties that we had almost lost the taste of, ripened off well, and that with only once sulphuring. Notably we had some splendid bunches of rich, cool, translucent green Grapes from a new European variety called the *Diamant Traube* [Scotch White Cluster]. The new American varieties have done nobly; never damaged by the *Oidium*, and standing the changeable weather better than the European kinds, they are the Grapes for the million. Rogers' hybrids Nos. 1, 2, 4, 9, and 12 are all very good, varying in colour, size, and earliness; Nos. 1 and 2 being the latest of the five. Another of Rogers' hybrids called *Salem* is a fine early Grape, large, round, copper-coloured, and ripening early. Allen's Black Hybrid is also a very good early black Grape,

its only drawback being, in wet weather, a disposition to drop from the bunch somewhat. It is one of the least pulpy of this class of Grapes. Adirondac is first-class here, of fine quality, early, good bunch, beautiful black berries. Isabella is hardy, healthy, early, and an abundant bearer, but so far not so good in quality as Adirondac or Allen. Iona and Delaware have both justified the high character for quality which they have received in America, but the Delaware is too small for us as a table Grape, although reputed to be of surpassing excellence for wine. The Iona does well here grafted on the Isabella—far better than on its own roots. Some were grafted this season with Wagener's patent Vine-grafting machine, and the grafts took famously. Among the later Grapes should be mentioned the Maxatawny, a fine large white fruit of great excellence, but, so far, only a moderate bearer; and Anna, a copper-coloured Grape of good quality, slightly musky, plentifully borne on a strong-growing Vine covered with large, thick, and beautiful foliage. The Lincoln, a Grape of the festivals family, a strong-growing Vine, large, long-shouldered bunches of rather small jet-black berries, with fine blue bloom, no pulp, produced very heavily this season. Some others are coming forward, especially some crosses made by Dr. Wyllie, which promise very well.

Apples on our young trees have been both abundant and good. Those from the southern states of North America (not from South America, as some fancy) are carrying off the honours. Commencing in December with the Carolina Red June, we never saw a richer sight in fruit than this small tree with its clusters of fruit presented; the unripe and the ripened fruit exhibited all changes of colour, from light pink to a deep and glowing crimson; and when tasted they were found to be "as good as they looked." This was followed by American Summer Pearmain, Julian, Rhodes' Orange, Bruce's Summer, Taunton, Family, Stancill, Transcendent Crab, Late Wine, Abram, Horn, Gladney's Red, Kittageskee—nearly in the order in which they are narrated. We are usually troubled here with a small worm which penetrates the flesh of the Apple, and spoils the fruit; but Carolina Red June, American Summer Pearmain, Bruce's Summer, Transcendent Crab, Abram, Horn, and Gladney's Red were not at all affected. The others were, to a greater or less degree. These last-mentioned will well repay anyone who can grow Apples at all. Among European sorts Cox's Pomona, Yellow Ingestrie, Stirling Castle, and Kirke's Golden Pippin have done well, and are worth growing.

Pears.—We have had the usual abundant supply of first-class cooking (stewing and baking) Pears from our old friend the China, a tree of which should be in every garden. Beurré d'Amanlis, Baronne de Mello, Beurré Superfin, and Thompson's have furnished a few first-class fruit—enough to make us wish for more. We are told that Pears will not succeed here, but we have been so accustomed to this cuckoo cry respecting every agricultural and horticultural product now usually grown, that we almost take it to be a good omen, and prophetic rather of success. The Pear requires, as a tree, a greater age than many others to produce a paying crop of fruit. Hence in localities suited to it, and with liberal culture, some varieties are sure to succeed; and some of us are testing varieties for general information. Some varieties as the Beurré d'Amanlis, Duchesse d'Angoulême, Louise Bonne de Jersey, and others do best when worked upon Angers Quince stocks; others must have the Pear, or at least be double-grafted. We would recommend for trial Beurré Clairgeau, Williams' Bon Chrétien, Clapp's Favourite, Lawrence, Baronne de Mello, Doyenné Boussoch, and Howell on the Pear stock; Beurré Diel, Beurré Hardy, Duchesse d'Angoulême, Buffham, and Edmunds on the Quince.

Quince.—The China Quince stands at the head of this list for quality, size, health, and freedom from offal or waste—all entitle it to the first rank among Quinces. There is only one doubt about it, and that will take some extended experience to settle—whether it is only a very moderate bearer or no. This Quince is not yet ripe here. The others are all over. The Angers is the first to ripen—a very good useful fruit, and the tree makes the best stock for Pears that suit the Quince. The large Portugal comes next—stews of a beautiful colour; and lastly the Apple-shaped, also a good useful fruit. Rea's Mammoth Seedling has not yet fruited sufficiently to enable us to decide upon its merits.

Blackberries.—The Lawton, or New Rochelle, is a very fine fruit, and grows and bears most abundantly; if in rich land it becomes quite troublesome.

Raspberries.—The Semper Fidelis and some of the autumn-bearing sorts have done very well. Give the Raspberry the rich soil and the Blackberry the poor.

Gaavas, white, yellow, and purple, have been abundant and good; not so much affected by maggot as in the few previous summers.

Mangoes.—We have nine different kinds, but not all fruiting yet. Those that have fruited are very good, and the liking for them grows very rapidly upon those who frequently partake of them. The fresh seed sown in good garden soil germinates very quickly.

Date Plums, both of the Kaki and Mabola species, have been good, but not so plentiful as last year. We are happy to hear it is the intention of the Acclimatisation Society to make an effort to introduce from Japan some of their best sorts of Kaki, as the Japanese have them in almost endless variety, as Englishmen have the Apple, some for the kitchen and others for the dessert. We are not so far advanced as to be able to report the fruiting of the Date and the Cocoa Palm. Some of your readers, especially in the north, may do so, and complete a very good assortment of choice fruits. There is ample margin for a very interesting paper on Oranges, Pine Apples, and Bananas alone. We have some six new sorts of the latter from Polynesia, which we hope to report upon when they fruit.—FRUCUS (in *The Queenlander*).

ALPINE FLOWERS.

At this period of the year, when so many parties both in England and abroad are out among the mountains, primarily in search of health, but frequently connecting with it the collection of Ferns and wild flowers, it may be interesting to give a list of some of the floral beauties to be met with. Where the English names are added it will be seen that they also belong to the British flora.

Anemone alpina	Meum Mutellina
sulphurea	Myosotis alpestris
alba	Neottia spualis, Lady's Tresses
vernalis	Orchis nigra
Arnica montana	Phaca astragalina
Azalea procumbens, Creeping Azalea	Pyrula uniflora
Astragalus alpinus, Mountain Milk	Pedicularis tuberosa
Vetch	Pinguicula alpina, Alpine Butterwort
Antennaria dioica (or Gnaphalium),	Primula auricula
Cat's-foot	farinosa, Bird's-eye Primrose
Androsace Chamæjasme	elatior, Oxlip
Bartsia alpina, A pine Painted Cop	Ranunculus alpestris, Alpine Crow-
Campanula barbata	foot
Chrysanthemum coronopifolium	acutifolius
Dryas octopetala, Mountain Avena	glacialis
Eriophorum alpinum, Alpine Cotton	narcis-siflora
Grass	montanus
angustifolium, Common Cotton	Rhododendron ferrugineum
Grass	hirsutum
vaginatum, Haretail Cotton	Rosa alpina
Grass	Saxifraga aizoon
Gentiana acaulis, Dwarf Gentian	aizoides, Yellow Mountain Saxi-
bavarica	frage
campestris, Field Gentian	umbrosa, London Pride
verna, Spring Gentian	Soldanella alpina
Gemma montanum	Silene acaulis, Cushion Pink
Hedysarum Onobrychis	Salix reticulata, Net-leaved Willow
Homogone alpina	Trollius europæus, Globe Flower
Hutchinsia alpina	Trifolium alpinum
Linaria alpina	montanum
Lloydia serotina	Viola calcarata
Luzula lutea	cornuta
nivea	biflora
Maianthemum bifolium, Two-leaved	Vaccinium vaginatum
Maianthemum	Vitis-Idæa, Cowberry

—EDWARD COPLAND, *Interlaken*.

ROSE SHOWS.

A PROPOSITION has been made in a contemporary relative to an alteration in the method of exhibiting Roses, which I conceive to be so detrimental to the best interests of the queen of flowers, that I desire to enter my protest against it in *limine*. The proposition is to substitute for the present plan of showing Roses in boxes some such plan as that adopted by Mr. W. Paul at the Botanical Society's Evening Fête, of showing them in immense masses, somewhat in the style of the Rose shows at Brie. I protest against it for the following reasons:—1. That it will tend to vulgarise our exhibitions; we have enough of mass-bedding out of doors without introducing it to shows of cut flowers. 2. It will tend to do away with all the care taken to improve the quality of the Rose, either by raising new varieties or by improved methods of culture, for quality can never be a consideration where cartloads of blooms are

required. 3. It will put the amateurs quite out of the field, for no amateurs could, or would if they could, engage to contribute to such an exhibition. 4. It would do away with all rivalry, for it would be simply a contest of big battalions, and not of real culture. 5. If the formality of the present system is complained of, I do not see that it is one whit less formal to huddle together in a lump some twenty thousand roses than to place them as they are now placed in boxes. 6. I do not think that the beauty sought for would be obtained; it is one thing to arrange flowers for an evening fête, another to arrange them to be seen by daylight, and after a few hours' display of half-faded flowers, as seen at some places in France, are by no means pleasing objects.

I might like Dogberry, add other reasons to my sixthly and seventhly, but I have said enough to express my decided objection to the proposed alteration.—D. Deal.

BEDDING GERANIUMS.

I think, with the exception of Roses, it would be difficult to name a tribe of flowers in which the public is more generally interested than in bedding Geraniums. Everyone having a garden cultivates them more or less. In some places they are planted by the thousand, in others clumps dotted about in mixed borders give colour which is much required after the spring flowers are out of bloom. As conservatory plants they are, perhaps, still more valuable. Cultivated with less trouble than most others, less liable to the attacks of insects, and continuing in bloom longer than any other tribe, no wonder they are favourites. They have one great fault—they bear carriage badly when in full bloom.

For years I have raised thousands of seedlings, every flower carefully crossed with my own hands, with the hope of getting a few superior or different to those previously raised. Dr. Denny, of Stoke Newington, is also an extensive raiser, whilst Mr. Laxton, of Stamford, has taken the double ones under his care. Besides these, many persons try their hands at raising a few seedlings most years, the result being that no class of plants has been more improved than this. Most persons, perhaps all, act from mixed motives, and it may be questioned whether the ambition to be the producer of new beauties in a favourite class of flowers or fruits is not as strong a motive as the hope of pecuniary reward. One thing is certain—those who raise a good plant wish to be known as its raiser, and they feel aggrieved when others adopt their favourites without acknowledgment. In 1873 several of us who were thus interested agreed to offer prizes for our seedlings, to the exclusion of all varieties except our own, that the public might have an opportunity of seeing what we had effected. Dr. Denny and I offered £7 7s. each to be thus competed for, and others followed suit. The show was to be held at Kensington in July. The Royal Horticultural Society also offered prizes, open to all varieties—i.e., to anyone. We were glad to think that all, and ourselves as well, would have the opportunity of seeing our plants compared with those raised by others. Mark the result. The Society made no stipulation that the raiser's name should be attached to the plants shown, and I had no sooner entered the Show than Mr. Gibson, after having congratulated me on the beautiful plants shown by Messrs. Catlin and Brise, added, "But you must take care, for others are very close at your heels." Amongst the kinds shown for the best twelve new varieties are sorts about as good as yours." As may be imagined, I was soon in search of these rivals. What was my astonishment to find eleven out of the twelve plants staged were my own kinds, but the exhibitor had forgotten to attach the raiser's name to them. Finding several other collections contained varieties of mine, all without acknowledgment, it struck me our object, at any rate mine, was defeated. My object was a purely selfish one: I wished to see my sorts well grown and brought in comparison with those of others; and no doubt those who offered similar prizes under similar conditions were also disappointed, for I was the only one who repeated the offer this year.

Now, I think the object of the Society in offering prizes for new plants ought not only to be the enabling the members and visitors to judge what is the best worth cultivation, and to reward the growers, but to do honour to the raisers of the best varieties. As it is now, good things are welcomed, those who produce them are ignored. Charity ought to be performed in secret; but when we as a rule see objects of art and things of value sent out by men who wish to be unknown, then and then only need we be ashamed of our desire to be recognised. It is

unjust that persons should be assisted in taking credit to themselves that belongs to others. Let us have a fair field and no favour. Let the Society offer good prizes worth trying for, for collections, subject only to the conditions that name and raiser's name be attached to each plant, and then those interested in the matter will, I have no doubt, willingly help to find the funds. But if it is to be done it should be done at once. Time is necessary to prepare plants worth exhibiting. J. R. PEARSON, *Chilwell*.

FROME ROSE SHOW.

Will you allow me to write a few lines concerning a most commendable effort that has been made by some gentlemen at Frome Selwood, Somerset, to hold a good Rose show?

For some three or four years we have had what is called a Rose club at Frome, and also at Warminster, two towns where the Rose is, I may say, worshipped. I do not know, by the way, why the term "club" is given to our little affairs, except that they are so small that perhaps our committees hesitate to call them societies. The schedules of our show have hitherto been very simple affairs, and the rules of the club rather too simple in my opinion. We give prizes for twenty-four, twelve, six, and even one variety of Rose; but we only allow members to take one club prize, which makes it rather a poor look-out for outsiders like myself to travel eighty miles for one prize; but it is for the honour of the thing, and also for the encouragement of Rose-growing that these clubs have been formed, and the wise men who originated them think that one way to bring about this latter desideratum, is for there to be every reasonable probability that each exhibitor should take some sort of a prize. But for the encouragement of outsiders, as well as other members of the club, Mr. Keynes, of Salisbury, and Messrs. Durbin, and Pavitt, of Bath, give extra prizes which may be carried away in addition to the one club prize, so that you may (as I am happy to say I did this year) carry away four first prizes.

This season, however, the Frome club determined to do something great, and after great efforts on their part actually gave an open prize of £20 for twenty-four distinct varieties, three blooms of each. At least they divided £20 in this way: first prize £15, and second prize £5. This great inducement brought some of the largest growers in England. Cranston thought it worth his while to send all the way from Hereford; Prince came himself from Oxford with most magnificent specimens from his seedling Briar, which perfectly astonished me. Their marvellous freshness, considering the hot night we had and the long journey, their robustness (the date was July 19th) at the time of year, their form and colour, indeed their "good all round" condition was wonderful. Mr. Cant—the brave, the enterprising, the grand grower from Essex, came with blooms that would have been superb if they could but have been seen the night before. Mr. Bennett, of Stapleford, put in an appearance, and one, too, which was so good that in any other company he would have been *facile princeps*. Last of all in enumeration, but first in merit, as the Judges decided, came my friend the veteran grower from Salisbury—the, may I be pardoned if I say, historical "Johnnie Keynes." Fresh from his nurseries with Roses cut that very morning, or at least the night before, came the good old man, and what a sight his boxes were! "In to a day, my dear sir; in to a day!" he told me at Salisbury two days before, and indeed he was, as his Moss Roses proved. I went round them carefully, and I think I never saw before such a good general bloom as he had. "Oceans of bloom" is the only phrase I can employ; and ah! Messrs. Editors, what joys, as I write this, does this term cause me! I saw long lines of every Rose I love. I saw thousands of such Roses as Lefebvre, Rothschild, Baumann, Olibo, and all the new ones. I wandered down long lines of such shy bloomers as Louis Van Houtte and Lord Macaulay, and each Rose seemed to me more perfect than the last. I could have spent a week in that nursery, and then not cry "Enough." The hospitable owner had almost to drag me to dinner.

Well, gentlemen, this grand old grower, who, as he fondly and proudly boasts, has taught the Rose world a principle which is the very foundation of success in exhibiting—viz., disbudding, came to Frome, and not only came, for *venit, vidit, et vicit*. He took the first prize; he did more—he actually took it home with him in his coat pockets, "*all in silver*." Yes, that game old fellow with a most smiling face and a most loaded person, walked off with £15 in shilling pieces, paid to

him by the Hon. Sec. from the gate money; but Mr. Prince ran him uncommonly close. I believe the judgment was perfectly right, but I went through those stands time after time all through the day, and I never saw, except for our prize at Exeter, a closer thing. Bravo the seedling Briar! To fight Mr. Keynes almost at home, and to press him so hard as Mr. Prince did at Frome, speaks volumes for the staying enduring properties of that stock. I do not know how we are to do without cultivating it if we wish to exhibit at the later shows, for the hot suns of July make short work of Manotti and standard Roses, and the seedling only comes to perfection when the others are done. The Teas that I bought of Mr. Prince are now just in their first beauty against a south wall, whilst the other Teas are preparing for their second blooming. I do not think an exhibitor who wants to ensure a succession can do better than buy a certain quantity of seedling Briar Roses of all the best sorts. He will then, in my opinion, be able to show at the Crystal Palace, and if he likes at Gratham on the 25th of July.

At Frome this year Mr. Prince showed a treble of Baron de Bonstetten, exceedingly good; indeed, all his high-coloured Roses were perfect. He spoilt his box—and at every show yet, in my opinion, he has done the same—by staging great coarse specimens of that abomination Paul Neron. What beauty can there be in this Rose? It is large, immense indeed, but it is coarse, washy in colour, and generally of very bad form, and yet there are some good judges of Roses who always show it. My friend Mr. Turner, of Slough, is never without it, and it did more to spoil his box, and so make him lose the first prize for seventy-two at the National, than anything else.

At Frome, as elsewhere in the country, wherever a Rose show is held, hospitality was the order of the day, and how kind our good friends at Frome were I cannot tell. One gentleman, in whose grounds the Show was held, a perfect stranger to me, took me to his house, put refreshments before me, told me that he must leave me, but begged me to make myself at home, stay as long as I liked, do what I liked, and I should delight him. And I did, Messrs. Editors: I found a shady tree on his lawn near the band (the excellent band of the 15th Regiment), lay down, listened to the music till (I blush to say it) I went off into a most delicious dose; then at six o'clock I went to evensong at the glorious church which Mr. Bennett has made famous throughout the world. Late at night I landed at Bridport, with ten miles' drive before me, and the comet to light me on my way home.—JOHN B. M. CANN, *Monkton Wyld*.

ROYAL HORTICULTURAL SOCIETY.

AUGUST 5TH.

FRUIT COMMITTEE.—Alfred Smee, Esq., F.R.S., in the chair. It having been brought to the notice of the Committee that in the schedule of the Exhibition on September 2nd no number is specified as to the quantity to form a dish of Potatoes, it was decided that henceforth a dish of Potatoes shall consist of nine tubers.

A Cucumber called Green Gem was sent by Mr. Dean, of Bedford, which was passed. Messrs. Cuthush & Son, of Highgate, sent specimens of Princess Alice Cucumber, a good, prolific, and hardy variety of good deep colour, but it was not thought any better than other varieties in cultivation. Mr. Alfred Smee brought specimens of autumn-sown Tripoli Onions of various kinds, from seed supplied by Messrs. Carter & Co., which had been manured with phosphate of ammonia. They were very good specimens.

Two very handsome specimens of Smooth Cayenne Pine were sent from the Royal Gardens at Frogmore. They weighed 9 lbs. each, and were awarded a cultural commendation. Mr. A. Crawford, the Gardens, Thornden, Brentwood, sent fruit of a seedling Nectarine. This was of an excellent flavour and a good fruit, but it was so similar to Elrge that the Committee thought it was not advisable to introduce it as a new variety. Mr. Sage, of the Gardens, Ashridge, brought excellent specimens of Walburton Admirable. Mr. J. Clark, Roehampton, sent a dish of Moorpark Apricots, which were of good flavour. Mr. Woodbridge, of Lion House Gardens, Isleworth, exhibited five different varieties of Plums. Mr. N. Kneller, Malshanger, sent a seedling Melon, which was not sufficiently good to merit a certificate.

FLORAL COMMITTEE.—Mr. J. Fraser in the chair. The number of subjects submitted to the Committee on this occasion was small as compared to those brought forward at the earlier meetings. Messrs. Veitch had a first-class certificate for a seedling

Zygopetalum with a bluish purple lip and brown-black sepals and petals—a very effective flower. The same firm also sent a choice group of Orchids, including fine specimens of *Odontoglossum Sealeperianum*, *Saccolabium Blumei majus*; also *Cypripedium Sedeni* and *Dominianum*, together with *Dendrochloa fassus* and other ornamental Palms.

From Mr. Ball, of Chelsea, came a group of new plants, as *Campsidium filiciforme*, *Picus Parcelii*, *Odontoglossum Reelii* with a charming flower, *Verschaffeltia melanochates*, &c., which have been noticed in previous reports, together with *Metroxylon filare*, a handsome Palm for table decoration, which received a first-class certificate. Mr. Denning, gardener to Lord Lonsborough, had a like award for a *Dendrobium* with very small but extremely numerous orange flowers, marked with narrow purplish streaks. Messrs. F. & A. Smith, of Dulwich, sent a splendid group of Balsams; Mr. Offord, nurseryman, Upper Clapton, an *Ageratum*, called Clapton Gem, but of coarse habit, though producing large heads; Mr. Eckford, gardener to the Earl of Radnor, Coleshill, a stand of seedling Verbenas; and Mr. H. Loder, gardener to H. B. Hinnell, Esq., Forest Hill, a gigantic specimen of *Lilium auratum* in an 11-inch pot, with two spikes 10 feet high, but the flowers past. G. F. Wilson, Esq., Heathside, Weybridge, had a first-class certificate for *Lilium speciosum atrosanguineum rubrum*, coloured like the true *L. speciosum rubrum*, but with flowers larger (fully 8 inches in diameter) and much earlier, the typical variety being one of the latest of the group. Mr. Rudolph Barr again contributed a group of Lilies, consisting of about a dozen species and varieties.

Mr. Kinghorn, of the Sheen Nurseries, Richmond, exhibited a *Fuchsia*, called *Richii*, sent to H. W. Powhall, Esq., by Dr. Suter, Bishop of Nelson, New Zealand. This received a botanical certificate, and was subsequently identified as *F. procumbens* (*R. Cunningham*). It is a neat basket plant, but presents nothing remarkable in its flowers, which are small, nearly erect, yellow, with purplish stamens. Mr. R. Dean, of Ealing, sent cut flowers of African and French Marigolds, the latter very fine, and recommended for bedding, but there was no means of judging of the habit of the plants. Some cut flowers of shrubs were also shown, including *Pavia macrostachya* and *Clethra arborea*, of which the flowers bear a striking resemblance to those of the Lily of the Valley. From Messrs. Paul & Son, Cheshunt, came a large collection of cut Roses.

PACKING FRUITS.

To prevent the placing of boxes of fruits and flowers on their sides, it has long been my practice to tie one, two, or three boxes or baskets on the top of a larger one, so that one position only is left for the parcel to rest on. But a basket with a cross-handle, and strong wooden or osier lid, I find is the best article to use. A Peach-box or flower basket, if flat, can act as a bottom tied to the other. I have found no plan so satisfactory as this. Of course it is very important that nothing should be moveable when packed; no shaking of trains or vans should put the articles out of their place.

Grapes are generally sent into Covent Garden in cross-handled baskets, named Sea-kale baskets, placed on soft paper shavings, with clean paper next the fruit. Each bunch is placed upright, as close together as they can be packed, but not wrapped in anything, as the bunches rub each other less than any material which can be used; thin paper is placed over the top, and wadding or soft shavings used to fill up any vacancies between the fruit and sides of the baskets.

There are few fruits which wadding does not taste when placed next them. Thin tissue paper should be between the fruits and wadding.—M. TEMPLE (in *The Gardener*).

LESSONS FROM THE DROUGHT.

THROUGHOUT the greater part of the country the drought has been severely felt. In some parts it has been disastrous to the farmer; and coupled with the dry and frosty nights, has had disastrous effects on nursery stock and on gardens, the cause of much anxiety and extra labour in watering and other care, wherever trees and shrubs have been recently moved on any extensive scale: even those moved early in autumn with balls, and which looked quite fresh up to the middle of April, though quite taken to the new positions, suffered nearly as much as those spring-planted, simply because they had not had time to root deep. When the moisture became exhausted from the immediate surface, they were in equal distress with those planted in spring.

In pulling up some shrubs lately which were dead, or seem-

ingly so, a rather curious appearance presented itself: the roots were bristling with young white growing points, showing that there was plenty of life there, although the knife showed by cutting the bark that the stems were dead to the surface of the soil. Those plants, *Cupressus Lawsonii*, had been repeatedly watered, but had failed to keep the part above ground alive; evaporation had been too rapid throughout the heat and dryness of the day, and coldness and equal dryness at night, that the plant became exhausted in consequence. Shade, therefore, in this case would have been much more beneficial than watering, but for the practical difficulty of shading trees and shrubs per acre.

Exhaustion, we need not say, in a more or less aggravated form, was the general effect on vegetation, but in a very different degree on different subjects: whereas some plants became permanently paralysed, others only seemed to husband their energies and become exhausted in appearance only. Broad-leaved plants such as *Rhododendrons*, *American Azaleas*, and the broad-leaved Japanese plants, suffered permanently, especially those subjected to the full blaze of the sun, and we believe more from the actual heat than the drought. The sun at 100° to 120° blazing on them actually had the same effect as fire—we mean that the atmosphere heated to that extent would not have affected the plants in the same way had they been shaded. Almost the whole of the *Coniferae* within our experience, which includes a good many representatives of the family, stood the drought well, their wiry foliage being capable of withstanding a dry atmosphere, like the *Acacias* and other similar-leaved plants of Australia. We refer to recently-planted subjects; and now since rain has fallen, they are starting to grow with a bound; they make multitudes of roots with greater freedom when seemingly in an over-dry state. This is strikingly illustrated in the case of two specimen plants of *Thuja's dolabrata*, both which had in winter occupied prominent positions temporarily for the purpose of decoration, from which they were removed in March. It was June when one of them became extremely dry at the root, while the other was even wet; both are equally fresh at top, but the dry one has made an enormous mass of fresh white roots, while the other and wet one had not made any. What has been the cause of this important difference? Was it the comparative warmth consequent on the dryness that encouraged root-action, or the natural effort of the plant to obtain for its healthful existence moisture which the other enjoyed? The moist atmosphere of winter prevented exhaustion in the case of the dry tree. Probably *Coniferous* trees as a whole prefer a moist atmosphere and a moderately dry soil. Their natural habitats suggest this idea: the various forms of *Cupressus Lawsonii* seem to stand drought the worst.

In the kitchen garden the heat and drought have had similar effects on vegetables. Broccoli, Cauliflower, and Cabbages showed exhaustion, in spite of much artificial watering. Those useful vegetables will not stand heat, it is foreign to their nature. Onions, on the other hand, though they assume that glaucous bluish green which is the effect of drought, made good their hold in the soil, and when rain came made quite a rush into growth. Water in their case would be beneficial with a scorching sun; but the Cabbage tribe under strong sun, even with sufficient root moisture, make a flaccid and weakly growth. Herein lies the superiority of Scotland over the South in the matter of small fruits and succulent vegetables, and it is foolish to make disparaging comparisons of the respective cultivations. The French are not supposed to excel in summer vegetables, and the northern gardener is supposed to beat his southern neighbours; but if the matter be closely inquired into, it will be found that climate has most to do with it, and not altogether cultural skill. A hot dry atmosphere will cause young Cauliflower to bolt and open their heads in spite of the cultivation, and Cabbage will refuse to make solid crisp hearts; but we in the south may fairly claim to know more about the cultivation of French Beans, Scarlet Runners, Tomatoes, Vegetable Marrows, &c.

Such a season as the present teaches us lessons which have been learned generations ago in Spain—the value of water and irrigation. All watering under such intense heat is useless unless thorough, or in the shape of complete irrigation. This we have been in a position to prove this season by having an abundant supply of water at various points and scarcity at others. At one point we were able to allow water to run in a stream among some Roses, and their freshness and fullness of bloom was a complete contrast to others. Moreover, these irrigated Roses have been completely free from blight, while

others were hopelessly infested, and we irrigated a large portion of flower garden with marked results under the bright sunshine. No garden can be called complete without a ramification of pipes and hydrants, and an abundant supply of water, which is procurable in the majority of gardens. Water is more particularly necessary in the fruit garden. The flowers and vegetables are too apt to get a full share of water at the expense of fruit trees. Heat and dryness have a ripening or maturing effect on the wood of fruit trees, but in conjunction with plenty of nourishment at the root, otherwise they have a decidedly exhausting effect; and although wood may appear ripe, and abundance of fruit buds set, say on Peach trees, the following spring will most assuredly tell a tale of bud-dropping, fruit not setting, and disappointment at the stoning period. And the same remarks apply to fruit trees in general. Shade is a most important auxiliary in a variety of cases during a season of excessive heat, especially in the case of newly-planted trees and shrubs, while watering at the root will be found of no avail to keep plants alive. Shade in some form will be quite successful. It obviates the scorching effects of the sun on a plant, the cultivation of which has been impaired by removal. Materials for shading need not be expensive or difficult to get. Branches of Spruce or of common Laurel, even a handful of grass or straw thrown over a plant, will shade it sufficiently to carry it through a trying time. The shade of trees to grass enables it to retain its green appearance, while that exposed to the sun is scorched to the colour of hay.

It is a bad practice to mow grass too closely in times of heat and drought. Grass shades itself, and mulches the ground, and so prevents the sun drying up the soil. Moreover, grass condenses, and is an instrument in the manufacture of dew for the maintenance of its own growth. Without the grass dew is not deposited, and it should therefore not be too closely mown in very dry weather. All that is necessary for appearance is an even surface, which can be effected by adjusting the cutters of the machine by a sufficient depression of the front roller. Akin to shade is the benefit derived from the use of the syringe on newly-planted shrubs and trees. Moistening the leaves and branches in the evening assists the leaves materially to maintain life. It may sometimes be possible to moisten a whole clump of shrubs or trees by a hose from a hydrant; or, when such is not attainable, a large garden engine and attendant water-barrel will effect much with the labour of two men. With several hundred feet of hose and a small hand fire-engine we have been able to do good service among shrubs and trees lately planted. A dry spring and a heavy soil have taught us the lesson that the early autumn is the best time to transplant trees and shrubs, not excepting *Hollies* and *Coniferae*.

There is one class of plants that shows wonderful tenacity of life under heat and drought—namely, Mosses and Lichens. No plant seems to enjoy moisture more than they do, even to saturation, when they grow with wonderful rapidity, yet none stand drought better. The sun does not seem to have the power of killing many of them, even on stones that become so hot that one cannot bear the heat with the hand. Even some Ferns bear the dryness with impunity. Large masses of the common *Polypody* may be seen perfectly dried up; to all appearance the fronds are gone, and the roots like a door-mat, yet with the first rain it springs into a mass of verdure.—(*The Gardener*.)

WINDOW POT PLANTS.

THE desire to foster a love of window plants among cottagers has long been experienced by the conductors of our horticultural journals, and it is gratifying to see the headway this branch of cultivation has made, and its beautifying effect on many of the dwellings of our artisans. One drawback I have frequently noticed is that, notwithstanding the owners exercise the greatest care and patience with their plants, these do not seem to thrive properly. In many cases which I have examined the reason is evidently the condition of the pots; therefore a hint or two may be serviceable to many.

It is too often the custom to place window plants—*Geraniums*, *Calceolarias*, *Fuchsias*, &c., in their young state in small and dirty pots, and when the plant has attained a certain size, if it is fortunate enough to do so, to endeavour to remove it to a larger pot. From the originally dirty state of the pot this is found to be a work of difficulty, and the plant has to be literally cut out, and the roots are consequently

injured, often leading to the death of the plant. Before potting plants well wash the pots—no matter whether they are new or old—with warm water and soap. Wash them both inside and out, using a scrubbing-brush. Afterwards repotting is simple. A tap of the hand at the bottom of the pot will cause plant and soil to leave the pot as easily and cleanly as a good cook can turn out the evidence of her skill from a well-battered dish.

The second drawback to successful cultivation to which I would call attention is the prevalence of painted pots. This is a great mistake. All window pots should be porous, and by daubing them thickly over with paint, the outer air is kept from the roots. In place of this let the outside of the pots be well scrubbed with soap and warm water at least twice or thrice a-year. Attention to these two simple recommendations will result in great satisfaction to many who are now perplexed as to the reason why their window plants are not equal to those they see elsewhere.—BERA.

THE DEFICIENT RAINFALL OF THE PRESENT SEASON.

The drought of the present season being remarkable, a few observations on the subject will not be out of place. The following table shows the rainfall in inches and hundredth parts for the first seven months of the driest of the last twenty years, as well as that of the November and December preceding each. I have thought it advisable to add the latter two months, as the copious rainfall which is usual in these doubtless exercises considerable influence on the supply of water for domestic purposes in the following summer; for instance, the effect of the limited rainfall of last November and December is seen in the lack of water in some of our springs. I have coupled in this table the rainfall of one wet period by way of contrast.

RAINFALL AT LINTON PARK, KENT, FOR A PERIOD OF NINE MONTHS.

	1857-58	1863-64	1867-68	1869-70	1873-74	1879-80
	Inches.	Inches.	Inches.	Inches.	Inches.	Inches.
November	2.15	1.85	1.26	2.14	1.73	3.67
December	0.49	1.71	2.42	3.79	0.46	3.82
January	0.79	0.77	3.65	1.66	1.27	2.87
February	0.77	1.36	1.37	1.14	1.31	1.49
March	0.80	3.06	1.29	1.61	0.83	2.61
April	1.93	0.59	1.21	0.43	1.91	2.81
May	2.16	2.35	1.92	1.11	1.21	3.12
June	0.67	1.24	0.71	0.32	2.63	5.09
July	2.63	0.63	0.61	1.95	0.72	2.97
Total for 9 consecutive months	12.45	13.56	11.24	14.21	12.07	27.49
Total for the 7 first months of each year	9.81	10.00	10.56	8.23	9.83	20.00

From the above it will be seen that the rainfall of the past nine months, November and December of last year, and the first seven of the present, is less than that for any like period during the last twenty years; while for the past seven months of the present year alone upwards of $1\frac{1}{2}$ inch more fell than in 1870, and a little more than in 1855. But I find, if we go back another month and include October as well as November and December in each period, we shall still make the present season a dry one, slightly more so than either of the two periods first mentioned in the table, and considerably more so than the same time in 1869-70.

The current opinion, therefore, that we are passing through a dry period is well founded, yet I think there have been summers in which vegetation seemed in greater distress. In general I believe corn is good, and the straw of a full average length. The hay crop has certainly been light, and the pastures at the present time present a burnt-up appearance, yet not worse than they have often done, and not so bad as at the same time in 1868, when, in addition to the turf, many timber trees showed symptoms of distress, and in some places even healthy long-established trees died. I have certainly not met with anything of this kind the present season, but we may have it yet, for at the time I write (August 1st) there are no immediate signs of rain, and of late we have been often tantalised by prospects of it which have never been realised; so that we have given up regarding a close sultry atmosphere, or a cloudy sky and falling barometer, as the indication of coming rain. Very hot days have given place to moderately warm ones without any downfall; and we have in a manner become

so accustomed to dry weather, that were it not for the want of water we might almost think that vegetation was getting injured to it, and rain could be dispensed with. The prolonged drought, however, will tell its tale in the absence or deficiency of after-crops. I may sum-up the results of my observations on the season by saying that I give the good condition in which the ground was during the spring all the credit for what is good in the appearance of the crops at the present time, and will lay all the blame of what is bad on the atmosphere. At another time I will endeavour to explain this, if it requires any explanation; and I will here merely add that I fear more for the next two months than deplore the present, for certainly there has been more than one season in which vegetation was in greater distress than it is now, but I fear the water-supply for domestic use was never lower.—J. RONSON.

DESTROYING WASPS.

I SEE in your paper some observations on taking the nests of wasps. With me the process is very simple and cheap, and in plentiful years I have taken three or four nests in an evening.

In the first place get a small quantity of gas tar, mark the holes in the day, and when the wasps are all comfortably housed for the night pour in a moderate quantity of tar, then stop the hole with a wisp of straw previously dipped in the tar, and you will see no more of them. In one case the nest was in some loose peat soil with many holes preventing the tar being poured in. I took a sheet of brown paper well covered with short fibrous matter mixed with tar, and pegged it down, covering the whole of the holes, when no wasps escaped in the morning. My gardeners objected to the risk, therefore I undertook the business, and I believe entirely removed their fears in the simplicity of the proceeding.—JONAH S. WELLS.

"B." asks (page 28) if anyone knows of a better plan than his. I find the best and easiest plan is to go with a lantern when dark, and light a squib about 6 inches long, put a piece of clay in the hole, and in less than five minutes the nest can be dug out.—C. PURROTT.

HAVING seen in No. 695 the modes of treatment adopted for the destruction of wasps by your two correspondents, "H. W. S. C." and "O. Orpet," allow me to state the mode of treatment I have adopted when troubled with these pests in a former situation, and which, I think, is very simple, and I know to be very effectual. In the first place we used to take a walk round at midday in the vicinity of the garden and adjoining park to find out the nests, and then in the evening, when most of the wasps were at home after their day's mischief, we took with us a bottle of Scott's wasp-destroyer, some wadding or wool, and a small stick, first well moistening the wadding with the mixture (only a small piece of wadding is required), and then inserted it into the holes. In the morning, to satisfy ourselves, we have gone round and dug the nests out, and in not a single instance have I found a live wasp. The same remedy has also proved most effectual in vineries during the day. On going round the bunches of Grapes, and where the wasps had begun to eat the berries, we dropped a little of the mixture from a pointed stick into them. They devour it greedily for about a minute, then reel and tumble on the floor dead. I can say I have swept them up by hundreds. The wasps will, after a day or two, be, to use the words of the gardener under whom I was then serving, completely driven out of the houses, as the mixture smells rather strongly on a hot day, although it is not in any way disagreeable.—F. H. FROUD, *Putteridge Park Gardens*.

FORMING A GARDEN ON PEATY SOIL.

I AM about to convert into a garden about two acres of old grass land. It is principally peat, from 5 to 7 feet deep. I purpose first to plough it, and, after it is dry enough, to burn it, and spread the ashes on the top, ploughing it again before winter, during which it will remain untouched.

If you or any of your correspondents know of a better plan than this I should feel obliged by being made acquainted with it.—R. REED.

I should hardly think it advisable to burn all the soil and herbage the plough turns up, assuming it to be ploughed the

ordinary depth, but the turf and other herbage might be pared off with about 2 inches or so of the soil, and that might be burnt. This paring is sometimes done by hand, at other times by a kind of paring plough drawn by one or more horses, but in this case the slice taken off is not so uniformly thin as where the work is done by hand, and patches of turf are often missed. I should, however, certainly recommend paring in preference to burning the whole of the soil turned up by the plough. Paring and burning have often been condemned as diminishing the depth and quantity of staple soil, and trenching or otherwise burying the herbage in the ground that it may decay there has been recommended instead; but peat soil plants as a rule are slow in decaying, so that burning is often resorted to from necessity, and as you say the staple material is from 5 to 7 feet deep, there is ample to work upon.

The first thing I would do with the soil would be to have it well drained if necessary; and as water is often found below the peat it would be well to see to this, as draining can be effected much more easily now than hereafter. In general, the difficulty with peat land is to get it solid enough to retain moisture, and to assist this large quantities of sand, or it may be clay, may be added—sand if the peat does not contain enough of it, or clay if it is of too open a character. I am unwilling to recommend lime, as it is so destructive to vegetable substances that it would destroy what ought to assist in supporting several crops; but if it is a sort of sandy peat, lime may be used moderately. In general, however, the ashes resulting from the burning will be sufficient for one year, and the appearance of the crop will afterwards indicate what is best. Potatoes, most root crops, and Celery do well on such a soil, also Asparagus and Lettuce, while for the Cabbage tribe it is not so good; still in fresh soil nearly everything succeeds for a time, and I have seen excellent Plums produced.

Full exposure during the winter is necessary to drive wire-worms and other insect life abounding in a soil that has not been in cultivation; therefore plough it before winter as you propose. But I would recommend that if possible one half of the ground should be pared and burnt, as described above, and the other trenched by hand, burying the herbage no deeper than is necessary to prevent its again vegetating, and keeping as much of the top soil at the surface as possible, but stirring the whole to the depth necessary for all kinds of crops. A comparison of the two pieces would probably show that for the first year, and perhaps a second, that subjected to paring and burning would produce the better crops, but after that time I imagine the other would have its turn, and maintain its superiority for some time.—J. RONSON.

GOLDEN CHAMPION GRAPE SPLITTING.

From a reply to a correspondent recently, I observe that this Grape is splitting with him. It does so at times when there is an excess of sap sent up by its over-vigorous roots. The remedy for splitting in the case of any Grape is so self-evident that one is at a loss to conceive why it is not applied the moment the first berry gives way—namely, the diminution of the supply of sap by cutting the stems that bear the bunches about half-through a short way below each bunch—that is, between the main stem and bunch.—Vitis.

LEPTOSPERMUM OBOVATUM HARDY IN SCOTLAND.

THE specimen I send you of *Leptospermum obovatum* was taken to-day from an old bush in the gardens of Largo House, Fifeshire, where it must either have been planted early in the present or late in the last century. Largo House, once the property of Sir Andrew Wood, the famous Scottish admiral of the fifteenth and sixteenth centuries, is situated near the birthplace of Robinson Crusoe on the southern coast of Fife, overlooking the song-renowned Largo Bay, and backed by the scarcely less noted Largo Law, which rises on its north side to an altitude of 948 feet. In the grounds are numerous large aged specimens of *Arbutus*, Sweet Bay, Evergreen Oak, common and Portugal Laurels, &c., which give unmistakable evidence of the mildness of the climate; but I have nowhere met with such an old freely-growing specimen belonging to this peculiarly elegant genus of Australasian *Myrtaceæ*.—W. G.

ROCKWORK AT SANDRINGHAM. — Our readers will have remarked the fine bold strata of rocks which are represented in

the foreground of our illustration of Sandringham in our last week's number. We are informed that these rocks are artificial, and were constructed by Mr. James Pulham, of Broxbourne, on whom the extremely natural effect and artistic arrangement reflect great credit.

HOLLYHOCK DISEASE.

Was it not rather hasty to recommend the destruction of Hollyhocks affected by fungus? I see some of my neighbours get some flowers, and the plants in some instances look as if they would fight through the attack. The Mallow, too, has thrown up afresh and is blooming freely. There is a slight appearance of fungus, but very slight at present. I wish now I had kept my plants and seen if they could not have been saved.—J. W. PEWTERESS.

THE HURRICANE LANTERN.

THE hurricane lantern (*fig. 38*), which we now introduce to the notice of our readers, is so called because no amount of agitation either of wind or motion will extinguish it. Besides this qualification, it possesses several others, which render it extremely useful in every household, especially in the country. It is so perfectly safe that no accident from fire can possibly arise through it, except by the most utter carelessness, for the glass with which it is surrounded is so thick that it cannot easily be broken, and is so fixed that it cannot alter its position. The oil with which it is used is paraffin, and the light is a very brilliant one. As a garden lantern, or for country use about stables and outbuildings, it is the best we have seen, as being so perfectly safe and so bright. What a contrast to the old stable lantern, which carries a light but gives little, and which necessitates the removal of the candle when you enter the stable if you are to benefit by its use! We can highly recommend this lantern after having

Fig. 38.

used it, and Messrs. Dietz & Co., of Carter Lane, have conferred a benefit on country people by the introduction.

COPING BOARDS AS A PROTECTION FROM HAIL.

To speak of hail in July would seem to approach an absurdity, yet it is a fact, and in some respects it is feared a sad one. A long term of drought and extreme heat is succeeded by violent thunderstorms, the rain being of incalculable benefit, but the hailstones doing considerable injury. As may be imagined, it is anything but pleasant just when the scarcity of vegetables had reached its height, and when showers came bringing hope of relief, to see the remnant shattered by pellets of ice, as was the case on July 28th. The storm burst over this district (Lincoln) at noon on that day, and in half an hour the ground was covered 2 inches thick with hailstones the size of rifle bullets, many, indeed, exceeding an inch in diameter. The scene was emphatically a wintry one. Flowers are dashed and shattered exceedingly, pods of Peas are cut off, Scarlet Runners hanging in shreds, the foliage of Rhubarb and the Cabbage tribe riddled, foliage cut off trees and hedges, and fruit bruised severely. On some walls destitute of coping both fruit and foliage have been extensively cut off trees, and I am quite satisfied that had it not been for a 14-inch board-coping on a south wall the fruit of Apricots would have been spoiled, and the foliage of young Peach trees cut in shreds. I can see this from the stray shoots which have broken loose or stand out from the wall being in tatters.

Taking advantage of Mr. Luckhurst's experience as given in this journal, and having a lot of 7-by-1-inch deals by him, my

employer had them battened together and put up. We are satisfied they are a great protection from frost in winter and spring, and have now proved their usefulness in saving both fruit and fruit trees from the damaging effects of hail in summer. I am of opinion if these overhanging wood or glass copings were in more general use, that wall fruit would be more plentiful, and that Peach trees in cold localities would be in a substantial measure preserved against the destructive effects of severe winters. There would seem to be some misgivings lest the coping should be in some way detrimental to the trees by being left up in summer. It is not so, at any rate with walls of 10 feet high and upwards; with lower ones I have no experience. The boards here are easily moveable, but instead of making a mistake in leaving them up we should certainly have erred in taking them down.

The track of the storm was narrow—a mile or two wide, and had the corn been ripe the loss must have been immense; as it is, a great deal is knocked out.—J. WRIGHT.

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 22.

RECENTLY I have been somewhat amused at a popular misapprehension into which a number of people, otherwise tolerably shrewd, seem to have fallen. As I was pointing out to a friend the beauties observable in some insects I happened to remark that in these small animals there are variations in form and colouring which are, as it were, a compensation for their minute dimensions as compared with creatures ranking above them in the series of Nature. My friend pondered a little; I perceived some unsatisfactory idea was working in his mind. At last he brought it out. "Yes, that's true; but surely you don't call butterflies animals!" "Why not?" I answered. "They are as much entitled to the name as a dog, an eagle, or a fish. The word 'animal' certainly covers (without being over-particular about creatures near the boundary) all insects, and indeed whatever, by possessing sentient life and the power of moving about at its will, shows that it does not belong to the vegetable kingdom." But I found, on inquiry, that my friend was not solitary in his opinion; people frequently assume that an "animal" does not belong, as an appellation, to the lower classes in our zoological arrangement; and the error is also perpetuated in print, as I detect in several books the phrase "animals and birds," where the author evidently means "quadrupeds and birds." Of course a quadruped or mammal is an animal, still the possession of four legs gives no special claim to the epithet, and a two-legged bird, a six-legged insect—nay, a hundred-legged *Julus*, has an equal right to it.

Several of the butterflies that are regarded as specially associated with fields and lanes visit our gardens in the summer, not for the purpose of depositing eggs upon cultivated plants, nor even upon the grasses of our lawns; they are drawn by the attractions of the flower beds, perceived by them at a good distance off—certainly not by sight, but by smell or some other sense unknown to us. Entering the conservatory or the hothouse their end is often an unfortunate one; failing to find their way out they beat themselves hopelessly against the glass, or are made prey of by some prowling spider.

The Large Heath, also called the Small Meadow Brown (*Euphydryas Tithonus*), is a butterfly that may be noticed on garden flowers in July and the beginning of August, and it has a peculiar habit of pitching upon a leaf before it approaches the flower it is in quest of, and, having settled, it turns itself round. Usually the insect settles at first with its head away from the observer, and coming by the "right about face," it looks towards him. This species, like its relatives the Meadow Brown and the Wall butterfly, belongs to the group of butterflies called "Satyrs," though the appropriateness of the name is not apparent. I do not know whether the satyrs of the mythologic stories were slow in their movements, one would rather conclude just the reverse of that; but the Satyr butterflies are tardy fliers, and amongst them *E. Tithonus*, also unlike the hunter from which it takes the specific name.

This species, though not a showy one like the gay *Vanessas* that float on the summer breeze with marvellous rapidity, has elegant markings; the bordering of all the upper surface is brown, the centre of the wings a reddish brown, varying in shade, with two black spots on the fore wings enclosing white pupils. The under side has most variety of marking on the hind wings, displaying marblings of grey on a darker ground, and having four dark spots with white centres. The yellow

eggs of this butterfly are laid upon the blades of common grasses, each like a pyramid in miniature seen by a magnifier, but marked with a number of ribs. When the larvae come forth in August they feed for a month or two, not much increasing in size before the winter sets in, when they become torpid and sleep till the spring at the roots of the herbage. In the spring the larvae feed again on several Grasses, being partial to the Couch Grass (*Triticum repens*), so that they may be considered of some slight utility to the agriculturist in checking the growth of this pest. These larvae are spindle or shuttle-shaped, with small heads and two points at the anal extremity of the body, which is of an olive green, or sometimes a dull brown colour, with a dark stripe down the back, and two pale stripes on each side. The chrysalis is hung head downwards from a grass stem or leaf to which the larva had previously spun a pad of silk.

A much handsomer butterfly than this is the Wall (*Pyranga Megara*), a little like the preceding in the general aspect of the upper surface, but larger; and if we turn a specimen over to examine the under side we find it beautifully marbled, the colouring being several tints of brown and grey. The principal effect is, however, produced by six black spots on the hind margin, each of which is surrounded by four rings of different colours. This insect, which I have known to receive among entomologists the familiar name of "Meggie," does not often enter gardens, though so partial to roadsides and open spaces. The appellation of the Wall butterfly was given to it from its habit of pitching on walls or palings, pausing there until some bypasser comes near, and then darting off with speed. Indeed, it is capable of more rapid flights than others of the Satyrs, and I have seen it soaring so high in the woods as to be mistaken for one of the Pteridaries; whereas at other times parties of these butterflies may be noticed flying languidly about, so that "Meggie" is apt to be capricious. Most years there are two broods or flights of the species, some being out in May and some again in August. The larvae live and thrive upon Grasses like others of the Satyr tribe.

Some of the small butterflies known as the Hairstreaks make occasional excursions into gardens, that of the Black Hairstreak (*Thecla W. album*) amongst these, perhaps from the fact that the larva (*fig. 39*) feeds upon Elm, and rows of this tree are often planted near to the boundaries of parks, and solitary individuals scattered about pleasure grounds. This is an insect that, though by no means common, has seemingly of late years become more plentiful, or it may be that the butterfly had been generally overlooked by observers. It is only within the last few years that English entomologists have succeeded in finding the larva. All the beauty of this brisk little insect lies on the under side; above, all the wings present a very dull appearance. All the wings beneath are greyish brown, crossed by white lines or bands, those on the hind wings assuming the form of the letter W, and along the margin is an orange band and a row of black spots. These wings have also two conspicuous tails. Like its relative, *Thecla Quercus*, the species before us will soar upwards to the height of 50 feet when in the humour, and alight on the higher branches of the Elm; the attraction of flowers, especially those of the Bramble and Clematis in the hedges, brings it usually near *terra firma*. It has not been noted by those who have seen the insect in gardens what particular flowers it most affects of those cultivated and in bloom during July and August. This Hairstreak is seldom observed in the west of England, and it almost disappears as we approach the north. In Scotland and Ireland it is unknown. The young caterpillars appear in the spring of the year, from eggs fastened on the twigs of the Elm by the mother butterflies at this season, these eggs being coated with a varnish-like substance, which protects them from the cold and moisture. In colour, while they are small, the little caterpillars greatly resemble the young leaves of the Elm, and so they are not so easily found, while their dumpy aspect, when we do detect them, almost makes us doubt if they are caterpillars at all, and they glide along in slug-fashion, with the head hidden beneath the next segment. They possess, however, the usual "outfit" of legs, but these are inconspicuous. The woodlouse-shaped body has a ridge running down the back, which is brown in the full-grown caterpillar, and edged round with yellow. At that age it is more noticeable among the Elm leaves, though collectors most frequently obtain it by beating the trees into a net. Having ceased to eat, the caterpillar passes a silken band across the body and turns to a chrysalis, having only a repose of about three weeks. I may add that in the August number of the "Entomologist,"

the Rev. J. W. Mills states that he has found this summer a number of *Thecla W. album*, attracted by the flowers of the Lime tree in his garden.

About gardens, even in the vicinity of London, the delicate little creature with a long Latin name and a short English one, best known by the latter—viz., the White Plume (*Pterophorus pentadactylus*), flits about by day and night, looking much like a snowflake in the dusk of evening. The wings in

this, as in the rest of the Plumes, are cut into divisions, the fore wings forming two of these on each side, and the hind wings three, so that there are ten divisions instead of the customary four wings of the moth families. By Mr. Wood this feathery moth is ranked among the useful insects, because the larva feeds on the Nettle. Were that the general fact, it is not sufficiently numerous to make much inroad upon this prolific weed; and though I do not doubt the correctness of

Fig. 39.—CATERPILLARS AND BUTTERFLIES OF *THECLA W. ALBUM*.

the statement that the larvae have been found on the Nettle, I have myself taken them in the act of devouring the common Bindweed of the hedges (*Convolvulus Sepium*), and also occasionally on the garden *Convolvulus*; though, on the other hand, if the insect is not a friend, I will not call it an enemy of the horticulturist. The caterpillar, of course diminutive in size, is prettily marked with green, white, and yellow, and when full-fed it spins upon a leaf a silken coating, and attaches itself thereto to become a chrysalis, in the mode of some of the butterflies. To view the scales or plumes of this moth to advantage we must place it under a moderately strong microscope, when the beautiful feathering of these and their satiny lustre are brought out. It has an odd fashion of resting with extended wings, not folding them, as do most moths in repose. I have not been able to verify the assertion of some authors,

that these moths are called "ghosts" or "spectres" by country folk. What is called the common Plume (*P. pterolactylus*), also shows itself in gardens, with what special intent is not so easy to say, as the food-plant of the larva is the common Thistle, and one can hardly suppose that this little moth is a flower-lover. The wings of this Plume are dull brown, with some grey and red markings. But the handsomest of all the Plumes is the rare Rose Plume (*P. rhododactylus*); not so named because it feeds upon the Rose, but because the wings are suffused with rose colour, varied in the upper wings with white, yellow, and green. The Twenty, or Many-cleft Plume, must be mentioned lastly, as a visitant to outhouses and tool-sheds in gardens, though seldom seen on the wing. Here we have twenty, or, properly speaking, twenty-four plumes, which radiate almost in a semicircle. The species is

not sufficiently abundant to be injurious to the Honeysuckle, upon which the caterpillar and chrysalis have been taken, so that our admiration of it is not checked by any apprehensions. It is curious that in the autumn and winter months this small insect abides unmoved in some resting place it has chosen, keeping closely pressed to the wall until the spring with its genial warmth stirs it up to active life.—J. R. S. C.

THE LARGE VINERY AT LONGLEAT.

In the notes we made of a visit to Longleat, in Wiltshire, twelve months ago, we remarked that the great vinery which has been erected there since Mr. Taylor took the management of the garden was in our opinion the finest in the kingdom. We have never seen anything to compare with it, with the exception of that at Chiswick, which, it must be remembered, was built for a conservatory and not for a vinery. We are

now enabled to give a representation and description of this remarkable structure.

This magnificent vinery (represented in *fig. 40*), is 216 feet long and 30 feet wide in the clear. It is divided into three compartments, the first of which, 56 feet in length, is planted with Black Hamburgh and one plant of Chaptal. The second division, with the exception of one plant of Golden Champion, is entirely devoted to Muscat of Alexandria. The third division has one Trebbiano, one Mrs. Pince, one Strawberry Grape, two Madresfield Court, two Muscat of Alexandria, one Gros Guillaume, ten Lady Downe's, and eighteen Alicante. Madresfield Court is to be removed from this division, not because it is not a good Grape—it is one of the best in existence—but it is not a late-keeping Grape, and ought to be in the Hamburgh house if it cannot have a house to itself.

The Muscats are planted 7 feet apart, and are not kept so closely pinched-in as Vines usually are. The treatment seems

FIG. 40.—THE LARGE VINERY AT LONGLEAT.

thoroughly to agree with them, for it has rarely been our lot to see such a house of Muscats. The plants were struck from eyes in 1870, and were planted in July of the same year; but they look much older, and are carrying a crop of six or seven large bunches each, the berries of which are so closely packed together, that those who consider the Muscat of Alexandria a shy setter might fancy it was another variety. This, however, is not the case. The success is brought about by Mr. Taylor's common-sense way of treating Muscats like other Grapes instead of coddling or roasting them with a high night temperature, 55° being considered quite high enough during the flowering period. The Grapes are now changing colour beautifully, and promise to be all that can be wished for. None of the Vines in this range are to be forced: it is intended merely to supply Grapes from August to April.

The borders were formed in the simplest possible manner, turf being ploughed-up and carted at once, and fitted together in its place like so many bricks, only there was no mortar used; a very slight sprinkling of boiled 1-inch bones, about a hand-ful to a cartload, being all that was mixed with it. The bottom, being a blue clay, was concreted and well drained. The border is at present confined to the inside of the house, and there is likely by present appearances to be sufficient room there for the roots for some years to come, but there is provision made for outside borders when necessary.

There are in each division a tank and pump, into which the rain water is conducted, and there is also provision to let in water from another source when the rain water fails.

The heating (by Messrs. Weeks), is also done in a simple and most effectual manner, there being not a single dip in the whole arrangement; consequently it always works with a comparatively small amount of fuel, and there is never any difficulty about the circulation.

NOTES AND GLEANINGS.

AN old and valued friend writes from Toronto:—"Last winter in CANADA was on the whole a moderate one, but with some excessively severe weather occasionally. The spring was very backward—two weeks later than usual—and the summer has been cool, with frequent heavy thunderstorms. The fruit crop will be good in some parts, and very indifferent in others. Strawberries are at the height of the season now (July 13), but very acid, and lacking flavour; Cherries badly cracked on account of the rains; Currants just turning colour; Gooseberries *nil*. The Colorado Potato beetle has been very destructive, taking off whole fields, and utterly destroying the crop."

— At the LINCOLNSHIRE AGRICULTURAL SHOW, among the most interesting objects, were the seed stands exhibited for

competition by Messrs. James Carter & Co., of London, and Messrs. Charles Sharpe & Co., of Sleaford. The Judges awarded a first prize to Messrs. Carter & Co., and a second prize to Messrs. Sharpe & Co.

A HINT.

I AM a young gardener though an old man. I have been trying the last few years to learn gardening from books, and it is a failure. One reason is, every man writes down only his successes, which of course come out from the adaptation of his system to the circumstances of his garden. Under different circumstances the system, though correctly followed, fails. Persons situated like myself want a chronicle of failures as well as of successes, and, above all, the reason why. In my own case I think the reason why I fail is that my garden is so early. A warm south aspect on the slope of a hill brings fruit trees into bloom, and makes vegetables of all kinds two or three weeks earlier than with my neighbours, and as a result the late spring frosts destroy all the promise that was displayed. How can I retard the blooming of nearly three hundred trees? Is it to be done by any method of pruning? I have my place beautiful with shrubs and flowers, and the kitchen garden is fairly productive, but I cannot manage to get any outdoor fruit except against a wall. I have put in bushes, pyramids, and cordons, and at every purchase the nurseryman has assured me the trees would bring fruit enough the first year to pay the cost.

I do not know why I should bother you with this, but as I was writing you it seemed to come from my pen of itself. I daresay another gardener would succeed better, but my man suits me in so many ways I must keep him, even though I lose my fruit by it. Still, if you could give a hint how to keep back by pruning or in any other way the blooming of my trees, I think I should stand a better chance of ripening some fruit. —J. W. PEWTRESS.

MR. T. APPLEBY.

ON reading your account of the distressing circumstances under which our valued old friend and instructor Mr. Appleby is now placed, I forwarded at once, by your advice then expressed, a small contribution to his address.

If a tithe of your readers who year after year have profited by the practical cool horticultural wisdom of poor Appleby would do the same, an amount might be contributed more than necessary to stave off the cruel distress of the present moment until his expected relief becomes available.

Mr. Appleby was, I believe, one of the first to encourage and foster a higher moral tone amongst the young men placed under or with him by his example, conversation, and instruction. Such things are now happily more common than they were; but, doubtless, this consideration alone may influence many a kind heart in sending the sovereign or half-sovereign, or the humbler half-crown, by both high and low, rich or poor, of his old friends, readers, and approvers.

In cases like the present, *bis dat qui cito dat*. Send off, O brother gardeners, your mite at once. —R. T. C.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

WE have just finished summer-pruning the pyramid and dwarf fruit trees. Apple, Pear, and Cherry trees are exceedingly healthy, and the crops of all three are fully up to the average. As much cannot be said for the Plums; the trees are bearing a miserable crop, and have likewise suffered severely from the attacks of aphids, and no variety seems to have escaped. Some of the earliest Apples and Pears have been gathered. Early Margaret, Irish Peach, and Red Astrachan are the earliest. The last-named is a fine-looking Apple, and would be selected as the best by outward appearance; it is, however, somewhat too acid to be classed as a dessert Apple. Of Pears, Doyenné d'Été and Jargonelle out of doors are ready for use. In the orchard house Beurré Giffard has furnished some very fine fruit. This is a most excellent summer Pear, ripening with Jargonelle or slightly before that variety. We make either two or three gatherings of Pears, which considerably prolongs the season of them. Were the fruit all to be picked at once, such varieties as are named above would not be in use more than a week or ten days.

Planted out the young Strawberry plants which had been detached from the parents a week before. When it is possible to do so, the ground that is to receive the plants is not cropped previously—no that it would be much harm in good deep loam,

but in our dry gravelly soil a crop of early Potatoes or early Peas thoroughly abstracts the moisture from the ground, and unless we trench and manure heavily after the crops are taken off, the Strawberry plants do not succeed to our satisfaction. On the other hand, when the ground has lain fallow since the spring months, it is in the very best condition to receive the plants, and success is then a positive certainty. As usual, some of the new sorts have been tried, but there is nothing which comes up to our old standard varieties in the primary quality, flavour. Auguste Nicaise, a seedling raised by Dr. Nicaise, is a very free-bearing sort; the fruit, very large and even in size, is the best that has been tried this year. Sir Joseph Paxton has been exceedingly fine this season, but unfortunately it is one that will not succeed in our soil, and being very subject to mildew was discarded. At the great Exhibition held in Mr. Quilter's grounds, Birmingham, all the prizes were awarded to it; the dish that was first being fine indeed. President and Keens' Seedling are the sorts that succeed best with us in the dark-coloured section. Again, in the light-coloured Pine-flavoured section, one of the very best varieties, Dr. Hogg, also failed to maintain its character, though those who have suitable soil to grow it in place it at the head of the list. British Queen, considered by some more difficult to grow than the other, invariably gives us a good crop of fine fruit. The plants are put out 2 feet apart, except the small-growing sorts, for which 20 inches each way is sufficient. A small portion of rich loam is placed round the roots of each plant, making it quite firm, and leaving a slight depression around each plant for the purpose of retaining the water if it is necessary to apply it artificially. Red spider had also attacked the leaves, to destroy which they were dipped in a pail of water in which soft soap and tobacco had been dissolved. If Broccoli would succeed with us, the ground where the Strawberry plants had grown would be planted with it, and as this vegetable likes compact soil to root into, no digging is necessary; the plants may be let into the ground with a crowbar.

FRUIT AND FORCING HOUSES.

Vineries.—It matters but little whether the season is wet or dry, hot or cold, in our dry soil red spider will surely appear in the vineries, and unless preventive measures are promptly applied the leaves are destroyed before they have performed their work. How to destroy the red spider without injuring the leaves or disfiguring the fruit, is a question of considerable importance. Syringing the leaves will destroy it, if the water is applied with force and periodically. But then what about the fruit? The beautiful bloom, which is the principal point in well-grown Grapes, is quite destroyed, and the fruit is not fit to be seen on an exhibition table, or on any other. Sulphur applied to the hot-water pipes will destroy the red spider; but here again there is considerable risk of the fruit becoming rusty, for unless the fumes of the sulphur are moderately strong the pest will not be killed. Another plan we have tried, and when it is done by a careful person it is the most effective for the destruction of the spider, and for the preservation of the Grapes. It must also be practised on the first appearance of red spider. All leaves attacked are sponged over with water in which soft soap has been dissolved, and if the insect has spread pretty well over the house there is much difficulty in destroying it; also keep from rubbing or letting water drop on the bunches and so disfiguring them. Lateral growths have been freely produced, and we like to see these come pretty strong, as it is a sure sign that the Vines are not overcropped. Of course they are removed as soon as convenient. We are fortunately free from one plague this season, and that not a small one—viz., wasps and bluebottle flies. Various methods have been tried to destroy them, and also to keep them from the bunches. The bunches have been tied-up in paper and medicated bags; but by far the best way, indeed there is none other satisfactory, is to keep the flies out of the house, and this can be easily done by putting gauze over the ventilators. Placing the bunches in bags effectually spoils their appearance.

PLANT STOVE.

Many of the occupants of this structure are much benefited if they are removed to a cool house or even out of doors during the months of July and August. If *Ixoras* and *Gardenias* are infested with mealy bug place them in the greenhouse, where, if they are thoroughly syringed twice daily, this pest will be eradicated, and the plants will flower much more freely the following season when they are allowed to ripen their wood in an airy house.

Bougainvillea glabra is classed as a stove climber, but when well established the plants should be placed out of doors during the months indicated, and be wintered in the greenhouse. It may be said that a plant that will bear such treatment cannot be considered a stove plant at all; indeed, the only claim that it has to be classed as such is, that the plant is improved by being placed in heat in the early spring months. But many other plants that are usually in the catalogues as greenhouse subjects are better with the same treatment. *Statice Hoffordii* is a very fine greenhouse plant, perhaps one of the best of the *Statice* family, but we have not been able to grow it well with-

out heat in the spring months. *Pleroma elegans* requires the same treatment to cause it to grow and flower well. Removing some of the stove plants will allow those that remain to have more space to develop themselves, although at no time should stove plants be crowded.

Climbers have made free growth, and it has been necessary to thin-out the wood freely. It is a great mistake to allow climbing plants to overshadow the house, as those plants underneath that require light and air are much injured by them. As the days are becoming shorter we give more air, and do not allow the shading to be down longer than it is absolutely necessary.

FLOWER GARDEN.

Carnations and Picotees have made very strong grass this year, and before next week's "Doings" appear most of them will be layered. All the choice varieties are grown in pots. In this way we have perfect control over the roots, and it is also an advantage to be able to carry the plants into the greenhouse or conservatory when they are in flower; even if they are planted-out the flowers must be protected from the rains. Of Golden Tricolor Pelargoniums that are scarce, and of which it is intended to increase the stock, cuttings have been put in. All the more tender sorts should be propagated as soon as possible; better to have one good well-established plant than three or four that have been struck late and are with difficulty kept over the winter.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

TO CORRESPONDENTS.

*. It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

BOOKS (*J. Tine*).—We never heard of a work on general gardening written by a Mr. Mitchell. You must make a mistake in the name.

ROSES (*W. A. W.*).—The only way to get a list of all the Roses extant would be to procure the catalogues of all the Rose-growers, which they would willingly supply you with.

FRUITS FOR LEEDS (*A Subscriber*).—You could not have made a better selection, and they will all succeed in the situations you have indicated.

SEEDLING RASPBERRY (*J. D., Knaitsford*).—The fruit was so bruised in the carriage that we could form no opinion of it.

WHITE LILY (*Mrs. Lakenham*).—The Lily you sent is the old white Lily, in which the petals, and, indeed, all the parts of the inflorescence, are converted into white leaves.

AZALEAS AFTER THE BUDS ARE SET (*J. B. B.*).—The plants being now plunged in the open ground, ought to remain there until the end of September, and should then be moved to a light airy position in a house from which frost is excluded. The situation out of doors ought to be shaded from sun during the hottest part of the day, and the pots set on, not plunged, or only partially so, in coal ashes.

ROSES TO FLOWER IN WINTER (*Idem*).—To flower in winter prune the plants at once, and repot, but without disturbing the ball—merely removing

any loose soil. Place in an open sunny position, keeping well supplied with water, but not making the soil sodden, and water overhead morning and evening. This will be sufficient until the plants have started afresh; but water should be given if necessary to keep the soil in a moist healthy state. At the end of September the plants should be placed in a cool airy house having abundant ventilation, and be kept from frost. They may give you some flowers late in autumn and early in winter. The Tea-scented and Hybrid Perpetuals are best, but the Noisette and Bourbois classes are very useful.

DAVALIA CANARIENSIS NOT GROWING (*M. D.*).—We should at once repot the plant, removing all the rhizomes which are dry and sapless, keeping the centre of the plant rather high, and the rhizomes on the surface. Keep moderately watered, and moist overhead until autumn; then keep dry, but only so much so as not to allow of the rhizomes shrivelling. It will succeed in a greenhouse from which frost is excluded. Safty peat three parts, fibrous yellow loam one part, half a part each crocks (broken pots) and silver sand, with good drainage, will grow it well. We think the Lycopod sent is *Selaginella Lyallii*.

POLYPODIUM (DRYARIA) PUSTULATUM PROPAGATION (*M. P.*).—The above is the name of the Fern of which you sent us a frond. It is most generally known as *Drynaria*, but in some collections it is named *Pleopeltis pustulata* or *Billardieri*. Propagation is effected by taking off the creeping stems with a portion of the roots, and potting them singly in pots that will hold the rooted part, the short and branched stems being best, not more than half-covering the stems, and securing them in position with a peg or pegs. Keep moist and shaded it will soon make fresh roots, and begin to grow freely. It is best to take the divisions in spring just before or when the plants are commencing to grow. It may, however, be done now.

HOT-WATER BOILER (*Ledbury*).—There is such a great variety of boilers with but slight differences that we could not justifiably recommend one in preference to another; besides, as a rule, we do not recommend dealers. What you require may be gleaned from our advertising columns. Write to some maker stating the piping required to be heated, and ask for prices. Only a small boiler will be required, but it is well to have one that in power is above rather than beneath that needed.

HEATING CONSERVATORY (*A. F. IS.*).—You will need two rows—namely, flow and return, 3-inch pipes, along the front and both ends of your house. The most economical mode of heating would be from a boiler at the back of the kitchen fire, but so arranged that the hot water could be turned off or on as required, the water circulating to a cistern conveniently situated, and answering for baths, &c.; but care must be taken that when hot water is required for the conservatory, it can be had by the stoppage of the circulation in the cistern. You will need valves in the conservatory as well as in the flow and return from the cistern. Be careful not to have both the conservatory and cistern valves closed at the same time, also to have a proper supply cistern. The same measures are necessary to prevent an explosion. We should not think of having a boiler purposely for this house when you have the means of heating from the kitchen range.

HEATING (*Subscriber*).—Opinion differs as to the merits of cast or wrought iron for boilers. For general purposes cast iron is probably the better of the two. The valves should be within each house, and in the 2-inch pipes rather than the 4-inch, as the cost would be considerably less for the smaller size. Two-inch pipes will answer for the mains, and will give a more speedy circulation than were they of larger diameter, but we presume they originate from pipes of larger diameter, the flow and return in connection with the boiler being more than 2 inches. Instead of three rows of 4-inch pipes being better than two for a propagating pit, we should think four would not be too many, as two will be required for bottom heat, and yet two may be enough.

LETTUCES FOR WINTERING IN FRAMES (*M. A. H. E. L.*).—The best two Cabbage kinds are *Commodore Nutt* and *Lee's Immense Hardy Green* or *All the Year Round*; and *Cos*, *Hicks' Winter White*, and *Bath Cos Sugarloaf*. The seed should be sown in the second or third week of August, and the young plants transplanted under frames in October. We advise you to cover the surface, especially about the plants, with charcoal.

GERANIUMS FOR EARLY FLOWERING—STOPPING FUCHSIAS (*Idem*).—We presume the plants are of the Show, Spotted, and Fancy kinds, not of the Zonal or Nosegay sections. The former should be cut down now, each shoot to within two or three eyes of its base, and should be kept in a cool airy house until they break; when they have shoots about an inch long they should be turned out of the pots, the soil removed, and be returned to the same size of pot. Place them in a cold frame, and in September remove them to a light airy situation, in a house from which frost is excluded. For early flowering the plants should not be stopped, but be shifted into the blooming pots in November or early in December, and the shoots regulated as they advance. In February the temperature may be raised to 45° or 50° by fire heat, in March to 55°, and they will flower in April. Fuchsias ought not to be stopped later than six weeks before the time at which they are required to flower.

APHIDS ON CAULIFLOWERS (*W. K. R.*).—The aphid would be best destroyed by tobacco water, a gallon of tobacco juice diluted in five gallons of water, and applied to the plants overhead with a rose watering pot. Dusting the plants with quicklime early in the morning or late in the evening is very useful, repeating the dusting every second or third day; also a solution of soft soap, 2 ozs. to the gallon of water, applied with a rose watering pot at a temperature of 100°.

ROSE BUDS SCORCHED—PROPAGATING WALLFLOWERS, SWEET WILLIAMS, AND VIOLAS (*Nannie*).—The only way to prevent the scorching of the Rose buds will be to slightly shade them; a little hay or a branch of a tree tied on would answer perfectly. Your query respecting the Vines was answered the week before last; we have no recollection of circumstances prompting the advice. Write to us again with particulars. Wallflowers of all but the double kinds are best raised from seed, the double ones of particular kinds from cuttings. They do best raised annually, the old plants being rooted-out after flowering, or you may keep them for a second year, the parts which have flowered being cut away as well as any straggling growths. Sweet Williams last for several years if trimmed after flowering, and the flowering-stems cut away. The finest flowers are produced on young plants raised from seed annually. The same remarks apply to Violas. They are best propagated by cuttings every year, though they will endure for two or three years. They should be trimmed-in and top-dressed early in autumn.

PLANTS FOR GREENHOUSE (*Novice*).—Unless your house were heated it would not answer for plants in winter. We should advise you to have a stove boiler within the house, with a flow and return 2-inch pipe along the front, which will be sufficient to keep out frost. In this case your house will answer for Camellias, Epacris, Ericas, Acacias, Azaleas, Coronilla, Cytisus, which, with

Primulas, Cyclamens, Cinerarias, and a few bulbs, as Hyacinths, Narcissus, Tulips, and a few plants of *Spirea japonica*, *Deutzia gracilis*, and *Dialytra spectabilis*, would make your house interesting and gay during the winter and spring months. For the outside flower-pot you would see what Mr. Luckhurst advised in late numbers of this Journal, from which select such as are likely to meet your requirements.

MEN REQUIRED FOR GARDEN AND FARM (*A Thirteen-years Subscriber*).—For the kitchen garden you will require two men, and for the lawn, shrubberies, &c., three, for the farm grass land one man, dependant upon what is kept in the way of stock. If you have dairy cows, a man may be wanted for them, and poultry, &c., but if sheep and fat cattle, one man will do. It is the same with the garden and grounds. If there are many walks, an extensive carriage drive, and much mowing by hand, the men named may be under what the work demands; but we think your requirements would be met by a head gardener having a knowledge of grass land and stock, two under gardeners, an apprentice or boy, five labourers, and a shepherd. Extra help would, of course, be needed in hay time, &c.

CONSTRUCTING PIT FOR CUCUMBERS AND STOVE PLANTS (*H. P.*).—The house would be better 2 feet wider and higher, or 9 feet, which will give you more head room, the path being at the back, though we should have a shelf or bed 2 feet wide at the back, either of which would be useful, and a bed in front for the Cucumber plants. It should be 4 feet wide, and have two rows of hot-water pipes for bottom heat. They may either be in a chamber covered with flags, or be surrounded and covered with drainage rubble, and for top heat four rows of piping will be required. They may be 3-inch pipes. Bottom heat may be dispensed with for the stove division, but if you should wish to grow Melons, or change the division for Cucumber-growing, the border with bottom heat would be desirable. The incline of the roof should be 1 foot to 3 feet of width, which will give you a back wall of 9 feet, and front wall of 6 feet, 2 feet of it being sashed.

SPRING FLOWER GARDEN (*A Beginner*).—The design will be much improved by reducing the circles in the chain of outer beds to a uniform diameter of 5 feet, and by shortening the long beds 6 inches at each end, so as to give an additional foot of turf between the beds. The long beds ought also to be reduced from 6 to 5 feet in width, which will afford ample breadth of colour for so small a garden; and if the foot of space taken from the beds is added to the turf outside the design, it will materially contribute to the general effect, and more particularly improve the appearance of the sides skirted by the walks. A fine cone-shaped specimen 3 or 4 feet high of *Perceyia angustifolia* or *Cotoneaster Simmondsii* will answer admirably for the centre. The *Cotoneaster*, from the bold and striking effect of its profusion of large handsome scarlet berries, is perhaps preferable. Paper White is the best Narcissus to dot the bed of *Saponaria calabrica* with. Imperial Blue Pansy is the best of its colour; it is a deep rich blue. *Cerastium tomentosum* is certainly preferable to the *Antennaria* for carpet bedding. *Anemone coronaria*, or Poppy *Anemone*, is the best scarlet *Anemone*. Canary Bird is a fine yellow Tulip, but we would discard it from the beds of *Anemone*, and the crimson *Rox Rubrum* from the corner circles. Nothing can be more chaste than the effect of a bed of the delicate yellow *Cheiranthus Marshalli* edged with *Santolina incana*. The contrast of these and the *Anemone* beds with your beautiful panel beds will be excellent, and far more effective without the Tulips than with them.

DOUBLE BALSAMS (*Balsam*).—We are not aware that old seed produces a greater proportion of double flowers than new. If you get a good strain nearly every plant will produce double flowers, whether the seed be old or new.

FUMIGATING GRAPES (*An Old Subscriber*).—It will not hurt the Grapes to fumigate them to destroy thrips.

GRAPES DISEASED (*D. T.*).—Your Grapes have got the mildew. Dust them with flowers of sulphur.

DESTROYING WASPS (*J. J. Jones*).—You will find instructions in this day's number of the Journal.

SOWING POLYANTHUS (*J. P.*).—There is no better time to sow *Polyanthus* seed than now. Sow it in pans, and place it in a cool frame or spent Cucumber frame, and when the plants are fit to handle prick them out, and you will have strong plants before winter.

BORDER PLANTS FOR AUTUMN AND WINTER (*Anna Liffey*).—The two circular beds on turf would look well with a patch of *Erica carnea* in the centre, enclosed by three rings of grey, yellow, and deep crimson—*Santolina incana* next the *Erica*, then Golden-Feather *Pyrethrum*, with *Ajuga reptans* outside. In favourable seasons *Erica carnea* comes into flower soon after Christmas, and nothing can be brighter at that season than its dense cushions of fine pink. In planting the borders we would avoid straight lines or any geometrical pattern, striving rather to produce a natural effect that is certain to prove most interesting and pleasing, with dwarf shrubs of an evergreen and variegated character. A selection once made would last a lifetime with ordinary care, and by occasional additions of new introductions a rich collection might be formed of the very best of all hardy winter plants. We append a short list. *Erica mediterranea*, *Erica carnea*, *Ledum buxifolium*, *L. latifolium* compactum, *Rhododendron ferrugineum*, *Kalmia angustifolia*, *K. latifolia*, *K. nana*, *K. rosea*, *K. rubra*, *Andromeda floribunda*, *A. Catesbeii*, *A. polifolia*, *Azalea amona*, *Yucca recurva*, *Yucca gloriosa*, *Phylica aurea*, *Santolina Chamaecyparissus*, *Mahonia Aquifolium*, *Skimmia japonica*, *Osmunda variegata*, *Ilex Aquifolium*, *I. torulosa*, *I. Golden Queen*, *Laurustinus*, *Pernettya mucronata*, *Pernettya angustifolia*, *Cotoneaster microphylla*, *C. Simmondsii*, *Hedera albo-marginata*, *H. La Reine*, *H. aureo-maculata*, *H. chrysocarpa*, *H. palmata*, *H. Roemeriana*, *Juniperus tamariscifolia*, *Retinospora leptoclada*, *Retinospora coccinea*.

PREVENTING MOSS ON FLOOR OF GREENHOUSE (*White Rose*).—Dissolve 1 lb. of powdered arsenic in three gallons of cold water, boil and keep stirring; then add seven gallons of cold water and 2 lbs. crushed soda. Stir the whole well whilst boiling, and apply hot to the "quarries" with a rose watering-pot. It will kill the whole of the moss, but must not be allowed to run off on the borders in which the roots of plants may be. It may be kept from these by an old cloth laid on the sides of the pathway; afterwards burn the cloth. It will keep the floor free for a long time. Care must be taken in the use of this remedy, as it is poison.

DRACENAS FOR GREENHOUSE (*Idem*).—Some species of this highly-decorative genus would succeed. They are *D. australis*, *D. erythrorachis*, *D. fragrantissima*, *D. indivisa*, *D. nutans*, and *D. Veitchii*. *D. terminalis* and *D. rubra* would also probably succeed, if the plants had no more water than sufficient to keep them fresh, and were placed in the warmest part of the house. They may be grown from seed, but we believe it is not to be had of seedsmen

in this country. They would make nice plants in two years. The flowers are not remarkable; the plants are grown for the foliage.

POTATOES MAKING NEW GROWTH (*Old Subscriber*).—Are they quite as bad as you say? Have "all" made fresh growths? If so, better dig them up. Potatoes make a second growth when heavy rain comes after a period of drought. They have done so in our own garden this year. Those intended for planting are dug up, but the portion required in the kitchen has been allowed to remain, as only about one-third of the tubers have started to grow.

TREES FOR AN EXPOSED SITUATION AND CHALKY SOIL (*A Subscriber*).—If you contemplate the formation of a screen or protecting belt there is no better evergreen than the robust *Pinus austriaca* for such a position. Of others of this class the best are *Picea pectinata*, *Picea Pinaster*, *Pinus Cembra*, *Thuja Warreana*, with Scotch Fir, English Yew, Holly, and Evergreen Oak; and of deciduous trees take the Larch, Pseudo-Acacia, Elm, Maple, Spanish Chestnut, Turkey Oak, Common and Fern-leaved Beech, and the Birch.

STORING FILBERTS (*Chessington*).—See that the husks are thoroughly dry at the base before storing. A good plan is to place them in glazed jars, and paste paper or other material closely over the tops, keeping them where it is not damp, and where the temperature is tolerably equable—a dry cellar for instance. Or the jars containing them may be covered securely, and buried in a dry situation.

LEAF MOLD (*Beeps*).—The leaf mould you have in a cask we should turn out in a dry open place, and put in layers 2 inches deep, making each layer quite white with quicklime. Let the whole lie about ten days, then turn over, and blacken each layer with soot. After this turn over daily for a fortnight, and your leaf soil will be available for potting purposes.

SUPPORTING FRUIT-TREE BRANCHES (*Idem*).—There is no better method than a forked branch of a tree as a prop, placing a piece of matting in the fork or around the branch of the tree, which will keep it from rubbing with wind. We have sometimes secured the branches with soft rope stretched from the higher to the lower branches, and across, so as to form a balance. This has a much neater appearance, and answers well when the trees have strong central upper branches. Props are certainly not ornamental, but any temporary ungainliness can be tolerated for the sake of utility.

STOVE BOILER INSIDE GREENHOUSE (*J. H. A.*).—There is no fear of a stove boiler injuring the plants by consuming the air, as the air derived from the house for combustion must be replaced by fresh from the external air through the cracks, &c., of the door of the house and laps of the glass. The stove should have a smoke-funnel or chimney taken outside clear of the house to carry off the smoke and vapour resulting from combustion, and have attached to it a sufficient quantity of hot-water piping to exclude frost in the severest weather.

PLANTS NOT FLOWERING IN CONSERVATORY (*W. T. F. M. J.*).—From the fact of Orchids and Ferns doing well, it is patent your house is too dark for flowering plants, due, probably, to position, to the shade of adjoining objects, to the opaque nature of the glass, or to the work; or it may be artificially shaded to meet the requirements of the Orchids and Ferns. Which of these we are not able to say is the cause, but it is evident the flowering plants require more light, and probably air.

CRASSULAS AFTER FLOWERING (*D. D.*).—We conclude that they are Kalosanthes coccinea or allied kinds. Cut down each shoot to within an inch of its base, keeping the plants in a light airy position, and watering carefully. Disbud to two or three shoots on each branch. Repot in the same size of pot when the shoots are well broken, reducing the ball by picking the soil away from the sides with a pointed piece of wood. Winter in a light airy position in the greenhouse, watering moderately. Shift in February into pots of from 2 to 4 inches larger diameter, increasing the supply of water with the growth, or from April up to the middle of June, then place out of doors on slates in front of a south wall or fence, watering as required, and remove to the greenhouse in September. They will flower the following season, staking the shoots or tying them down or out as they advance. The plants will in this case only flower every alternate year. They will flower every year if you only cut back now the shoots that have flowered, leaving those not flowering this year for next; but in this way the plants are not nearly so finely formed as by the other process.

NAME OF FRUIT (*W. F.*).—The Apple is Sheep's Snout.

NAMES OF PLANTS (*J. E. S.*).—*Veronica spicata*. (*H. Pollard*).—1, *Lapageria rosea*; 2, *Polygala grandiflora*; 3, apparently a *Crassula*, but a wretched specimen; 4, a *Begonia* of some kind; 5, *Mirabilis fasciata*. It is next to impossible to name plants from such specimens as these. (*Chas. Clay, M.D.*).—If you will send us a piece of the plant we will endeavour to name it, but we cannot make anything of it by the description you give. (*R. Maitland*).—It is *Selaginella leptophylla*, called the "Resurrection Plant" from the property you describe of opening and closing after it is withered. It does not require any special treatment. (*Flora*).—*Vicia Cracca*. (*Bristolian*).—1, *Calanthe Bractei*; 2, *Cestropis fraphis*; 3, *Polypodium cambricum*; 4, 5, 6, are probably all three varieties of *Selaginella Martensii*, but specimens are all without fructification, so we cannot be certain. (*Alfred W. G. P.*).—*Sedum spurium*. (*Mrs. H. Jones*).—1, *Crassula (Rochea) coccinea*; 2, *Silene Armeria*; 3, *Verbena bonariensis*; 4, *Santolina incana*. (*G. S.*).—*Raphanus Rhipsanthemum*. (*Idem*).—6, *Gentiana cruciata*. All the others are unnameable, being without flowers. (*Mrs. W.*).—*Ischidius linearis*, *Asclepias curassavica*. (*J. N.*). *Nicotiana physaloides*, *L.*

POULTRY, BEE, AND PIGEON CHRONICLE.

MOULTING.

The following notes will answer the queries of "E. H. R."—The natural time for fowls to moult is when the principal work of the year is done, and when the thin worn-out plumage that has been more than sufficient during the summer months must give place to new and better clothing for the winter. It is a great strain on the constitution of a fowl, and could not be properly carried on if any other effort were required at the same time. When, then, the natural season for laying, sitting, and rearing a brood is over, the whole remaining energies of the bird are thrown into the formation of a new plumage. The

older the bird gets the longer the process lasts, but it generally comes to a satisfactory conclusion, except where heating food and spiced condiments are used. The food during the moulting time should be nourishing and cooling. Ground oats slaked with milk are very good; lettuces are excellent; barleymeal, sopped bread, groats from gruel, are all good. All stimulants are bad. A cool body is essential to the formation of healthy feathers. The stub that is to form the feather must have a cool and moist bed in which to grow. Such food as we have named will supply it. Stimulants and heating food dry up all the nutriment of the embryo, and it dies away. Inexperienced people often advise hempseed. Nothing can be worse; nothing is more heating. The effect of feeding a moulting bird on hempseed entirely, and then continuing it as the staple food, is to turn the plumage nearly black. Where birds are fed on it when the plumage should be growing, the feathers die before they attain maturity. Blackened stubs take the place of a bright and healthy plumage, itching follows, and the bird, to allay it, positively eats away the flesh. This is more especially the case with the flight feathers of the wing. Sugar has the same effect on Parrots.

Some breeds moult more easily than others. We know no bird that moults more easily than a Dorking; none moult with so much difficulty as the Spanish. Neither Houdans nor Crève-Cœurs are clever moulters, and we are almost disposed to say that non-sitters are bad moulters.

BUCKINGHAM POULTRY SHOW.

(From a Correspondent.)

This was held in connection with the forty-eighth annual horticultural exhibition on Tuesday July 28th, and was a great success. It is, we understand, to be continued annually, but with some modifications, for however successful any show may be, it is rare indeed that some improvements cannot be suggested for the future. One of the principal we believe will be to throw open the competition, and increase the prizes, so as to have separate classes for chickens; for on this occasion adult and young birds competed together, and in some instances the latter appeared to look rather disdainfully on their seniors in their now tattered garb. Perhaps in no instance were the effects of exhibition more apparent than in a good pen of Dorkings exhibited by the Rev. E. Bartrum, where one hen appeared to be so much beaten that she crouched in one corner of the pen, implying as plainly as actions could, "Give me rest time; I change my dress, and I shall not then be ashamed to face the public again."

The *Game* classes contained some very good birds, but many of their owners appear to want a model for dubbing from the yards of such exhibitors as Fletcher, Matthews, &c. There were some very promising chickens in these classes. Black *Spanish* were few in number, but good in quality. *Cochins* were very good. Especially promising was a pen of Buff chickens shown by Mr. J. K. Fowler, but they require a few weeks' more enjoyment on their runs ere they do battle with their elders. *Bantams* were all in one class, but are to be divided for the future. The Any variety class contained a good pen of Minorcas, also Crève-Cœurs and Houdans.

Turkeys were but poorly represented. This we were surprised at, as we know many good birds are reared in Buckinghamshire and the adjoining counties, but the *Ducks* and *Geese* made up both in quantity and quality for their neighbours' shortcomings.

We cannot close these few remarks without mentioning for the satisfaction of absent exhibitors, that we never saw a better working Honorary Secretary and Committee, who took the entire charge of the specimens committed to their care, ministered to their wants, and stationed themselves at various points, so that the whole Exhibition was under their eyes, thereby saving many birds that large share of unlucky pokes with sticks and even umbrellas from visitors that has become too prevalent to be pleasant to either the birds or their owners. Turner's pens were used, but as we have before remarked, they would be much better if he would strain a piece of calico or canvas along the backs; it would be lighter carriage, and not cost much. With the open wire backs, especially the centre rows, where they stand back to back, some such contrivance would be most beneficial; birds would then face the public, instead of as now continually trying to reach their neighbours. The tent was crowded with visitors throughout the day, and all the specimens were fed and repacked the same evening for the return journey.

OPEN CLASSES.

DORKINGS.—2, Rev. E. Bartrum, Berkhamstead; J. Rodwell, Maidsmoreton. **GAME.**—1, S. Field, Ambrosden, Bicester; 2, J. Rodwell. **SPANISH.**—Black.—1, E. Winwood, Worcester. 2, W. Nottage, Northampton. **BRAHMAS.**—1, H. Wyman, Peterborough. 2, A. F. Faulkner, Thrapstone.

OPEN ONLY TO MEMBERS

DORKINGS.—1, T. Gough, Buckingham. 2, J. Terry, Buckingham. **COCK.**—1, G. M. Morecraft, Winslow. **COCHINS.**—1, J. Rodwell. 2, A. F. Faulkner. **HE.** J. K. Fowler, Aylesbury. **COCK.**—1, J. K. Fowler. **HE.** J. Gurney, Winslow.

GAME.—1, S. Field. 2, A. C. Rogers, Buckingham. **C.** J. Salmons, Maidsmoreton; J. Bennett, Stowe. **COCK.**—1 and **HE.** A. C. Swain, Radcliffe. **SPANISH.**—1, F. Coates, Thornborough. 2, W. White, Buckingham. **HAMBURGHS.**—Gold or Silver-pencilled.—1, A. F. Faulkner. 2, Rev. A. G. Hilton, Westbury. **HE.** T. C. Hudson, Buckingham. **C.** J. Gurney, Winslow. **HAMBURGHS.**—Gold or Silver-pencilled.—1, J. Gurney. **BRAMA FOOTRA.**—1, J. Gurney. 2, J. Terry. **HE.** J. K. Fowler, Aylesbury. **COCK.**—1, J. Rodwell. 2, J. Gurney. **BANTAMS.**—1, T. Bradbury, Buckingham. 2, J. Gurney. **C.** A. F. Faulkner. **ANY OTHER VARIETY.**—1, J. Gurney (Minorca). 2, J. K. Fowler (Silkies or French). 3, J. K. Tibbets, Buckingham (Houdans). **HE.** J. Steeden, Tingewick. **FAVORABLE.**—1, J. Bennett. 2, E. Euerston, Buckingham. 3, J. Treadwell, Radcliffe.

GESE.—1, J. K. Fowler. 2, Mrs. M. A. Osborn, Maidsmoreton. **HE.** J. Treadwell, Radcliffe.

DUCKS.—*Lyonsbury*—1 and 2, J. K. Fowler. **HE.** J. Rodwell. **C.** G. Davies, Buckingham. *Roan*.—1 and 2, J. K. Fowler. **HE.** T. Attwood, Ickhampstead.

TURKEYS.—1, J. Bennett. 2, Mrs. M. A. Osborn.

CHICKENS.—1, G. M. Morecraft, Winslow. 2, J. Terry. **HE.** J. Steeden, Tingewick.

SPECIAL PRIZES.

FOWLS.—1, R. Soden, Buckingham (Game). 2 and 5, J. Steeden (White Silkie and Golden-pencilled). **HAMBURGHS.** 3, W. Burchell, Buckingham (silver Hamburgs). 4, W. Hickman, Gawcott (golden Hamburgs).

DUCKS.—1, A. Tyrell, Buckingham. 2, T. Hands, Maidsmoreton. 3, W. Wheeler, Buckingham. 4, J. Gauthier, Buckingham (Aylesbury). 5, J. Giles, Buckingham.

EXTRA PRIZES.—Mrs. M. A. Osborn, Maidsmoreton Mill (Peacock); J. Steeden (collection of Rabbits, Pigeons, and Fowls).

JUDGE.—Mr. W. B. Jeffries, Ipswich.

CASTLE DONINGTON POULTRY SHOW.

This was held on July 29th in conjunction with a Floral Exhibition in the grounds of the Hall Farm, Castle Donington, Derby.

DORKINGS.—*Cock*.—1, S. W. Hallam, Whitwick. 2, Miss M. Murray, Thulston. **C.** H. Feast, Swansea. **HENS.**—1, M. M. Cashmore, Sheepshead. 2, S. W. Hallam. **C.** H. Feast.

BRAHMAS.—*Cock*.—1, Rev. R. Story & H. Story, Lockington Vicarage. 2, J. Chant, Coalville. **HENS.**—1, H. H. Thompson, Chesterfield; 2, Rev. R. Story & H. Story. **C.** A. Eyre, Castle Donington. **HE.**—1, Dr. J. Holmes. 2 and **HE.** Rev. R. Story & H. Story. **C.** W. Mills, Duseworth.

COCHINS.—*Cock*.—1, M. M. Cashmore. 2 and **C.** Rev. R. Story & H. Story. **HENS.**—1, B. S. Lowndes, Stoney Stratford. 2, M. M. Cashmore. **HE.** and **C.** Rev. R. Story & H. Story.

SPANISH.—*Black.*—*Cock*.—1, S. W. Hallam. 2, Hon. G. Hastings, Donington Park. **HENS.**—1, S. W. Hallam.

GAME.—*Cock*.—1, R. A. Burton, Castle Donington. 2 and **C.** J. Richardson, Longborough. **HE.** Earl of Loudoun, Donington Park. **HENS.**—1, Earl of Loudoun. 2, J. Richardson.

HAMBURGHS.—*pencilled.*—*Cock*.—1, S. W. Hallam. 2, G. T. Eaton, Castle Donington. **HE.** M. M. Cashmore. **HENS.**—1, R. A. Burton. 2, M. M. Cashmore. **C.** S. W. Hallam.

RABBITS.—*Double Lopped*.—1, H. Robotham, Castle Donington. 2, M. M. Cashmore. *Heaviest*.—1, H. Robotham.

JUDGES.—Rev. T. O'Grady and Mr. Marshall.

LEICESTER POULTRY AND PIGEON SHOW.

The entries at this Show last year were somewhat in excess of those of 1874, but it is most satisfactory to be able to say, never has Leicester Show abounded in so many first-class poultry as last week. In almost every case the winners were birds of note throughout the kingdom, and we may safely state such an exhibition would have been a credit to any town in the empire. Among the most notable breeds, perhaps, were Light Brahmans, White Cochins, and Buff and Partridge. R. S. S. Woodgate, Esq., and Mrs. Agnes Williamson showed three pens of Whites of such transcendent merit, that the Committee at once permitted an extra prize to be awarded, as they generously did in some other instances. We cannot do otherwise than speak most highly also of Mrs. Williamson's Light Brahmans as being especially praiseworthy. The Buff *Cochin* chickens were exceedingly fine and well shown, but the *Game* fowls were not in bygone years. No *Hamburgs* competed except Golden-

spangled, many of which were excellent; the class being equally open to Silver-spangled, none, however, of the latter colour being sent. There should certainly have been a class for the Pencilled breeds likewise, but we suppose it was an oversight when making-out the original prize schedule that will now be corrected. Game *Bantams* were many of them very good, the Brown Reds particularly so, and the Any other variety class for Bantams was really of the highest character.

The *Aylesbury Ducks* proved to be magnificent, and some remarkably fine Rouen ducklings were exhibited. Whistling Ducks, which always appear as self-satisfied as can be imagined, caused many visitors considerable interest; and the Selling classes abounded with cheap bargains to those requiring them. The *Geese* and *Turkeys* were remarkably fine, and we were glad to see they enjoyed pens ample enough in size to allow exercise for the birds themselves, and also an easy inspection by visitors.

It may be some years ere so many high-class *Pigeons* are to be found in so small a collection, among the Toys there being Frillbacks, Fire Pigeons, and many other interesting and scarce varieties.

No Committee can be more deserving of support, every attention being devoted to the welfare of the birds during the Show, and the repacking of the poultry, &c., at Leicester is invariably managed with the greatest care and expedition. The fine weather brought together a very large company on both days.

DORRINGS.—1 and 2, J. Watts, King's Heath. 3, S. C. Pilgrim, Hinckley. *Chickens*.—1, J. Watts. 2, M. M. Cashmore, Sheepshed, Loughborough.

SPANISH.—1, J. T. Hincks, Humberstone. 2, M. Brown, Ab Kettleby, Melton Mowbray. *he*, H. Yardley, Birmingham.

COCHINS.—*Cinnamon and Buff*.—1, H. Tomlinson, Birmingham. 2, H. Yardley. *he*, E. Winwood, Worcester. *Chickens*.—1, H. Thompson. 2, H. Yardley. *he*, F. J. Draper, Burton-on-Trent; H. Feast, Swanscoe.

COCHINS.—*White*.—1, R. S. S. Woodgate, Farnbury, Tunbridge Wells. 2 and Extra 2, A. Williamson, Leicester. *Chickens*.—1, R. S. S. Woodgate. 2, No competition.

COCHINS.—*Any other variety*.—1, T. Sear, Aylesbury. 2, T. Sheppard, Humberstone. *Chickens*.—1, T. Sheppard. 2, H. Feast. *he*, T. Simey, Aylestone, Leicester.

BRAMMAS.—1 and *he*, A. Williamson. 2, J. Watts. *Chickens*.—1, E. Kendrick, Jun., Lichfield. 2, J. T. Hincks. *he*, J. T. Hincks; J. J. Watts; W. J. Ford, Humberstone.

GAMES.—1, Earl of Londond, Donington Park, Derby. 2, A. Peake, Somerby, Oakham. *Chickens*.—1, W. E. Oakley, Atherstone. 2, W. T. Everard, Ashby-de-la-Zouch. *he*, E. Winwood. *Cock*.—1, Earl of Londond.

HAMBOURGS.—*Golden or Silver-spangled*.—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, M. M. Cashmore. *he*, S. W. Hallam, Whitwick. *c*, H. E. Emberton, Oadby.

BANTAMS.—*Game*.—1, J. Mays, Gloucester. 2, W. T. Everard. *he*, E. Bell, Burton-on-Trent. *Clear-legged, any other variety*.—1, H. Draycott, Humberstone. 2, M. Leno, Markyate Street, Dunstable. *he*, R. H. Ashton, Mottram, Manchester; H. Yardley. *c*, J. T. Hincks.

SELLING CLASS.—*Price not to exceed £1 10s.*—*Cock or Cockerel*.—1 and 2, T. Sheppard. *he*, J. T. Hincks. *c*, Earl of Londond; W. Birch, Barnacle. *Hens or Pullets*.—1, H. Yardley. 2, W. Birch. *c*, J. Watts.

Mr. Edward Hewitt, of Sparkbrook, near Birmingham, was the Judge.

PONTEFRAC T POULTRY SHOW.

The following are the prizes awarded at this Exhibition held on July 30th. The number of entries was not very great, but the quality was generally considered very good.

COCHINA.—1, H. Bleasby, Hambleton. 2, J. Turton, Ackworth.

BRAMMAS.—1, Lady Hawke, Womersley Park. 2, Dr. Holmes, Chesterfield.

DORRINGS.—1, W. Brown, Ackworth. 2, J. Butterfield, Ackworth.

HAMBOURGS.—1, J. & W. Kellett, Ossett. 2, W. Appleby, Ackworth.

ANY BREED.—1, J. B. Hepworth, Rake Bridge. 2, J. Turton, Ackworth.

GAME.—1 and 2, J. B. Hepworth.

SPANISH.—1 and 2, F. Pickard, Pontefract.

BANTAMS.—1, W. B. Arundel, Tanshelf. 2, J. Hillaby, Tanshelf.

ANY OTHER BREED.—1, J. & W. Kellett, Ossett. 2, J. W. Hepworth.

DUCKS.—*Rouen, or any other variety*.—1, W. B. Fletcher, Ackworth. 2, Lady Hawke.

GEES.—1, J. B. Hepworth. 2, J. Middleton, Grove Farm.

TURKEYS.—1, Lady Hawke.

PIGEONS.

FANTAILS.—1, W. W. Fowler, Baxtergate, Pontefract. 2, J. H. Sykes, Huddersfield.

CARRIERS.—*Cock*.—1 and 2, G. J. Taylor, Fartown, Huddersfield. *Hen*.—1 and 2, G. J. Taylor.

TRUMPETERS.—1, R. E. Kitching, Bawtry. 2, W. W. Fowler.

PUTTERS.—1 and 2, G. J. Taylor.

OWLS.—1 and 2, W. W. Fowler.

JACOBINS.—1, G. J. Taylor. 2, J. H. Sykes.

BARDS.—1 and 2, G. J. Taylor.

TUMBLERS.—1, J. H. Sykes. 2, W. W. Fowler.

NCNS.—1 and 2, W. W. Fowler.

ANY VARIETY.—1 and 2, G. J. Taylor.

FANCY BIRDS.

CANARIES.—*Yellow Belgian*.—1 and 2, W. W. Fowler, Baxtergate, Pontefract. *Buff Belgian or Foreign*.—1 and 2, W. W. Fowler. *Yellow English*.—1, Petty and Cuss, York. 2, J. Hornby, Pontefract. *Buff English*.—1, W. W. Fowler. 2, J. Hornby. *Mottled*.—1, G. Cressey, Carleton. 2, J. Hornby.

BULLFINCH.—1, Miss Carter, Pontefract. 2, J. Hornby.

GOLDFINCH.—1, J. W. Walker. 2, J. Hornby.

GOLDFINCH MITE.—1, A. Sweeting, Pontefract. 2, W. W. Fowler.

LINNET.—1, J. Hornby. 2, W. W. Fowler.

GREY PARROT.—1, F. Pickard. 2, W. Wilson.

RABBITS.

LOP-EARED.—1, J. M. Mander, Wakefield. 2, J. W. Hemmant, Pontefract.

ANY OTHER VARIETY.—1, W. Schofield, Pontefract.

Messrs. Addy, of As-tern, and Crofts, of Mantle House, Blyth, acted as Judge.

THE POULTRY-KEEPER.—No. 14.

THE SPANISH FOWL.

GENERAL CHARACTERISTICS.

Body oval; erect on the feet; muscles well developed; legs long; four toes on each foot; feathers of the hackle and wing of the ordinary length; broad, long sickles; tail bushy, carried erect, and close to the neck; plumage entirely black, black and

Fig. 41.—Spanish Cock.

white, or floury white, in chickenhood; comb single, fleshy, and erect (fig. 41).

Weight.—At full age from 6 lbs. 10 ozs. to 7½ lbs. Bones small and light.

Flesh.—Abundant and very good.

Shape.—From the upper part of the head under the feet from 21½ inches to 23½ inches; from the back under the feet, 15½ inches.

Head (fig. 42).—Particularly distinguished by the thick wrinkles of the cheeks.

Comb.—Single, erect, and very high, larger than in any other variety, very thick at the base, slender at the upper part, denticulated with large regular points.

Wattles.—Long, slender, and pendant, and of the same colour as the comb, which is of a very rosy colour.

Ears.—Thick and sinewy, of the same colour and nature as the cheeks, with which they seem to join, and to make one large piece of white, only interrupted by a small thin bunch of feathers, which covers the auditory organ.

Cheeks.—Large, thick, and white, with a very light blue tint. When the bird gets old its cheeks are full of large wrinkles and irregular folds, so deep that the eye disappears when the head is seen behind or in front. Its cheeks are seamed with very small depressions, far apart and invisible at a distance.

Tufts.—Composed of small black feathers, fine and few.

Back.—Nearly straight, and generally black.

Eye.—Iris, red; pupil, dark chocolate.

Foot.—Rather slender; length, $3\frac{1}{8}$ inches; colour, slate blue.
Toes.—Usual size, same colour as the feet.

PLUMAGE.

The plumage of the cock is completely black. The feathers of the hackle, the back, and loins have metallic iridescence of silver, and in certain positions have mixed tints of green and purple. Those of the shoulders are of a velvety black. The wing coverts are of a green and bronze hue, as also are the large and small sickles; the rest is dull. Altogether the Spanish

Fig. 42.—Spanish Cock's Head.

cock has the *hidalgo's* aspect, belonging to it alone. Its vestment of velvety black, its face covered with white, its comb in the form of an aigrette, and its red gills, give it quite a Spanish air.

CLEVELAND POULTRY SHOW.

The annual Show of the Cleveland Agricultural Society was held at Middlesbrough on July 31st.

Time was when North Yorkshire could muster such an array of *Geese*, especially of the White Embden variety, as no other part of the kingdom, and five years ago, when this Show was held at Middlesbrough, the display of *Geese* was a great treat; but we hear the fanciers of this quarter have "killed the Goose for the golden egg," for this year not a single pen put in an appearance, the best of all the produce having, no doubt, been drafted off by the great exhibitors. Driffield interfered considerably with the entries at Middlesbrough, both exhibitions taking place on the same day. Although many pens were sent too late, the entries having closed, they were rightly refused. We may also hint, that it would be much better were exhibitors to make their entries earlier, and thus lighten the duties of those in office. A capital tent was provided, and this proved an excellent place for shelter during the smart showers which occurred at intervals throughout the day.

Spanish were first with two entries, but only one pen came to hand, the cock being a nice smooth-faced bird. Of *Dorkings* only the winners were good; but in *Cochins* were some fine specimens, the two pairs of Buffs to which the awards were made being grand in all points. In the next class, *White* were first and *Partridge* second, both being good pens. In *Brahmas* the winners were *Dark*, the first adult, and the second young birds. Pen 22 contained an exquisitely pencilled pullet with only a moderate cockerel. In pair of *Red Game*, the first were *Black-breasted*, and the cock of rather striking quality, with pretty good hens. *Duckwings* were first in the next class. In single cocks, *Black-breasted Reds* also won; the first a grand-coloured bird, the second good in shape but bad in colour; a fine stylish *Brown Red* being only highly commended on account of bad bumble feet. *Bantams*, *Game*, were bad, but the next class contained some nice cocks, the first and second being perfect *Blacks*, and a third prize was awarded to very good *Silver Sebright* chickens, which were, however, too young for successful competition. *Hamburgs* had some fair birds, *Golden-pencilled* coming first on the list. The first-prize pen contained a fine cock with a hen faulty in tail. A very good pen of *Golden-spangled* won first. The first-prize *Silver-spangled* were an even pen, but the rest were sorry. The Variety class was divided, the first section being for the old, and the second for young birds. In the former *Red Malays*, *Crève-Cœurs*, and *Houdans* won; and in the latter the awards were—first, *White Cochins*, and second *Brahmas*.

There were some good *Ducks*, but of *Goslings* and *Turkey poults* we can say little.

RABBITS.—There were two classes, the first for *Lops* of all properties. In this the first prize went to a good *Black-and-*

white buck, a little too gay in marking, $21\frac{1}{2}$ inches by 4 inches in the ear; the second to a *Tortoiseshell buck* rather low in condition but of good points, and $21\frac{1}{2}$ inches by $1\frac{1}{2}$ inches; third coming a *Black buck* $20\frac{1}{2}$ inches by 1 inches. Many of the others came very close in points, measurement excepted.

SPANISH.—*Black*.—1, Pollister & Hawkins, Topcliffe, Thirsk.
DORKINGS.—1, J. White, Warley, Northallerton. 2, T. P. Carver, Langthorpe, Boroughbridge. *he*, Lady D. Yeoman Woodlands, Whitby.
COCHINS.—*Dark and Cinnamon*.—1 and 2, G. H. Procter, Darham. *he*, D. J. Hobson, White, *he*, J. Stan, Middlebrough. *Any other colour*.—1 and *he*, G. H. Procter. 2, J. Bell, Kirkgate, Thirsk. *c*, I. Garbutt, Faradale, Kirby Moorside.

BRAMA POOTRAS.—1, T. Dobson, Kirby Moorside. 2, J. Clemmet, Stokesley. *he*, T. P. Carver, Langthorpe, Boroughbridge; W. J. Frank, Eaglescliffe, Yarm.

GAME.—*Reds*.—1, W. Pett, Middlesbrough. 2, W. Easby, Ormesby, Middlesbrough. *Any other variety*.—1, Holmes & Fardon, Great Driffield. *Cock*.—1, W. Youngsband, Darlington. 2, F. Blackburn, Ingley Greenhow, Northallerton. *he*, Holmes & Fardon.

BANTAMS.—*Game*.—1, Holmes & Fardon. 2, Miss E. M. Ellerby, Easingwold. *c*, J. Peel, Middlesbrough. *Any other variety*.—1, R. H. Ashton, Mottram, Manchester. 2, Wells & Sherwin, Ripon. 3, — Carver. *he*, T. P. Carver, Langthorpe, Boroughbridge; C. Hopper, Dairy Knoll, Middlesbrough.

HAMBURGS.—*Golden-pencilled*.—1, Holmes & Fardon. 2, S. G. Kilson, *he*, W. Bearpark, Northallerton; J. Webster, Whitby. *c*, G. Alderson, West Hartlepool. *Silver-pencilled*.—1, Holmes & Fardon.

HAMBURGS.—*Golden-spangled*.—1, T. P. Carver, Langthorpe, Boroughbridge. *Silver-spangled*.—1, Holmes & Fardon. 2, G. Alderson.

POLISH.—1, W. Bearpark. 2, C. Walker, Boroughbridge.

ANY OTHER VARIETY.—1, Lady D. Yeoman (Black-breasted Red Malay). 2, T. P. Carver. 3, G. Alderson (Houdans). *he*, Holmes & Fardon. *Chickens*.—1, 2, and *he*, W. J. Frank (White Cochins and Brahmas).

ANY VARIETY OF QUACKS FOR THE USE OF THE SEX.—1 and 2, T. P. Carver. 3, J. Gates, Kirby Carlton, Northallerton. *he*, Mrs. Buffham, Lofthouse, Saltburn; G. Pounder, Kirby Moorside.

DUCKS.—*Applebury*.—1 and 2, T. P. Carver. *Toucan*.—1, T. P. Carver. 2, G. Pounder. *Any other variety*.—1, T. P. Carver.

GOSLINGS.—1, R. Dodsworth, Stinton, Stockton. 2, G. Pounder.

POULTS.—1, H. Elft, Seamer, Yarm. 2, G. Pounder.

RABBITS.

LOP-EARED.—*Buck or Doe*.—1, 3, and *c*, B. W. Boulton, West Hartlepool. 2, J. R. Torbeck, Middlesbrough. *he*, J. S. Robinson, Darlington; J. R. Torbeck, R. Robinson, Middlesbrough; E. W. Boulton.

ANY FANCY BREED.—1, E. W. Forster, Middlesbrough. 2, J. W. Garbutt, Easton Junction.

EXTRA SECTION.—1, J. W. Taylor, Middlesbrough.

JUDGE.—Mr. E. Hutton, Pudsey.

GREAT HORTON POULTRY SHOW.

The fifth annual Exhibition was held on the 1st inst. at Great Horton, a busy suburb of Bradford; but, notwithstanding careful management, the Show does not progress, owing, we think, to the antiquated style of schedule. If proper attention were bestowed on it we think the Society would receive a good share of support.

Of single *Game* cocks there were ten entries, but only those noticed were of good quality. First came a *Black*, and second a *Brown Red*. In single hens, of which there were nine entries, the winners were *Brown Reds*, the second a grand pullet of this year, after which we found nothing of note till we came to the *Spanish*, of which very good pens were shown. In *Cochins*, first were *Buff* chickens, and second old *Whites*; whilst for *Dark Brahmas* the first were adults and the second young birds, but we confess a preference for the young pen. *Hamburgs* had three classes, Mr. Beldon taking all the prizes with capital birds. In *French* the first were *Crève-Cœurs* and second *Houdans*; and in the Variety class the winners were respectively *Silver* and *Golden Polands*. *Game Bantams* were fair, first *Piles*, and second *Duckwings*. Two nice pens of *Black Rose-combs* were shown in the next class, and in the Variety class the first were *Golden Sebrights*.

PIGEONS.—The entries were better than in poultry, the classification and prizes being better proportionately, and the birds may be pronounced a fair collection. In *Carriers Duns* were first and *Blacks* second, some excellent young *Duns* being also shown. *Dragoons* were good, and most of them were noticed; the first *Blue*, and the second *Brown-barred Silver*. *Owls* were fair, and *Turbits* very good, the birds being well placed—first *Yellow*, and second *Red*. *Short-faced Antwerps* were, *Duns* first and *Red-chequers* second; and in *Long-faces* the prizes were placed similarly; the first were a fine strong-built pair of birds. In the Variety class *White Pouters* stood first, and *Yellow Jacobins* second.

RABBITS had but one class with eight entries, the first prize going to a *Fawn-and-white buck*, and second to a *Fawn*, both of which were *Lop-ears*, but we failed to obtain the measurement.

GAME.—*Cock*.—1, E. Aykroyd, Ecclesfield. 2, J. Hodgson, Galloway Hill. *he*, J. J. O. Bradford; R. Hemingway, Shelf. *Hen*.—1, E. Aykroyd. 2, H. Butler, Bradford. *he*, J. W. Thornton. *Black-breasted*, or any other *Reds*.—1, J. Hodgson. 2, J. Fell, Alwalton. *he*, R. Hemingway. *Any other variety*.—1, J. Fell.

SPANISH.—*Black*.—1 and 2, H. Beldon, Goitstock, Bingley.

COCHIN-CHINAS.—1, H. Beldon. 2, H. Beldon; E. Throp, Horton. *he*, C. Carr, Wilden.

BRAMA POOTRAS.—1 and 2, H. Beldon. *he*, W. Hodgson, Keighley.

HAMBURGS.—*Gold or Silver-spangled*.—1 and 2, H. Beldon. *Gold or Silver-pencilled*.—1 and 2, H. Beldon. *Black*.—1 and 2, H. Beldon. *he*, J. Sharp, Bingley.

FRENCH.—*Any variety*.—1, G. W. Hibbert, Godley Hyde, Manchester. 2, D. Moulson, Bradford.

ANY OTHER VARIETY.—1 and 2, H. Beldon. *he*, D. Sharp, Bingley.

BANTAMS.—*Game*.—1, H. Beldon. 2, E. Smith, Wyke. *he*, G. H. Rudd, Great Horton; E. Smith. *Black Rose-comb*.—1, A. Smith, Northowram. 2, H. Beldon. *Any other variety*.—1, H. Beldon. 2, W. Wilkinson.

SELLING CLASS.—1, H. Peldon. 2, C. Carr. *hc*, D. Monlson.
DUCKS.—1, J. Pollard, Wibsey. 2, W. Wilkinson. *hc*, J. R. Pollard, Wibsey; Miss Lantley, Allerton.

PIGEONS.

CARRIERS.—1 and *hc*, W. R. A. Miller, Walsall. 2, J. Holden, Wibsey Slack.
DECOYONS.—1, H. Jennings, Allerton. 2, W. H. A. Miller. *hc*, H. G. Poole, Bradford. 3, W. Reece, B. Smith, Keighley.
OWLS.—1, Tordoff & Wilkinson, Wibsey. 2, H. Jennings.
TRUITS.—1, H. G. Poole. 2, J. Wilkinson, Clayton; J. Hawley, Gillington.
NISKS.—1, H. Jennings. 2, J. E. Mason, Clayton.
ANTWERPS.—*short-faced*.—1, H. Jennings. 2, J. Holden, Wibsey Slack. *hc*, W. Ellis, Idle. *Long-faced*.—1, H. Jennings. 2, M. Monecy, Low Moor.
ANY OTHER VARIETY.—1, J. Hawley. 2, T. Holt, Bradford.
SELLING CLASS.—1, H. Jennings. 2, J. Hawley.

RABBITS.—1, G. S. Burton, Beeston Hill, Leeds. 2, J. Armstrong, Leeds. *c*, F. Pohlman, Wheatley.

JUDGES.—Mr. A. Sutherland, Accrington; and Mr. J. Falkner, Hummanly, York.

EARLSHEATON POULTRY AND PIGEON SHOW.

THIS proved a very excellent Show, although the first held by the present Committee. It is pleasing to record its complete success, as the whole of the Committee well deserved so satisfactory an issue, for none could individually strive more than they did to ensure a full share of popularity. Many years back poultry shows were held at Dewsbury, but from lack of energy on the part of the managers in those days they proved to be not self-supporting, and were consequently discontinued. We have only to add there is not the slightest probability of such results in the hands of those now at the helm. The ground on which the Show was held is remarkable for the extensive views it affords of the surrounding district, even for twenty miles or more. The day was also exceedingly fine, being bright and sunny, with a brisk breeze that rendered all things pleasant; but had any storm suddenly arisen, the poultry would have been without any protection, as the pens were placed in the open field. Tents are always the most advisable plan, and, in the long run, ensure greater public support.

In *Spanish* fowls Mr. Brown, of Sheffield, took the first position with both cocks and hens, closely pressed, however, by Mr. Thresh, of Bradford. Many of the *Spanish* were not looking so well as customary, from the intense and long-continued heat of the present summer. Only rarely have better *Buff Cochins* been shown during the whole year, Mr. Tomlinson, of Birmingham, taking first in the class, and the plate prize for the best pen of poultry in the Show with a magnificent *Clear Buff* cock, large in size, unusually well booted and breeched; closely followed, however, by a somewhat smaller specimen, also of high quality, the property of Mr. C. Sidgwick, of Keighley. These birds, as was also the first-prize *Buff* hen, were shown in plumage that would have added credit to even a Christmas show. In *Brahmas*, on the contrary, although really fine show birds, even the prizetakers were in anything but show condition. Of *Hamburgs* but little can be said in the way of commendation. Some very good *Game* fowls were shown, but the heads of one or two of the cocks were absolutely shaven so closely that the crown of the head was entirely denuded of feathers. This should not be practised, and certainly detracts most considerably from their appearance to any practical eye. *Brown Reds* proved to be the best of the *Game* fowls.

In *Game Bantams* were a few first-class pens, but the time of moulting was upon most of them. In the *Variety* cock class a really good *Grey Dorking* and *Silver-laced Bantam* were the respective winners; and in the fellow class for hens, again a *Grey Dorking* stood first, and *Golden Poland* second; the latter had her crest, which was naturally an abundant one, almost entirely cut away at the front, and, as was justly remarked, appeared "as though she had just come from a barber's." In class 165a, for a cockerel or pullet of any breed, a nicely-shown *Light Brahma* pullet was first, and a *Spanish* cockerel second, and with the exception of a *Dark Brahma* pullet (pen 8, highly commended), none others of an entry of thirteen pens were otherwise than inferior. Both *Aylesbury* and *Rouen Ducks* were really good, and some specially fine ducklings were shown. In the selling classes *Dark Brahma* and *Partridge Cochins* in cocks, and *Red Pile* *Game* and *Spanish* in hens, were most commendable.

In a general class for *Rabbits* of seventeen entries, Lopped-eared ones were the winners. A few very fine dishes of eggs were shown.

Among the *Pigeons* Mrs. J. Firth, of Dewsbury, took a very large proportion of the prizes with *Carriers*, *Barbs*, and other very high-class specimens. To this lady's *Barbs* was also awarded the extra plate prize for the best pen of *Pigeons* exhibited, and it may with truth be stated all the *Pigeons* were unusually perfect.

SPANISH.—Cock.—1 and Extra, E. Brown, Sheffield. 2 and *hc*, J. Thresh, Bradford. *Hen or Pullet*.—1, E. Brown. 2, J. Thresh. *hc*, S. W. Hallam, Whitwick.

COCHINS.—Cock.—1 and Plate, H. Tomlinson, Birmingham. 2, C. Sidgwick, Keighley. *hc*, J. Walker, Rochdale. *c*, S. R. Harris, Cusgrave, St. Day. *Hen or Pullet*.—1, J. White, Netherton. 2, H. Tomlinson. *hc*, J. Walker; C. Sidgwick; S. R. Harris.

HAMBURG.—Cock.—1, S. W. Hallam. 2, D. Crosland, Chickcley. *Hen or Pullet*.—1, S. W. Hallam. 2, J. White. *c*, W. Jagger.

BRAHMA.—Cock.—1, J. F. Smith, Sheffield. 2, W. Firth, Birkenshaw, Leeds. *hc*, J. Watts, Birmingham. *Hen or Pullet*.—1, W. Whiteley, Sheffield. 2, J. Watts.

GAME.—Cock.—1, J. Fortune, Keighley. 2, C. W. Brierley, Middleton. *c*, H. C. and W. J. Mason, Birstal. *Hen or Pullet*.—1, C. W. Brierley. 2, H. C. and W. J. Mason. *hc*, J. Fortune.

BANTAMS.—*Game*.—Cock.—1 and Pipe, G. Auderton, Accrington. 2, A. Smith. *hc*, W. F. Entwistle, Westfield, Bradford. *c*, G. Noble, Staincliffe. *Hen or Pullet*.—1, G. Noble. 2 and *c*, W. F. Entwistle.

ANY OTHER VARIETY.—Cock.—1, J. Walker. 2, A. & W. H. Silvester, Sheffield. *Hen or Pullet*.—1, J. Walker. 2, A. & W. H. Silvester.

ANY VARIETY.—Cockerel or Pullet.—1, J. Watts. 2, J. Thresh. *hc*, H. Digby, Lindley.

DUCKS.—Any variety.—Drake.—1 and 2, J. Walker. *c*, T. Halmshaw. Ducks.—1 and 2, J. Walker.

DUCKINGS.—1, H. Digby.

SELLING CLASS.—Cock.—1, W. Mitchell, Birkenshaw. 2, J. Walker. *Hen or Pullet*.—1, J. Thresh. 2, H. C. and W. J. Mason.

PIGEONS.

CARRIERS.—Cock or *Hen*.—1 and *hc*, Mrs. J. Firth, Dewsbury. 2, H. Yardley, Birmingham.

POUTERS.—Cock or *Hen*.—1 and 2, J. E. Crofts, Worksop. *hc*, P. R. Spencer, Hereford.

RABBS.—Cock or *Hen*.—1, Eggstand, and 2, Mrs. J. Firth. *hc*, P. R. Spencer.

TUMBLERS.—Cock or *Hen*.—1, H. Yardley. 2, J. E. Crofts. *hc*, W. Moore, Pickering.

OWLS.—Cock or *Hen*.—1, Mrs. T. Waterworth, Dewsbury Moor. 2, H. Yardley. *hc*, S. Anderson, Mithel.

FANTAILS.—Cock or *Hen*.—1 and 2, J. F. Loversidge, Newark. *hc*, P. R. Spencer. *c*, Q. Blum, Broughton.

ANTWERPS.—Cock or *Hen*.—1 and 2, J. Crosland, Wakefield. *hc*, G. Oldroyd; *c*, M. Blingworth, Earlsbaton.

ANY OTHER VARIETY.—Cock or *Hen*.—1 and 2, A. A. Vander Meersch, Tooting, London. *hc*, A. A. Vander Meersch (3); J. E. Crofts. *c*, A. & W. H. Silvester, Sheffield.

SELLING CLASS.—Cock or *Hen*.—1, W. H. Firth, Dewsbury. 2, A. Smith. *hc*, A. & W. H. Silvester. *c*, J. Watts; S. Anderson; W. Phillips, Ossett.

RABBITS.—1, J. E. Croft. 2, J. Armstrong, Leeds. 3, G. S. Burton, Beeston Hill, Leeds. *hc*, A. W. Whitehouse, Northampton. *c*, G. Cooper, Earlsbaton; G. Ibbertson, Earlsbaton; J. Hallas, Huddersfield; A. & P. Kiley, Chickney; G. S. Burton.

Messrs. Hewitt and Teebay judged the poultry and Rabbits, and Capt. Heaton the Pigeons.

PIGEONS AND RABBITS AT THE ALFORD POULTRY SHOW.

PIGEONS.—There were ten classes for Pigeons, and for the amounts offered the entries were good. The pens were well arranged, and the birds attended to by a capital staff, which, considering that this is but the second Show, is a great credit to the Society. *Carriers* were fair; second, a young *Dun* cock of great promise; and first, a handsome *Black* hen of two summers. *Pouters* were: First a grand *White* cock, 1½ by 6½ inches, and very showy; the second, full large, but not in such trim, was also a *White*; and third a very good *Blue*, though shorter in feather and limb than the others. *Fantails* were another three prizes for Newark, and all very good, the third one having grand motion. *Owls* were all English, the first and second *Blues*, and the third *Powder Blues*. *Antwerps* came up well, considering the class was a mixed one. First was a good *Short-faced Red Chequer*, rather too long in feather; second a *Long-faced Blue Chequer*, very good in head and flying properties; and third a *Short-faced Dun*. *Barbs* were very good, which, while young, were well made up, smart, and clean; the first a *Yellow*, and the others all *Blacks*. In *Tumblers* a good *Almond* stood first, a good *Blue Beard* second, and a *Black Bald* third. *Dragoons*.—Of these there were eight entries, a good strong *Blue* first; second also *Blue*, but a little too long; third of the same colour, and a bird of this year. 569 was good in many points, but had a very ugly beak. The *Any other variety* class was large, and many birds were noticed. The first prize went to a really good *White African Owl*; second a *Red Turbit*, and third a *Red Magpie*, while a *Black Mottle Trumpeter* was very highly commended. There were seventeen entries in the *Selling* class, but nothing of any quality.

In *CAGE BIRDS*, first was a *Grey Parrot* in Class 69, and second a pair of *Budregars*. In *Belgians*, Messrs. Knight & Spencer showed two good birds, but the rest were poor. *Norwich Canaries* showed up well, but the colour was not high, a *Jonque* cock being awarded the prize. For a *Canary* of any other variety, first came a pretty *Lizard*, and second a very good *Jonque Cinnamon*. Mules were not of great value, but some pretty *Goldfinches* came forward in the *Finch* class. *Skylarks* very poor, but *Thrush* and *Blackbirds* were very good.

RABBITS.—In *Lop-ears* a grand *Fawn* doe in the highest bloom was first, second came a doe of great length, and third an *Albino* doe, also large and very good in all points. This class being for *Self-coloured Rabbits*, the question naturally arises—viz., Is an *Albino* a *Self-coloured Rabbit*? We think not, and the question cannot be too soon settled; for all practical purposes these are almost worthless. *Broken-coloured Lops* shared the prizes as follows:—First, a *Blue* and *white*; second, *Black* and *white*; and third, *Fawn* and *white*; the first in rather bad order, but the others in better bloom. As regards *Belgian Hare Rabbits*, there seems to be some difference of opinion respecting points, for in this case the awards were made to the largest, the best-furred *Rabbits* being left last. *Silver-Greys* were very good, and the prizes well placed. In *Himalayans* the winners even

were somewhat mousy on the feet, but withal good; Angoras proving a fair lot and well placed also. In Dutch the winners were all Blue, this colour seeming to approach nearest perfection. The first two were adults; but the third, not more than five or six weeks old, was exceedingly pretty. The Patagonians in the Variety class were of great size and shown in fine order. We published the poultry awards last week.

PIGEONS.

CARRIERS.—*Cock or Hen*.—1 and 2, J. E. Palmer, Peterborough. 3, H. Yardley, Birmingham. *hc*, R. Ashton, Huntingdon.
POUTERS.—*Cock or Hen*.—1, H. Simpson, Spalding. 2, E. J. Palmer. 3, H. Yardley. *hc*, R. Ashton; E. J. Palmer. *c*, C. G. Cave.
FANTAILS.—*Cock or Hen*.—1 and 2, J. F. Loversidge, Newark. 3 and *c*, W. H. Tomlinson, Newark. *hc*, H. Simpson.

OWLS.—*English.*—*Cock or Hen*.—1, J. E. Palmer. 2, W. Woodhouse, King's Lynn. 3, Rev. W. V. Longe, Tuddenham Vicarage, Ipswich. *hc*, H. Yardley; J. E. Palmer. *c*, Dr. G. Walker.

ANTWERPS.—*Cock or Hen*.—1 and *hc*, H. Yardley. 2, C. W. Billett, Richmond. 3, J. Watts, King's Heath, Birmingham. *hc*, Dr. E. A. Harbord, Boston; C. W. Billett; F. Hodgson, Great Driffield.

BARNS.—*Cock or Hen*.—1 and 3, H. Yardley. 2, C. G. Cave, Spalding. *hc*, W. Massey, Spalding.

TRUMPETERS.—*Cock or Hen*.—1 and 3, H. Yardley. 2, W. Woodhouse. *hc*, J. E. Palmer. *hc*, J. E. Palmer; Dr. G. Walker.

DRAGONS.—*Blue and Silver.*—*Cock or Hen*.—1, W. Smith, Walton, Liverpool. 2, W. Larkins, Biggleswade. 3, H. Yardley. *hc*, J. Walker; J. Watts.

ANY OTHER VARIETY.—*Cock or Hen*.—1, H. Yardley. 2, J. Watts. 3, A. Canty, Barton-on-Humber (Marpie). *hc*, F. Hodgson (Mottled Trumpeter). *hc*, E. Foster, Ilford (Turbit); H. Yardley; H. Simpson (Trumpeter).

SELLING CLASSES.—1, W. Massey. 2, H. Simpson (White Fantails). 3, H. Yardley. *hc*, W. Larkins (Trumpeters); G. F. Clare, Louth (see Pigeons); A. Canty (Owls); C. G. Cave. *c*, W. Larkins (Jacks); H. Simpson (Pouters); T. H. Dows, Boston (Ural Ice).

CAGE BIRDS.

PARROT, PARROQUET, OR ANY FOREIGN BIRD.—1, L. Allen, London. 2, J. Priddy, Boston. *hc*, J. Atkin.

CANARY.—*Delight.*—1 and 3, Knight & Spencer, Arlesey, Beds. *Normich.*—1, E. Ross, Cheap-side. 2, J. Hornby, Alford. *hc*, Knight & Spencer. *c*, Knight and Spencer; J. Atkin; S. Tomlin. *Any other variety.*—1 and 2, S. Tomlin. *hc*, A. Lambert, Alford.

MULES.—1, T. H. Dows. 2, S. Tomlin.

LINNET OR FINCH OF ANY VARIETY OF FINCH.—1, C. Bond, Alford (Goldfinch). 2, Knight & Spencer (Goldfinch). *hc*, L. Brown, Alford (Goldfinch); Mrs. Jackson (Bullfinch).

LAKE.—*Sky or Wood.*—1, T. Hobster, Boston.

TURKISH OR BLACKBIRD.—1, H. Baldwick, Boston; Mrs. J. Smith. *hc*, J. Martin, Alford; J. Atkin.

ANY OTHER ENGLISH BIRD, CAGE OR OTHERWISE.—1, Master L. J. Brackenbury, The Elms, Alford. 2, T. Coppertwaite, Alford.

RABBITS.

LOPE-EARED.—*Self-coloured.*—*Buck or Doe.*—1, T. Myton, York. 2, F. Banks, London. 3, W. Whitlam, Alford. *Any Broken Colour.*—*Buck or Doe.*—1, F. Banks. 2, C. King, London. 3, J. H. Brand, Barton-on-Humber. *hc*, T. Myton.

BOLEIN HARE.—*Buck or Doe.*—1, W. Whitlam. 2, J. T. Billett, jun. 3, T. H. Dows.

SILVER-GRAY.—*Buck or Doe.*—1, S. Ball, Braford, Yorks. 2, Miss Mortimer, Ross. 3, R. H. Grew, St. John's, Wakefield. *c*, J. Boyle.

HIMALAYAN.—*Buck or Doe.*—1, R. A. Bousier, Penarth. 2, W. Whitworth, jun. 3, Master T. H. Atkinson. *hc*, Miss J. Burton, Alford; Leggett & Cawood, Thorne.

ANGORA.—*Buck or Doe.*—1, H. Swetnam, Fulford. 2, S. Ball. 3, P. Stanley, Leamington. *c*, J. & H. Martin; T. Garner, Kinschore.

DOCK.—*Buck or Doe.*—1, J. Boyle, Blackburn, Lancashire. 2 and 3, H. Gilbert, Rugby.

ANY OTHER VARIETY.—*Buck or Doe.*—1 and 2, M. Marsland, Goele. 3, G. Des Forges, Bilsby, Alford.

SELLING CLASS.—*Price not to exceed 30s.*—*Buck or Doe.*—1, Jones & Simkins, Wolverhampton (Light Grey-and-White Lop). 2, T. S. Lacy, Leicester. 3, J. T. Codrington, Spalding. *hc*, J. Bowman (Dorsetshire Back). *c*, Jones and Simkins (Fawn-and-White); A. Canty (Double Lop).

CATS.—*English.*—*Male or Female.*—1, D. Mountain, Alford.

The Judges for Pigeons were Mr. Hutton, Pudsey; for Rabbits, Cats, and Cage Birds, Mr. J. W. Harrison, Spalding.

WHITWICK POULTRY SHOW.

This was held on the 4th inst. We must defer our remarks till next week. The following is the list of awards:—

GAME.—*Black and Brown-breasted Red.*—1, Earl of Londun. 2 and *hc*, J. Richardson, Loughborough. *Any other variety.*—1, J. Richardson. 2, E. Bell, Haringlow.

DORKINGS.—1, S. W. Hallam, Whitwick. 2, — Pilgrim, Hockley. *c*, M. M. Cashmore, J. Almey.

SPANISH.—1, S. W. Hallam. 2, H. T. Cooper.

COCHINS.—1, H. Tomlinson, Birmingham. 2, M. M. Cashmore. *hc*, H. Yardley, Birmingham. *hc*, G. F. Pa freyman, Sheffield. 3, Sears, Aylesbury. *c*, J. Hall, Swadlow.

BRAMMAS.—1, J. Hall. 2, Rev. R. Story, Lookington Vicarage, Derby.

HAMPBROS.—*Gold or Silver-pencilled.*—1, J. Hall. 2, J. Loaz, Bromley. *hc*, G. De Lisle, H. H. Thompson, Colleshill, Farnham. *c*, M. J. Cashmore, Gold and Silver-pencilled. 2 and *c*, J. Ward. 3, T. E. Jones, Wolverhampton. *hc*, M. M. Cashmore; S. W. Hallam.

ANY VARIETY.—1, J. Long. 2, Rev. A. G. Brooks, Shrewsbury. 3, J. Hall. *hc*, J. Richardson. *c*, H. Feast.

BANTAMS.—1, H. Yardley. 2, M. M. Cashmore. *hc*, E. B. H.

DUCKS.—1, T. Sears. 2, J. Brown, Markfield. *hc*, M. M. Cashmore.

GEES.—1, J. Swift, Greenhill, Whitwick. 2, F. Walker.

TURKEYS.—1, F. Walker.

LOCAL CLASSES.

GAME.—*Black and Brown-breasted Red.*—1, W. T. Everard. 2, J. Moo. *c*, T. Smith, Whitwick. *Any other variety.*—1, W. T. Everard. 2, W. Kirby.

DORKINGS.—1, S. W. Hallam.

SPANISH.—1, S. W. Hallam. 2, J. Gunn.

COCHINS.—1, J. Gunn. 2, S. W. Hallam.

BRAMMAS.—1, J. Gunn. 2, S. W. Hallam.

HAMPBROS.—*Gold or Silver-pencilled.*—1, W. Rawlings. 2, J. Ward. 3, J. Ward. *hc*, S. W. Hallam.

ANY VARIETY.—1, J. Ward. 2, G. F. Thirby, Whitwick.

BANTAMS.—1, S. W. Hallam. 2, W. T. Everard.

PIGEONS.

CARRIERS.—1, W. H. G. Miller, Walsall. 2, G. Bentley, Rickmansworth. *hc*, H. Yardley. *hc*, M. M. Cashmore.

POUTERS.—1, H. Yardley.

FANTAILS.—1, J. F. Loversidge, Newark. 2, G. De Lisle. *hc*, Rev. A. G. Brooke. *c*, H. Yardley.

TUMBLERS.—1, H. Yardley. 2, J. Almey.

ANTWERPS.—1, H. Yardley. 2, G. Lendley. *hc*, G. De Lisle. *c*, Earl of Lougham.

ANY VARIETY.—1, G. Middleton, Bardon Hill. 2, S. W. Hallam. *hc*, R. Mould, Coleorton; T. Middleton.

RABBITS.—*Any variety.*—1, J. B. Dobell, Loughborough. 2, A. J. Cayless. *hc*, M. M. Cashmore. *Local Class.*—1, W. Kirby, Donington. *hc*, J. Kirby.

CANARIES.—*Yellow.*—1, G. Chamberlain. 2, T. Bradley. *Any other colour.*—1, G. Chamberlain. 2, T. Moore. *c*, T. Hawthorne.

JUDGE.—Mr. E. Hutton, Pudsey.

LISKEARD POULTRY SHOW.

(From a Correspondent.)

This was held on July 23rd, in connection with the Horticultural and Dog Show, and, I believe, was a success. The birds were exhibited in a large marquee.

The first class was a very singular one, and one that we do not often meet with; in fact, I think this is the only Show that offers prizes for Hennies, Tassels, Muffs, and any other White-legged Game adapted for table purposes. In single cocks the first prize, a gold medal, was won by a Tassel, a very good bird of the breed, but looking as if he was unwell; the second prize was the amount of entry fees of the class, and was also won by a Tassel in capital feather for the time of year. This bird belonged to Miss Bella Short, who also won the prize given to the exhibitor of the greatest variety in the class. Most of the birds looked as if they could stand any amount of steel, and I thought they were more suited for fighting than for exhibition. *Game*, any variety.—It is a very bad plan to throw all the varieties of Game into one class; and if there had been one or two more classes provided, I am sure it would have paid, because there are a great many Game fanciers in the county. As it was, Mr. Browne won first with what I should consider his best Brown Reds, and they were truly good; a pair of very fair Black Reds second, and moderate Brown Reds third. In *Dorkings* Mr. Barnell's pair of Coloured were perfection; a very good pair of Whites being second, and a fair pair of Coloured third. *Spanish*, including Minorcas and Anconas, were very poor, neither second nor third prizes being awarded. In the *Malay* class a pen of rare birds were first, and well deserved their position. The *Cochin* class, any variety, contained some excellent birds and some noted winners, Mr. Harris taking first honours with his far-famed Buffs, splendid-coloured birds. Second came a very nice pair of Partridge, though rather small—the birds, I think, with which he won the cup at Dorchester. Two pens of very fair Whites were highly commended. In the *Brahmas* grand Darks won an easy victory; Mrs. Holmes second with a very good pen of Lights. Of *French*, any variety, there was only one entry, which turned out to be splendid Houdans, and they well deserved the first prize. In the next class I was much vexed to find a beautiful pair of White-crested Black *Polands* too late for competition; having been exhibited up the country on the previous day, they were not despatched in time for the Show, otherwise they would have been first, and the first prize bird second. In *Gold or Silver-spangled Hamburgs* the first was won by a very smart and good pair of Golden, second only moderate; in this class also the same gentlemen's birds as in the preceding class arrived too late for competition, and contained a cock only, but he was a good spangled bird, and with an equally good hen would have run the first prize birds hard. Of *Gold and Silver-pencilled* there were only two entries, and only one was a good pair, which easily won first. In the *Game Bantams* a very good pair won easily, the cock especially so, although he had begun to moult; Mr. Currah taking second with his noted Brown Reds, the cock bird being rather mossy. In *Bantams*, any other variety, a capital pair of Black *Rose-combs* were first, and I have a strong impression that they were the same birds that were highly commended at St. Austell, only they were entered in another name. Good White-booted won second. The single cock class contained some very fair specimens, Mr. Lias winning with a splendid Partridge *Cochin*; a Black Red being second.

In *Ducks*, Aylebury or Roven, Mr. Cratt was first with the birds that won second at St. Austell last Show. A pretty little pair of Decoy Ducks were second in the Any other variety class.

The *Pigeons* were few, but contained some good birds, especially the Carriers, Dragons, and Antwerps.

We published the list of awards last week.

CARRIER PIGEONS EXTRAORDINARY.

ONE of the most curious incidents connected with modern journalism is the regular employment of Carrier Pigeons in collecting intelligence for the daily and weekly newspapers. In the competitive exertions to procure the "Latest Intelligence," it has been found that for short distances newspaper reports can be sent readier, cheaper, and quicker by press Carrier Pigeons, flying a mile per minute, than by the postal telegraph.

These aerial postmen are entrusted to resident correspondents in various places, ready to be dispatched at any moment, whilst others are sent out by reporters to places where important events are transpiring. It is now no uncommon thing to see reporters at police courts, inquests, public meetings, &c., dispatch folio after folio of "copy" by press Carrier Pigeons tossed through the nearest window, or thrown out of a train or steamer going at full speed. The attachment of these birds to the place of their birth, and their ability to find their homes from marvellous distances, are, of course, their distinguishing characteristics.

A "columbar" or home is established at the various newspaper offices, and whenever a bird arrives with a message the act of the Pigeon entering its cot sets a call-bell ringing in the editor's room, the bell machinery continuing in motion until attended to. Being expressly bred for press purposes—conveying news to our great cities—they are not the pure Carrier Pigeon (which is larger, heavier, and slower on the wing, and not so well adapted for press purposes), but are of a special pedigree, bred by Messrs. Hartley & Sons, of the *Woolwich Gazette*, Woolwich, from prize birds imported from the best lofts of Antwerp, Brussels, and Liège; all "producteurs" being rejected which have not won a 300-mile "concours." Press Carrier Pigeons owe their origin to Darwin's principle of "natural selection," or the "survival of the fittest." In the struggle for life in connection with the compulsory flying of long distances, the homing and flying powers of the Pigeons are developed to a large degree, whilst the birds which cannot do the distance are necessarily lost and eliminated. The surviving or winning voyageurs become thus educated to the highest standard of perfection, and this system being continued through many generations (the flying distances increasing every year), a race of Pigeons have been produced with powers which a few years ago would have been deemed impossible.

Press Carrier Pigeons, though as a rule only used for short distances, in competition with the electric telegraph, can be specially trained to distances of 500 miles, and frequently fly to England from Dublin, Brussels, Paris, Lisbon, and even Rome. The utilisation of the instincts of birds for press purposes is being carried even farther than this. An ocean-homing bird of great docility, intelligence, and spirit, has been found in Iceland, which flies at a meteor-like speed of 150 miles an hour, and is able to find its home, over sea and land, from any part of the habitable world. A pair of these birds a few days ago brought dispatches from Paris to a lonely spot, congenial to their nature, in a wild and rocky part of Kent, within ten miles of London, in an hour and a quarter. Press Carrier Pigeons took the dispatches on to the City, the whole distance from Paris to London, by actual parcel mode of conveyance, being done within an hour and a half. If the experiments at present being made in training and educating them continue successful, it is hoped by next summer to establish a daily miniature ocean mail between America and Europe, the whole distance to be traversed between sunrise in one hemisphere and sunset in the other.—(*Standard*.)

[When will general newspaper writers understand anything about Pigeons? I may well put this question, considering that the above ludicrous paragraph appeared the other day in a first-class London daily paper. Fancy "folio after folio" attached to poor Pigeons' legs or central tail feathers! But, Pigeons, hide your heads before "the ocean homing bird from Iceland, who now builds in Kent." I should like the writer to catch that bird. Always catch your hare first. If building "in a wild and rocky part," I should fancy this bird would be wild too; rather large, I should also fancy, and with possibly strong beak and sharp claws. I hope the writer will kindly catch that bird. When the bird comes back I presume he carries a whole *Standard* of news at least. At the next Crystal Palace Show I hope my friend Mr. Wilson, always enterprising, will kindly borrow the wondrous bird and put him among the Homers; or, better, put off the Show until April 2nd, and send the writer to catch him on April 1st before noon. Perhaps after all the writer misdirected his letter, and his account was meant for *Fun or Judy*—a sort of heavy, very heavy, joke.—WILTSHIRE RECTOR.]

HONEY PROSPECTS—A RODEBOROUGH VALE APIARY.

This is the fourth year of my experience as a bee-keeper, and it is by far the best honey season I have known. My stock in the spring consisted of nine Ligurians, eleven hybrids, and five English, since ligurianised. My best Ligurian stock, after taking from it seven nuclei, has half filled a super; from another I have taken two supers weighing gross 33 lbs. and 43 lbs., and it has nearly filled a third. From one other a super weighing 47 lbs. Three more have nearly filled two supers each, and five one each; the rest were either partly filled with comb in the spring, and have crammed the stock hives, and partly filled supers, or from being ligurianised have been thrown back. One has been

kept comb-building to supply nuclei; one swarmed, after partly filling two supers, on June 15th; the queen had one wing damaged, and fell in front of the hive, most of the bees returning. I then, on the 20th, took out three brood combs with queen cells, making three nuclei, thinking it would stop a second swarm; but they threw a very large one on the 25th, which has filled up the hive, and stored considerable honey.

My bees are all, with the exception of one hive, in Woodbury hives, mostly made of 3-inch stuff; the later-made ones are 1-inch, and on separate stands, which I consider preferable. I gave them above 2 lbs. of sugar syrup monthly through the winter and spring, and they were mostly strong in April. I lost three stocks during the winter; one from neglect, and two lost queens. My supers are of wood, with a small 2-inch window, and when filled hold about 40 lbs. The honey harvest is now, I think, over, and I am taking off supers. Aston's bee trap clears them with very little trouble.—G. S. T., *Stroud*.

BEE-KEEPER'S CALENDAR FOR AUGUST.

GENERALLY speaking, August is the last month of honey-gathering in Great Britain, and where bees are taken to the moors it is often the best. I have stated elsewhere that a twenty-acre field well sprinkled with white clover will, in favourable weather, yield to bees 100 lbs. of honey daily; and I have no hesitation in saying that twenty acres of good heather will yield more honey while it continues in flower than clover. The heather being hardier is less affected by weather. Clover is easily affected by cold weather, and seldom yields much honey after July. On heather bees can creep from flower to flower, and thus load themselves easily and speedily; whereas on most other plants they have to fly from flower to flower. Once only have I known a hive gather 20 lbs. in two days, and this was done on the moors. Mr. Shearer, in a letter of the 21st of July, 1874, informs me that on the Saturday before a swarm of his rose in weight 10 lbs. in twenty-four hours—that is to say, from Friday night to Saturday night. Such gatherings by single swarms are unusually and exceptionally large. Five pounds gathered from clover or heather by a swarm in twenty-four hours are a very good day's work. By-and-by we shall frequently hear of 5 lbs. being stored-up in a day by a single swarm. By the figures of Mr. Bagshaw in last week's *Journal* I see that some of his hives gained about 15 lbs. a-week each—i.e., from 30 lbs. to 35 lbs. in seventeen days.

All bee-keepers who intend to remove their bees to the moors should transport them there as soon as possible, for now (July 31st), bees are gathering honey from the early heather blossoms. Two days ago I took fifteen hives to the Glossop moors, the bees of which commenced to gather honey almost as soon as the doors were opened. By the time this letter appears in print we shall have thirty more hives there; indeed, they would have gone this week if the carter had not been previously engaged. The early blossoms of heather yield more honey than the later ones. The reader must bear in mind that the first half of the heather season is better for honey-gathering than the second half.

Those who do not remove their bees to the moors will now begin to think of taking their honey, for, where there is no heather, honey-gathering generally ends with July.

Before a hive is taken for honey the apiarian should examine all his hives thoroughly and weigh them with a view to select a certain number for stock, and mark those that are to be put down for honey. In seasons of early swarming the first swarms are generally the heaviest, and as they contain the oldest queens and most honey they are usually marked for honey. This year the swarming time was uncommonly late, and therefore many of the stock or mother hives are heavier than their swarms at the present time. A fortnight of favourable weather will enable the swarms on the moors to overtake, overleap, and outweigh the stock hives. Our first swarm weighed 56 lbs. before it was taken to the hills.

In selecting stock hives the apiarian should prefer those with young combs of the worker kind, and as free from drone cells as possible; and it is desirable that the hives should be filled or nearly filled with combs now, for in spring bees instinctively build too much drone comb in hives but partially filled. Such hives become half filled with drones about the swarming time, and it is well known that drones eat a great deal of honey and gather none.

Second swarms and turnouts have both young queens and young combs, and therefore are eligible in this respect for keeping. In good seasons they are generally heavy enough for stocks, say from 40 lbs. to 50 lbs. each. Where the turning-out system is not followed, the mother hives as well as first swarms are often in good years too heavy for keeping. If first swarms be selected for stocks the ages of their queens should be considered, for it is not safe nor wise to keep queens three years old. Some die at that age, and none live more than four years. A great loss is sustained if a queen is permitted to die of old age, whether death takes place before or after swarming. Some

fourteen days pass before the bees can rear a queen to take her place, and about fourteen days more pass before the young queen begins to lay. This is not all, for if the queen die after swarming the bees instinctively begin at once to build large sheets of drone comb in the centre of their hive. If a hive with an old queen be selected for stock—and this is often done—and another with a younger queen be selected for honey, the bees with the old queen should be driven into an empty hive with the view of seeing and destroying the queen. Then the bees with the younger queen should be driven from the honey hive and cast into the other; also the bees bereft of their queen should be cast back into their own hive amongst the rest. Thus the stock hive would obtain a young queen and a double portion of bees. If the hive with the young queen be selected for stock, the bees of the other (but not its queen) should be united to it in like fashion. Apiarians who keep large hives and manage their bees in this way have hives second to none for excellence, power, and real value. Old combs are most objectionable—black and ugly, frequently half filled with pollen. The honey in them is difficult to take. I repeat that old queens and old combs should be pushed aside in selecting stocks for another year. Every bee-keeper who does not wish to increase his stocks, and who manages them on the swarming principle, can do this easily every autumn.

“Sometimes in very good seasons almost all the hives become too heavy for stocks. What, then, should be done?” Part of their stores must be cut out. “But then that leaves room for drone combs next spring.” Of course it does, but we can’t help it. To-night I shall cut a great number of honeycombs from three hives that will be taken to the moors next week. They now weigh about 60 lbs. each, and are rather too heavy for an old man like myself to lift on and off a cart. I expect to obtain 60 lbs. of honeycomb from the three. The practice of reducing the weight of hives now is more convenient than commendable. If these hives were to go to the moors as they are, and were to have fourteen days of fine weather, they would rise in weight to more than 100 lbs. each. There are two ways of dealing with hives too heavy for keeping—viz., by reducing their weight, or by driving all the bees out of them at the end of the season into empty hives and taking their honey; and if this be done, where are the stocks to come from? The honey in such seasons and cases is taken, but the bees are preserved and fed. Two swarms, or one large one, are put into an empty hive and fed very vigorously; at least, 20 lbs. of sugar and about an equal weight of water should be boiled and given to every such swarm or hive of bees. From this syrup the bees will nearly fill a 16-inch hive with combs, and such feeding promotes breeding. A good hatch of young bees is produced late in the season in these sugar-fed hives, which make very good stocks. Their combs are young, and free from a superabundance of pollen. When spring arrives they will be found to thrive uncommonly well. While being fed they should be kept warm, and the syrup given to them regularly in considerable quantity. Every bee-keeper will use his own contrivance in feeding such swarms. I have not spoken against any system of feeding, and I am not going to begin to do so now. Such swarms are fed from below by various contrivances. Sometimes through holes in the floor-board the bees get the food from a hive or dish below; and I once saw a very successful apiarian feeding his swarms from pits dug in the earth. The holes or pits were about 1 foot wide and deep, with a dish at the bottom; the hives were placed over them and kept warm; the syrup was poured into the dishes daily. Thus one season, just ten years ago, he created nine as good stocks as the eye of man ever beheld. “How much sugar did he use in making these nine stocks?” He told me he gave 25 lbs. to each hive. He sold above £50 worth of honey that year, and could well afford to buy £5 or £6 worth of sugar.

“In taking honey from heavy hives do you destroy the unhatched brood?” Yes, if we have plenty of bees without it; but if the hives are not plentifully filled with bees we endeavour to hatch the brood by fixing or placing the combs of brood (cut from the honeycombs) in a box or hive as regularly as we can, and casting a swarm amongst them, covering all up with a lid. Sometimes the brood combs of three large hives are placed in a box thus, and hatched by a single swarm. The bees thus hatched are invaluable for strengthening hives not strong in bees. “Do not the combs thus placed fall out?” They would if the box were turned up or placed on a board, but this is avoided by placing the board over the combs and not moving the box.

In unfavourable seasons the heaviest hives are most eligible for stocks. The bees of the weaker ones are made to strengthen the stronger ones. The bee-keeper’s aim should be to have all his stocks well filled with bees, and food enough in them to keep them till March.

When I took up my pen I intended to arrive at the most disagreeable thing in bee-keeping—viz., the taking of honey and wax, but that will have to stand over till next month.

One favour I have to ask of the readers of this Journal and the public generally: it is that they will not write so many

private letters to me. While I am anxious to promote apian science and help working men to make money from bee-keeping, I have not time to answer private communications. If the readers will kindly send their inquiries to the Editors I shall be greatly indebted, and some day perhaps I will give them my autobiography in acknowledgment of their considerate conduct. Twenty letters a-week about bees and so many postage stamps are a heavy tax for a working man to pay.

[Those who ask questions really must attend to this request, and our own to the same effect which appears at the head of answers to correspondents.—EDS.]

A great many letters lately have been written to ask how bees are driven and united. Doubtless many of these letters come from beginners who need instruction. For their benefit let me here repeat what will have to be repeated again and again before all apiarians are enlightened and advanced. When bees are to be driven their hives are first smoked—well smoked with fastian rags, then turned on their crowns, other hives empty placed on and over them, and a tablecloth rolled round the junction to keep in the bees. The bottom hive is now beaten with the open hand to cause the bees to run up. About fifteen or twenty minutes’ drumming will drive almost all the bees into the empty hive. A few stragglers that remain can be brushed out with a feather or killed with a puff of powder. Thus hives of honey are free from bees. The bees driven can be easily united to another hive by first pouring minted syrup over the combs and bees of the hive to receive them, and about twenty minutes afterwards the bees should be cast in amongst the combs and bees, and thus the union is accomplished frequently without the destruction of a bee. I heartily congratulate the apiarians of Great Britain and Ireland on their prospects of a large harvest of excellent honey.—A. PETTIGREW.

DOGS.—No. 4.

OFFICIAL DOGS.—(Continued.)

A MARK of a thorough good protective dog, who understands well his office, is that in whatever house his master and he are in, he protects that house because his master is there. Protective dogs are, as to varieties, very different, some very large, others very small; for the little pet of the house, whose barking cannot be stilled by the thief who seeks an entrance, is not to be despised. Nay, such dogs, if not allowed to get near an outer door or a window, where they may be either stupefied or poisoned, are more hated by burglars than large dogs, if these are simply chained outside a house where they are easily quieted. The sharp little Toy Terrier, the little Spaniel, the Maltese, the Toy Skye, the Pug, &c.—all these have a higher than fancy value if they are made dogs of protection, dogs of office. But let all owners of pet dogs remember that their dogs cannot be expected to be alert and useful at night if they are fed after the middle of the day. The wheezy, plethoric, dainty, crammed pet who will just condescend to eat rich food, and that late in the day, is sure to be enoring his apoplectic sleep, and not be awake and barking when wanted, and the thief may walk over his very nose. Oh! why will ladies overfeed their pet dogs? for so doing they destroy both their beauty and utility. Tastes, of course, differ in regard to dogs, and right and well it is that they do differ. One man prefers a large dog, himself often being small; while a six-foot burly man is devoted to dogs that he can put into his pocket. My own taste runs for concentrated strength, as seen in a Bull-terrier, at least, when wanting a protective dog; although, perhaps, the lone farm is better guarded by two dogs, a Bull-terrier, much hull, and a cross-bred Mastiff. These, if with a dash of Scotch Deerhound in them, are preferred by Australian settlers.

Occasionally, a few times in one’s life, the real use of a protective is brought strongly before us. Three years since I was driving late in the evening across Salisbury Plain, from Salisbury to Devizes. Excepting the Fen country, this perhaps is the dreariest ride in all England. The Druids—if they were Druids—rightly chose that situation for their hateful and bloody worship: the scene was suitable to the deed. I shudder now when I think of that supremely dreary ride. The land being poor, pasture farms are few—here one and there one, with vast barns and offices rising on the horizon, as ugly as the Plain itself, like ill-shaped warts on deformed horny knuckles. And as I approached each farm, oh! the barking of the dogs! that barking which is combined with tearing at the chain—mad, furious barking—that of dogs savage by long confinement. These were dogs protective indeed, and no chance had the pilferer or the burglar. I seemed to be in some half-civilised country, and if a group of blacks with spears in hand had crossed my path I should scarcely have been surprised. The value of such dogs as dogs of office in such a lonely place can hardly be over-estimated. As a hint, I would observe that brindle is the best colour of all for night dogs, the colour for the game-keeper’s protector, and for the farmer who goes his rounds at night. Brindle of some shades is also a rich handsome colour, and I regret that it is objected to on the show bench. This certainly is

a mistake. If that colour be not encouraged it will die out. All dogs of protection ought, I think, to be allowed to be prize dogs, and brindle be rather considered a qualification by a judge than otherwise. Further, all large and fierce dogs, and all, in fact, able to attack a thief or a poacher, ought to be thoroughly obedient: lacking that, they lack a controlling power in their master, without which their courage may become mere blind fury. This obedience may not of necessity be brought about by cruelty or even severity, for the dog regards his master as a kind of Homeric god: he is cowed by him, he reverences him, he is flattered by his praise, and miserable by his frown. Let the master only use discreetly his power over his dog, and he need not be cruel in order to be obeyed.

The dog in office—good useful brute—serving his master for a bone, and, for what he cares more, an approving pat; yet, though he holds office and fulfils its duties ably, I had almost written conscientiously, yet how pleased he is to be freed from office at times! Look at his vulgar-looking useful friend, the carrier's dog. His master comes to his inn at length—(who does not remember the carrier in "David Copperfield," that laconic lover with his "Barkis is willing?")—the horse, that old bony animal, with a bit of blood in him nevertheless, is put in with a jerk and general rattle of all the contents of the cart. They begin to move: the curate's books tilt the slender side of the mud-servant's handbox, making the flowers on the bonnet shake like a peal of bells, and the village grocer's hamper settles itself after many a creak. Then by a sign from his master old Pincher is allowed to be off duty, and he readily jumps off the cart. At once he is all life and good nature, scampering, jumping up at the horse's nose; now looking up at his master, now dashing rapidly on the road home, then returning, then saying a sweet word to a lady friend, and apparently assuring her she will see him again next market day. Why, the dog's quite changed because he is off duty. He remembers the soldier—a grim silent man when posted as sentinel; but see him walking in the park, he is another man quite.

Well, we all need to lay by office and its duties sometimes, dogs and men—men as well as dogs. The two points are to work well and then to rest well—work with a will, and recreate mind and body sensibly. Alas! that so many of my poorer friends, who work so hard and so well, yet take their recreation so foolishly, so degradingly! Ah! well, poor fellows! They are better than they used to be, that is one comfort. They do drink too much, but they are less cruel; they do not bull-bait, and hodge-bait, and cock-fight, and dog-fight as they did so generally "when George the Third was king."—WILTSHIRE RECTOR.

OUR LETTER BOX.

AGE OF BRAHMAS LAYING (P. P.).—We have had both Brahmas and Cochins laying at seventeen weeks old, but they are the exceptions. It has been a common thing at twenty weeks. These two breeds are the earliest we know. From many pullets of both breeds now more than twenty weeks old we have not yet an egg. We believe the drought, in making the surface of the earth sterile in the way of animal food, has a great influence in these things. Taking the average of many years, we should not look for eggs till they are twenty weeks old.

BRAHMA FEATHERS (F. L.).—The feather you have enclosed is that which would the least enable us to form an opinion as to the merit of your birds. We cannot imagine that the colour of a Wood Pigeon should have anything to do with that of a Dark Brahma. Being pencilled to the throat is a great virtue in plumage, but if the ground colour is bad it would not avail in competition. If they are Dark Brahmas they should be shown in the Dark Brahma class. If the colour is so exceptional that they are not like other birds of that breed, show them among the varieties. We cannot think the feather you send came from a pure Brahma.

SPANISH FOWLS (W. P. B.).—We know few fowls more attractive in appearance than good Spanish, but they will not stay at home unless they are in confinement. They are the Englishmen of the poultry yard; they are never at home but when they are abroad. We keep them, but they leave yard, orchard, stable manure, good grass run, and all that should make a place attractive, to damage the garden. We should in your place keep Brahmas, or if you object to them, we would keep Crève-Coeurs. The latter are not always at home, but with ten acres of grass we think they would be content. We, however, pin our faith to Brahmas. A little attention to common rules will make them answer every useful purpose, and do all that can reasonably be expected. The soft eggs show want of health and condition. The mortality is beyond all idea. If the hens died in laying, the food must have been of a most stimulating character. Such produces internal fever, and makes laying a dangerous operation.

VARIOUS (F. R.).—We cannot publish your letters.

PIGEONS AT BLACKBURN POULTRY SHOW.—Mr. Dalton writes correcting the mistake of our reporter in ascribing the first prize for Carrier hens to Mr. Stretch and not to him-elf. The awards, however, were correctly given in the accompanying prize list.

HOW TO OBTAIN HIGH-COLOURED CANARIES (T. L. S.).—The method to which you refer is that given by Messrs. Demore & Orme in our number for December 11th, 1873 and which was as follows:—"Reg. bicolor, and cayenne pepper. These are the whole of the ingredients used by us, which have proved so successful in producing the high colour so much admired."

DRIVING BEES (George Abberley).—Driving bees is done by turning their live upside down, and placing an empty hive of the same size over the other, rolling a tablecloth or calico sheet round the junction of the two hives to keep the bees in; then drum on the bottom hive with open hands for about fifteen or twenty minutes. The bees are thus driven from the bottom hive

into the top one. You should take the straw hive off the box and drive its bees into another hive, place them where they were before—on the top of the box, and take the honey from the straw one. Your other box hive could be enlarged to admit the bees now hanging out, or you could drive them all into an empty hive, and then feed them vigorously with a view to cause them to fill their hive with combs and brood before the season ends. Late turnouts should be well fed while they have a disposition to build combs and hatch brood.

BEES TURNING OUT GRUBS (E. Emlyn White).—No doubt the grubs are those of drones, and it is no uncommon thing for bees so to treat their male progeny. We do not think the "drought" had anything to do with it, although it is not considered good management to give bees more than one entrance. Either, as you surmise, the bees wanted storing room, or else they foresaw the end of the season and the further uselessness of drones.

LARGE LATE SWARM (J. W. P.).—Your swarm 6 lbs. in weight, of Saturday, July 25th, is much too late for all ordinary seasons and localities. But this is not an ordinary season, and you have been near you, so you may find them thrive well. We shall be glad to hear again as to their weight in three weeks' time. You cannot now prevent the other hive from swarming if so determined. Should they swarm, we advise you to return them, after cutting-out all royal cells visible in the old hive.

REMARKS.

29th.—Frequent, and in some cases, rather heavy showers, but on the whole a pleasant day; but rather stormlike evening.

30th.—Fine day, rather cloudy about 5 p.m.; but fine evening and night.

31st.—A very fine day, wind rather high; stormlike at night.

August 1st.—Rain in early morning, but soon clearing off; fine day, though somewhat cloudy; very close and damp evening.

2nd.—Rather dull morning; a very oppressive day, with sudden puffs of wind, and at times a few large drops of rain.

3rd.—A most delightful day, bright, dry, and cool.

4th.—Dull morning; frequent showers, one very heavy for a very short time between 4 and 5 p.m.; fair evening.

The mean temperature nearly identical with that of last week, but some of the days being damp and stormlike were very oppressive, and made it seem warmer than it really was. Some of the recent storms have been felt here; the rain that has fallen has lowered the underground temperature about 3°.—G. J. SIMONS.

COVENT GARDEN MARKET.—AUGUST 5.

SUPPLY moderate this week, and prices remain much the same as last. Importations are large, comprising Peaches, Nectarines, Apricots, Green Gage Plums, and several varieties of common Plums.

From observations taken near London during forty-three years, the average day temperature of the week is 73.3°; and its night temperature 50.3°. The greatest heat was 92°, on the 18th, 1842; and the lowest cold 36°, on the 18th, 1865. The greatest fall of rain was 1.12 inch.

FAILURES.

WAS much interested and amused by the letter of an old gardener in last week's Journal, who complains that while there are no end of men who write about their successes, none write about their failures. Allow me, then, to make a beginning, and write about my failures. It is not, I am sorry to say, a difficult subject; it by no means presents that bewildering maddening doubt which week by week assails me—

“What am I to preach about this time?” I have loads and loads of failures to choose from, and not one of them have I ever described. Let me begin with one which your correspondent himself mentions—viz., fruit trees.

Here, I believe, I am in much the same position as your correspondent. I have a light poor soil, a favoured sheltered position, a lovely climate, plenty of walls, and yet I cannot produce a Peach or an Apricot, a Plum or a Cherry. I am the possessor of 100 yards of wall, and I have never had above a dozen Peaches since I came here. This year I have had exactly seven, three of which were of the size of a Green Gage; and yet it is not that I have taken no pains, for I have done every mortal thing I could think of to ensure a fruit crop. I have taken up all the old worn-out trees, prepared the borders according to the best rules, planted good sorts, and have watered, and washed, and protected, and fussed and fumed, and wept and howled, but all to no purpose. I never have fruit, and I do not think I ever shall, unless some kind friend will take pity on me, and tell me what is wrong. When this place was built twenty-five years ago the crop of Peaches used to be so great that the clerical society of this neighbourhood always used to fix their meetings at this house when the Peaches were ripe, and now they do not come at all, and I do not blame them. In fact, I am afraid my Peach failures had a great deal to do with causing the death of that society, for it began to languish about the time the Peaches gave signs of failing, and it is now defunct; and although a new one has since, phoenix like, risen on its ashes, it knows not me, for my Peaches “are not.”

As to the cause of my failure, the only one I can think of is the exceedingly late frosts, which not only destroy the bloom, but also kill the young wood. Every succeeding year here the frosts have been later and later, till this year we had a severe one on the 8th of June. How can tender fruit trees like the Peach stand such changes of temperature as our climate groans under? We cannot expect them to do so, and the only course that I can see is that recommended by a neighbour of mine—“When-ever a Peach tree becomes old I replace it with a Pear.” (Please spell the word right, for the neighbour in question is such a tremendous punster that he would be too delighted to see it misspelt.) These do well here in most places, and it is best to cultivate fruit which, though inferior in quality,—though, I believe, many would deny this—is superior in every other way, but most of all in its

hardy nature. But yet it is very distressing to give up the Peach and Nectarine, and I hope that some kind friend will come to the rescue, and tell us how we may grow the Peach in the open with a fair chance of success. Any hints as to pruning, protecting, watering, and washing will be esteemed as a great boon by, I should think, many others besides—JOHN B. M. CAMM, Monkton Wyld.

I CANNOT say with Mr. Pewtress that I am a young gardener, for my garden was planted in 1862, and I have watched the coming seasons year after year with something of the feeling of drawing a prize in a lottery—hope and fear. My garden is situate on a northern slope, so I cannot attribute the failure to too early blossoming; besides, this part of North Hants has the reputation of being always backward. The protection afforded to the grounds would appear perfect. On the north and east are planted (now fine-grown trees) *Pinus austriaca*, tall Filberts, and between them a thick Quickset hedge, and on the south and west there is a good wall. The place looks snug enough. The trees grown are pyramids and bushes, and appear to be in perfect health.

My man generally in May writes to me to come and see the garden, which is then a perfect garland (to use his own words); and I may say it is my chief gratification once in the year to travel fifty-four miles if only to view this lovely and beautiful picture, and our hopes then begin to brighten up when the old man surveys the grand effect, and exclaims with pride, “I think, sir, there is no doubt about fruit this season.” But alas! how frequently our hopes, like trees, are blighted. Look at the garden now (August), compare it with the month of May; “look on this picture and on that,” not a fruit of any kind—Pears, Apples, Plums, Cherries, all a failure. I prune and pinch according to orders, still the trees grow and bloom, and have done nothing more for the last three or four years. Your correspondent Mr. Pewtress thinks if he could retard the early blooming all would be well. Perhaps so; but here mine is a case of what you might suppose to be proper backwardness, and the result the same—no fruit. People say, “Have patience, when the season is favourable there will be plenty of fruit,” but I am getting old; and when I first planted the garden great pains were taken to buy of nurserymen of good repute, whose catalogues I would peruse, reading the descriptions of delicious fruit until my mouth watered. Now, after twelve years' growth I walk despondingly round the garden looking on nothing but green leaves until my eyes water.—J. LOVELL, Overton, Hants.

PRESERVING FRUITS.

“WELL, Mr. Green, if you don't know when Cherries are dry enough to gather you had better ask someone who does; those you have sent in are as wet as possible.”

“I can assure you, Mrs. Bouncer, they were perfectly dry when gathered half an hour ago.”

“No, you cannot assure me of anything of the kind;

if they were dry when they were gathered they would be dry now. I have not preserved fruit these twenty years without knowing something about it, and I am sure I never had any sent-in in such a state till you came here. I don't know what we are coming to;" and the good old lady sighed in despair.

The fact was the Cherries had been perfectly dry when gathered, but it was a comparatively cool summer day, and they were taken into a heated room for bottling, where the moisture immediately condensed on the fruit, and in a few seconds it became as thoroughly wet as if it had been in a shower of rain. Had Mrs. B. remained a little longer upstairs till the fruit became warm through, all would have been right in the good lady's eyes; but as it was, the fruit in her opinion was entirely spoilt, and Mr. Green "was no gardener."

This is no imaginary picture, although I am happy to say it was not my personal experience. The genus to which Mrs. Bouncer belongs would not flourish here, it requires special culture. Half the fruit that is preserved (?) in some private establishments is spoilt through inattention to, or want of knowledge of, such apparent little matters as the one I am attempting to point out. Sometimes it is the bottles or jars that are brought in from a cold place and immediately filled, and sometimes the fruit is allowed to remain uncovered in the bottles in a variable temperature for a considerable time before being corked down. Mrs. Bouncer is a most careful person, but somehow she generally manages to bottle up more water with the fruit than is good for its keeping, and then after a few weeks she cannot understand how it is that the mould appears; but the storeroom and the gardener will probably have to share the blame between them. Mr. Green's vineries—when the Grapes were ripening, and the sun raised the temperature suddenly before he could get at the ventilators—have given him more practical lessons on the subject than the poor man was in need of; but it is of no use for Mr. Green to understand the subject unless he can manage to convince Mrs. Bouncer, and that is no easy matter.

For bottling fruit to keep well, it is necessary that it should be corked up perfectly dry, using the best corks procurable. If it is placed over the fire at all (most fruits that are usually bottled will keep perfectly well without this), the water should not quite boil, but merely begin to rise in small bubbles, when the fire should be drawn, or the preserving pan taken carefully off and allowed to become quite cold before the bottles are removed. Now, all this care is imperatively necessary for preserving fruits whole in bottles for tarts, ices, &c.; but, on the other hand, for making jams and jellies, if the fruit is boiled directly it is gathered, and not allowed to stand about till it begins to decay, it matters not how wet it is—in fact, in a dry summer when the fruits are comparatively short of juice it is a great improvement to add a little water before boiling. No one need be timid about this, because a moment's reflection will show that during the process of boiling in an open vessel all the water is quickly evaporated, and if there is no water to evaporate, of course some of the juice of the fruit will be lost.

I am surprised that amongst the varieties of Strawberries that have been lately recommended for preserving, I have not seen any mention of the old Grove End Scarlet. I certainly do not know any other kind half so good for the purpose. I suppose it is on account of its small size that it is not more grown; but what it lacks in size it makes up in numbers—in a good season it averages at least a pint of fruit to a plant. The jam made from it is of a good colour, of good flavour, and of even consistency: all the fruit breaks up in boiling, there are no lumps. A fruit for making jam or jelly ought always to be acid; I think no one ever complains that jam is not sweet enough. It should also be of a decided colour; most large-growing Strawberries are light-coloured inside, and therefore cannot produce red jam. Vis-comtesse Hériart de Thury is of a good colour throughout, and is a prodigious bearer, but when made in jam its seeds are too numerous and prominent.

Is there a recognised but variety of the Morello Cherry? One tree I have amongst others was last year a fortnight later in ripening its fruit than the rest; there is a difference this year, but I am afraid it is not so marked.—W. TAYLOR.

SEEDLING BRIAR STOCKS.

MR. CAMM, at page 118, speaks highly of the seedling Briar as a stock for late blooms of Roses. Will you allow me to inquire whether these seedling Briars are raised from English-grown seed or from imported seed, or are the stocks themselves imported from France? I ask because, from something

which a noted rosarian told me a few weeks ago, I am inclined to think the seedling Briars are imported from France. If they are, whence can amateurs get supplied?—P.

THE KITCHEN GARDEN.—No. 10.

IN laying out the area of a garden there is more economy in plainness and simplicity of arrangement, both in the present and in the after management, than there is ever likely to be in striking-out those peculiar figures, such as oval and circular shapes, for the sake of combining ornamentation. It would require a large scope of ground for a gardener to make the latter plan appreciated, because a vast deal more space would be taken-up by a multiplicity of walks, &c., to say nothing of the extra amount of labour involved in cropping, and the design must be large and bold to be seen to advantage when every quarter is cropped. A fruit garden so arranged might be more in character; but for a fruit and vegetable garden combined, such as our amateurs are likely to require, the plainer the arrangement the better, especially when on a small scale, and where it is so necessary that every foot of space should be made the most of.

The first thing to be thought about is the borders and the width they are to be struck out. The rule is, and I think it will generally bear criticism, to make them the width of the height of the wall, but in some instances I think it would be an advantage to depart from it; for instance, if the garden should be a parallelogram in shape, and the walls all 8 feet high, I think the south borders ought to be 10 or 12 feet wide, or even more than that if the situation and soil are good, and the remainder of the borders may be of a width equal to the height of the walls; but if the length of the parallelogram should run directly north and south, I would set off two borders, the first one to be not less than 12 feet in width, and the other about 20 feet wide, both running parallel with the wall, the second border being divided from the other by a properly-made walk. This would be found an excellent additional piece of ground to prepare for the growth of early vegetables, and is rendered necessary, I consider, from the position of the garden, it having but a small southern aspect compared with the others.

The work of setting out the borders is very simple. Running as they do parallel with the walls, it is only to measure-off the desired width from these and strike them out with line, stakes, and spade; and then the walks ought to intervene between the borders and the centre of the garden, which is the remaining portion to be divided off. Here let me observe, that although it is absolutely necessary to have a walk running round the interior of the garden as above indicated, and to which those from each entrance should communicate, it is a great fault to have too many in other directions, as is seen in some gardens. It is a waste of ground for very little purpose; and in small gardens of an acre it is a question whether one other walk running through the centre would not suffice for all purposes, or at most there ought only to be two walks intersecting each other in the centre of the garden, dividing it into four compartments instead of two. This is a matter, however, upon which the proprietor would be the best judge, and the situation and means of access to the garden would afford him a guide. In some cases where there is an object in the centre to which it would be desirable to have easy communication I would say, by all means make the most of it. Or it may be that the principal supply of water is to be obtained from the centre of the garden: if so, the more facilities for access to it the more advantageous it will be, provided these be not overdone.

Enough has been said to show that the garden should be divided into compartments in the most careful manner, having regard always to that plan which is likely to prove the most convenient and useful according to the situation, means of access, and other circumstances which it is sometimes not possible for a person to foresee and provide for unless on the spot.

To take things in their regular order, the next thing to be considered is the width of the walks and their formation. I have so far been advocating as few walks as possible, and I think it proper to make those few as wide as can be done, paying due regard to three things that will always be appreciated—viz., the facilities for conveying materials to and from the ground, and the comfort of those who visit it, as well as the size of the garden. For the first two purposes the walks ought not to be less than 5 feet wide, which will allow two barrows to pass each other easily, or if a small pony cart is

used this width will suffice, whilst two persons can very comfortably walk side by side on a path 5 feet wide. Now we come to the size of the garden, for which, if small, very wide paths would look objectionable, besides taking up unnecessary space. For a garden of an acre none of the walks should exceed 6 feet, and this width might be allotted to the main walk if found necessary to have one; and I should advise a little difference in them, such as those leading to any particular place or object, leaving the others narrower. Many have their walks 4 feet wide or even less, but I prefer to see a few walks properly arranged for comfort, as stated above, and if more are needed let them be temporary workmen's walks merely cut out in the ground and dug-up again when not wanted.

Next comes their formation, and this is not a very difficult matter in some localities, while in others it is so. I am an advocate for their being made well. There are three or more kinds in general use: there are the old-fashioned gravel walks, asphalt walks, and those made of concrete. Grass walks, though sometimes used, are becoming less common. To have a firm smooth gravel walk is the pride of many, but owing to the scarcity of good binding gravel other modes are resorted to when it cannot be obtained without a great outlay. In heavy soils, or in low situations, to make a good walk the soil should be taken out quite 18 inches, or even more, and the bed of the walk made hollow in the middle, in which should be laid a substantial pipe drain. The whole should be covered with at least 1 foot of rough rubble, such as broken brick, stone, clinkers, and then with 3 inches thick of broken materials of a similar kind, all well beaten down; afterwards put on 2 inches of fine gravel and roll it, then finish off with another inch of the same material, and roll that. While the first layer of coarse material is being formed, take care to keep the centre of the walk the highest, so that the layers may all be of uniform thickness, and they are not then likely to give way easily. The above will make a good walk; but, if necessary, or if material is plentiful, the walks may be made more substantially by excavating deeply and making thicker layers. It sometimes happens that gravel cannot be obtained, in which case a substitute must be found. Coal ashes sifted fine, or road sand, may be used. The only objection to the former is their colour, otherwise they are always dry, if on a prepared bottom, and likewise clean. I am compelled to use them for the kitchen garden, and like them because they are not affected by frost so much as other materials. Road sand is also clean, but often wants renewing, and is affected by frost; if laid on moderately wet and afterwards rolled it hardens considerably, and makes a tolerably good surface to a walk.—THOMAS RECORD.

DESIRABLE PLANTS FOR BEDDING.

MANY of your readers, like myself, no doubt require some ten or fifteen dozen plants every spring for bedding purposes. Whether it is cheaper to provide a greenhouse for the purpose of saving such a number, or to purchase a fresh supply annually, is a question into which I will not enter; but with myself the saving of trouble leads me to prefer the latter way. Purchasing has likewise the advantage, that if you meet with anything that takes your fancy you can be supplied with it at a moment's notice in any quantity at reasonable prices.

As regards Geraniums, four years ago I tried six dozen Vesuvius; next I tried the same quantity of Jean Sisley, and last year I had Omega, but this year I have come back again to Jean Sisley; and being particularly fond of bright distinct colours with other corresponding qualities, Jean Sisley is that which I prefer. Of the Tricolors none that I have yet tried grow with that robustness which is necessary to keep up a constant pleasing effect. This year I have Lady Cullum, and if there is a better for my purpose I should only be glad to hear of it. Of the Golden-leaved I have Crystal Palace Gem; and though it is of slow growth it is a very pleasing kind, and another year, with a little more rich soil in the beds, it will, I think, be more to my taste. I am particularly fond of good Bronzes, and this year obtained two dozen of Black Douglas, which are now such splendid plants (foliage only), that I should hardly know how sufficiently to praise them, the growth being robust, and the colour really superb.

This brings me to, in my lot, the flower of the season—Cannell's Lustrous Lobelia. Oh, what a gem! Pray allow me to give this little picture its due, for amid flowers for bedding purposes it is all the heart can desire. You have compactness, free blooming, and such an intensity of colour as most cer-

tainly in all my travels I never previously beheld. For edging I use Golden Feather Pyrethrum and Lobelia fresh planted every season, with colours nicely balanced; and with a few other little nienacs I contrive to derive a succession of pleasure from what is within the reach of many, if they so will, one of the treasures of the earth—a sweet little garden.—JOSEPH WITHERSPOON.

HALF AN HOUR AT CANNELL'S.

A BRIEF record of a visit to this floral bee-hive may not be absolutely devoid of interest. It is the little centre of a great business—the little head of a trade ramification embracing not only the whole of Britain, but extending to the continents of Europe and America, and even to the antipodes. One must travel far and wide to find so much business of its kind, and such an extensive collection of popular plants compressed into a space so small as may be seen on the railway embankment of Woolwich Dockyard station.

When last at this bee-hive it was weak—a very small infantile affair; now it is strong, overgrown, enclosed as with an iron band by boundaries impregnable. It has grown and spread over the property of eight or nine landlords until it can grow no longer there; and Mr. Cannell, on the very day of my visit, was negotiating the purchase of several acres of land whereon to "swarm" with all his host. This is one of the successes in business founded entirely on energy, perseverance, sound trade principles, and professional skill. Mr. Cannell is a man of nerve, self-reliance, quick decision, and great activity. He is in many respects an original. He struck out a new line by making the post office the chief medium of transport for his wares. He, a lover of plants, yet not rich, thought there might be thousands like him, and therefore offered small plants at small prices; he let the world know it, and the thousands came. His trade lists are "guides," and have a sniff of originality about them. His essays are not quite like those of other folk in language, and in idea often different to those of other men. His boilers are "circulators," and instead of heating by orthodox water pipes in the orthodox way—along the sides, floor, and under stages, he suspends the hot water in gas pipes along the roof and just underneath the glass of his houses and pits. Truly this is a bold innovation.

I will now take a glance at the place and its contents, and a selection of plants which have merit to recommend them will occupy disposable space. If he who doubts the produce of the soil is a benefactor, then Mr. Cannell holds honourable position amongst cultivators. What was no long time ago a hard, dry, barren slope of rubbish now teems with floral life—a selection of the best varieties extant of typical popular plants, in immense numbers, and of great value. The place may be said to be covered with glass, consisting of light span-roofed houses and a great extent of low pits—that is, about 2½ feet deep at the back by 1½ in front—the very places for the well-being of their hundreds of thousands of little occupants. What strikes one at a glance is the prevailing health and cleanliness of the vast array of small plants. There is no question as to their being well tended. Their order of arrangement, too, is simple and effectual, the nursery being, in fact, an exact counterpart of the catalogue. Turn from a page of the list containing the names to the corresponding page in the nursery, and you see the plants. The stock in trade of any given kind is thus seen at a glance, and there is no time lost in hunting for any particular thing wanted. Not only are plant-loving amateurs supplied with their dozens in little post-boxes, but thousands are also here manufactured for the trade. It is curious to see the run on particular things, in some of which it is almost impossible to keep pace with the demand, while of others a small stock suffices. From this little spot have first issued to the world many varieties of plants of great merit, especially amongst Fuchsias and Pelargoniums, of which the store is very extensive and good. So numerous, in fact, are the varieties offered, that is a no small difficulty with many to select a few dozens. This indeed is felt as one of the greatest obstacles of many intending purchasers, who only purchase a few plants at a time, and who desire them free, distinct, and good. By way of aiding these, and imparting an element of usefulness to this communication, I append a few that may be relied on, not because they are new or old, or cheap or dear, but because they possess merit and give value for money.

Commencing with the plants that have made the place famous—viz., Fuchsias, the following are good in their re-

spective sections:—With *white tube and sepals*: Guiding Star, Mrs. J. Live, Minnie Banks, Our Futuro Queen, Baroness Burdett Coutts, Princess Beatrice; and for the largest bloom, Arabella Improved; and for covering space or pillars, Lustre. *White-corolla'd* (single): Delight, Mrs. L. Bennett, Cannell's Gem. *White ditto* (double): Marchioness of Aylesbury, Little Alice, Avalanche. *Darks* (double): Avalanche, Alpha, Marksman, King of Doubles, the old Blue Beauty; and for size, Champion of the World. *Darks* (single): Enoch Arden, Tryme-Oh, Crown Prince of Prussia, Father Ignatius, Mr. R. Pexton, Killiecrankie, and as a little gem, La Traviata. Of *Sels*: Sedan is one of the best. Of *Stripes* (dark): Striata Splendour, light; Striata perfecta. *Variegated* (foliage): Sunray and Regalia. To make the list longer might be to make it less useful; those named all possess decorative merit, and are inexpensive. Cannell's great gem this year, but perhaps, considering its name, I had better say great mainstay, is Mrs. E. Cannell. The name should be a guarantee of the excellence of this Fuchsia. I have not seen it in bloom.

Looking at the Pelargoniums one is fairly bewildered by the variety. Dividing them into sections, the following are noted as the cream:—*Gold Tricolors*.—The best new ones are Mrs. H. Little, J. Downie, Gem of Tricolors, and Miss Goring. Older and less-expensive kinds: Peter Grieve, Prince of Wales, Sir R. Napier, Mrs. Punnett, Achievement, and Macbeth. *Silver Tricolors*.—New ones: Dolly Varden, Mrs. Laing, and Lady Dorothy Nevill. Older varieties: Lass o' Gowrie, Mrs. Col. Wilkinson, Prince Silverwings. *Gold Bicolors*.—The newer ones: Prince Arthur, W. E. Gumbleton, Mr. and Mrs. Harrison Weir, are very telling. Less costly, because older and more plentiful: Marshal MacMahon, Black Douglas, Reine Victoria, Mrs. John Lee, and Emperor of Brazil; while Golden Harry Heever, by its diminutive growth, will be in demand for bedding. Of *White-edged* bedding kinds: Princess Alexandra, May Queen, Pearl, and (creamy) Queen of Queens. Ditto with white flowers: Mrs. J. C. Mappin and Waltham Bride. We now stop to look at a curious striped-flowered Zonal with a curious name, Killisch Von Horn; and another Fancy with white-blotched petals, Mrs. Smith. Amongst *doubles*: Jewel, Prefet de Lyon, M. Dumortier, Emilio Castelar, and Asa Grey must have honourable mention.

We now come to the grand array of *Zonals* for pot-culture, the most useful production of modern times, proof against insects, and determined to grow and bloom freely. Of the new ones: Dr. Sharp (purplish), and Rienzi, Dr. Denny's fine soft scarlet zonal, must march abreast at the head of the column, followed by Harry King, H. Greely, Mrs. Bizard, Truth, Mrs. Chandler, Darkness, Jessica, Circulator, Corsair, Glitter, Purple Prince, Sir C. Napier, Heartsease, with an array of others hard to cast aside. Of bright *bedding Zonals*: Jean Sisley, Flamingo, Omega, Vesuvius, and Cannell's Dwarf are amongst the best. Of various-tinted Pinks, Master Christine must head the list in company of Amaranth, Maize, Mrs. R. Hole, and Mrs. Upton. The best of the Whites is, perhaps, White Clipper, closely followed by The Bride. But there is yet another class unrivalled for bedding, and some for pots. Of the former: Triomphe de Stella, Charlie Cashon, Violet Hill, Vesta, and Crimson King possess great merit; while Brindley, Overall, Princess of Wales, L. Heywood, Mr. Gladstone, C. Dickens, J. George, Matilda, Col. Holden, &c., are all worthy of a place in-doors and out.

The above list of Geraniums—a very select one from a very long one—may be useful to those essaying the culture of these useful plants. It is reliable, and contains colours to suit all tastes, at prices to suit all pockets. Mr. Cannell grows Verbenas in great number, clean and healthy, but space prohibits any elimination.

Violas are evidently in demand, Cornuta Perfection, C. Sensation, and the new Queen Victoria having a great run. Lobelias are still popular as ever, and increasing in variety. Of Mr. Cannell's great batch, Lustrous is the best of all the darks, in colour superior to any, in habit intermediate between the speciosa and pumila types, and more constant and continuous in bloom than either; Cobalt Blue is excellent; Charming—well, its name speaks truly. Succulents are in great numbers and variety, Echeveria tabuleformis being much in request. It is curious to note the popular taste in plants, which can never be so well arrived at as in a plant manufactory. I will name just one more plant, which would seem to be running the stock off its legs, easy as it is to be raised by hundreds of thousands—viz., Stellaria graminea aurea. It is a soft yet clear and decided yellow edging plant of dwarf dense habit,

It is the first real rival the Golden-Feather has met with. It is going somewhere in immense numbers, and we shall hear of its merits as the season progresses. It is a plant of promise, free, easy of increase, and effective. Need it be said that in this floricultural hive all is business and activity? Such labour, enterprise, and persevering effort ought to result in a grand harvest of emolument to the proprietor.—J. W. B.

NOVELTIES IN THE ROYAL GARDENS, KEW.

MUSA SUPERBA is planted with good effect on one end of the rockwork. It is of importance as a fine-foliaged plant for the greenhouse and the open air in summer. For these purposes it has been but little used. It deserves attention from its dwarf habit, and the great recommendation that it can be dried off and stored under stages or in other convenient places for the winter. When at rest the plants are like large bulbs, and in this condition might be imported by the hundred, cutting off the leaves, if any. When required to start in spring they should be repotted in rich loam. A warm house is needful at first, but when beginning to grow freely they may be hardened off for the greenhouse, and for sheltered positions in the open air when all danger of frost is over.

Bowiea volubilis is a very interesting Cape Liliaceous bulb, planted against the wall of the new range. It has been there without other protection during the past winter, and is now in flower. The inflorescence branches indefinitely, is twining, and many feet long. The branches are green and succulent, and do not all bear flowers, but apparently perform the same function as the leaves. These are two in number, produced before the inflorescence, and die away as it grows. Seeds are freely produced; they should be sown in sandy soil. The young plants will soon appear, and should be allowed to complete their first growth in the seed-pot. When inclined to grow after rest they may be potted off singly in small 60-pots. As regards water, the method of giving it should be the same as for other Cape bulbs. Bowiea volubilis, from its graceful habit of growth and unique character, is suitable for all collections. It does well in a cold frame or greenhouse.

Phygellus capensis var. major is very handsome, with large panicles of scarlet flowers. Though quite hardy, it is, doubtless, improved by being against a wall. It is easily increased by means of cuttings.

ROSES OLD AND NEW.

It is said of Oxford that it is so learned a place because so much learning is carried there and so little is brought away! Rosarians are a learned body, and the reason is they keep so much learning to themselves. I always look to the index for the word "Roses," and if it is not there I drop "our Journal" for awhile. Much cannot be said at this flagging period of the season, but still something may be said. I propose to speak

Firstly, of good old Roses still retained here, and that have seen the death and exit of many hundred Roses. They are—Baronne Prevost, La Ville de St. Denis, William Griffiths, Aicalie, Souvenir de la Malmaison, Souvenir de la Reine d'Angleterre, Triomphe de Paris, Madame Louise Carique, Alexandrine Bachmeteff, and Madame Campbell. Madame Louise Carique is a capital pole and wall Rose. All these Roses have been under my care for many years; they are stalwart bushes on the Manetti stock; they have seen the death or exit from the catalogue of many hundreds of Roses. Surely "a living dog is better than a dead lion!"

Secondly, the best Roses from the year 1863:—Pierre Notting, Madame V. Verdier, Lord Macaulay, Leopold Premier; they are all first-rate. 1864—Marguerite de St. Amand, Maréchal Niel, Duchesse de Caylus, Dr. Andry; all first-rate. 1865—Marie Bady, Abel Grand, Alfred Colomb; all first-class. These are very good—Fisher Holmes and Prince de Portia. 1866—Felix Genero, Madame Margottin; first-rate. These are good—Annie Wood, Black Prince, Monsieur Noman, Princess Mary of Cambridge. 1867—Baroness Rothschild; it wants scent and a little more fulness, but is very handsome. 1868—Edward Morren, first-rate. These are very good—Madame Creyton, Perfection de Lyon, and Thyra Hammerick.

I do not know the dates of the following, but they are very good:—Devienne Lamy, Vicomtesse de Vézins, Baron Chaurand, one of the very best dark Roses; Louis Van Houtte (Lacharme), Baron de Bonstetten, Maxime de la Rocheterie, Baroness Louise Uskull, Madame George Schwartz, Etienne Levet, very fine; Pierre Seletzky, Félicien David, and Claude Levet. The

last I hope will be full enough; it is very handsome as an opening bud—a first-rate button-hole Rose. Allowance—I have made but little—should be made for “infants” on comparatively weak stocks, especially as they had a bad season for establishment. I have Ducher's Van Houtte; it is quite distinct and good. I am surprised that such a nice crimson-purple Rose as Baronne Pelletan de Kinkelin should have gone out. It is like, but very superior to, Eugene Verdier and André Leroy d'Angers. It is a good grower and free bloomer both on Manetti and on its own roots. Mr. Turner kindly gave them both to me with others many years ago. I do not think Ducher's Van Houtte or Madame Masson (Gloire de Chatillon is the same) should have gone out. We want not only good Roses, but better than those we have, and distinct from these. To persons liking dark Roses I specially recommend Louis Van Houtte (Laeharne), Baron Chaurand, Maxime de la Rochetiere, full-sized, and Baron de Bonstetten. The Roses here have done splendidly, and are very healthy.—W. F. RADCLIFFE.

NOTES ON STRAWBERRIES.

IN No. 694 of THE JOURNAL OF HORTICULTURE Mr. John Taylor, Hardwicke Grange, recommends several sorts of Strawberries for preserving, but I believe the only best for that purpose is *La Constante*. The fruit is of a dark red colour, of excellent flavour, of firm substance, and of medium size.

Several times I saw in this Journal recommended Keena's Seedling and Black Prince, and tried them therefore, but I found them scarcely worth gathering. For forcing, as well for general purposes, I prefer Early Prolific, Sir Joseph Paxton, and President. To grow large fruits I take Unser Fritz (Gloëde) (Our Frederick, the Crown Prince of Germany), I daresay there is no larger and finer variety than this. Dr. Hogg and Cockcomb follow in size, and both are of delightful flavour.—A. P., Germany.

IN AND OUT OF ABERYSTWITH.—No. 3.

I HAVE seen some of the most celebrated of waterfalls in England, that of Lauterbrunnen in Switzerland, and that of James' Town in St. Helena, but never did I comprehend how the grand and the beautiful might be combined with and aided by such a down-rush of water, until I saw that at the Devil's Bridge, twelve miles from this town. This waterfall is the only one I know descending hundreds of feet through mountain rocks, wildly arranged, mostly approaching the perpendicular, yet clothed thickly with Oaks and the most luxuriant of undershrubs and wood plants. The Swiss and the St. Helena waterfalls descend from heights as lofty, perhaps loftier than this, but they are merely bare streams of water—not a break in their entire length—not a shrub on the face of the rocks from the summits of which they descend, and viewed from a distance they look like great lengths of white ribbon waving in the wind. The Devil's Bridge waterfall descends between huge masses of rock by four leaps, and then joins the river Rheidol by a fifth. These are respectively 18, 60, 20, 110, and 70 feet in length, and each leap ends in a rocky chamber, one of which is so rounded by the whirl of waters as to be named the Devil's Punch-bowl. Every leap is varied by jutting rocks, and each descends amid trees and shrubs which afford most effective dark bounds to the white foaming water. Anyone intending to arrange an artificial cascade would do well to visit this waterfall, not in the hope of copying even the smallest of its leaps, but to observe the need—the unescapable need—if the utmost beauty is sought for, to break the fall of the water however short its length—to compel it to make at least one leap, and to have the rockwork sides of its course well planted. I have seen one such, and although the entire fall was not more than 25 feet, yet the rockwork broke it into two falls, and the foamed water as seen through the bordering evergreens and trailing plants deserved and obtained the exclamation—“That is really beautiful!” An artificial waterfall can never merit the designation of “grand.”

I was disappointed in not finding rarer plants at the Devil's Bridge, and there were but few Ferns. Among these were *Cystopteris fragilis*, *Hymenophyllum Wilsoni*, and *Ceterach officinarum*.

The residence of Lieut.-Col. Powell is about four miles from Aberystwith, and has an additional temptation for visitors by being reached by the only road unfractured with a turnpike. The residence is handsome and well described by its name, Nant Eos, the Nightingale Dingle, for the whole park is

beautifully wooded on each side of a ravine, and is such a place as that queen of song birds delights in.

The approach from the entrance lodge to the house is about a quarter of a mile beneath noble specimens of Beech and other forest trees, and I should think that under them is the only quarter of a mile in all Great Britain that is entirely covered with the Aaron's Beard, *Hypericum calycinum*. The dressed grounds are small in extent, and the only specialities in them are two *Araucaria imbricata*; they are 25 feet high, most vigorous, and have not a brown leaf upon any branch, from the top to those which in a wide circle rest upon the ground. The approach from the house to the chief part of the dressed grounds is by a well-planted path by the wall side of the kitchen garden, which, it is to be regretted, intervenes. By this path is a mound surmounted by Mulberry trees, and that mound is the cemetery of dogs who have died in the service of the Powells. Small slate tablets are inscribed with their names, and one has an appropriate addition—

“TRAVELLER, a Retriever.

“That undiscovered country from whose bourne
No TRAVELLER returns.”

The kitchen garden is large and excellently cultivated, and the crops of Black Hamburg, Black Prince, and Muscat Grapes in its vineries were very fine in every respect.

The gardener, John Evans, is one of the sterling blue aprons of three generations ago. A Welshman, knowing little English, to whom Abercrombie, Miller, and London are unknown, and who never knew of any gardening periodical—not, O! Editors, even of THE JOURNAL OF HORTICULTURE!—yet he is a thoroughly successful gardener, has given entire satisfaction during the forty years he has rooted at Nant Eos, and, like others I have known, regular in his days for performing certain sowings and plantings every year, so as to need no “Gardener's Remembrancer” but an almanac. He was about planting-out his Leeks on Lammas Day, August 1st; and as he told me that they were sown in March, I will wager that the sowing was done on its first day, the anniversary of St. David. In talking with John Evans about the plants and crops, I found that he did not know some of them by the names we apply. He had only heard of the *Araucaria* as the “Monkey Tree,” and some others which I do not remember; but the divergence in names led to my thinking that the names by which plants are popularly known here afford evidence showing which are native and which exotic of Wales. For instance, Welshmen know Celery, Cauliflower, and Potatoes only by those names, showing that they are comparatively modern introductions; but Raspberries are *Mafons*, Strawberries are *Mefus*, and Leeks are *Cenin*. These last were evidently esteemed by Welshmen throughout known ages the bulb of all bulbs, the type of bulbs, for Garlic is *Cenin* ewineg, or Leek with Claws; the Chive is *Cenin* y gwinwydd, or Leek of the Vines—that is, clustered; and the Hyacinth, *Cenin* y brain, the Leek of Dignity, or King of Leeks! Since being here the derivation of many names have become to me explicable, which defied me before. Onion is evidently an abbreviation of its Welsh name, *Winwyn*, pronounced *ōnōn*. That apparently absurdly-named town in Devon, Penny-come-quick, is the corruption of the Welsh *Pen y cwm* (*cōm*) gwic—that is, the Head of the Valley Village. Apple is evidently derived from its Welsh name, *Apal*; and the Yew from *Yw*, pronounced *Yoo*.—G.

TURNIP CULTURE.

My crops of Turnips have been excellent for such a dry season. I have been drawing regularly from the 18th of June. I generally sow my first crop about the beginning of March, a small sowing at a time (every three weeks), so that they are always young. I have had throughout July as fine a lot of young Turnips as anyone could wish, sweet as sugar, as white as snow, and fleshy.

The variety I grow for my first crop is the Early American White Strap-leaf, a much quicker grower than either the Early White Dutch or Early Stone, as it comes in fully ten days earlier.

I find it is a good plan, previous to sowing, to give the ground a good dressing of soot and burnt ashes (equal quantities), as it prevents the ravages of the flea, and when the drills are drawn it mixes regularly with the soil.

The varieties I grow for winter and spring use are the Early White Green-top, Chirk Castle Black Stone, and Early Stone, with a few of the American Strap-leaf, which come in for the supply at the end of the autumn; this I sow at the end of

July and beginning of August. The borders where the early Kidney Potatoes were grown are useful for the late sowings.—W. McPHERSON, *Snelston Hall*.

ROSES AT CHESHUNT.

I WAS fortunate in fixing the date of my visit to these world-renowned nurseries of Messrs. Paul & Son, although in ordinary seasons I should have been too late; but the spring frosts had so effectually retarded the bloom by destroying the first buds, that, although eager enough for the fray, Mr. George Paul had been unable to put in an appearance at the earlier shows, but when he did enter the lists all other competitors went down before his determined onslaught, as the tilted fields of Exeter, Birmingham, and a host of other places bear witness to. It was a great treat, then, in the freshness of the early morning, to go under his experienced guidance through the serried ranks of those Roses from whence have come the marvellous blooms that have won for him such honours, but which are nothing to be compared in beauty to those which one sees in their freshness here; and I hope that the idea which was thrown out at Exeter may be carried out, and that we may next year have in the metropolis an exhibition of Roses which have been cut on the morning of the show instead of having been cut twenty-four hours or more, and when the lovely hues that distinguish so many, but which are so evanescent, may be seen. How Marie Baumann has been admired this year! yet I have not seen a bloom of it at a show with that beautiful glow which, like the blush on a fair maiden's cheek, adds so immensely to its real loveliness.

To say that Roses are grown at Cheshunt by the acre is what everyone knows. A quarter of a million or more of plants on the Briar and the Manetti would be, I suppose, about the ordinary stock of the firm, and that the plants are wonderful in their vigour is what one would expect from so experienced a grower and from such a soil. What a rich unctuous loam is that of these Hertfordshire fields! and how many a rosarian who has, perhaps, to combat with chalk, or sand, or gravel must sigh when he sees the depth of this soil, so suitable for the Rose! But my chief object in visiting the nurseries, independently of the pleasure of talking over our favourite flower with my friend Mr. George Paul, was to go with him through the new Roses and to see some of his own flowers in perfection, and I shall therefore give now my opinion on them, backed, as it is in most, if not all, instances, by that of one whom I regard as about the best judge of a Rose that I know.

Madame Lacharme.—I am utterly at a loss to understand my good friend Mr. Camm's determined attack on this Rose. I have never heard much doubt expressed as to its beauty; the only doubt that I in common with some have had is whether it was really a Perpetual, and so far from thinking that good old Lacharme has made a mistake in sending it out, I believe it will be associated for many a year with Charles Lefebvre as a testimony of his great success as a raiser. All doubts, too, as to its character of second blooming were set at rest by an inspection of a whole quarter of hundreds of plants, both on the Manetti and Briar, for every fresh shoot was full of bloom; and then its vigour and freedom will tend to make it a great addition to a class we are as yet sadly deficient in. I have since seen it on the seedling Briar at Mr. Prince's, and there it was equally good. Let Mr. Camm take heart of grace, and he will yet have to rejoice over a flower he now despises. *Madame Lacharme* is a Rose of 1872, and if the question is put, "Where are the other Roses of that year to be put?" Echo must answer, "Where?" Perhaps by-and-by the verdict will have to be reversed, but at present I must honestly say I do not believe a greater collection of rubbish was ever sent over than the Roses of that year, and I feel how grave is the injury done to our Rose-growers who bud and propagate hundreds of varieties which are afterwards found to be utterly worthless.

Claude Levet.—This was shown by Messrs. Paul & Son at South Kensington, and awarded a first-class certificate, a proof of the fallacy of judging of the merits of a Rose from plants grown in pots, for it will not do. There is not sufficient stuff in it, and we can tolerate now-a-days neither weak growth nor thin flowers, and so *Claude Levet* will be, I think, condemned.

Pierre Seletzky.—Quite a second-class Rose, but, like many, may occasionally be caught good, especially in the autumn, when Roses in good character are somewhat scarce.

Madame Marius Cote.—A pleasing but not first-rate Rose, in form exactly like *Madame Moreau*, but lighter in colour.

Those who like that style may grow this, but I do not think that it will be a general favourite.

Mrs. Veitch.—At one time this Rose promised well, but there is not enough stuff in it. As a rule, when French raisers give an English name to their flowers they are not worth a great deal; there may be exceptions, but "*exceptio probat regulam*."

Madame Emma Combey will not do, although a large Rose and at one time regarded as promising.

Mrs. Laing.—Miserable, reminding one of that long-discarded Rose *Reine des Violettes*.

Félicien David.—This is a pleasing but not first-class flower, and may, perhaps, improve on acquaintance.

Souvenir de J. G. Veitch.—I hope that this Rose may deserve the praises bestowed upon it by Mr. Camm. I cannot say that, although a pleasing shade of colour—a bright deep crimson—it strikes me as a first-class Rose, and its habit lacks vigour; in truth we have so many crimson Roses that a flower ought to be very good to take its place amongst them, and I do not think this is one of those that will do so.

Mlle. Fernande de la Forest.—What a name! and what will our gardeners make of it? Well, I do not think they will have much trouble about it, for I very much question if it will ever come to be much grown. It promised at one time well, but has lately belied its promises.

Marie Coulet.—This is certainly a very pretty Rose; whether it will ever make a show Rose is doubtful. The colour is a light rose, passing into blush; is small in size, and I fear not very vigorous in habit.

As to the other *souvenirs*, *madames*, *mademoiselles*, *docteurs*, &c., that made up the seventy or eighty Roses which our friends over the water so temptingly placed before us, I think they may all be dismissed with an admonition not to show themselves again. And I now come with real pleasure to speak of our home-raised varieties. One can look back to the time when *Devoniensis* was our only English Rose; and now, thanks to the energy and skill of some of our best growers, we are getting a race of flowers which will hold their own with any of the "furriners," and which in vigour of constitution will leave nothing to be desired.

Annie Laxton.—This flower will maintain its character, for it must not be forgotten that it was awarded at the Royal Horticultural Society's meeting at Bath the first prize for the best new Rose. It is now well known from its having been seen in so many winning stands, and is a flower deserving of being universally grown. The shape is good and the colour very pleasing, while the habit is very vigorous. Mr. Laxton is fortunate in having raised it.

Bessie Johnson.—This, too, is well known as a light blush sport from *Abel Grand*, and has been found a very useful Rose for exhibition.

Cheshunt Hybrid.—That this Rose has Tea blood in it cannot, I think, be questioned. I saw the plant from which the seed-pod had been obtained, and think Mr. Paul's idea that it is the product of a cross between *Camille de Rohan* and *Madame de Tantes* is correct. I saw very large quantities of it in growth here, and we had it blooming in my own houses and garden, and consider it a most beautiful and distinct flower, and must be universally grown.

S. Reynolds Holt.—It would be a pity if the name of this distinguished rosarian were connected with an inferior Rose; and when Mr. George Paul named his flower thus he doubtless intended it to be a real and not a fancied compliment. I am happy to say that, from what I saw of it here, it is likely to take a very high rank as a dark Rose. The colour approaches that of *Camille de Rohan*—a deep mauve flushed with scarlet, of fine form, and very large shelly petals. I saw it, of course in large quantities, and it was decidedly the best dark Rose in the grounds.

W. Wilson Saunders.—A fine well-shaped flower of medium size; the petals very large, and the shape of the flower similar to *Charles Lefebvre*, but without the deep blackish-crimson shading of that flower, being of a bright vivid crimson. This, too, will, I think, be a good addition to our lists.

The Shah.—As brilliant as anything *His Imperial Majesty* ever wore. The colour is a pure red without any shading, and shows its parentage—*Duke of Edinburgh*. It will probably take its place as a garden rather than as an exhibition Rose, and as such will for its vigour and colour be very effective. Besides these Mr. Paul has some other seedlings: one called *Dr. Hooker*, a seedling from *Duke of Edinburgh*, and another from *Maréchal Vaillant*, somewhat in the style of *Fisher*

Holmes, but larger. These may by-and-by come into commerce, for at present they promise well.

Of the new Roses of 1873 I saw but one in bloom—Captain Christy, of which much has been said, and which will be to all appearance a good addition. It is of a silvery peach colour, of the shape and character of Victor Verdier. Neither here nor elsewhere have I as yet seen any other of the new Roses, and so can say nothing of their qualities. Of older Roses Marie Van Houtte, Souvenir de Paul Neron, Comtesse de Naudillac, and Belle Lyonnaise, Teas, struck me as specially good, and Capitaine Lamure, Madame Hippolyte Jamain, Clovis, and Prince Stirby as Roses I should like to add to my lists.

There are a multitude of noteworthy things at Cheshunt, but I have confined myself simply to the Roses; but Strawberries, fruit trees, ornamental shrubs and trees are all well and carefully done, and all will well repay a visit.—D., *Deal*.

LATE STRAWBERRIES.

No fruit is more generally popular than the Strawberry: I do not therefore doubt but that very many of your readers will be glad to have light thrown upon various points about which I want information. I hope that some one qualified to speak on the subject will notice what I write. For one person who can afford to grow Grapes a hundred can grow Strawberries, and it must be a matter of interest to all such to hear how the Strawberry season may be prolonged. I should be very glad if some of your readers who grow many varieties would inform us when they had their first and their last dish this season, and the kinds which composed these dishes. I do not want this information so much from men like Mr. Luckhurst, who have all the resources of wealth at their disposal, who can gather their first crop from artificially heated borders and their last from plants that were forced in March, but from those who have no assistance save from the open air and natural soil. There must be some advance in the varieties. It would be a great boon if those who have tried them would tell us what kinds ripen well late in the season. I remember about ten years ago, when I lived not twenty miles from my present abode, I used to be pretty sure of a dish up to the 18th of August of a kind called Nimrod. I cannot now hear of its existence—it seems to have vanished.

My first ripe Strawberry this year was on the 29th May, which is unusually early for this part of the world, and I had a very large dish of Black Prince on June 10th. My last dish was of Oscar on August 1st. I shall have only a few poor berries of the same kind now. Next year I shall have Elton and Myatt's Eleanor, but I do not expect that they will be a bit later.

Cockcomb with me does not reach the great size described by Mr. Radclyffe and other correspondents. It does not grow even so large as British Queen, although the ground on which it is grown is made as rich as manure can make it. I should like to know what aspect suits this Strawberry best. Admiral Dundas I have of an enormous size—nearly three times as large as Cockcomb. Frogmore Late Pine is not a very late fruit with me, not later than Cockcomb.

Now if any of your correspondents will tell us of new Strawberries which beat Black Prince for earliness and Oscar and Elton for lateness, and give a more abundant crop than Oscar, they will deserve and shall obtain my gratitude.—D. F. J. K.

BEDDING GERANIUMS.

I wish to endorse what Mr. Pearson has said in your last number with respect to Geraniums, and quite agree with him that at all the principal horticultural shows, especially those of the Royal Horticultural, Botanic, &c., the name of the raiser ought to be appended; and I also strongly deprecate the custom of some nurserymen advertising new kinds of Geraniums without giving the raiser's name, often endeavouring to take credit to themselves.

I may also say of Mr. Pearson's Geraniums what perhaps he does not like to say himself—that having now carefully tried and tested different kinds of bedding Geraniums for many years, I have found more good ones amongst those of his raising and sending-out than from any other raiser. For instance, of eighteen kinds of pink Geraniums that I have bedded-out in distinct beds this year twelve are his raising, and of the twelve I shall only discard one. Nothing can surpass the beauty of Mrs. Lowe, Amaranth, Florence Durand, Mrs. Fyche, Contessa Quarto, and Mrs. Holden.

Moreover, in spite of the persistent attempt to cry down bedding-out gardens and to praise everything that is a perennial or an alpine, I shall be much surprised if after a short interval of untidy mixed borders and herbaceous quarters, &c., there is not a greater demand than ever for choice varieties of bedding Geraniums. Certainly I never yet experienced a season where quality is so entirely superior to quantity. However, I am anticipating somewhat some remarks I wish to make later on in your Journal. So long as the great majority of gardeners only propagate those sorts of strong-growing Geraniums that they think will stand hard usage in winter, keep them starved in cold pits without light or heat, and think that the value of a gardener depends on the quantity of plants grown instead of the quality, so long will bedding-out be open to much criticism; but if only a gardener will give as much pains to make his garden not merely gay but interesting and attractive as he does to get a succession of Grapes in his vineries, then persons of good taste and judgment will no longer have to complain of small and inferior plants, and endless repetition of the same plants over and over again.

I am called by some of my friends the champion of bedding-out. Certainly this year's experience of my own garden has more than ever confirmed my previous impressions, and has helped to convince me more and more that perennials and alpine, though good in their places, will not succeed in knocking the wind out of the sails of their half-hardy brethren. Take Geraniums, Lobelias, Ageratums, Verbenas out of our gardens, and what should we be reduced to? I have had my perennial borders very gay with Sweet Williams, Antirrhinums, Delphiniums, &c., but they are all things of the past now, and their places cannot be filled; and though Gladioli, Phloxes, &c., may help to make the borders passable, yet the gaps and barren places are legion.—C. P. P.

DESTROYING WASPS.

THINKING the plan of destroying wasps mentioned by Mr. C. Purrott to be simplicity itself, I went for the purpose of destroying a nest when dark, with a lantern, and lit a squib about 6 inches long. I then put a piece of clay in the hole, but on attempting to dig the nest out I found myself in "less than five minutes" about a mile away from the place, with a fearful buzzing of wasps round me. I found this would not do. Query: Are "C. P.'s" instructions sufficiently clear for ordinary brains?—DELTA.

LAST evening in walking past the vinery, I observed wasps issuing from a hole in the woodwork, and level with the garden walk. Having obtained a thin stick, about 18 inches long, I made a train of gunpowder and sulphur, which I wrapped round the stick, I then shoved the train into the hole, and stood ready with a turf, with which, as soon as I had fired the train, I blocked up the hole. On examining the nest this morning I found every wasp dead. A more easy, simple, safe, and effective way I do not know.—BETA.

THE GOLDEN PIPPIN APPLE.

WHEN and where the Golden Pippin was first discovered, are now matters of uncertainty; but all writers agree in ascribing to it an English origin, some supposing it to have originated at Parham Park, near Arundel in Sussex. Although it is not recorded at so early a period as some others, there is no doubt it is a very old variety. It is not, however, the "Golden Pippin" of Parkinson, for he says "it is the greatest and best of all sorts of Pippins." It was perhaps this circumstance that led Mr. Knight to remark, that from the description Parkinson has given of the Apples cultivated in his time, it is evident that those now known by the same names are different, and probably new varieties. But this is no evidence of such being the case, for I find there were two sorts of Golden Pippin, the "Great Golding" and the "Small Golding, or Bayford," both of which are mentioned by Leonard Meager, and there is no doubt the "Golden Pippin" of Parkinson was the "Great Golding." Whether it was because it was little known, or its qualities were unappreciated, that the writers of the seventeenth century were so restrictive in their praises of the Golden Pippin, it is difficult to say; but true it is whilst Pearmain, Red Streaks, Codlings, and Catsheads are so highly spoken of, the Golden Pippin is but rarely noticed. Ralph Austin calls it "a very special Apple and great bearer." Evelyn certainly states that Lord Clarendon cultivated it, but

it was only as a cider Apple: for he says, "At Lord Clarendon's seat at Swallowfield, Berks, there is an orchard of one thousand Golden and other cider Pippins." In his "Treatise on Cider," he frequently notices it as a cider Apple; but never in any place that I can recollect of as a dessert fruit. In the "Pemena" he says, "About London and the southern tracts, the Pippin, and especially the Golden, is esteemed for making the most delicious cider, most wholesome, and most restorative." Worlidge merely notices it as smaller than the Orange Apple, else much like it in colour, taste, and long keeping." Ray seems the first who fully appreciated it, for after minutely and correctly describing it, he says, "Ad omnes culinæ usna præstantissimum habetur, et Pomaceo conficiendo egregium." De Quintinye remarks it has altogether the character of the Paradise or some other wild Apple; it is extremely yellow and round, little juice, which is pretty rich, and without bad flavour. But the "Jardinier Solitaire," more impartial, or with better judgment, says, "Son eau est tres sucrée; elle a le goût plus relevé que la Requette; c'est ce que lui donne le mérite d'être reconnue pour une tres excellente pomme." The opinion of Angran de Rueneuve is also worth recording. "La Pomme d'Or est venue d'Angleterre; on l'y appelle Goule-Pepin. J'estime qu'elle doit être la Requette des Pommes, et que la Requette ne doit marche qu'après elle; car elle est d'un plus fin relief que toutes les autres Pommes." Switzer calls it "the most antient, as well as the most excellent Apple that is." But it is not my intention to record all that has been written in praise of the Golden Pippin, for that of itself would occupy too much space, my object in making these extracts being simply to show the gradual progress of its popularity.

Fig. 43.—The Golden Pippin Apple.

The late President of the London Horticultural Society, T. A. Knight, Esq., considered that the Golden Pippin, and all the old varieties of English Apples, were in the last stage of decay, and that a few years would witness their total extinction. This belief he founded upon the degenerate state of these varieties in the Herefordshire orchards, and also upon his theory that no variety of Apple will continue to exist more than two hundred years. It would be needless to enter into any discussion upon a subject concerning which so much has already been said and written, as there is sufficient evidence to confute that theory. The Pearmain, which is the oldest English Apple on record, shows no symptoms of decay, neither does the Catshead, London Pippin, Winter Quoining, or any other variety; those only having been allowed to disappear from our orchards which were not worth perpetuating, and their places supplied by others infinitely superior.

It is now considerably upwards of half a century since this doctrine was first promulgated, and though the old, exhausted, and diseased trees of the Herefordshire orchards, of which Mr. Knight spoke, together with their diseased progeny, may ere this have passed away, we have the Golden Pippin still, in all the luxuriance of early youth, where it is found in a soil congenial to its growth; and exhibiting as little symptom of decay as any of the varieties which Mr. Knight raised to supply the vacancy he expected it to create.

In old nurseries like those at Sawbridgeworth, where the same Golden Pippin has been cultivated for centuries, and continued from year to year by grafts taken from young trees in the nursery quarters, I never saw the least disposition to

disease, canker, or decay of any kind; but, on the contrary, a free, vigorous, and healthy growth.

But this alarm of Mr. Knight for the safety of the Golden Pippin, and his fear of its extinction, were based upon no new doctrine, for we find Mortimer a hundred years before, equally lamenting the Kentish Pippin. After speaking of manures, &c., for the regeneration of fruit trees, he says, "I shall be glad if this account may put any upon the trial of raising that excellent fruit the Kentish Pippin, which else, I fear, will be lost. For I find in several orchards, both in Kent, Essex, and Hertfordshire, old trees of that sort, but I can find no young ones to prosper. A friend of mine tried a great many experiments in Hertfordshire about raising them and could never get them to thrive, though he had old trees in the same orchard that grew and bore very well. I likewise tried several experiments myself, and have had young trees thrive so well as to make many shoots of a yard long in a year, but these young shoots were always blasted the next year, or cankered; which makes me think that the ancients had some particular way of raising them, that we have lost the knowledge of." Although this was written 150 years ago, we have the Kentish Pippin still, which though not so much cultivated, or so well known now as then, is, nevertheless, where it does exist, as vigorous and healthy as ever it was.

The fruit (fig. 43) is small; roundish, inclining to oblong, regularly and handsomely shaped, without inequalities or angles on the sides. Skin rich yellow, assuming a deep golden tinge when perfectly ripe, with a deeper tinge where it has been exposed to the sun; the whole surface is strewn with russet dots, which are largest on the sunny side, and intermixed with these are numerous embedded pearly specks. Eye small and open, with long segments, placed in a shallow, smooth, and even basin. Stalk from half an inch to an inch in length, inserted in a pretty deep cavity. Flesh yellow, firm, crisp, very juicy and sugary, with a brisk, vinous, and particularly fine flavour.

One of the oldest and by far the most highly esteemed of our dessert Apples. It is also an excellent cider Apple. The specific gravity of its juice is 1078.

It is in season from November to April. The tree is a free and vigorous grower, but does not attain a great size. It is also an excellent bearer.—H.

FERNS AS WINDOW PLANTS.

THERE are few plants which require less attention and yet give more satisfaction to dwellers in towns than do the hardier description of Ferns. From the fact that many of them are greenest and best in winter when other plants are out of bloom, their culture ought to be patronised by the poorer classes who cannot afford more expensive plants. Amongst the limestone formations of North Lancashire the Fern commonly known as Stag's-head is very numerous and luxuriant. The beautiful green fronds grow to a length of 12 inches to 18 inches, and many of them, when cultivated in pots, fork so as to be rare and beautiful Ferns, the tips of the fronds forming into a bunch. I should like to call the attention of city horticulturists to the fact that these Ferns might be gathered at a very trifling expense and sent to town by wagonloads, seeing that the hedges are full of them in the district named. Arrived in cities they might be potted, and a good profit realised from the sale at from 9d. to 1s. per pot. They will live for many years, and would form "a thing of joy" in many humble homes, to the dwellers in which the sight of a green leaf is a pleasure. The beautiful little Maiden-hair, Royal, Parsley, and other Ferns, are equally common in the district.—BETA.

PLEASLEY VALE.

THE RESIDENCE OF W. HOLLINS, Esq.

DERBYSHIRE is noted for its romantic dales, but though many of these are far more renowned, yet few will better repay a visit on a quiet summer's day than Pleasley Vale. An hour's ride by rail from Nottingham brings us to Mansfield, a moderate-sized and pleasantly-situated market and manufacturing town, a place of great antiquity, and well known by name to the admirers of Robin Hood and his exploits. Leaving Mansfield by the road, we thread the village of Mansfield Woodhouse, where there is a picturesque church, and passing quarries, corn fields, and meadows, after a mile and a half we reach the scene of the present paper. Descending by a steep path which winds between crags that in places tower high overhead, and from whose summits hang as it were

trees nodding to their fall, we reach the vale, then crossing the little bridge which spans the stream, we are in Derbyshire, and pause to admire the scene around us. Here nature and art seem to vie with each other to render the place attractive. On the side along which the road winds the rocks tower up terrace above terrace, their sides covered with shrubs of all kinds; here and there a break occurs, and the natural slope of the wall side is preserved, and with a steep, though gradual, incline it rises till the sky peeps through the trees high overhead. On the other side, close under which the stream, here widened into a broad river, glides along, the banks clothed in all the richness of forest verdure, interspersed with flowering bushes, as Roses, Mountain Ash, &c., rises one mass of foliage, which, reflected in the calm stream beneath, forms a picture of surpassing beauty. This water has been utilised for manufacturing purposes, and two spinning mills have been erected, one at the centre, the other at the farther end. Far from destroying the natural beauty of the vale, these erections and their surroundings have virtually increased it. Tastefully designed, massive in structure, and as far as possible in keeping with the surrounding scenery, they break the continuity of foliage, and give a charm to the natural features of the landscape. The stream, once a little rivulet meandering, hidden between deep banks, forms first a lake-like reservoir with its banks fringed with shrubs, then, as it glides along, a calm broad stream.

Pursuing our journey we enter the gardens near the gardener's cottage and flower garden, which is a picture of beauty and an index to what we may expect within. From the picture that is here presented we are at once convinced that Mr. Quintin Read, the superintendent, is a master of his profession. Leaving this fairy spot, we pass by a small shrubbery, and a nice rockery clothed with alpine plants, into what is called the old kitchen garden; for as the owner's family has increased the kitchen garden has been extended to meet the demand. Along the centre of this garden is a ribbon border on the right, and on the left as far as a cross walk; and the remaining length is a mixed border, containing choice Phloxes, Pentstemons, Delphiniums, Gladioluses, and a batch of Geraniums put out for trial. The ribbon border on the right was planted first with a row of *Sempervivum californicum*; second, *Mesembryanthemum cordifolium variegatum*; third, *Viola Perfection*; fourth, yellow Pansies; fifth, *Verbena Purple King*; sixth, *Geranium Miss Kingsbury*; seventh, *Geranium Bayard*. The ribbon border on the opposite side of the walk was the same, except the first and second row, which were *Echeveria secunda* and *Antennaria tomentosa*, all very simple and very effective.

Turning into the early viney we found there an excellent crop of Grapes; we counted on one Black Hamburgh Vine forty-six bunches. All the Vines bore a heavy crop; none of the bunches would weigh less than 1 lb., and many of them from 2 to 4 lbs.; the berries fine, and the colour good. Beneath this heavy crop of Grapes there was a large collection of Begonias, Ferns, and other plants. Among the latter we noticed a large specimen of *Adiantum farleyense*, also *Dicksonia antarctica*, *Adiantum concinnum latum*, and many of the commoner sorts, all in a healthy condition. The Grapes in the next house had not begun to colour, and here every available spot was taken-up by plants and made the most of. Azaleas that had bloomed in the conservatory had been brought here to make their growth, and many that had been forced early and had completed their growth were either turned out of doors or put in safe quarters in cold pits.

From the viney we passed into a Peach house with one set of trees trained on the back wall, and another set on an iron trellis in front. The trees were in very good health and carrying a heavy crop of fruit. In a little adjacent span-roofed house one side was devoted to Cucumbers, and the other to a large *Allamanda Schottii*. In this house for several years Rollisson's Telegraph Cucumber and Pearson's Long Gun have been planted side by side, and both are so good that it is difficult to tell which is the better. Cut flowers are in great demand, and the *Allamanda* is one of the most useful plants for the purpose. In adjoining pits and frames were large quantities of Epacris, Heaths, Zonal Geraniums, Balsams, and other useful greenhouse plants, and in shady situations frames were filled with Primulas, Cinerarias, &c.

Passing-out of this garden we enter the kitchen garden proper, and here neatness and good order prevailed on every hand. Peas, Potatoes, Celery, Lettuces, and other vegetables were in luxuriant health, and scarcely bore any traces of the long-continued drought. This is to be traced in a great mea-

sure to the practice of deep digging and subsequent surface-stirring. We observed that there was not an inch of ground unoccupied, and in odd corners there were hundreds of hardy spring flowers to be brought to the beds in the flower garden when the glory of the present plants shall have passed away.

Retracing our steps we again reach the carriage drive, and passing through a small gate we find ourselves on a broad terrace walk in front of the mansion (see fig. 41). It is built in the Italian style of architecture, and commands most pleasant views. The internal arrangements are superb, and the adornments exquisite. Turning round to the right there is a small but neat flower garden, surrounded by an ornamental balustrading. Beyond is the extensive lake. The lake is fringed with trees and shrubs, and has an irregular outline, so essential in water scenery. Immediately in front of us is the geometric flower garden. There is a circle in the centre about 7 feet in diameter, surrounded by another circle of the same width divided into four beds. At four angles are four other circles of the same size as that in the centre, and between these are other beds with their ends concave, to suit the circles on each side. At each end are long narrow beds, which seem to enclose the whole; these are about 5 feet wide bounded by curved lines to match the outlines of the adjacent beds. All the beds have raised edgings either margined with *Echeveria* or *Sempervivum*. The centre bed was margined with *Echeveria secunda*, and edged with *Dactylis glomerata variegata*, and *Lobelia Crystal Palace compacta*, within which is a band of *Gnaphalium lanatum*, and the centre is filled with *Geranium Amaranth*. Then two of the four beds surrounding the centre are margined with *Echeveria secunda*, and edged with *Golden Feather Pyrethrum*; two diamonds are formed in the centre of each bed with *Golden Feather Pyrethrum*, and filled with *Colerus Verschaffelti*, and the groundwork between the diamond-shaped beds and the *Golden Feather* edging, was *Alternanthera amabilis*. The other match beds were margined with *Echeveria secunda*, and had a broad edging of *Alternanthera magnifica*. Two diamonds formed in the centre of each bed were of *Colerus Verschaffelti*, and filled in with *Gnaphalium lanatum*, and the groundwork of the bed *Mesembryanthemum cordifolium variegatum*. The four circular beds at the four angles were all margined with *Echeveria secunda*, and edged with *Mesembryanthemum cordifolium variegatum*, within which was a band of *Iresine Lindeni*; and the centre of two of them was filled with *Geranium Miss Kingsbury*, mixed with *Lobelia speciosa*, and the other two were *Geranium Mrs. Pollock*, and *Viola Perfection*, plant for plant. The two beds between the four circles were margined with *Sempervivum californicum*, and edged with blue *Lobelia*, then a band of *Creed's Seedling Geranium*, and the centre of one filled with *Geranium Douglas Pearson*, and that of the other with the *Rev. T. F. Fenn*. The long narrow beds at each end were margined with *Sempervivum californicum*, and edged with *Cerastium tomentosum* and blue *Lobelia*, plant for plant, within which was a band of *Golden Feather Pyrethrum*, and then another inner circle of *Iresine Lindeni*, and the centre of one was filled with *Geranium Amy Hogg*, and the other *Geranium Arthur Pearson*. Every plant in this arrangement was in perfect health, and notwithstanding the adverse season, each had filled up its allotted space.

Although this flower garden is not on a large scale, yet many thousands of plants had been used in its embellishment, and its beauties must be seen to be appreciated. By the side of the terrace walk leading to the conservatory, and parallel with the flower garden, was a row of vases, or instead of vases there were short lengths of trees with the middle scooped out, and placed on end to give the appearance of rustic vases, and these were planted round with dwarf Yews kept closely cut; the dark green foliage of the Yews, and the bright magenta, pink, and crimson of the Geraniums with which they were filled, afforded a pleasing contrast.

We now pass on to the conservatory, and here a dazzling blaze of floral beauty presented itself to the eye. The stage and every available place were filled with such flourishing plants as are found in the best-regulated places at this season of the year. Conspicuous were *Pelargoniums*, both of the Zonal and Greenhouse section, and in the former we observed some splendid varieties raised and sent out by Mr. Pearson, of Chilwell. We may mention as being really first-class *F. Durand*, *Mrs. F. Burnaby*, *Amy Robart*, *Col. Holden*, *Rev. C. P. Peach*, *Mrs. Masters*, *Lady L. Egerton*, *Mrs. Fyitch*, and many others too numerous to mention. Up the pillars were trained *Plumbagos*; and from the roof, all in luxuriant health and

beauty, gracefully dangled Fuchsias, Tropæolums, and Passifloras.

Passing-on to the conservatory we wandered through the croquet-ground amidst foliage of diversified hues, and charming beds of flowers. The rocks on the left tower upwards perpendicularly many yards high. The scenery in this charming spot is of the true Derbyshire character. Here large masses of rock had been removed to obtain space for the main walk which leads to the zigzag walks through the wilderness. A large piece of rock standing on the croquet-ground clothed with Ivy, Cotoneasters, and other evergreens formed quite a novel feature in this part of the grounds. In the "wilderness," which is situated on a high eminence behind the mansion, a lover of the beautiful would fain linger. On the summit of the hill the flower gardens for the children are situated, as well as a cosy, well-arranged summer-house for chil-

dren's tea and picnic parties. Ascending a very high rock a splendid view presents itself. On these hills, high rocks projecting here and there, the visitor might easily fancy himself rambling amidst the romantic scenes of Matlock, instead of the luxuriance of Pleasley Vale. We are now obliged to leave this rural retreat, and pursuing our journey onwards we at last emerge from the woodland scenes, and here a glorious landscape bursts upon the gaze. Down in the hollow, and apparently under our very feet, stand two handsome cottages, one for the use of the head-gardener, and the other for the head-coachman, and further on to the right are the kitchen gardens, hothouses, &c., already noticed. In the front of us are the shrubberies, the lake with its pleasure boats, swans, and water fowl. Beyond the lake is the undulating landscape, which stretches before the eye like a charming panorama.

Leaving this high acclivity we pass down a large number of

Fig. 44.—PLEASLEY VALE.

rustic steps, and find ourselves on the carriage-drive near the gardener's cottage at the point we entered the grounds. The cottage was a pattern of perfect beauty; the walls were mantled with Roses, Cotoneaster, Pyracantha, and Clematis Jackmanni was decked-out in all its purple glory. In front of the cottage was a neat flower garden chiefly planted with choice Geraniums. The centre bed was Violet Hill Nosegay edged with a Bronze Geranium, and an outer band of Viola Perfection. Another bed of Geranium Corsair was equal to anything we have seen this season, and two beds of Geranium Miss Kingsbury mixed with blue Lobelia were worthy of imitation. William Sanday, Amaranth, and Mrs. Holden were hardly coming-up to Mr. Read's expectations, but no doubt he will report on these and many others under his charge before the close of the season. The coachman's flower garden was also beautiful. One pretty mixture we noticed was a bed of Geranium W. Underwood, Geranium Mrs. Pollock, blue Lobelia, and variegated Thyme.

The last bit of flower gardening we shall notice, but not the least, was by the roadside leading to the village of Pleasley. It was at the end of a shrubbery, in a curve in the road, was about 60 feet long and 9 feet wide, and separated from the road by a light wire fencing. The first 9 feet was separated from the rest of the bed, and formed a little design to itself. There is a circle cut into eight parts by lines radiating from

the centre to the outside, and these parts were planted with *Antennaria tomentosa* and *Alternanthera magnifica* alternately, with a large *Echeveria metallica glauca* in the centre; and the other space which formed a square was filled-in with variegated Thyme. The other part of the bed was planted as follows: There was a double row of *Sempervivum californicum* along the front and each end of the bed; next a row of *Mesembryanthemum cordifolium variegatum*; then half-circles were formed of Golden Feather *Pyrethrum* in double file, with the ends abutting against the *Mesembryanthemum*, and filled-in with *Alternanthera amabilis*; behind the Golden Feather was a broad band of *Iresine Lindenii*, with another course running behind that of *Stachys latata*, and the back row was *Geranium William Thomson*. What is praiseworthy is that such a magnificent arrangement should be seen by everyone travelling on the road, yet never a leaf has been touched, though people of all grades daily pass by.—P.

A RUSTIC SUMMER HOUSE.

We borrow from Mr. J. Caven Fox's "Illustrated Catalogue of Rustic Summer Houses, &c.," the accompanying illustration (fig. 45), of an extremely neat little structure. It is no mere fauzy design, but, like the large one which we gave at page 79, is in actual existence in the gardens of the Royal Horticultural

FIG. 43.—RUSTIC SUMMER HOUSE AT SOUTH KENSINGTON.

Society at South Kensington, where it has attracted the attention of many visitors. There are many situations in a garden in which a summer house of this description would be an ornament, and prove useful as well, while a covering of heath or reeds would ensure greater coolness in summer than a wooden or tiled roof would do.

ROSE SHOWS.

THE paragraph in last week's Journal with the familiar signature of "D. Deal," appended to it, concerning a new mode of exhibiting, has struck me with amazement, and almost consternation. I only see your excellent paper, as I find this supplies all my wants, and contains more information about Roses than all the others combined; and it does not do to discuss a proposition without knowing its exact nature, but yet, as "D. Deal," has opened the question, there can be no harm in my saying what I for one think of it. "To show Roses grouped in beds like they do at the great exhibitions in France." Such, I believe, is the proposition, and a more revolutionary and preposterous one I have never seen. Why, the merits of the individual bloom must be entirely out of the question if grouping or massing is to be the test. What, Messrs. Editors, is to become of all our boxes and tubes which we have got together at so much expense? What is to become of the small growers? Are they to be left out in the cold, or their small offerings to Flora's court to be swamped by the hecatombs of the champion growers?

Then, as to space: How can the managers allot the proper space without having awkward gaps? for we know, even with our present system, how many persons enter and do not stage, so that it often happens that all the arrangements made previously by the manager have to be altered on the morning of the show. The boxes have to be moved and made to cover more space, or *vice versa*. But how could this be done where beds were allotted to each entry? The secretaries would be compelled to impose a fine, or take some other disagreeable course, to insure the attendance of those who enter (like, I regret to say, Mr. Quilter did at Birmingham, in imposing what really amounted to a fine of £2 on all who entered and did not compete for his champion cups). In fact, the proposition if carried out would be replete with difficulties, and would in my opinion ruin, or at all events greatly decrease, the welfare of every Rose show in England. Such, gentlemen, are my sentiments.—JOHN B. M. CAMM, *Monkton Wyld*.

QUISQUALIS PUBESCENS.

M. HOUËLLET directs attention to this as an ornamental plant of the highest merit, but not sufficiently known. He says: I had long cultivated in pots some plants of it, but they never gave the slightest sign of flowering. Two years ago, however, it struck me to turn a plant out in the bed of a stove, and in a short while its branches extended to a length of upwards of 80 feet, and this year formed garlands of flame-coloured flowers. These continue more than two months, and I can affirm that no climber is better suited for covering the pillars and walls of plant stoves. It has, besides, another good quality—that of never being attacked by insects, to which other stove climbers are so subject. It is probable that in the south-east of France—at Nice, for instance—it would, like the Bougainvillea, flower well out of doors. It should be planted out in the house in a mixture of leaf mould and loam, to which a little peat may be added for young plants. It is easily propagated by cuttings of the half-ripened shoots put in in peat soil under a bell-glass in the propagating house.

The plant belongs to the order Combretaceæ, and being a native of the warm parts of India, it thrives in the stove, and possibly it could even be grown in an intermediate house.—(Abridged from *Revue Horticole*.)

THE PLAGUE OF GNATS AND FLIES.

SOME of my family have left London to enjoy for a time life in the country. The change is very enjoyable and pleasant to them, but there is a drawback to their comfort in the plague of gnats and flies. They have written to me for a remedy, and I shall be glad to tell them the best, and one that will be effectual. I hope this will excuse my troubling you.—E. M. M.

[Will some of our readers come to the relief of our correspondent, and suggest a remedy? Gnats and flies are difficult

game to bring down in sufficient quantity to make the sport productive of any beneficial result. They are difficult to catch, except by the "catch-em-alive." You cannot fumigate them without first catching or surrounding them; to poison them seems the only remedy, and for this purpose we use in dwellings "Papier moure," to be had of all grocers and oilmen.—EDS. J. OF H.]

THE POTATO CROP.

I SEND you the result of my Potato crop, the whole of which, I am thankful to say, is now safely housed.

Early Rose, a magnificent crop; Hayes' Kidney, poor; Patterson's Victoria, good; Jersey Blues, very good; Dalmahoy, very good; Bresee's King of the Earlies, fair; Bresee's Peerless, a splendid crop; Red-skinned Flourball, poor; Sutton's New Hundredfold Flake, excellent. New Extra Early Vermont—of this I planted 1 lb., and have 17½ lbs. of Potatoes, some small, but for the most part a fine sample.

Among all these Potatoes there is not a speck of disease, except among the Bresee's Peerless. Why the disease should have attacked these I cannot conceive; it is, however, far too valuable a Potato to give up.

Amongst my Potatoes of every sort are many very small ones. This I attribute to the fact of their having been cut down so often by the spring frosts. Still I hold this to be no argument against early planting, for

First, the succession of Potato-cutting frosts this spring was quite exceptional.

Second, it is better to have some small Potatoes amongst the sound ones than to have the whole crop rotten.

If all the Potatoes had been of good size the ground could not have held them, and then we should have complained of so many green ones. As it is, I have a capital crop on the whole.—H. G. M., *Guildford*.

PRINCESS ALICE CUCUMBER.

In the last number of "our Journal," page 119, in your report of the meeting of the Royal Horticultural Society at South Kensington on the 5th inst., you say that "Messrs. Cuthbush & Son, of Highgate, sent specimens of Princess Alice Cucumber, a good, prolific, hardy variety of good deep colour, but it was not thought better than other varieties in cultivation," which calls forth our opinion based on three years' trial, and supported by dozens of gardeners who grew it in the last and present season, that it is the best variety for general purposes we have yet met with. It is first-class for winter work, ordinary house work, and frames; hardy in constitution, most prolific bearing, and having firm heavy fruit of a peculiarly nutty flavour.

We have been for many years, like most seedsmen, asked for "a good Cucumber that will do for any purpose;" and until three or four years ago, when we met with Princess Alice in Bedfordshire, we have never been able to procure such a one as would give general satisfaction to our customers; and if anyone who is at all interested in such a subject would give us a call here within the next three or four weeks, he can be shown it growing in a cool house and in an ordinary pit. Nevertheless, if it is like any other sort we shall be only too pleased to know what the sort is, that we may procure it, and test next year; but in the meantime we shall maintain our own opinion as to its superiority until proof, direct proof, of our error.—WM. CUTHBUSH & SON, *Highgate, N.*

NOTES AND GLEANINGS.

WE learn that a POMOLOGICAL CONGRESS is to be held at ANGERS, commencing on the 28th of September. The Angers Horticultural Society will have an exhibition of fruit, and all horticultural societies and amateurs both in this and other countries are invited to contribute to the show. The jury is to be chosen from members of the Pomological Congress of France.

—In the last number of the "Revue Horticole," M. Carrière directs attention to the value of CLEMATIS BALEARICA as an evergreen climber for the conservatory or greenhouse. The plant is a native of the Balearic Isles, and at Paris stands the winter against a wall with a good aspect; but in this case its flowers are liable to be nipped by frost owing to the early period (February and March) at which they appear. But for conservatory decoration at that time, when flowers are gene-

rally scarce, it is admirably adapted, whether planted-out and trained up the pillars or against the walls, or grown in pots, producing multitudes of large yellowish-white bell-shaped flowers, streaked and spotted on the inside with rosy purple.

— The handsome RHODODENDRON CAMPTYLOCARPUM flowered in the greenhouse at Dysart House, Fife, N.B., for the first time in the month of March.

— At a recent meeting of the Berlin Academy, a paper was read by Professor Dove on THE GENERAL CHARACTER OF MILD WINTERS. One fact which appears from his figures is that several such winters often follow one another in close succession, or with little interruption. It also appears (1) that sudden exceptional moderating of the temperature in the last third of December is very frequent; but does not always betoken a continued mild January of the following year; (2) that a cool November and cold first half of December generally point to a mild January following; and conversely, a mildness in the former period points to a severe midwinter. The phenomena, lastly, show that the earth's surface at a determinate time falls into determinate weather systems; and the rules found for one of these are without significance for another. As these systems depend on air currents, they can have no universal application.—(*English Mechanic*.)

— THE INFLUENCE OF FORESTS in drawing moisture from the heavens, says the "Californian Horticulturist," may be seen from the experience of San Diego, California. Previous to 1863 there was yearly a rainy season, which made the soil nourishing and productive. In 1863 a destructive fire swept over the greater part of the country, destroying the forest, and blackening the hills. Since then there has been no rainy season at San Diego.

— THE EMPLOYEES of MESSRS. SUTTON, of READING, accompanied by their wives and relations, went on the 5th inst. for their annual excursion—the cost of the journey being defrayed by Messrs. Sutton, who also presented each with a good round sum for recreation and refreshment. At 7 A.M. more than two hundred of the employes and their friends, accompanied by some of the members of the firm, took their departure by special train for Hastings, where they enjoyed for several hours the attractions of that beautiful watering place. This is another instance of that kind and considerate feeling which exists between the employers and the employed of the great Reading seed firm.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

EXCEPT clearing off sticks and Pea haulm from which the crop has been gathered, also the last of the spring-sown Cauliflower, hoeing-up and gathering-off the weeds everywhere, little else has been done. Just a word in reference to the spring-sown Cauliflowers. For the last ten years we have sown seeds in the autumn, and also early in the spring, the latter sowing being made under glass lights. The autumn-sown plants have furnished us with good heads, white and firm, from the middle of May onwards. The spring-sown plants are intended to succeed them, and this they do in a way; but although the seeds are in most cases taken out of the same packets, the produce is as different as light is from darkness. The produce of the latest-sown is such that we are ashamed to send it to table; and in whatever part of the garden the plants are grown the result is the same—the heads are green and loose. This year the plants were put out on the Gladiolus ground, and that is very rich: in fact, the same ground is selected for both sowings. We have now come to the conclusion that the fault lies in our light gravelly soil, which does not seem to have sufficient holding power for this class of vegetables to succeed in the summer months. But do we not learn a useful lesson from this in the way of charity to the gentlemen who supply the seeds? It would be very easy to point to the quarter of bastard-looking plants, and so lay the blame on the seeds, if the fine crop that had been previously cut did not give the lie to the assertion.

Then about the weeds. These should never be allowed to become so large that it is necessary either to rake or gather them off. We very seldom use a rake during the summer months. The hoe is kept at work whether weeds are to be seen or not, and the surface remains as it is left by the hoe.

Sowed early Cabbages for use in April, May, and June. It is always best to sow on hard poor soil, and thinly, so that stocky plants may be produced. Some persons, as soon as the young plants have formed the rough leaf, prick them out, say 3 inches apart: this certainly produces better plants, but we have no time for it. Peas generally fail with us at this time, but to make up for it Dwarf Kidney Beans and Scarlet Runners do famously. Any quantity of fine succulent pods can be

gathered from a row or two of the latter. If it is necessary to sow two or more rows together, a distance of 6 feet should be allowed between them. There is not a more profitable vegetable for cottagers' gardens than Runners, and when well cooked few are more wholesome. When the plants show the least signs of distress from excessive drought, a drill should be drawn about 3 inches deep, at a distance of 6 inches from the roots, to be filled up three or four times with water. It is not desirable to pour the water against the stems of the plants.

Potatoes are turning-out well in the fields. Dalmahoy and White Dons are extra good, but a few diseased tubers have been found, and one badly affected was found in a basket of Extra Early Vermont. By-the-way, this last is a Potato that can be recommended for small gardens; it is very early, the tubers are large (four fine-shaped specimens just weighed are only half an ounce short of 3 lbs.). The haulm is very short, more so than that of the Ash-leaved Kidney.

FRUIT AND FORCING HOUSES.

Pinerias.—Suckers that were put into pots about the end of July or earlier should now be treated to a warm moist atmosphere of from 70° to 75° at night if the weather is mild; indeed, the best instructions would be to say, Keep up a good heat in the hot-water pipes, and shut-up early. With a bottom heat of 90° or 95° the plants will grow rapidly, and when their roots strike through the bottom shift them into their fruiting-pots at once; in fact, they ought to be in them now if they are to be started to fruit in January next. Our own Queens and some Smooth-leaved Cayennes put in about this time last year are now coming-in. Before potting the suckers it is well to examine them carefully, and to pick and wash-off any insects or scale that may be hidden in the axils of the leaves. It used to be a common practice to lay the suckers out to dry for a few days before potting them, but that was in the days of old, when Pines were grown in pots that required two men to move them, and from two to four years was the time required to produce the fruit. The only motive for drying the suckers would be to prevent them from rotting at the base, but this never happens if the pots are not watered for a week after the suckers are potted. In the house where fruit are ripening and swelling-off admit air freely, and unless it is necessary to hasten the maturation of the fruit very little artificial heat is necessary. If the plants are in good health it will not be necessary to shade after this time.

Orchard House.—The trees still require abundant supplies of water at the roots, and such late sorts as Lord and Lady Palmerston, Salway, &c., are syringed in the morning. A larger proportion of the Peaches than usual have split stones, nor is the fruit large. The Nectarines are good, but this is not the only season in which, though the Peaches have only been of average quality, the Nectarines have been first-rate. An extensive experience leads us to the conclusion that the Nectarine is more amenable to pot culture than the Peach. One thing particularly noticeable is, that should the trees have suffered from a deficiency of water at the roots, Peaches would be "woolly," or what a Scotchman would call "duffy," and it would not be so with Nectarines. Except looking over the trees daily and gathering the fruit as it ripens, the trees have not required any other attention. We used to place bags made of gauze under the fruit, into which it dropped when quite ripe; this is not such a good way as gathering the fruit daily when it parts readily from the stalks.

GREENHOUSE AND CONSERVATORY.

Many of the usual occupants of these structures have been shifted out to other quarters; for the present, however, it is an easy matter to keep these houses gay with Zonal Pelargoniums and other hardy subjects, not to mention such fine and distinct flowers as Phloxes and Gladiolus. The latter need not be grown in pots; all that is necessary is to cut the spikes, and insert them in bottles of water. The bottles should be quite concealed by the pots or foliage of other plants, and the deception is complete. Too much cannot be said in praise of the Phlox for decorative purposes, but to be utilised in the greenhouse the plants must be grown in pots; it will not answer to cut the spikes in the same way as those of the Gladiolus. One of the principal marks in their favour is that they are so easily grown, and are exactly suited for the owners of small gardens, who have not much time to spare to look after their plants. In their culture glass may be dispensed with entirely. If the cuttings were struck according to previous instructions, and grown-on in pots out of doors, the plants will now be in full beauty, and may be arranged in the greenhouse.

Azaleas are now in a moist atmosphere and a stove temperature, and to grow this plant well no other treatment is preferable to this. Our plants were potted shortly after they had done flowering, and placed in heat at once; they soon show that the treatment answers by the way in which the new rootlets lay hold of the fresh fibrous peat in all directions. Heath, Epacris, and all the more robust-growing New Holland plants are better out of doors until the first week of September; they must be removed indoors two weeks earlier than this if there is no provision made to throw off the rains.

FLOWER GARDEN.

Layered the Carnations and Picotees, and will put in cuttings of all Zonal Pelargoniums as soon as possible. These are planted in boxes in preference to placing them in beds out of doors; it is not always convenient to lift and pot the young plants before the autumn frosts set in, and the boxes can be removed under a glass protection at any time.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

TRADE CATALOGUES RECEIVED.

William Paul, Waltham Cross, London, N.—*Bulb Catalogue*.
Downie, Laird, & Laing, Forest Hill, London, E.C., and Edinburgh.—*Descriptive Catalogue of Bulbous Flower Roots and Spring-flowering Plants*.

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Books (*J. Mayall*).—There is no manual for the aquarist in the series you mention. (*Mrs. T. Cartledge*).—You will find sufficient directions for the cultivation of Asparagus in "The Kitchen Garden," of the series of "Manuals for the Many," published at this office, price by post 4½d. (*A. Learner*).—The "Cottage Gardeners' Dictionary," price 6s. 6d.; or, if that is too expensive, "The Garden Manual," price 1s. 8d., free by post. Both can be had from this office.

CRYSTAL PALACE AUTUMN ROSE SHOW (W. J. W.).—No such show has been announced.

WAX FLOWERS (*Admirer*).—What do you mean by "wax flowers most easy of cultivation?"

LILIUM AURATUM (S. E.).—There must be something constitutionally weak in the bulb of your *Lilium auratum*. It is just in the place where it ought to succeed. It may be that the habit of not opening is natural to that particular plant. We can only recommend you to throw it away and get another.

CLEMATIS FAILURES.—SELECT BEDDING GERANIUMS (M. H. M.).—Lady Cullum, golden variegated; Miss Kingsbury, silvery variegated; Rev. F. F. Ferns, deep crimson; Charlie Cusson, brilliant scarlet; Mrs. Lowe, bright pink; Mrs. Vincent, crimson. The failure of the Clematis is probably owing to the drought. Do not hastily remove them; the brown-looking and apparently dead branches of such exhausted plants often retain sufficient vitality to yield growth of extraordinary vigour with suitable treatment. We had several plants which were in a similar condition to yours last season—that is to say, they started into growth in spring, growing freely for a time, but the bark and foliage became brown and dead-looking prematurely. Water was immediately and abundantly given to the roots, a quantity of rich manure forked into the soil in winter, and this season the whole of the plants have recovered, growing with remarkable vigour, and yielding a fine display of flowers.

VICTORIA REGINA VIOLET—VARIOUS (D. F. J. K.).—This should be treated in precisely a similar manner to The Czar, and it will flower simultaneously with it. Of Pansies, Hooper's Marquis will probably suit you. It is a bright bronze colour, and flowers freely and continually throughout the season. Apply to the gardener, Morningside, Kildermunster.

ORANGE FUNGUS ON ROSES (*Inquirer*).—Mr. Radclyffe recommends, and uses most successfully, 2 ozs. of blue vitriol dissolved in hot water, and added to two or three gallons of cold, to be sponged over the leaves.

RECENTLY-PLANTED FRUIT TREES BLOSSOMING (*Perplexed*).—There is nothing unusual in the trees planted last winter now blossoming. We have some large pyramid trees lifted last autumn that are now in full blossom. Remove the trusses of bloom, and water if the weather continue dry. Manure at planting is not good, but it would cause the trees to break freely, and then fall away, owing to the dryness of the season. The stored-up sap is sufficient to cause the trees to start freely into growth, but there being no roots to sustain the growth, this, if roots are not speedily emitted, languishes, and the trees not infrequently die, branches in some cases partially only. Your trees will be all right another season; this year they only show the effects of the removal.

SITE FOR GREENHOUSE (*Idem*).—The situation, as your sketch shows it to us, will not suit for flowering plants; but it would answer for variegated and fine-foliated plants, and for Ferns especially. It may be that it would have sun in the middle of the day, and in that case it would suit flowering plants pretty well, but it would then be necessary to shade the fernery from March to October. The site, however, as your sketch shows, is not a good one. If it have sun at all, it will only be in the hottest part of the day, and fixed shading will only be available, as you are absent at that time of day. The shading would be necessary to keep the plants from scorching.

STORING SEED POTATOES (*Sabbib*).—As you cannot store them on shelves, we should thoroughly turn them by exposing them on the surface of the soil or on the floor of a shed, turning frequently if laid more than one layer deep, and then spread them in a cool cellar or other place safe from frost, in layers not more than 6 inches thick (3 inches would be better), and between each layer of Potatoes put 3 inches thick of dry sand or ashes, covering the upper layer with a 6-inch thickness of sand or ashes. If they are placed outdoors in a "pie" or "hog," a dry situation should be chosen, and a straw and earth covering given in severe weather. The Potatoes should be kept from sprouting; or when they begin to sprout they should be removed, and placed eye-end upwards in shallow boxes or upon a floor, so that the first sprouts may be preserved. Plant when the sprouts are from one-half to three-quarters of an inch long.

APPLYING GAS LIME (*Idem*).—It may be applied to land a little prior to inserting the crop, at the rate of twenty bushels per acre, distributing it equally over the surface, and ploughing or digging in before sowing or planting. Double the quantity may be applied in autumn if the ground is not required for cropping before spring. A ton of gas lime is a sufficient quantity to mix with ten tons of soil. Thoroughly mix the lime with the soil, turn over once or twice, and apply as a top-dressing to grass land at the rate of ten or twelve loads per acre. Gas lime is a hydro-sulphuret of lime with a little ammonia.

CULTURE OF ANARYLLIS LONGIFLORA ALBA AND ROSEA (C. R. H.).—These are better known as *Crimum capense album* and *rosea*. They are hardy in sheltered situations and light well-drained soil. They have not flowered because they are not strong enough. Give them abundant supplies of water when growing, and in winter only give enough to keep them fresh, assigning them a light and airy position in a cool house. Repot in spring in yellow loam three parts, and one part peat, with a sixth of sand, and good drainage. They will flower when they have more strength.

ARRANGING STOVE, VINERIES, AND GREENHOUSE (H. P.).—You could not do better than arrange your proposed houses into four equal divisions of 20 feet each, though the size of the departments depends principally upon what you wish most for. Probably you care most for fruit, and would content yourself with a moderate extent of glass for flowers; and in this case we should have an early vinery of 18 feet, which will accommodate six Vines, and a stove of equal size may form the centre. A late vinery of 24 feet, and a greenhouse of 20 feet, would take up your length. The greenhouse we should have at the most desirable point of entrance at the end of the range, the stove next, then the early vinery, and the late vinery at the other end of the range. Two 4-inch pipes along one end and the front will be sufficient for the greenhouse, four along the front and both ends for the stove, the same number for the early vinery—that is, if Grapes must be had in May or early in June, whilst for the late vinery two pipes along the front and ends will suffice. The piping should be so arranged that the houses can be heated separately or together. As to the boiler we cannot advise; take from our advertising columns that most likely to meet your requirement, and write to one or more of the advertisers, stating what you require, and asking for an estimate.

BELGIAN GARDENS (*Old Subscriber*).—At Ghent, Linden, Rue du Chameau; Van Houtte, Leideberg; Jean Verschaffelt, Leideberg; Auguste Van Geert, pres de la station de St. Nicolas; Palliere, Leideberg. Charles Van Geert, Antwerp; Jardin Botanique de l'Etat, Brussels; Botanic Garden, and that of M. de Camart d'Hamel at Malines.

ROSE RUE D'OR (D. D.).—You can obtain it from any of the Rose-growers.

CLIMBING DEVONJENSIS NOT BLOOMING (*J. Hobbs*).—If your plants have only been planted one season, it is the very best thing that could happen to them not to bloom the first year if they are making good growth. Allow all the growth you can without stopping, and you are sure of good bloom next year. With climbing Roses to cover a wall, or trellis, &c., it is far better to insure growth the first year rather than blooms.

MARSHAL NIEL ROSE NOT FLOWERING A SECOND TIME (*Constant Subscriber*).—The same remarks as above very nearly apply here. Marshal Niel is very apt to make fine vigorous growth after blooming, and the second bloom will then come on side shoots from the stronger growth at a later period. So long as you can have vigorous growth you are sure sooner or later of good blooms, and it is better to wait patiently. You need not be afraid of over-feeding, it will be sure to reward you in the end.

SULPHATE OF AMMONIA FOR ROSES (G. W. J.).—It is good for all Roses as well as Tea Roses when carefully used in about the quantity and proportion you name—1 oz. of guano and a quarter of an ounce of sulphate of ammonia to the gallon of water. If the guano is old more may be used.

ROSES OF PORTUGAL ROSE NOT OPENING (*Idem*).—It is very often a bad opener, and hardly worth much trouble. It is most likely to succeed on its own roots in a sheltered situation in good garden soil not too heavy nor too light.

GROWING ROSES ON SHALLOW SOIL ON FELLEGIOUS SUBSOIL (*Milland Country*).—If you dig out all your beds 2 to 2½ feet deep, and incorporate your irony subsoil in about the following proportions—three loads of the upper soil to one of your irony subsoil and one of the blue clay, and add one load of decayed leaf soil and one of manure, you will succeed in making a good Rose soil. The different soils ought to be carefully mixed; the best way is to cart them to a heap and turn them over twice before putting them into the beds, but if this entails too much trouble and expense have the beds well

forked over twice before planting. The blue clay requires a rating and breaking-up before it is good for Roses. We should recommend Roses on the Maucetti or seedling Briar. The time is not far distant when standards will be things of the past, at least for permanent planting, as the blooms, except in very exceptional cases, deteriorate each year after the first or second season. There is no reason why you should not grow exhibition Roses. The worst soils under proper care will produce good blooms. Witness the success of the Rev. J. B. M. Camm, of Monkton Wyld, whose soil naturally is about the worst for Rose-growing that could be found. We could have given, perhaps, more accurate advice if you had stated what was the nature of your upper soil, but we conclude from its being over the iron subsoil, that it is somewhat light and gravelly. As a broad rule the Dog-Rose stock succeeds best in strong soils, with unctuous clay, &c.; the Maucetti on good garden soils and light ground; and strong-growing kinds, as Gloire de Dijon, General Jacqueminot, John Hopper, and Marchal Niel on their own roots.

SEEDS NOT GERMINATING (W. G. M.).—If the seed has been in a pot eight months and is yet sound, it may yet vegetate. You cannot "make" seeds vegetate before their time. Broken sea shells can be obtained from any of the principal nurserymen, or from dealers in sand, loam, &c.

NEMOPHILA (Spring Garden).—*Nemophila insignis* will, no doubt, stand the winter in County Armagh. It does so in England, or, at least, the seeds which are in the ground grow very early in spring, and the plants are gay in the spring garden.

ANTHRURUM REGALE (J. L. W.).—This may be shown either as a flowering or as a line-foliated plant. If it is in flower, of course it may be shown as a flowering plant, but it would not help the collection much.

TWELVE TEA ROSES (Tea Rose).—The best are *Souvenir d'Elise*, *Souvenir d'un Ami*, *Niphetos*, *Devonensis*, *Catherine Mermel*, *Marie Van Houtte*, *Madame Jules Margottin*, *Madame Willmer*, *La Belle Lyonnaise*, *Comtesse de Nadaillac*, *Madame Fretot*, *Perle de Lyon*.

NOISETTE ROSES (Idem).—*America*, *Celine Forestier*, *Maréchal Niel*, *Triomphe de Rennes*.

PEAR ANNA NELIS (F. C.).—This Pear is not worth growing.

PLUMS (John Ferme).—The only way we know of for drying Plums is to place them in a slack oven after the bread has been withdrawn, and gently dry them; take them out, and repeat the process till the fruit is well shrivelled. They will then keep for some time.

VINE LEAVES (G. L. H.).—Your Vines are infested with thrips. Fumigate immediately with tobacco smoke. The best remedy to destroy brown scale on Peach trees is to wash them in water when the leaves are off with a strong solution of Gishurst compound, 8 ozs. to the gallon of water.

VINES IN GREENHOUSE (A. L.).—Grapes can very well be grown in such a house as you specify. If you can place it in a position for the lights on one side to slope to the south, all the better; but if not, the west will do.

GRAPES AND PEACHES DISEASED (J. Bryan).—There can be no doubt that the roots both of the Vines and the Peaches have got into ungenial soil. Is your soil heavy and not thoroughly drained? The fruit has every indication of this being the case.

VINE FOR COOL GREENHOUSE (Flycatcher).—As a companion to your Black Hamburgh you may have Black Prince, or, if you prefer a white Grape, White Muscadelle. Cut down the Gorse in the winter time, not now.

GRAPES (F. Stanford, jun.).—The Grapes you sent appear to be Muscat Hamburgh, a very excellent variety. There is no special cultivation for it, but it requires a little more heat than the Black Hamburgh does when grown in a cool vinery. If you give a little heat at blooming-time, and till the berries are well set, you will succeed.

SEEDLING CARNATIONS (W. E. A.).—Your Carnation does not differ from many others which we have seen. Seedlings bloom much more freely than plants propagated by layers, and you will probably find on propagating your seedling in this way that it will to some extent lose its free-blooming habit.

GREENHOUSE LAMP (A New Subscriber).—The lamp you mention will not be injurious to plants, provided you have ventilation in the house. We presume the laps of the glass are open. If such is the case there will be escape enough for any fumes that could cause injury.

FACING OLD BRICK WALL (D. Bridg).—As you say it will cost you £60 to face your old brick wall, and you are averse to incur that expense, the best thing you can do is to fill up the defects with cement, and wire the walls, to which you can then fasten the fruit trees. As regards your Peach trees, cut out all the gross shoots now, so that the wound may heal over this season, and so prevent gumming. It is not they which produce the fruit.

COMMON BRAKE AS COVER (J. Rogers).—The only way to introduce the common Brake into grass land to serve as cover, is to transplant it in masses. It will soon spread.

FRUIT-ROOM (R. F. B.).—We should prefer the dark room for fruit. You ought to have some means of ventilation; if you have not, you must use a room with a window, which you can board or otherwise cover-up, reserving sufficient for ventilation.

BUILDING A FRUIT-ROOM (Cornubia).—The walls should be of bricks or stone, and not less than 14 inches thick. In a house 15 feet by 12, one window will be necessary, which should be made to open, and so serve the purposes of ventilation. The best internal arrangement is a staging of laths, one tier above another, the staging to be 3 feet wide, and 1 foot 9 inches apart. If your house were wide enough, as it would be if 15 feet wide, there might also be a staging in the centre that would be 4 feet wide, which would give 6 feet for the two side stages, 4 feet for the centre one, and 2½ feet for a path all round. Drawers would be an extra expense, and are not necessary. Any builder in your neighbourhood would be glad to give an estimate for it. You will find a long article on the subject at page 80 of the number for January 22nd of the present year.

CATERPILLARS ON PLUMS (Mootee).—The only way to get rid of them is hand-picking.

SPIDER IN VINERY (D. M.).—The spider is not uncommon in England. It will do no harm to either the Vines or the fruit, as it feeds on other insects.

NAMES OF PLANTS (Frank Corbett).—*Achillea Millefolium*. (*Britannica*).—1, *Abies Smithiana*; 2, *Abies excelsa*; 3, *Abies Douglasii*; 4, *Wellingtonia gigantea*. (*Silly Hill*).—*Hypericum calycinum*. (*A. Fisher*).—*Opuntia Salicifolia*, *Parm.* Brazil. Wants rotting and more water. (*Amer.*)—*Buddleia Lindleyana* (*Bot. Reg.* 32, t. 4.). (*L. C.*, *New Abbey*).—*Cystopteris fragilis*, var. *dentata*, *Hook.*

POULTRY, BEE, AND PIGEON CHRONICLE.

DORKINGS AT BUCKINGHAM SHOW—POULTRY MISFORTUNES—CRYSTAL PALACE SHOW.

I was very much amused on turning to the Journal of Thursday last, to find that your correspondent from Buckingham had pilloried me for sending certain birds to the Show there which, according to his account, displayed signs of over-exhibition. Now, I do not in the least object to your correspondent's good-humoured remarks, but I should like to set him right, as well as myself, before your readers. My birds were not in such good condition as I could have wished, not because they had been over-exhibited, but because they had begun to moult. The moult this year has come on so suddenly that the interval between the last day of entry and the Show has been enough to destroy the chances of otherwise good birds. That my pen ought to have had some chance of success, if in proper trim, is clear from the fact the cock was a winner at the Crystal Palace, and one of the hens was first at Birmingham. I must, however, admit the justice of the award, and compliment Mr. Jeffries on his firmness in declining to give a cup to birds that were not, when exhibited, worthy of such a prize. As it was, I doubted after I had seen the pair selected for the Show whether I should send at all, and decided in the affirmative only because Buckingham was near, and the entries apparently few. It is no easy matter to select a good pair of Dorking hens even from a large yard, in the months of August and September, and if the Buckingham Committee will be content next time with a single hen, I will endeavour to send one that shall be neither "tattered," moulting, nor "over-exhibited."

It affords, I believe, pleasure to some folks to hear of the misfortunes of others, and I daresay a few of my friendly rivals will not be sorry to learn that I have had rather a disastrous time of it this spring. First of all, the best hen I ever bred fell ill of cancer in the throat. After she was dead I discovered that some infallible recipe had been found in America, and if I mistake not, this was given in the Journal not very long since. I applied, or rather my man applied, for I have very little time to attend to such things, caustic again and again to the sore, but in vain. The disease at last made its way outside, and closed one of the eyes, whereupon the case was abandoned as hopeless. Next, her sister showed indications of something being wrong with one of her feet, and is now, alas! a confirmed gouty subject. I see, unfortunately, signs of gout in other good birds, and there is no anti-gout sherry or other such specific that will either remove, alleviate, or prevent this hideous complaint. Moreover, the heavier your birds are, the more liable they are to it!

In my simplicity I could only hope that my early chickens would make-up for my losses—a delusion. Although we keep our places as clean, I think, as is possible, our youngsters contrived to catch roup. I had never seen the disease in chickens before, and, indeed, did not recognise it at first. A friendly voice from Rochdale at length warned me of what was likely to happen, but unfortunately too late, and so I have been compelled to sacrifice my hopes and slay not a few of my most promising birds. Some, however, survive, I trust to avenge the memory of those who have passed so prematurely away! Verily, "he who dabbleth in Dorkinga dealeth in disappointment."

As I am writing to the Journal I should be glad of permission to touch on one or two other topics. Can any of your readers recommend a good incubator? I sprinkle the eggs before hatching, put them in water, and yet fail as much as ever. My man sometimes announces eight or ten chickens the day before hatching, and only one or two come out alive. This is particularly the case when the sitting hens are heavy; they seem with their weight to crush the chickens just as they are hatching. I feel disposed to try an incubator in such cases for forty-eight hours, and then place what chickens there are under the hen that has been sitting.

And now a word on the Crystal Palace Show. I venture to hope that this year we shall have pairs of pullets instead of the cock and hen class, at all events among the Dorkings. The single-bird system is now being carried out *usque ad nauseam*; and a class for pairs of pullets would, I believe, bring as many or more entries than the class referred to, and would to my mind be more interesting. To breed a pair of good birds must require more skill than a single one, and the fortunate possessor of one good bird ought not to be rewarded as much as he who has two that are not only good, but uniform in goodness. In fact, I believe the system of showing pairs tends to encourage the *boni fide* breeder rather than the man who buys-up a few good birds and then shows them singly all round the kingdom.

May I also suggest to the same Committee that it would be very advisable to station a man at the Clapham Junction Station on the days of the arrival and of the departure of the birds? I have heard from several quarters strange stories of the manner

in which the fowl-baskets are rolled and pitched about there, and in any case no harm would be done by a precaution of this kind. Lastly, I would suggest that if a person should have the good fortune to win a cup, he should receive, if he likes, the money in full instead of the cup. Certain good people, whose names I entirely forget, wrote to me after the last Show, suggesting that I should select a piece of plate or some article as a cup. Now, I cared neither for a piece of plate nor any of their articles, as I happen to have a *penchant* for photographs, and fancy I can show some rather good specimens which I have purchased as poultry trophies. Upon declining to buy of these good folks, who, I suppose were authorised by the Committee to write, I found I was mulcted of a certain proportion of my prize. Of this I do not complain, as due notice was given; still, I think a flourishing body such as the Crystal Palace Committee is supposed to be, might pay in full, as is now usually done elsewhere.—E. BARTON, *Berkhamsted, Herts.*

PROPOSED CONTINUATION OF BRISTOL POULTRY AND PIGEON SHOW.

WE have received the following circular:—"The Bristol Poultry and Pigeon Show held in January last was again a loss to the Committee of about £70, and at a meeting recently held it was decided to discontinue the Show and dissolve the Committee. It does seem a disgrace to a large city like Bristol, that such should be the end of a Society which has struggled against hope and loss for seven years.

"It could not be expected that a small body of gentlemen should carry on the annual Exhibition in the face of so serious a loss year after year, but I still think it might be done if everyone in Bristol and the neighbourhood who feels an interest in the matter would assist. With this object in view I am willing to undertake the gratuitous management of another Show, provided I can get twenty gentlemen to assist the undertaking in so far as to join in the moderate guarantee according to the subjoined form.

"The fee paid to our late Secretary being thus saved, with a fairly successful Show I hope there will be no loss, or at most such a trifling deficiency as would not be felt when divided amongst so many; in which case, of course, a debtor and creditor account will be submitted to the guarantors.

"Any larger subscription or cup for any particular class which you may wish to give will be thankfully received, and will be considered equivalent to the guarantee.—E. CAMBRIDGE, *Horfield, Bristol.*"

[We agree with Mr. Cambridge that Bristol ought to be able to sustain a poultry exhibition as successfully as Birmingham, and to aid him in his praiseworthy effort we have authorised him to offer a five-guinea cup. This is not to be a precedent, for a poultry show is not needed where it cannot be self-sustained.]

PERMIT me to say a word on the above subject. There have been eight annual shows held in Bristol: the place for exhibition excellent, the management good, and the birds exhibited of first-rate quality. To those residing in the south-west of England who have an eye for poultry and Pigeons each show has been a rare treat. I use the word "rare," because shows do not abound in these parts. But—and there is usually a "but" to everything—every show has entailed a heavy loss on the Committee. Last year the loss amounted to £70—not a trifle to lose. Still the lovers of poultry at and near Bristol are inclined to persevere, and have issued a circular with the same heading as this article. Mr. Cambridge offers to undertake "the gratuitous management of the Show for next year provided he can get twenty gentlemen to assist the undertaking in so far as to join in a moderate guarantee in the following form"—viz., a promise to subscribe annually one guinea to the Show, and in addition an equal share with twenty or more gentlemen in the loss, if such there be, provided that share does not exceed the sum of £2 2s. Surely twenty good and true men may be found to undertake this, at most an outlay of three guineas! I have before recommended cage birds to the Bristol Committee, knowing that as there are more single ladies living at Clifton than any other place in England, there must be a great number of lovers of Canaries and other song birds, for the larger number of admirers at least of the Canary, that parlour pet, are ladies of means and leisure.

I will now tender another piece of advice to my Bristol friends, and that advice shall take the form of an anecdote. The owner of a house was exceedingly troubled with rats, and tried all sorts of plans to get rid of them, but still they came, and still the owner suffered loss. At last the old-fashioned farrier of the town, a man of no education, and who never knew the name of any disease from which any of his equine patients suffered, but generally knew how to cure them, said he could for a five-shilling fee undertake to recommend a certain cure, and that the owner should cease to suffer loss. The old farrier came, looked through the house, nodded knowingly, and having seen all the damage done, and the five-shilling piece having

touched his palm, then he closed the door for fear of listeners, approached the owner's ear, and whispered "Cats!" Now I recommend cats to cure this Bristol malady. Wherever cats are shown crowds come to see them. I nearly had my coat torn from my back at the Birmingham Cat Show by the densely-packed throng. The Rifle-drill Hall at Bristol would be an excellent place, and, unlike the Birmingham wooden booth, would be well ventilated.

I say, then, "Cats!" and the Bristol Committee would find that cats meant cash.—WILTSHIRE RECTOR.

THE CARRIER PIGEON.

THE Carrier should be a large bird; large in body, large in limb, and large in presence; a bird with style, of the quality noble. Not a bird deformed by an immense beak or distorted wattle, but a bird of proportions. Who cares for a long hook piercing a wrinkled bunch of excrescence, attached by a short neck to a runtish body? Wring off such heads and feed the bodies to the dogs, and rid the earth at once of two-thirds of the Carriers now encumbering it. We want the blooded style, the thoroughbred, not the Runt head, with its heavy Flanders look. Let the Runt retain that; it is bred for the pot and deserves all the weight that can be attached to it. Who of us would choose a woman whose ankles were beef to the heel? Not one; and we should be as well educated on the symmetry of Carriers.

The body of the Carrier should be large, broad across the shoulders, the muscles prominent and firm; the feathering should be hard as that of the Game fowl; the bow of the wing must be prominent, the flights long and smooth with a wide stretch—say 35 inches, and should lap above the tail; the leg must look large in proportion to the body, the bird standing high; the feet must be red, the toes long and well spread; the neck long and thin, closely covered by small hard feathers. The head is of itself a study; most of the properties are claimed to lie there, and so much attention has been devoted to it that the equally valuable size, shape, and style have almost ceased to exist. The result is that any dumpy mass of feathers with a fungus and a hook at one end is called a Carrier, and takes rank by reason of the length of its hook. To my mind this is a very great mistake, and a large, firm, reachy bird, with a bold, fearless style, should always take precedence of a dumpy, no matter if there is a difference of a sixteenth of an inch in beak or wattle.

The properties of the head lie in the beak, wattle, eye, and skull. Much attention has always been paid to the beak, and there are many persons who are called beak fanciers, because they set more store by that point than any other. Their object is to attain a long, straight, and thick beak, and they will sacrifice everything else to accomplish the purpose.

I have tried a number of experiments on beaks, and have come to the conclusion that the least done artificially to increase the length the better. One thing, however, is very important—the young birds should be fed by the old ones, that is, the old Carriers, for no other variety has mouth large enough to feed the young without compressing the soft, cartilaginous bones of the beak, and interfering with its growth. This is a very simple thing, but to any observer it is very suggestive, for not even Dragons can feed young Carriers satisfactorily.

The beak must be long and straight; for crookedness, even of the slightest, is a disheartening eyesore; crookedness either lateral or downward. The curve downwards is very obnoxious, and some of the Roman-nosed birds look more like voracious vermin than "kings of Pigeons."

Thickness is necessary to preserve the proportions of the beak and prevent its becoming spindling. The mandibles must also fit, the lower within the upper, that the bird may not be open-mouthed or distorted. The fitting of the parts of the beak is seldom perfect, by efforts to increase the length, or by the compression by the smaller beaks of feeders, a deformity consisting of a pinching-in of the sides of the upper half near its point is produced, and the shape of the part is destroyed. One hundred years ago an inch and a half was considered a long beak, but in those days more attention was given to the other properties; now the same measurement is thought useless, and from one and three quarters to two and a quarter are the extremes which contain the average lengths. The measurement is from the tip of the beak to the centre of the eye. Very long measurements can sometimes be obtained from the Roman-nosed birds by using a tape around the curve, but it is fallacious, as honesty determines the direct line as the standard.

The wattle is a wearisome thing to wait for; it is seldom of much importance until the bird is two years old, and it continues to improve to the fourth year. I have bought a good many Carriers, of which it was said, "When they get a little older the wattle would be very large." After watching three years I turned out one old bird to fly with the commons, and ten years afterwards his wattle had increased so much as to entitle him to rank with Dragons. By the way, that bird was, to my knowledge, thirteen years old, and he must have been a year old when I bought him. I also know of a Horseman that has been

in the same loft nine years—pretty good specimen of longevity in Pigeons. The wattle must be broad across; an English walnut, with the long diameter across the back, would be a fit illustration; broad from side to side, short from before backwards, high and tilting forwards. It looks like a cauliflower, or fungous growth, is pinkish-red in colour, and hard to the touch in old birds, but like velvet in the young. When the bird is diseased, it becomes white or very dark red, the latter being the condition when the bird is gorged by overfeeding and suffering from vertigo. When the birds are moulting, or in bad health, the wattle shrinks very much. Some fanciers desire the wattle to extend under the lower beak, but it is generally preferred that this should not be. The circumference of the wattle of the beak should be over $3\frac{1}{2}$ inches.

The eye is an exceedingly important point with the Carrier.

Upon it depends much of the impression the bird makes upon his admirers. A dull listless eye will doom the best bird in other respects. Like the same organ in man it is the sentinel of the brain, and upon its alertness depends the judgment passed of the general physical powers. Its glance should be quick, comprehensive, and confident. The colour is a bright orange red, the redder and more fiery the better. It is surrounded by a broad cere, which is of the same nature as the wattle of the beak. This cere must be smooth, regular, and of equal width all round the eye. It is exceedingly difficult to develop it perfectly at all points, and it is most apt to become thin at the posterior part of the circle, thereby winning the name of pinch-eyed. A cere the size of a silver quarter, or about an inch and a quarter in diameter, is a good one.

The skull has only of late years commanded attention. At

Fig. 46.—ENGLISH CARRIER PIGEON.

first the fanciers were indifferent whether it was short and thick, or long and narrow. Good taste, however, prevailed, and the demand is for long narrow heads, flat on top or with a slight depression in the centre. Between the wattles of the eyes, as they appear above the head, the distance must not be over half an inch.

Carriers are of two colours, or rather of one colour—black, with the adjunct colour, dun, by the aid of which the deeper black is maintained in its purity, a cross being often necessary to prevent the black from becoming rusty or washed out.

Reds, whites, yellows, and blues, have been bred, but they are not of much account, and have ranked little better than Horsemen or Dragoons. They occupy about the relative position that paste diamonds do to the genuine articles.

I have been in the habit of judging Carriers by the following standard:—1st, size; 2nd, shape; 3rd, style; 4th, colour; 5th, head; 6th, eyes; 7th, beak; 8th, wattle.

I use more points than the writers recommend, and place the most neglected first, as it is now easier to obtain a good head-

and-beak bird than one of good style and shape.—(*American Fanciers' Journal*.)

[The above article on the Carrier is from the same lively pen from which emanated that on the Fantail, and which was inserted in this Journal a short time since. In passing, I will just notice that our consins across the Atlantic have now two papers devoted to poultry, Pigeons, &c.—the "Poultry Bulletin" and the "Fanciers' Journal." This fact shows the great attention recently paid to these subjects in America.]

Dr. Morgan's article on the Carrier will be read by all with interest, for it is so well written; but everyone will not wholly agree with him. Thus English fanciers, or at least exhibitors, will probably differ from him in what he says upon the head and beak of the Carrier, points the most difficult of all to breed for, and whatever is most difficult to attain English fanciers think most highly of. Still, the words of the lively doctor will do good. We have at shows too many Roman-nosed birds with beak out of proportion to bird, and these beaks the result of art, not nature. More regard for style would be well. Grace in the

Carrier cannot exist with hooked beaks and wide-gaping mandibles. Dr. Morgan is a little incorrect as to narrowness of the skull not having been attended to until recently. Old Moore dwelt upon "a long narrow head," and speaks of the head's "length, narrowness, and flatness." Again, Dr. Morgan would scarcely speak of "Blues not being of much account" had he seen our recent Crystal Palace Shows. Blues in England are greatly improved, and may now be seen of first-rate quality. I point out these little matters, not to depreciate, but to correct from an English point of view; of the American I can say nothing. Dr. Morgan's writing is excellent, and from the freshness of his descriptions and evident knowledge of his subject will be sure to attract attention.—WILTSHIRE RECTOR.]

[We reproduce from our number of April 7th, 1870, the accompanying figure of a high-bred English Carrier, drawn for our pages by Mr. Dean Wolstenholme.—Eds.]

MELTON MOWBRAY POULTRY SHOW.

THIS Show progresses annually in the most satisfactory manner, the present year's entries exceeding those of last season by nearly forty pens. It is not, however, simply as to numbers that improvement is limited, for, on the contrary, in very many of the classes the competition could not be exceeded even at the largest of such meetings. The Committee, practically conversant with the best means to insure success, adopt them. The Show, which includes an excellent floricultural and horticultural display of the highest character, takes place under three very spacious tents, which in every case are admirably fitted-up for the purposes to which they are applied; and each committee-man, having his fixed post, performs his duties with undeviating regularity, so that the most perfect order and punctuality prevail in every department. The hurry and bustle that so frequently mar many shows are at Melton entirely unknown. The grounds in which the Show takes place are especially well suited to the purpose, abundance of seats beneath trees now in full beauty adding much to the satisfaction of those visitors to whom a day's rural pleasure is a great boon, as a change from close business occupations. The weather proved delightful, and the Show was attended by most of the surrounding gentry.

In Grey Dorkings the first-prize pen was excellent, but the others were much inferior in quality. The Spanish fowls were not in show condition, as, indeed, of this breed, few are to be found just at this time from the unfavourable season they have endured. *Cochins* were decidedly good, and to Mrs. Williamson's pen of White the extra plate prize for the best pen of poultry in the Show was allotted. It is almost needless to say more than that these unusually perfect fowls were shown in faultless condition, as, indeed, were the same lady's Light *Brahmas*, which so closely competed for this special prize. The Judge himself stated "it was an injustice to the rejected pen either way," and therefore devoted considerable time in making his final decision. The Dark *Brahmas* were not equal to the Light ones. *Hamburghs* were fair classes, but the competition was, as to numbers, somewhat limited. *Game* (mostly deeply moulting) were fine, the Brown Reds being decidedly the best of any, a "brick-breasted" Brown Red cock, with hen, taking the principal Game prize in the general classes, but beaten for the special Game prize by a single cock, also a Brown Red, shown in capital feather and condition by Mr. Andrew Peake, of Somerby. A remarkably fine hen in the first-prize pen is the only remark called for as to the *Houdans*.

A very fine pen of Malays, well-grown chickens, adult Black *Hamburghs*, and *Crève-Cœurs*, were the winners in the Variety class. All three of the prize pens of Game *Bantams* were Black Reds, but none of them were in good feather. Very superior Gold-laced Sebrights (chickens) and Speckled Japanese (adults) won in the Variety Bantam class, but for the third prize there was not a competitor. *Turkeys* were remarkably fine, as were the *Geese*, the second-prize White Spanish *Geese*, a rare breed, being shown in the highest of condition. The two special classes, one for chickens, the other for ducklings, for table uses, caused a first-rate entry of most suitable specimens.

A grand collection of *Pigeons* added greatly to the interest of this Show. The Carriers, to which breed the extra plate prize for the best pen of Pigeons shown was given, were unusually good, and two such pens as those shown by Mr. Edmund Walker, of Branston Gate, Leicester, are rarely to be selected from the same loft. The *Almonds*, *Pouters*, and *Fantails* were specially good, and the *Archangels* were a large entry of first-class birds. A grand pair of Black *Barbs* and a pair of Fire *Pigeons* took the Variety prizes for Pigeons. Mr. Cashmore, of Sheepshed, was a large exhibitor, and very successful among the Pigeons.

There was a capital show of *Rabbits* on view, the heaviest weight being 15 lbs. A class for young Rabbits, not to exceed twelve weeks old, produced an entry of thirteen pens of unrivalled excellence.

DONKINS.—1, M. M. Cashmore, Sheepshed. 2, N. Whitechurch, Melton Mowbray. 3, M. Kew, Market Overton.

SPANISH.—1 and 2, M. Brown, Ab-Kettleby. 3, J. T. Hincks, Humberstone. *COCHIN-CHINA*.—*Cinnamon or Buff*.—1 and 2, H. V. Story, Ruddington Manor. 3, M. Kew. *Any other variety*.—1, Cup, and 3, Mrs. A. Williamson, Quenborough. 2, M. M. Cashmore. *GRAHAM Pouter*.—*Light*.—1 and 2, Mrs. A. Williamson. 3, J. T. Hincks, Humberstone. *Dark*.—1, H. V. Story, Ruddington Manor. 2, M. M. Cashmore. 3, G. Milford, Melton Mowbray. *HAMBURGH*.—*Golden-pencilled*.—1, J. Ward, Barton Hill. 2 and 3, T. Wild, jun., Burton Lodge. *Silver-pencilled*.—1, M. M. Cashmore. 2 and 3, No competition. *HAMBURGH*.—*Golden-spangled*.—1, J. Ward. 2, M. M. Cashmore. 3, G. Hewitt, Melton Mowbray. *hc*, T. Wild, jun. *Silver-spangled*.—1, Hughes, Oakham. 2, M. M. Cashmore. 3, C. Thurbury, Salthay. *GAME*.—*Black-breasted or other Reds*.—1, M. M. Cashmore. 2, A. Peake, Somerby. 3, A. E. Mitchell, Long Chawson. *Any other variety*.—1 and 2, N. Whitechurch, Melton Mowbray. *Any variety*.—*Cock*.—1 and Extra, A. Peake. 2, C. Chambers, Oakham. 3, T. Shippam, Melton Mowbray. *HOUKANS*.—1 and 3, J. French, Melton Mowbray. 2, J. T. Hincks, Humberstone. *ANY OTHER VARIETY*.—1, M. M. Cashmore. 2, M. Kew (Black *Hamburgh*). 3, J. Morley, Sysonby (Crève-Cœurs). *c*, De L. Gerard, Garendon Park (Silkies). *BANTAMS*.—*Game*.—1, J. T. Hincks. 2, M. Stokes, Hosc. 3, T. Whitaker, Melton Mowbray. *Any other variety*.—1, M. M. Cashmore. 2, J. T. Hincks. 3, T. Thurbury. 1 and 3, M. Kew. 2, N. Whitechurch. *GEES*.—1, M. Kew. 2 and 3, N. Whitechurch. *DUCKS*.—*Aylesbury*.—1, M. M. Cashmore. 2 and *hc*, R. & H. Gill, Holwell. 3, E. Snell, Barrowden. *Rouen*.—1 and 2, J. Wright. 3, Miss E. H. Wingfield, Market Overton. *ANY VARIETY*.—*Cockerel and Pullet*.—1 and 2, Miss E. H. Wingfield. 3, M. M. Cashmore. *c*, J. T. Hincks. *Ducklings*.—1, J. Wright. 2, M. M. Cashmore. 3, R. & H. Gill.

PIGEONS.

CARRIERS.—*Pair*.—1, Cnp, and 2, E. Walker, Leicester. *hc*, J. T. Hincks; M. M. Cashmore (2); S. Kestin, Twyford. *TRUMPETERS*.—*Pair*.—1 and 2, M. M. Cashmore. *hc*, J. T. Hincks. *c*, W. Haseldine; J. Kemp, Melton Mowbray. *FANTAILS*.—*Pair*.—1, A. Staunage, Marefield. 2, W. Gamble, Thorpe Satchville. *hc*, W. Latham, Melton Mowbray. *c*, Masters J. E. & A. Wakerley, Melton Mowbray; M. M. Cashmore. *POUTERS*.—*Pair*.—1 and 2, M. M. Cashmore. *hc*, A. Fetch, Melton Mowbray; W. Haseldine; R. Widdowson, Melton Mowbray. *JACOBIANS*.—*Pair*.—1, Master A. Ridge, Melton Mowbray. 2, M. M. Cashmore. *c*, M. M. Cashmore; W. Gamble. *TRUMPETERS*.—*Pair*.—1 and 2, W. Gamble. *ARCHANGELS*.—*Pair*.—1, A. Hardstaffe, Melton Mowbray. 2, J. Andrew, Melton Mowbray. *hc*, W. Latham; Master H. F. Hinde, Little Darby. *c*, W. Haseldine. *ANY OTHER VARIETY*.—*Pair*.—1, Master E. Ridge, Melton Mowbray (Barbs). 2, M. M. Cashmore. *hc*, J. H. Inchley, Mount Sorrel (Frillbacks). *hc*, J. T. Hincks (Magpies); J. Andrew, Melton Mowbray (Nuns); M. M. Cashmore; J. Kemp, Melton Mowbray (Antwipers and Horsemen); J. Inchley (Frillbacks and Swallows).

RABBITS.

GREATEST LENGTH OF EAR.—1, W. Canner, Leicester. 2, W. Haseldine. *HEAVIEST WEIGHT*.—1, W. Glover, Scalford. 2, W. Haseldine. *hc*, W. Glover; R. Robinson, Melton Mowbray. *ANY VARIETY*.—1, J. T. Hincks (Silver-Grey). 2, M. Kew (Angora). *hc*, W. Canner (Silver-Grey); A. Fetch, Melton Mowbray; W. Hinman, Melton Mowbray; J. Dickinson, Melton Mowbray; Masters A. J. & N. Payne; W. J. Priestman, Melton Mowbray; T. Bates, Melton Mowbray (2); M. Kew (Angora). *c*, J. H. Reehley (Patagonian). *YOUNG*.—1, E. Rance, Kirby Bellara. 2, J. P. Hewitt, Great Dalby. *hc*, J. T. Hincks. 2, T. Bates (2); W. Haseldine; W. Moore, Melton Mowbray. *c*, M. M. Hinman, Melton Mowbray; M. Kew.

The prizes were awarded by Mr. Edward Hewitt, of Sparkbrook, near Birmingham.

HORNINGLOW POULTRY SHOW.

THE third annual Exhibition was held at Horninglow, Burton-on-Trent, on the 8th inst. The following are the awards of the Judge, Mr. R. Teebay:—

DORKINGS.—1, J. White, Warlaby, Northallerton. 2, S. W. Hallam, Whitwick. 3, J. Watta, King's Heath, Birmingham. *hc*, H. Feast, Swans. *COCHIN-CHINA*.—1, B. S. Woodgate, Penbury, Tunbridge Wells. 2, H. Tomlinson, Birmingham. 3, M. M. Cashmore, Sheepshed, Loughborough. *hc*, H. Yardley, Birmingham; W. J. Cooper, Burton-on-Trent; H. Feast; E. J. Draper, Burton-on-Trent. *c*, E. Winwood. *BRAHMAS*.—*Dark*.—1, J. F. Smith, Sheffield. 2, H. Feast. 3, J. Watts. *hc*, J. Holmes, Whitecoats, Chesterfield. *c*, C. Hall, Swadincote; G. M. Cooper, Burton. *Disqualified*, W. Whiteley, Sheffield. *Light*.—1, W. Whiteley. 2, E. Kendrick, jun., Lichfield. 3, A. O. Worthington, Burton-on-Trent. *SPANISH*.—*Black*.—1, J. Gashbrook, Burton. 2, S. W. Hallam, Whitwick. 3, H. Feast. *GAME*.—*Black or Brown Red*.—1, R. Ashley, Nantwich. 2, E. Bell, Burton. 3, E. Clavey, Burton. *hc*, T. Haycock, Burton-on-Trent. *c*, H. Feast; Duke of Sutherland, Stoke-on-Trent; E. Winwood. *Any other variety*.—1, E. Winwood. 2, R. Ashley. 3, Duke of Sutherland. *hc* and *c*, E. Bell, Burton-on-Trent. *HAMBURGH*.—*Golden or Silver-spangled*.—1, J. Robinson, Lindley, Olley. 2, J. Ward, Ashby-de-la-Zouch. 3, H. P. Bayley, Lushbury, Wolverhampton. *hc*, Duke of Sutherland; J. Robinson, Lindley, Olley. *c*, S. W. Hallam, Whitwick. *Golden or Silver-pencilled*.—1, Duke of Sutherland. 2, J. Robinson. 3, W. Speakman, Nantwich. *hc*, C. Hall; J. Ward. *BANTAMS*.—*Game*.—1, W. Baskerville, Manchester. 2, Duke of Sutherland. 3, J. Mayo. *hc*, W. Baskerville; A. Ashley, Worcester. *Any variety except Game*.—1, E. S. S. Woodgate. 2, R. H. Ashton, Mottam, Manchester. 3, J. Mayo. *hc*, F. Holbrook, Derby; J. Watts; S. W. Hallam, Whitwick. *c*, H. Yardley; W. Cooper, Eacup. *ANY OTHER VARIETY*.—1, H. Feast. 2, A. Sinclair, Burton. 3, M. M. Cashmore. *hc*, C. Hall. *LOCAL CLASS*.—*Cross-bred Fowls*.—1, J. C. Lane, Burton-on-Trent. 2, H. Marshall, Burton-on-Trent. 3, T. C. Viney, Burton-on-Trent.

CROOK POULTRY SHOW.

THIS was held on the 5th inst., when the following awards were made:—

TURKEYS.—*White*.—1, W. Canney, Bishop Auckland. 2, W. Love, Redgate, Wolsingham. *hc*, Miss Crisp, Yarn. *c*, G. Love, Malton. *Any other variety*.—1, W. Canney. 2, W. Love. *hc*, A. M. Palmer, Bishop Auckland. *GEES*.—1, Miss Crisp. 2, W. Love. *hc*, A. M. Palmer, Bishop Auckland. *DUCKS*.—*Aylesbury*.—1, W. Canney. 2, O. A. Young, Driffield. *Any other breed*.—1, D. Shaysy, Brancepeth. 2, W. Canney. *hc*, O. A. Young. *Ducklings*.—1, R. Charlton. 2, J. Enstie. *hc*, W. Canney. *GAME*.—*Black-breasted or other Reds*.—1 and 2, T. Robson, Bishop Auckland. *hc*, W. Youngusband, Darlington; G. Holmes & Purdon, Great Driffield.

Any other variety.—1, J. Wilkinson, Tow Law. 2, Pickering & Duggleby, Driffield. *he*, G. Holmes & Pardon. *Undubbed*.—1, J. Gibson, Stanhope. 2, A. M. Palmer.

SPANISH.—1, W. Jobling, East Bridge End, Frosterley. 2, G. Morson, Beechburn. *he*, W. Robson, Crook.

DORKINGS.—*White*.—1, G. Love. 2, J. T. Proud, Binchester, Bishop Auckland. Any other variety.—1, C. Widdas, Darlington. 2, J. T. Proud.

BRAMA POOTRAS.—1, F. E. Gibson, Middleton-in-Teesdale. 2, W. J. Frank, Egglecliffe Farm.

HAMBURGH.—*Golden-pencilled*.—1, J. Forster, Tow Law. 2, G. Holmes & Pardon. *he*, J. Jackson, Tow Law; A. Harbott, Bishop Auckland. *Silver-pencilled*.—1, G. Holmes & Pardon. 2, J. Jackson. *he*, W. Simpson, Pye Close; W. Jopling.

HAMBURGH.—*Golden-spangled*.—1, R. Smithwaite, Bieldershaw. 2, J. Forster. *he*, J. Jackson; R. Keenleyside, Aycliffe. *Silver-spangled*.—1, Pickering and Duggleby. 2, G. Holmes & Pardon. *he*, J. Gibson.

BANTAMS.—*Game*.—*Black or Brown Reds*.—1 and 2, W. Grey, Tow Law. *he*, W. Updady, Tow Law. *c*, O. A. Young. Any other variety.—1, G. Holmes & Pardon. 2, W. Grey.

COCHIN-CHINAS.—1 and 2, G. H. Procter, Durham. *c*, G. Holmes & Pardon.

POLANDS.—1 and 2, J. T. Proud. *he*, W. D. Maddison, Sunniside.

GAME.—*Chickens*.—1, F. E. Gibson. 2, F. Horne, Tow Law. *he*, B. Ellison; J. Gibson.

SPANISH.—*Chickens*.—1, Pickering & Duggleby. 2, J. Ridley, Bridge End, Frosterley.

DORKINGS.—*Chickens*.—1 and 2, C. Widdas.

BRAMA POOTRAS.—*Chickens*.—1, G. Mason, Shildon Lodge Colliery. 2, O. A. Young.

HAMBURGH.—*Golden-pencilled*.—*Chickens*.—1, R. Keenleyside. 2, Waller and Wrightson, Stokesley. *he*, W. D. Mathison; J. Jackson. *Silver-pencilled*.

—*Chickens*.—1, R. Keenleyside. 2, W. Jopling. *c*, O. A. Young. *Silver-spangled*.

—1, R. Keenleyside. 2 and *he*, T. Ayre, West Auckland.

BANTAMS.—*Game*.—*Black or Brown Reds*.—*Chickens*.—1, W. Canney. 2, W. Grey. Any other variety.—*Chickens*.—1, W. Grey. 2, T. Ayre.

COCHIN-CHINAS.—*Chickens*.—1 and 2, G. H. Procter.

POLANDS.—*Chickens*.—1, W. D. Maddison. 2, J. T. Proud.

GOSLINGS.—1, H. Kander, Wolsingham Park. 2, W. Canney. 3, H. Forrest, Durham.

BARNDOOR.—*Cross-bred*.—1, Mrs. Sanderson, Wolsingham. 2, W. Fally, Crancepeth Colliery.

SELLING CLASS.—1, W. Hall, South Church. 2, C. Widdas.

PIGEONS.

CARRIERS.—1 and 2, J. Robinson, Sunniside.

POUTERS.—1, A. Tate, Tow Law. 2, J. Darque.

TUMBLERS.—1, J. Darque. 2, S. & W. Coulson, Redgate, Wolsingham.

TRUMPETERS.—1, R. J. Smith, Yarm. 2, J. Darque.

FANTAILS.—1 and 2, A. Tate, Tow Law.

JACOBINS.—1 and 2, J. Young, Bishop Auckland.

ANY OTHER VARIETY.—1 and 2, J. Young.

JUDGE.—Mr. W. Bearpark, Ainderby Steeple, Northallerton.

BRIDGEND POULTRY SHOW.

THE Show of the Glamorganshire Agricultural Society, which is one of the oldest in the kingdom, was held at Bridgend on the 5th and 6th inst. In poultry the Society had not previously ventured so far as to provide pens for the exhibition of the specimens sent, but this year the management fell into the hands of Mr. Leyshon, and on a proper representation of the advisability of providing pens being made, this spirited gentleman at once consented to arrange the matter, and the result was that Mr. Billett's pens and a large marquee were secured, while the whole was arranged with great skill, and everything carried out with the utmost precision.

The *Dorkings* were good, but not well matched in point of colour, but in form and size the three pens of winners were good. The chickens were fair. Light *Brahmas* in the adult class were unusually good, but the chickens were not very forward, though the winners showed excellent points. Adult Dark *Brahmas* were miserable, but there were some good chickens, especially the first-prize cockerel and second-prize pullet. *Game* were mostly shaky in feather, as may be expected at this time of the year. The first in Reds was a stylish Brown Red, the second a good Black Red, but he had lost one spur. Chickens were very young—too young, in fact, for work, but the first in Reds (a pen of Brown Reds) were very good and stylish, the second, Black Reds, being only poor. Adult *Spanish* were not good, but the first-prize pen of young were tolerably good. *Cochins* were the class of the Show, the winners *Buffs*. The first two, though not the largest, were in symmetry and colour far ahead. In chickens a well-grown pair of Whites were first; Partridge, needing little but age, second; very good Blacks, as the Blacks go, third. In Golden *Hamburghs* the first were very well spangled, the second *Pencilled*, both being adult birds. In Silvers, first came a well-known champion *Pencilled* cock and a good pullet, while the second pen contained a Spangled cockerel of rare excellence, but the pullet was rather light in marking. Of *Polands* the first were very good Silvers, second White-crested Blacks, and third Goldens. There was a class for *Black Hamburghs*, and in this a very good pair of adults were first, though out of feather. Some of the young birds were wrong in comb. *French* were a very good class; a pen of *Crève-Cœurs* in fine bloom first, *Crève-Cœurs* being also second, and *Houdans* third. Four other pens were noticed.

In *Game Bantams* the first were good old Piles; second and third Black Reds, very good in style, but the second-prize cock was a little rusty on the bars; the third-prize pullet only low in condition. The winning *Bantams* of Any other variety were all Black, and very good, a pair of White-booted being highly commended. In Any other distinct breed the first and second were nice *Siltsans*, and the third *White Dorkings*.

Aylesbury Ducks were none of the largest, but in point of

quality not easily surpassed. The Rouens, on the contrary, were large and mostly good in points. The first and third prizes went to adults, and the second to young birds of great promise. In the next class of Ducks the first were *White Decoy*, and second *Muscovy*. There was nothing striking in *Geese* and *Turkeys*; in fact, not anything approaching what we find at the winter shows of this locality.

There were two Selling classes, of which one was for fowls and the other for Ducks, but from these we could not see very much desire to part with much good poultry.

DORKINGS.—1, A. Haine, Tredegarville, Cardiff. 2, H. Edwards, Tidenham, Cheltenham. 3, R. Leyshon, Bridgend. *he*, W. Bevan, Swansea; J. C. Barry, Neath. *c*, R. Leyshon. *Chickens*.—1, H. Feast, Swansea. 2, A. Haine. *he*, W. Bevan.

BRAMA POOTRAS.—*Light*.—1, T. Dean, Marden, Hereford. 2, J. Bloodworth, Cheltenham. *he*, H. Dean, Cardiff; W. Harris, Pen-y-vai, Bridgend; W. Jenkins, Angelton, Bridgend. *Chickens*.—1, T. A. Dean. 2, W. Harris. *he*, E. Lawrence, Ewenny, Bridgend (2).

BRAMA POOTRAS.—*Dark*.—1, W. Bevan. 2, G. F. Stacey, Merthyr Tydfil. *c*, J. H. Price, Nilton Court, Bridgend; H. Feast. *Chickens*.—1, H. Feast. 2, Bridgewater & Yoxall, West Bromwich. *he*, T. A. Dean; Bridgewater and Yoxall.

GAME.—1, H. E. Martin, Southport, Fakenham. 2, J. Mason, Worcester. *he*, W. L. Blake, Llandaff; E. Winwood, Worcester. *he*, J. P. James, Sketty, Swansea. *Chickens*.—1, G. Bentley, Eastcheap, London. 2, E. Winwood. *he*, S. Barford, Hafod, Swansea; J. Andrews, Worcester; D. W. J. Thomas, Brecon.

SPANISH.—1, H. Feast. 2, E. Winwood. *Chickens*.—1, G. Bentley. 2, H. Feast.

COCHIN-CHINAS.—1, C. Bloodworth, Cheltenham. 2, J. Bloodworth. 3, E. Winwood. *he*, J. Williams, Pyle, Bridgend; H. Feast (2). *c*, Mrs. Thomson, Tregeos, Bridgend. *Chickens*.—1, J. Bloodworth. 2, R. Jones, Neath. 3 and *c*, H. Feast.

HAMBURGH.—*Golden-pencilled and Spangled*.—1, J. Long, Bromley. 2, H. Feast. *he*, C. Bloodworth; Mrs. G. M. Rolls, Monmouth; P. Hanson, Stonehouse, Gloucester (2). *c*, J. E. Davies, Neath. *Silver-pencilled and Spangled*. 1, J. Long. 2 and *c*, J. Carr, Swansea. *he*, H. Feast.

POLANDS.—1, R. Jones, Neath. 2 and *c*, H. Feast. *c*, C. Bloodworth.

HAMBURGH.—*Black*.—1, H. Morris, Angelton, Bridgend. 2, H. Feast. *he* and *c*, J. Carr.

FRENCH.—1, H. Feast. 2, W. Harris. 3, G. Hibbert, Godley, Manchester. *he*, W. Harris; Mrs. Llewellyn, Bridgend (2); H. Feast.

BANTAMS.—*Game*.—1, J. Mayo, Gloucester. 2, E. Payne, Cardiff. 3, H. Feast. *he*, Wingfield, Ledbury, Worcester. Any other variety.—1, K. H. Ashton, Mottram, Manchester. 2, H. Feast. 3, J. Mayo. *he*, H. Feast.

ANY OTHER VARIETY.—1 and 2, and 3, H. Feast. 4, J. P. James. *he*, Mrs. Llewellyn.

DUCKS.—*Aylesbury*.—1, Miss Knight, Bridgend. 2, H. Feast. 3, H. K. Jordan, Bridgend. *he*, Mrs. Llewellyn. *Rouen*.—1, Mrs. P. Tabervill, Bridgend. 2, J. F. Davis, Neath. 3 and *c*, J. Saunders, Cornstown, Bridgend. *he*, —Donne, Monkton, Bridgend. Any other variety.—1, Mrs. G. M. Rolls. 2, H. Feast. *he*, Mrs. Llewellyn. *c*, J. G. H. Morris; J. Saunders.

GESE.—1, W. James, Llynwmmwr, Sketty, Swansea. 2, W. S. Powell, Tregeos. *he*, W. Donne.

TURKEYS.—1, A. Watts, Colly, Bridgend. 2, W. Donne.

SELLING CLASS FOR FOWLS.—*Cock and Two Hens*.—1, J. Saunders. 2, Mrs. G. M. Rolls. 3, W. Harris. 4, E. Lawrence, Ewenny. *he*, C. Bloodworth; L. Jones, Coychurch, Bridgend. *he*, J. F. Davis; J. Carr; Miss J. E. Nicholas, Newport. *c*, Mrs. Thomson, Tregeos, Bridgend; J. Saunders; J. Dyer, Bridgend.

SELLING CLASS FOR DUCKS.—*Drake and Two Ducks*.—1, Miss Knight. 2, T. Arthur, Ewenny. 3 and 4, J. F. Davies. *c*, Mrs. Thomson; J. G. Morris.

The Judge was Mr. E. Hutton, Pudsey.

PRESTON POULTRY SHOW.

THIS took place on the 7th inst., in connection with the Agricultural Society's Show.

GAME.—*Cock*.—1, 2, and 3, C. W. Brierley, Middleton.

DORKING.—*Cock*.—1, J. Walker, Rochdale. 2, S. H. Stott, Preston. 3, H. Feast, Swansea.

SPANISH.—*Cock*.—1, 2, and 3, J. Leeming, Broughton.

BANTAM.—*Game*.—*Cock*.—1, W. F. Adie, Preston. 2, G. Anderton, Accrington. 3, G. Hall, Kendal.

DORKING.—1, J. Walker. 2, J. Robinson. 3, D. Parsons, Cauden.

FRENCH.—1, E. Harrison, Cottam. 2, H. Walton, Rawtenstall. 3, W. H. Crabtree, Levenshulme. *he*, H. Feast. *c*, J. Robinson.

BRAMA POOTRAS.—1 and 2, T. F. Ansell, St. Helens. 3, W. H. Crabtree. *he*, W. H. Crabtree; J. Watts, Birmingham.

SPANISH.—1, 2, and 3, J. Leeming.

GAME.—1 and 2, C. W. Brierley. 3, J. Leeming.

COCHIN-CHINA.—1, T. Asplen, Church. 2, W. H. Crabtree. 3, H. Tomlinson, Birmingham. *he*, W. Whitworth, Longsight.

HAMBURGH.—*Golden-pencilled*.—1, J. & G. Duckworth, Church. 2, J. Robinson. 3, J. Long, Bromley. *he*, W. Speakman, Nantwich. *he*, H. Feast.

HAMBURGH.—*Silver-pencilled*.—1, J. Long. 2, J. Robinson. 3, H. Feast.

HAMBURGH.—*Golden-spangled*.—1 and 2, G. & J. Duckworth. 3, J. Robinson.

HAMBURGH.—*Silver-spangled*.—1, J. Robinson. 2 and 3, J. Long.

BANTAMS.—*Game*.—1, W. F. Adie. 2 and *he*, G. Hall. 3, J. Camsell, Preston.

BANTAMS.—*Except Game*.—1, J. Leeming. *he*, J. Watts, Birmingham. *c*, J. Walker.

GESE.—1 and 2, J. Walker. 3, Capt. Anyon, Whittle. *he*, F. E. Rawson, Halifax. *c*, S. H. Stott; J. P. Rogers. 1, J. Walker. 2, W. Penny. 3, S. H. Stott. *he*, S. H. Stott; F. E. Rawson; E. Harrison.

DUCKINGS.—1 and 2, J. Walker. 3, T. Wakefield, Newton-le-Willows. *he*, S. H. Stott.

DUCKS.—1 and 2, J. Walker. 3, T. Wilkins, Longton. *he*, Rev. —Perry, Ashton. *Rouen*.—1, S. H. Stott. 2, J. Walker. 3, T. Wakefield. *he*, S. H. Stott; T. Wakefield; L. Utley.

ORNAVENTAL WATERFOWL.—1 and 2, H. B. Smith. *he*, H. B. Smith; J. Walker.

TURKEY.—1, J. Walker. 2, J. Gardner, Preston.

PIGEONS.

CARRIERS.—1, J. Hawley, Bradford. 2, W. Sefton, Blackburn. *he*, J. Stanley, Blackburn; J. Gardner.

TUMBLERS.—1, J. Gardner. 2, E. Horner, Leeds. *he*, J. Gardner (2); J. Hawley. *c*, E. Horner; J. Gardner.

BAVES.—1, J. Hawley. 2, T. Pincock. *he*, J. Gardner.

OWLS.—1 and 2, J. Gardner. 3, W. Penny. *he*, J. Gardner; A. Warburton, Haslogden. *c*, A. Warburton; R. M. Viny, Kilderton.

POUTERS OR CROPPERS.—1 and *he*, J. Gardner. 2, E. Horner. *c*, E. Horner; J. Stanley.

FANTAILS.—1, E. Horner. 2, J. Richmond, Oswaldtwistle. *he*, J. B. Bowdon, Blackburn.

ROSTS.—1 and 2, H. Yardley, Birmingham.

TURBITS.—1 and c, S. Lawson, Preston. 2, E. Horner. *hc*, J. B. Bowdon; J. Gardner; J. Hawley.
DRAGONS.—1, H. Yardley. 2, F. Graham, Birkenhead. *hc*, F. Graham; J. Gardner; E. Horner; W. Setton. c, W. Smith, Walton; J. Watts; H. Livesey, Fulwood.
TRUMPETERS.—1 and 2, J. Gardner. *hc*, J. Gardner; E. Horner.
JACOBIANS.—1, E. Horner. 2, J. Gardner. *hc*, J. Gardner; J. Hawley; J. Richmond.
NUNS.—1, E. Horner. 2, J. Hawley.
ANTWERPS.—1, J. Stanley. 2, J. Gardner. *hc*, J. Gardner; J. Hawley.
ANY OTHER VARIETY.—1 and 2, J. Hawley. *hc*, E. Horner.

RABBITS.—1 and *hc*, J. Irving, Blackburn. 2, M. Marsland, Goole.

CATS.—1, E. Baxter, London. 2, E. Horner. 3, J. Atkins, Preston. *hc*, H. B. Smith, Brighton.

JUDGES.—*Poultry*: Mr. R. Teebay. *Pigeons*: Mr. W. B. Tegetmeier.

DRIFFIELD POULTRY SHOW.

THIS, the second Show of the season, was held at Driffield on July 31st, and as regards weather and attendance of visitors was all that could be desired. The entries of poultry (219), were better than previously, the only drawback being that in place of uniform pens such as Turner's some very ugly skeps were used, which took up much room and destroyed the effect of the whole. We would strongly recommend the Committee to abandon these for others of a more comfortable kind.

Of *Dorkings* there were seven entries, but these were only moderate in quality; and of *Spanish* five, the winners being good. Of *Red Game* there were seven entries, Messrs. Thornton and Adams dividing the spoil with good birds. In the other variety of *Game* Mr. Sale's *Duckwings* were to the front, winning easily; second also *Duckwings*, but the latter showed the effects of overwork. *Game* chickens had ten entries, all of which were worthy of prizes; the first and second went to Brown Reda, Pen 55, *Duckwings*, being also greatly admired. *Cochins* were nothing grand if we except the first-prize *Buffs*; the chickens also being indifferent. *Hamburghs* were very poor, doubtless owing to the classes being mixed, and the prizes scarcely being worth contending for. The *Farmyard* cross is a great feature of this county, and many fine useful birds were shown. In *Game Bantams* there was nothing of note; but the *Black* and *Japanese* in the next class were pretty good.

Years ago this district was noted for its large *Geese*, and unlike some other parts it still keeps up its prestige in that respect. *Turkeys* and *Ducks* were of moderately good quality.

PIGEONS were shown in Turner's pens under a tent, and these formed a great contrast with the display of poultry; but we certainly expected to have seen more entries for 20s. prizes. Mr. Horner's seventeen entries did not come to hand, and the pens were empty, which we regret. *Carriers* were poor, except the first; *Pouters* the same. In *Jacobins* the first and second were good; the first *Fantails* fair birds. The *Almonds* in the next class were grand in head, beak, and eye; the hen especially a real gem, but the cock getting too dark; second *Red Agates*, also with wonderful head, beak, and eyes. *Barbs* were poor; but *Nuns* good, as may be expected here. *Turbits* four pens, and all good. The *Selling* class contained some good birds; first were *White Dragons*; and second *White Pouters*, which were soon claimed. Two extra prizes were recommended by the Judge, and allowed.

RABBITS were shown in pairs, a system we cannot sufficiently condemn, and we think this will not occur here again; there was, however, only one class in which a pair of good *Black* and *White* Lops were first; second also *Fawn* Lops; the third prize going to *Himalayans*. Had the *Rabbits* been shown singly the entries would have been much larger, as it is very difficult to get a pair well-matched and good in all points, especially in the *Lop*-eared variety.

DORKINGS.—1, H. Smith, Norton, Malton. 2, R. W. Richardson, Beverley. *hc*, H. Feast, Swansea. *Chickens*.—1, R. W. Richardson. 2, G. Pounder, Kirby-moorside. *hc*, R. Stabler, Driffield; D. White, Driffield. *Cock*.—1, J. Ness, Driffield. *hc*, D. White; W. H. Young, Driffield.

SPANISH.—1 and 2, J. Duggeby, Driffield. *hc*, H. Feast. c, H. Smith. *Cock*.—1, J. Duggeby.

GAME.—*Black-breasted* and *other Reds*.—1, J. W. Thornton, Bradford. 2, W. Adams, Ipswich. *hc*, W. Adams. *Cock*.—1, Mrs. J. S. Jordan, Elmswell, Driffield.

GAME.—*Any other variety*.—1, F. Sales. 2, J. A. Staveley, Tibthorpe Manor. *hc*, J. Duggeby; J. A. Staveley. *Cock*.—1, J. A. Staveley. *hc*, J. Duggeby.

GAME.—*Any variety*.—*Chickens*.—1 and 2, W. Adams. *hc*, T. Dyson, Halifax; J. A. Staveley. c, T. W. Lister, Stokesley.

COCHIN-CHINA.—1, H. Gibson, Driffield. 2, T. Holmes & G. Purdon, Driffield. *hc*, W. Horner, Norton, Malton; A. Canty, Barton-on-Humber; H. Feast, *Chickens*.—1, D. & J. Heston, Whitley. *hc*, W. Santon, Driffield. c, S. Richardson, Driffield.

HAMBURGH.—*Golden and Silver-spangled*.—1 and 2, J. Duggeby. *Cock*.—1, J. Duggeby.

HAMBURGH.—*Golden and Silver-pencilled*.—1, H. Feast. 2, H. Holmes & G. Purdon. *Cock*.—1, G. Pounder.

HAMBURGH.—*Any variety*.—1, H. Adamson, Eastgate, Driffield. 2, H. Smith. *hc*, Mrs. R. Stabler, Driffield; R. Newby, Welburn, York; Mrs. Scott, Eastgate, Driffield.

FARMYARD CROSS.—1, G. Pomder. 2, J. Ireland, Frodingham, Driffield. *Cock*.—1, W. H. Young. *hc*, G. Robinson, Frodingham; J. Ireland; — Etherington, Sigglethorpe; R. Loft, Beverley.

BANTAMS.—*Game*.—1, C. Holmes & G. Purdon. 2, W. Adams. *Cock*.—1, C. Holmes & G. Purdon. 2, J. Stabler.

BANTAMS.—*Any other variety*.—1, W. Ransom, jun., Driffield. 2, A. Brooks-bank, Middleton. *hc*, J. W. Baron, Driffield; H. Feast; J. Duggeby. *Cock*.—1, J. Duggeby.

ANY OTHER VARIETY.—1 and 3, H. Feast. 2, R. Loft. *hc*, W. Horner; H. Feast. *Cock*.—1, R. Loft. 2, O. A. Young. *hc*, W. Horner; G. Blakey, Driffield; Mrs. Adamson, Eastgate.

SELLING CLASS.—*Cock*.—2, J. Walker, Barton-on-Humber (Dorkings). 3, G. Pounder (Black Red Game). *hc*, J. Blanchard, jun., Driffield; Mrs. Smithson, Driffield. *Heads*.—1, Mrs. G. H. Pickering, Driffield. 2, R. W. Richardson. 3, R. Loft.

GEES.—1, O. A. Young. 2, T. Balderson, Beilby, York. *hc*, T. Croft, Pluckham, Fridaythorpe; T. Stabler. *Young*.—1, Mrs. M. Hought, Driffield. *hc*, E. Stabler, Driffield; O. A. Young.

TURKEYS.—1, Mrs. Jordan, Eastburn, Driffield. 2, Mrs. J. S. Jordan, Elmswell, Driffield. *Young*.—1, J. Lamplough, Skipses, Hull. *hc*, Miss L. Robson, Lowthorpe, Hull.

DUCKS.—*Aylesbury*.—1, W. Piercey, Driffield. 2, Mrs. J. S. Jordan. *Ducklings*.—1, O. A. Young. *hc*, W. Piercey.

DUCKS.—*Rouen*.—1, R. Crowe, Bridlington. 2, O. A. Young. *Ducklings*.—1, Mrs. Jordan. *hc*, G. Pounder.

DUCKS.—*Any other variety*.—1, R. W. Richardson. 2, O. A. Young. *Ducklings*.—1, O. A. Young. *hc*, R. W. Richardson.

EXTRA STOCK.—1, W. H. Young. 2, Miss Robinson, Swaythorpe, Bridlington. 3, H. Naylor, Driffield. *hc*, O. A. Young.

PIGEONS.

CARRIERS.—1, J. Aconley, Pickering. 2, F. Holgson, Driffield. 3, W. G. Purdon, Driffield.

CROPPERS.—1, Mrs. J. Blanchard, Driffield. 2, A. Spencer, Driffield. 3, B. Hudson, Driffield.

JACOBIANS.—1, J. Blanchard, sen., Driffield. 2, J. Aconley. 3, R. W. Richardson, Beverley.

FANTAILS.—1, R. W. Richardson. 2, T. S. Stephenson, Newbegin, Beverley. 3, Miss S. Clark, Carnaby, Hull.

TUMBLERS.—1 and 2, W. Adams, Ipswich.

BARBS.—1, R. W. Richardson. 2, J. Aconley. 3, C. Wroth, Hull.

NUNS.—1, Mrs. Blanchard. 2, J. W. Stabler. 3, A. Leason, Driffield.

TURBITS.—1, R. W. Richardson. 2, J. Blanchard, sen. 3, D. Maynard, Driffield. *hc*, J. Aconley.

ANY OTHER VARIETY.—1, R. W. Richardson. 2, J. D. Maynard. 3, A. Canty, *hc*, W. Leason.

SELLING CLASS.—1, R. J. Maynard. 2, and Extra, J. Blanchard, sen. 3, R. G. Sanders, Leven, Beverley. Extra, Mrs. Blakey, Driffield. *hc*, J. Aconley; J. Blanchard, sen.; G. Desner, Driffield; A. Spencer (2); L. W. Richardson.

RABBITS.—*Any breed*.—1, J. Hume, York. 2, W. Bradley, Hesale Junction, Hull. 3, W. G. Purdon, Driffield. *hc*, H. M. Eames, Driffield; A. Canty, Barton-on-Humber.

Mr. Cannan, Adolphna Works, Bradford, was the Judge.

ORMSKIRK AND SOUTHPORT POULTRY SHOW.

THIS was held on the 4th and 5th inst. at Southport. There were 196 entries of poultry and 161 of Pigeons. The following is the prize list:—

DORKINGS.—*Coloured*.—1, J. Walker. 2, J. Robinson, Garstang. *Chickens*.—1, T. Briden, Leeds. 2, S. Eriery, Rochdale.

DORKINGS.—*White*.—1 and 2, J. Robinson. *Chickens*.—1, J. Robinson. 2, E. Williams, Barrow.

COCHIN-CHINA.—*Buff*.—1, C. Sedgwick, Keighley. 2, W. H. Crabtree, Levens-ingham. *Chickens*.—1, C. Sedgwick. 2, W. Taylor, Manchester.

COCHIN-CHINA.—*Partridge or grouse*.—1, T. Stretch, Ormskirk. 2, W. H. Crabtree. *Chickens*.—1, C. Sedgwick. 2, W. A. Taylor.

BRAHMA POOTRA.—*Dark*.—1, T. F. Ansell, St. Helens. 2, W. H. Crabtree. *Chickens*.—1 and 2, Cup, T. F. Ansell. 2, A. Legg, Lea Green.

BRAHMA POOTRA.—*Light*.—1, W. H. Crabtree. 2, J. Mitchell, Moseley. *Chickens*.—1, R. E. Horstall, Grassendale. 2, T. A. Deane, Hereford.

HAMBURGH.—*Gold-spangled*.—1, G. & J. Duckworth. 2, H. Beldon. *Silver-spangled*.—1, J. Robinson. 2, J. Long.

HAMBURGH.—*Gold-pencilled*.—1, H. Beldon. 2, G. & J. Duckworth, Accrington. *Silver-pencilled*.—1, J. Long. 2, H. Beldon.

GAME.—1 and 2, Cup, C. W. Brierley, Middleton. 2, J. Bell, Southport. *Chickens*.—1 and 2, T. P. Lyon, Liverpool.

BANTAMS.—*Game*.—1, R. F. Adie, Preston. 2, W. F. Entwisle. *Any other variety*.—1, J. Lealand. 2, J. W. Morris, Rochdale.

ANY OTHER VARIETY.—1 and 2, H. Beldon.

EXTRA STOCK.—1, F. Young, jun.

GEES.—1 and 2, J. Walker, Rochdale. *Goslings*.—1, J. Walker. 2, A. Woods, Sefton.

TURKEYS.—1, J. Walker. 2, J. Brookall, Wigan.

DUCKS.—*Aylesbury*.—1, J. Walker. *Rouen*.—1, S. H. Stott, Preston. 2, P. Unsworth, Lawton.

PIGEONS.

POUTERS.—*Cock*.—1, J. Richmond, Oswaldtwistle. 2, E. C. Stretch, Ormskirk. 3, W. J. Warburton, Stalybridge. *Hen*.—1, H. Yardley, Birmingham. 2, E. C. Stretch. 3, Major Cryer, Southport.

CARRIERS.—*Cock*.—1, H. Yardley. 2, P. R. Spencer. 3, E. C. Stretch. *Hen*.—1, Major Cryer. 2, P. N. Spencer. 3, E. C. Stretch. *Young*.—1 and 2, A. Bilyeald, Nottingham. 3, Major Cryer.

BARBS.—1, T. W. Townsend, Bowdon. 2, H. Yardley. 3, T. H. Stretch.

DRAGONS.—*Blue or Silver*.—1 and 2, E. C. Stretch. 3, J. Gardner, Preston.

ANY OTHER COLOUR.—1, F. Graham. 2, W. H. Mitchell. 3, J. Gardner.

TUMBLERS.—*Short-faced*.—1, H. Yardley. 2, H. Vernon, Wavertree. 3, J. Gardner. *Long-faced*.—1, J. Watts. 2 and 3, A. & W. H. Silvester, Sheffield.

OWLS.—*Foreign*.—1, T. W. Townsend. 2, H. Yardley. 3, Major Cryer. *English*.—1 and 2, T. W. Townsend. 3, J. Watts.

JACOBIANS.—1 and 2, J. Richmond. 3, J. Gardner.

TURBITS.—1, A. & W. H. Silvester. 2, T. W. Townsend. 3, E. C. Stretch.

FANTAILS.—1, H. Yardley. 2, J. Richmond. 3, T. W. Townsend.

ANTWERPS.—*Short-faced*.—1, H. Yardley. 2, W. Gamon. 3, J. Gardner. *Long-faced*.—1, J. Gardner. 2, H. Chadwick, Croston. 3, T. H. Stretch.

ANY OTHER VARIETY.—1, H. Yardley. 2, A. & W. H. Silvester. 3, J. Gardner.

—(Preston Guardian.)

WHITWICK POULTRY SHOW.

THE fourth annual Show took place on the 4th inst. Good marquees were provided, and Turner's were used. The birds were well attended to; and the only thing we could take exception to was that the floors of the pens were covered with sawdust, a practice we cannot sufficiently condemn, for many valuable birds have been lost through swallowing portions of this indigestible rubbish. Unfortunately the fore part of the day was very wet, and this prevented to a considerable extent the influx of visitors.

Game stood first, and in *Reds* a very good cock with a poor hen was first, but the second-prize cock was badly squirrel-tailed, and all the others had some fatal defect. In the next class *Piles* were first, and *Duckwing* chickens second. *Dorkings* were poor except the winners, and *Spanish* not of the highest merit. *Cochins* were a good class, Mr. Tomlinson taking the lead with a grand pair of *Buffs* in fine bloom, and second were a pen of good *Partridge*, good *Buffs* being also very highly commended. Of *Brahmas* there were only two pens, the first very good in colour, the second large. *Hamburghs* were mixed classes, but the entries were pretty fair. The first prize for *Pencilled* went to a grand pen of adults; *Golden* were first, and an equally good pen of *Silvers* second, the latter showing the effects of their journey. Some other very good pens were also noticed. In *Spangled* the winners were both *Golden* and in fine feather, the first prize going to adults, and the second to a well-grown pen of chickens more like old birds than ought else even in marking. In the *Variety* class a fine pen of *Silver Polands* won, seconded by a pen of adult *Malays*; chickens of the latter kind being also very highly commended.

In *Bantams* the first were a very pretty pair of *Golden Sebright* chickens, and second fair *Blacks*.

There were several classes for local exhibitors only; and here we found some good birds, notably the first-prize pen of *Brown Red* chickens, which we have not seen surpassed this year; and in *Golden-spangled* were some birds falling little short of the quality of those shown in the open class.

Ducks were very good, the first prize going to *Aylesbury* and the second to *Ronen*.

PIGEONS had but six classes, and the competition was not keen. *Carriers* were mostly young and promising. In *Fantails* first were *Whites*, and second *Blues*. In *Tumblers* Mr. Yardley won with a nice pair of *Almonds*, and in *Antwerps* with good *Short-faced Duns*; a very good pair of medium-faced *Red Chequera* being second.

RABBITS were inferior, except the first-prize *Blue-and-white* *Lop* doe in the open, and the *Lop buck* and *Angora doe* in the local class.

CANARIES.—For these there was not sufficient inducement to secure a numerous exhibition, but the first in both classes were really fine specimens of the "hot" variety.

The awards appeared in last week's number.

BISHOP AUCKLAND POULTRY AND PIGEON SHOW.

THE annual Show at this place was held on the 11th inst., and as regards the number of entries was very successful, those of poultry amounting to no less than 328, while *Pigeons* and *Rabbits* amounted to sixty-eight and twenty-eight respectively. We append a list of the awards, but must defer remarks on the individual classes till next week.

DOEKINGS.—*Grey*.—1, C. Widdas, Beechburn Grange. 2, J. T. Proud, Dinchester. *hc*, T. P. Carver, Langthorpe, Boringbridge.

COCHIN-CHINA.—Medal and 2, G. H. Proctor, Durham. *vhc* and *hc*, W. Hall, Eldon Old Pitts, South Church. *c*, A. Balmer, Bishop Auckland.

BRABMA POOTRA.—1, R. Shield, Swalwell, Gateshead. 2, W. Bedlington, Whitby. *hc*, A. Balmer, Bishop Auckland.

SPANISH.—1, Furness & Siddle, Rawtenstall, Manchester. 2, Pallister and Hawkins, Topcliffe, Thirsk. *hc*, R. Addison, West Hartlepool; W. Jopling, Frosterley. *c*, J. Pickering & Douglasby, Driffield.

GAME.—*Black-breasted and other Reds*.—1, C. E. Morgan, 2, T. Robson, Bishop Auckland. *vhc*, D. Cheyne, Morpeth. *hc*, C. E. Morgan; T. McKenzie, Stanhope; J. Ferry, Morpeth. *Any other variety*.—1, J. Robson, Bishop Auckland. 2, J. Pickering & Douglasby. *hc*, J. F. Walton, Horncliffe, Rawtenstall, Manchester.

HAMBURGH.—*Golden-spangled*.—1, R. Keenleyside, Avchiff, Darlington. 2, T. Horne, Towlaw. *hc*, J. Stewart, Dudley Colliery; T. P. Carver. *c*, J. Foster, Towlaw. *Silverspangled*.—1, J. Pickering & Douglasby. 2, R. Moore, East Rainton, Fence Houses. *vhc*, G. Alderson, West Hartlepool.

HAMBURGH.—*Golden-pencilled*.—1, J. Forster. 2, Harburn, Bishop Auckland. 2, Wells & Sherwin, Ripon. *Silver-pencilled*.—1, J. Maddison, Bishop Auckland. 2, J. Jackson, Towlaw. *hc*, R. Moore; J. Ferry.

POLANDS.—1 and *vhc*, J. T. Proud, 2, W. Bearpark, Northallerton. *hc*, J. Ferry.

GAME BANTAMS.—*Black-breasted and other Reds*.—1, W. Gray, Towlaw. 2, E. Walton. *hc*, W. Gray; A. Balmer, Bishop Auckland. *c*, J. Ferry; R. Hookaby, Stamford. *Any other variety*.—1, E. Walton. 2, J. Foster. *hc*, W. Gray.

BANTAMS.—*Any variety except Game*.—1, J. Ferry. 2, Wells & Sherwin. *hc*, W. Canney, Bishop Auckland; Rev. G. Milner, Hamsterley; E. Walton. *c*, T. Allison, Bishop Auckland.

DUCKS.—*Rouen*.—1, W. Canney. 2, W. Simpson, Frosterley. *Aylesbury*.—1, T. P. Carver. 2, A. O. Young, Driffield. *hc*, W. Canney; A. Balmer, Bishop Auckland. *Any other variety*.—1, Rev. G. Milner. 2, T. P. Carver. *vhc*, Col. Cathcart, Spenthorpe. *hc*, W. Canney; A. O. Young.

TURKEYS.—1, T. P. Carver. 2, W. Canney. *hc*, Mrs. Sanderson. *GESE*.—1, A. Balmer. 2, A. O. Young. *hc*, J. T. Kenton; Miss Scurr, Willington; Mrs. Robson, Bishop Auckland.

ANY OTHER VARIETY.—1, E. Walton. 2, Rev. G. Milner. *hc*, J. T. Proud; T. P. Carver.

ANY VARIETY.—*Cock*.—1, E. Walton. 2, W. Hall. *hc*, J. Ferry; Col. Cathcart. *c*, Rev. G. Milner; A. Widdas, Wotton-le-Wear. 1, E. Walton. 2, R. Britton, South Otterington, Thirsk. *vhc*, J. T. Proud. *hc*, J. Pickering and Douglasby. *c*, G. B. Bell, Caldwell, Darlington; A. Harburn, Bishop Auckland.

CHICKENS.

DOEKINGS.—*Grey*.—1, T. P. Carver. 2, C. Widdas.

COCHIN-CHINA.—Medal, 1, and 2, R. H. Proctor, Durham. *c*, E. Paulson, Darlington; Wells & Sherwin; W. H. Frazer, Easingcliffe, Yarm.

BRABMA POOTRA.—1, W. J. Frank. 2, T. P. Carver. *hc*, G. Mason, Bishop Auckland; R. Shield, Swalwell, Gateshead. *c*, A. Balmer, Bishop Auckland.

SPANISH.—1, Pallister & Hawkins, Topcliffe, Thirsk. 2, J. Pickering and Douglasby. *hc*, Furness & Siddle, Rawtenstall, Manchester.

GAME.—*Black-breasted and other Reds*.—1, J. F. Walton. 2, T. Robson, Bishop Auckland. *hc*, R. Britton, South Otterington, Thirsk; T. McKenzie, Any other variety. 1, J. F. Walton. 2, Mrs. Ellis, Darlington. *hc*, T. Horne, Towlaw.

HAMBURGH.—*Golden-spangled*.—1 and 2, R. Keenleyside. *Silverspangled*.—1, R. Keenleyside. 2, J. Ferry, Cowpen, Morpeth. *hc*, T. Ayre, West Auckland.

HAMBURGH.—*Golden-pencilled*.—1, J. Russell, Wharby. 2, A. G. Mitchell, Bishop Auckland. *hc*, Waller and Wighston, West Green, Stokeley; R. Keenleyside; D. Cheyne, Morpeth. *Silver-pencilled*.—1, J. Foster. 2, W. Jopling. *hc*, R. Keenleyside.

POLANDS.—1, J. T. Proud.

GAME BANTAMS.—*Black-breasted and other Reds*.—1 and Medal, Wells and Sherwin. 2, W. Canney. *hc*, J. Ferry; A. Balmer; E. Walton.

BANTAMS.—*Any other variety*.—Medal and 1, E. Walton. 2, T. Ayre. *hc*, T. P. Carver. *Any variety except Game*.—1 and 2, T. P. Carver. *hc*, Wells and Sherwin. *c*, J. H. Carlwright, Willington.

TURKEYS.—*Young*.—1 and 2, J. T. Proud, Bishop Auckland. *hc*, C. E. Morgan, Bishop Auckland (2).

GOSLINGS.—1, H. Forrest, Durham. 2, J. T. Reuter, Ripon. *hc*, Mrs. Robson, Bishop Auckland.

DUCKINGS.—1, C. E. Morgan, Bishop Auckland. 2, G. B. Bell, Darlington. *vhc*, F. E. Gibson, Middleton-in-Leedsale; T. P. Carver, Langthorpe. *hc*, C. E. Morgan; T. L. Nash, Sproutington.

ANY OTHER VARIETY.—1, J. F. Walton, Horncliffe. 2, Rev. G. Renton, Crook. *hc*, T. L. Nash; H. Johnson, Bishop Auckland.

SELLING CLASS.—*Cock, Cockerel, or Drake*.—1, J. T. Proud. 2, Pallister and Hawkins, Topcliffe, Thirsk. 3, Pickering & Douglasby, Driffield. *vhc*, G. B. Bell; J. T. Proud. *hc*, A. Widdas, Wotton-le-Wear; C. Widdas; R. Moore, East Rainton; J. F. Walton; T. P. Carver. *c*, Wells & Sherwin, Ripon; J. Russell, Wharby.

SELLING CLASS.—*Hen, Pullet, or Duck*.—1, T. Robson, Bishop Auckland. 2, J. Robson, Bishop Auckland. 3, J. F. Walton. 4 and 5, J. T. Proud. *c*, G. B. Bell. *vhc*, C. Widdas; T. P. Carver; G. H. Procter, Durham. *hc*, Mrs. Ellis, Darlington; A. Widdas; R. Moore; Pickering & Douglasby; Furness and Siddle, Rawtenstall. *c*, Wells & Sherwin; R. Moore (2); H. Robinson; T. P. Carver.

PIGEONS.

CARRIERS.—1, T. Bowen, Wotton Park. 2, Wells & Sherwin. *hc*, J. Robinson, Sunnyside, Towlaw; Wells & Sherwin; R. Blacklock, Sunderland. *c*, T. P. Carver.

POSTERS.—1 and 2, R. Blacklock. *West and c*, Wells & Sherwin.

TUMBLERS.—1, E. Dodd, Durham. 2, Wells & Sherwin. *vhc*, W. J. Donkin, Newcastle-on-Tyne. *hc*, W. J. Donkin; E. Dodd.

JACOBIANS.—1 and *hc*, G. Trueman, Bishop Auckland. 2, T. Bowen.

TURBOTS.—1, T. Bowen. 2, G. Alderson, West Hartlepool. *hc*, G. Trueman. *c*, G. R. Cochrane, Sedgfield.

FANTAILS.—1 and 2, J. F. Loversidge, Newark. *hc*, W. Bulmer, Stockton-on-Tees. *c*, J. Hemmings, Towlaw.

OWLS.—*English or Foreign*.—1, G. Alderson, West Hartlepool. 2 and *hc*, G. Trueman. *c*, R. Stephenson, Bishop Auckland (2).

JUDGE.—Mr. Hutton, Leeds.

THE PARAGON LAMP.

LAST week we noticed the Hurricane Lantern introduced by Messrs. Dietz & Co., of Carter Lane, and we now introduce to

Fig. 47.

our readers another invention of the same firm, which is more for domestic use. It is a new form of burner, which is applied to paraffin lamps, and is so constructed as to produce a flame of unexampled brilliancy, the light being white and dazzling, the result of a perfect combustion of the hydrocarbon. Our figure represents a burner of half the natural size; and the flame produced by a 1½-inch wick is nearly 3 inches wide and 2½ inches high. These are the best of the paraffin lamps that

have been brought under our notice, and for country houses they will be accepted as a great boon.

MANAGEMENT OF EARTHENWARE.—New earthenware should, before being used, be soaked in cold water for twenty-four hours; this will render it less liable to crack, as well as enable it to be made thoroughly clean. For washing articles which are not greasy, such as tea things, &c., every housekeeper should be provided with a good-sized wooden bowl, for by contact with this they will be less liable to be chipped and broken than when an earthen basin is used. Still further to avoid the danger of breakage, one article only should be put in at a time. A small cloth should be kept with which to cleanse them while in the water; for merely rinsing them and then wiping them on the tea-cloth will not ensure cleanliness. For washing the insides of jugs, a miniature mop, with a handle a foot long, like those sold for cleaning the chimneys of lamps, is indispensable. A little soda should sometimes be used for washing jugs, and if the same is occasionally used for washing tea-things, it will make them look much cleaner and brighter. Soda should, however, never be used except in small quantities, nor should it be constantly employed, as it has a tendency to injure the glaze. Soap or potash has not this injurious effect, but neither cleanses so thoroughly as soda. For tea-cloths linen must be used, as cotton fabrics are not sufficiently absorbent to dry the earthenware. For washing greasy earthenware, two tubs of suitable size should be provided; one, in which to wash them, must contain hot water, with a little soda, or, for the reasons stated above, potash or wood ashes, and the other, in which to rinse them immediately after they are washed, must be filled with clean cold water. After rinsing they should be placed in a rack, and they will be dry and fit to use or put by in an hour. Without the soda or some similar substance, perfect brightness and cleanness will not be secured. For keeping earthenware, a dry closed cupboard is to be recommended, for if the articles become either damp or dusty they will not look bright or well, even though they may be wiped when required for use.—(*Cassell's Household Guide.*)

PLURALITY OF QUEENS.

The experience of bee-keepers is asked by Mr. Boulton, of Ulverston, in the number of July 16th, on the subject of a plurality of queens in a hive. In the year 1850 I put a swarm with three-year-old queen into a unicombe hive, June 17th. On August 11th I observed two queens, one old (which I could distinguish by a defect on one wing), the other plump and young. They were perfectly amicable. I saw them lay eggs in contiguous cells. This continued for some time, and after a while the old queen was missing. Does this not indicate that, under peculiar circumstances—*e.g.*, the failing powers of an old queen at a time of year when there are no drones, the natural hostility of queens is repressed, and thus a wise provision made for the preservation of hives which would otherwise perish?

The season about here has been this year peculiar. I have ten hives, eight of them being very forward, hanging-out and with drones at the end of April. Then came the bitter weather of May, when they killed the drones, dragging-out the larvae. I have had but one swarm, and have taken 100 lbs. 4½ ozs. in glasses, side boxes, from eight of these hives. There has been no white clover, and the pastures are dried-up. No honey was gathered after the second week in July.

My neighbours in Rutland have had very few swarms, and some of them very little honey.—C. ALLISON HOLMES, *Thistleton Rectory, Grantham.*

OUR LETTER BOX.

BRAHMAS AND PHEASANTS LISTLESS AND AILING (*One Anxious for his Pets*).—You give no symptoms of rheumatism. It seems to us your birds suffer from mistaken care in some respects; instance, they are shut up in a nice shady yard during the heat of the day. A yard suggests to us a place with a flooring or pavement—brick, wood, or stone. Either would cause the malady you complain of. We cannot imagine a good run when the birds cannot find sufficient shelter. We have no respect for sharps, nor for tincture of acetic. We are by no means sure the birds want the latter. Let them have the run all day. They will find shade. The Pheasants may still roost under the rip with the hen. Shift the rip every morning. Peel on ground oats or barley meal in the morning, maize and scraps at midday, and ground oats in the evening. These latter should be mixed with milk. Let all feed alike, except that you may add some curli to the Pheasants' food. The Pheasants should roost under the hen, and the chickens also as long as they will. After the hen refuses to hover them at night she may be taken away, and the chickens will roost in the rip she has vacated. Feed them well; they will gain strength and appetite. The Pheasants want feeding oftener than the chickens.

LEICESTER POULTRY SHOW.—"In your report of Leicester Show in last week's Journal, you have H. Thompson as winning the first prize for Buff Cochin chickens. I beg to say I won the first prizes for both old birds and chickens.—H. TOMLINSON."

CANARY ASTHMATIC (*E. Walpole, jun.*).—"If the bird be moultling now it is not out of due course, and ought not to interfere with any local ailment from which it may be suffering. You can do nothing but keep it in a warm place

away from draughts. It may last the winter and sing again, but the chances are against it. Give a drop of cod-liver oil occasionally from a pointed stick, and a little bread and milk in the mornings.—W. A. B.

BOOK (*David Bruce*).—"We never heard of any book by the writer you mention.

CANARIES RUPTURED (*E. B. T.*).—"I have always found castor oil a tolerably certain cure if administered in time. A homoeopathic authority who has wonderful success in his bird-room advises the following:—Lycopodium sixth dilution on first appearance, afterwards *Calcarea carbonica* sixth dilution; and if thoroughly prostrated, and after diarrhoea has set in, *Arsenicum* sixth dilution. Give two drops to an ordinary water tin, which must be thoroughly clean, particularly on changing the medicine. These medicines can be had in 6d. phials of any homoeopathic chemist, and must be kept in a cool place.—W. A. B.

HIGH-COLOURED CANARIES (*T. S.J.*).—"We reprinted the recipe last week. No particulars as to quantities were given by Messrs. Bemrose & Orme.

HONEY-GATHERING.—"I beg to state that I am not the 'Mr. Shearer' who has informed Mr. Pettigrew of the wonderful feats of honey-gathering by bees, as stated by him in page 134 of last week's Journal.—ALEX. SHEARER, *Yester Gardens.*"

REMARKS.

5th.—Cloudy till noon; frequent slight showers in afternoon; in fact, a cheerless damp day.

6th.—A lovely day throughout; dry, cool, and very bright.

7th.—Rather dull morning, afterwards cloudy, windy, sometimes almost rainy, but with bright gleams of sunshine in between.

8th.—A very pleasant day, some parts of it particularly so.

9th.—Fine till about 2 P.M., when it clouded over. Rain began at 7 P.M., and continued to fall more or less all the evening.

10th.—Dull morning; rain before 10 A.M.; thunder at 1.40 to 2.30, and between 6 and 7 P.M.; alternate sunshine and showers.

11th.—Fine, but very boisterous wind till the afternoon, when it gradually lessened, and the evening was quite calm.

A slight fall in the temperature, caused, probably, by the frequent showers which have alternated with bright sunshine during the week. Many of the showers, though very short, had all the appearance of thunder showers in the largeness of the drops and the puffs of wind by which they were preceded.

ERRATUM.—In the remarks appended to last week's table the word "*some*" of the recent storms is printed, instead of "*none*" of the recent storms.—G. J. SYMONS.

COVENT GARDEN MARKET.—AUGUST 12.

SUPPLY well kept up, and a fair average amount of business doing.

26	W	Barton-on-Trent Horticultural Show.	72.5	48.4	60.1	15	5	5	59	6	9	7	238

From observations taken near London during forty-three years, the average day temperature of the week is 72.4°; and its night temperature 49.3°. The greatest heat was 89°, on the 25th, 1859; and the lowest cold 31°, on the 26th, 1861. The greatest fall of rain was 1.32 inch.

SUCCESSSES AND FAILURES.

THE Editors have surely done well in giving Mr. Pewtress's hint to the world. It is in human nature for a man to be proud of his success, and rightly so; it is right, too, that it be recorded with a plain narrative of its achievement, for it becomes instructive in pointing out a path to others who are seeking the same end. Such narratives, however, should be very plain and matter-of-fact, not written with a motive of self-glorification, but with a main object and intention of giving friendly aid to a struggling brother. A record of successes is, then, one of the best means of imparting information, and that in a form to work by; and the nearer it does this, the plainer it can be seen, and the easier it is to transfer from paper to practice, the more is its value enhanced, the object of the writer appreciated, and a detail of his experience welcomed. But after saying this it must be, beyond all controversy, the fact that a "chronicle of failures, and above all the reason why," would be of immense usefulness in pointing out the bogs and quicksands of gardening into which many a worker falls when he is least aware of their presence. But by the same principle that man is prone to advert to that which adds to his reputation, he is averse to recording anything which he may feel can be interpreted as detrimental to his fame. That is human nature, and what does it prove? Just human weakness. It is a manly act to own a fault, admit an error, acknowledge a failure, and it requires strength of mind and moral courage to do this, which is always commendable—yea, even more so than the honour which attaches to a success, which may have cost little or no sacrifice by physical, mental, or moral effort. I think it was Wellington who, on seeing a man pale on entering the deadly breach, expressed his admiration of the courage of that man above his fellows, who rushed in with seeming thoughtlessness; he saw and felt the danger, yet faced it, his comrades entering without seeing or heeding any danger at all.

We may take it that every successful man has had failures, and if he, for the benefit of others, summons-up courage to recount them, he does a good thing—a noble act which any right-minded man will appreciate. How frequent is a scene like this: A visitor comes into a garden, he may see things very good, and compliments the owner and manager alike; he has come to praise, and he praises. It is very pleasant, and is more or less encouraging, but I candidly own that I esteem it a greater favour to be in a right mind and manner told wherein I fail and why. So does every man, except the few unteachables whose misfortune is that, with them, pride and ignorance have the same meaning, only they do not know it. Some years ago my employer pointed out to the chief of a firm what he conceived a failing point. The reply of the latter was, that the greatest kindness anyone could confer was to tell him, not where he was strong, but where he was weak. That firm has

now one of the largest seed and nursery businesses in the world. Mr. J. W. Pewtress is of the same spirit, and eventually he will succeed.

The question is fruit failures, and in no branch of gardening are failures more common. In this matter I am one of the "erring ones." I have been within garden walls nearly thirty years, but not a day too long to be able to plant a garden with fruit trees to the best advantage. I might fail now as others, older and better men, have failed also, but should not make the same mistake as in more youthful days that most young men, and old men, though young gardeners, are apt to commit. Mr. Pewtress has made a mistake—he admits it—hundreds would be glad to help him out of it, but will feel their lack of power. I am of the weak but willing throng. Mr. Pewtress says, "I think the reason why I fail is that my garden is too early. A warm south aspect on the slope of a hill brings fruit trees into bloom, and makes vegetables of all kinds two or three weeks earlier than my neighbours", and as a result the late spring frosts destroy all the promise that was displayed." Here is a failure of no small magnitude—unsuitable site. He is not alone; but that is no aid, and his best consolation may be that it is unavoidable. It may have been, there or nowhere. That is often the case, and the grievance should certainly be less than when a man has had a choice of a good site and selected a bad one.

It may be, however, that he has made another mistake—the common snare above alluded to—of planting far too many varieties in a given piece of ground. If he has, there is hope for him, and that out of the number a portion may peradventure prove themselves adapted to the site. Fruit trees would seem to have their caprices, one variety appearing to be at home in one district, and another in another. It is always well to mark what may be called the local fancies of fruit trees, and to plant extensively those kinds which flourish in the places in which more trees are required. Fruit-tree catalogues are very alluring. The description of varieties is skilfully given, and there is generally one quality in this and another in that rendering most irresistible to the would-be planter, who is invested with a power to plant largely for the first time in his existence. It is not suggested for a moment that the lists are drawn up to mislead, but, on the contrary, they are very faithfully done. But it is not possible, in reading of the virtues of the several varieties, to be certain that these virtues will show themselves when the trees are planted in any particular district. If justice is done them they are mostly as good as represented. The thing is to find out the locality that naturally suits certain sorts, and this can only be done by experience. In looking over a garden of fruits in great variety, one is soon struck with a few kinds that invariably do better than their neighbours. They are nearly always laden with fruit, while others are generally destitute of it. The remark, under such circumstances, is frequently heard, "If all my trees were of these sorts I should be full of fruit." Then why not graft? That is the common-sense plan to adopt when half the trees in a garden are

invariably barren, and the other half fruitful. By attention to this one point—restricting the kinds which do naturally well in a certain district, grafting the unprofitable ones with sorts that are profitable, the fruit-resources of the country would be materially increased in a very few years.

Were I called on to plant extensively to produce a useful supply of fruit, I should limit myself to a very few sorts which I had reason to believe would prosper in the locality. Were I, on the other hand, to find already planted great variety producing little fruit, my one object would be to keep cutting-down the worst—those that would not do—and grafting with the best—that is, with those proving themselves good and certain bearers. By that plan in time, and no long time either, there would be plenty of fruit. That is the practice that will have to be adopted by those who have planted on the one-tree-of-a-sort system before they get any satisfactory bulk of fruit. Growing trees one of a sort on the pigmy system—that is, carrying root-pruning and summer-pinching to extremes with trees in an early state, will result in a garden museum of pomological curiosities, but never in a full and useful harvest of fruit. This infantile mutilation of fruit trees is going out of fashion, simply because the majority of growers can see no good in it. There may be fanciful amateurs who enjoy an orchard of lili-pution trees, and they have a right to indulge in the mode of culture that best pleases them; but for a huge bulk of useful produce let the trees have liberty to build-up a stout, sound framework, permit them to attain a healthy development, and then, if the sorts be good in themselves and suitable to the district, a golden yield may be expected. I like both root-pruning and summer-pinching, but not with severity when the trees are young and small, converting them into stubborn stunted dwarfs to die prematurely by lack of vital force.

But another idea may have utterance respecting Mr. Pewtress's trees and their liability to injury by frost in spring. It is this—that fruit blossom often suffers more on trees in a young state than on older ones. Has not everybody observed an old standard tree laden with fruit, when young dwarfs around it are fruitless? This very year our orchard of young trees has produced nothing, while some old ones towering high in the air are carrying a useful crop. They were all alike covered with blossom, but that of the young ones is taken, and that of the old ones left. Frost was the fell destroyer. But why? The position is a low one. Was it not that the upper strata of air was drier than the lower one at the moment of the frost's visitation? I am of opinion that that is the solution of the difference, and I am fortified by the fact that another orchard in the same parish, but high and dry and exposed, is literally laden with fruit, although the frost was fully as severe as on the spot where every blossom was killed. If I take my stand in this place for instance, and with an imaginary pair of compasses set to a mile radius draw a circle, and within this estimate the fruit on low-growing young trees, not only bush and pyramid, but young half-grown orchards on the one hand, and old tall standard trees on the other, what do I find? Where I find 10 cwt. on the low ones in the damp strata of air, I find 10 tons on the tall ones, where the air was drier at the time of blossoming. This is very startling, but very true. It is not always so, the younger and dwarfer trees sometimes bearing prodigiously, as, indeed, this spring they were in a sheet of blossom.

There is much yet to be learned on the relative hardness of the blossoms of fruits, and if those having large collections would steadily observe this point, something valuable might be educed. No wish is entertained to discourage the planting of dwarf trees; on the contrary, varieties suited to localities, and these planted by the dozen or hundred, according to size of garden, instead of having every tree a separate variety, would give abundance of fruit in a few years. My experience leads me to this, that in districts subject to spring frost let the trees have liberty and get up in the air. Better have to get ladders to gather than have no fruit to pick. That, too, is the best means of retarding and hardening blossom by its exposure to the full sweep of a cooler rarer atmosphere than exists a few feet from the ground. I remember on a certain June 2nd having five thousand Geraniums killed in the beds, a number in tall vases above them escaping with injuries, but easily recovered. This may be cold comfort to Mr. J. W. Pewtress, who seems to have gone in for miniature trees. His plan, if his sorts are numerous, is, I venture to suggest, to watch and graft, and he may yet get fruit. There are other three lines in his letter that most people will admire:—"I daresay another gardener would succeed better, but my man

snits me in so many ways I must keep him, even if I lose my fruit by it." Mr. Pewtress need not have told us he was an "old man." He has evidently world-experience. No man is perfect in everything, and if his gardener suits in "many ways" he is not far below average. There is much discomfort engendered by both masters and men expecting too much. If a man suits in "many ways," keep him; if a master in most, stay with him and serve him well, and there will be more comfort, confidence, and content in the world than at present exists. Mr. Pewtress may rely on it that it is not his man that is the cause of his having no fruit under the circumstances he describes, but a younger man might have thought so, and have changed a servant suiting in many ways for another that suited hardly in any; but to get a man to fill a garden with fruit on unsuitable varieties on an unsuitable site cannot be expected without expecting too much. We ought to have a supreme pity for unfortunate gardeners who are expected to "make bricks without straw," and a supreme honour for those employers who can and do think calmly and decide justly, not only as to the capacities of the man, but as to the nature of the material he has to work with, and the circumstances surrounding and governing the work.—J. WRIGHT.

DISBUDDING ROSES.

I STATED in my account of the Frome Rose Show that Mr. Keynes, of Salisbury, introduced the art or practice of disbudding Roses. My reasons for stating this were that Mr. Keynes has often told me so; and secondly, my friend Mr. Reynolds Hole makes the same statement in his "Book upon Roses," page 294, fourth edition. Since my letter appeared Mr. Cant, of Colchester, has written to me to correct the statement; and as I think it is not only just that we should give "honour to whom honour is due," and also important that rosarians should know who first introduced this practice, I will ask your leave to quote that portion of his letter which refers to the question.

"With respect to your letter in JOURNAL OF HORTICULTURE, somehow you have been misled in stating that Mr. Keynes was the first to introduce the practice of disbudding. I used to do it before Mr. Keynes appeared in the field as one of the great Rose-growers, and well call to mind the fuss that was made about it as far back as 1859 at the National Rose Show. (I think it was at the Hanover Square Rooms). Some of the exhibitors thought it unfair, and others even went so far as to say I ought to be disqualified. I admit that I did not carry out the disbudding to the extent it is done now, simply because I was afraid to do it. More notice was probably taken of it when Mr. Keynes came out, because he did it without finching."

This letter will, I think, settle the question, as, if it was at the Hanover Square Rooms, and in 1859, that disbudded Roses were first exhibited, that would be at the second National Rose Show, at which I believe Mr. Keynes did not exhibit.—JOHN B. M. CAMM, *Monkton Wyld*.

THE POTATO CROP.

FROM personal observation near the seacoast of Wales, and in some of the midland counties, we can testify that as late as last week the Potato plants in field and garden were *rigorous* and undiseased. We emphasise "vigorous," because we consider that varieties so late in ripening should not be cultivated. The season of danger commences about the end of July, and we believe that if every Potato were out of the ground between that date and the 10th of August the Potato disease would be altogether avoided.

We met recently large cultivators of the Potato, and they all said that they in future should cultivate no variety that is not early or middling early.

WELL done, "H. G. M.!" (see page 148). You are well to the front, but you are none too soon, for the rains are upon us, second growth is making rapid progress, and the blight looms behind darker than the thunder cloud which foretells its advent. I began lifting the general crop three days earlier this season, and have tried hard to finish to-day, August 13th, but the drenching rain drove us from the field, and last night most of us were wet to the skin; but the bulk of the crop is in a nice airy storehouse, and a few hours' more fine weather will bring the Potato culture of 1874 to a successful issue. My mainstay, Paterson's Victoria, is an excellent crop, the

tubers numerous and large—much larger than I anticipated, and the quality all that could be wished. Other kinds are also good, the whole of them being literally without disease of any kind.—EDWARD LUCKHURST.

BEDDING GERANIUMS.

THE discussion of bedding Geraniums in your paper is acceptable to many. The Roses have had their benefit, and it is time their companions in the flower beds had a turn. Mr. Peach has kindly sent a paper for the last two or three seasons, and other correspondents a few notes only. Will they now contribute something fuller? A warm vinery for the young stock in winter, and rich soil for them in summer, are not attainable by most gardeners. Colder treatment and poorer soil must be matched with stronger kinds than most of Mr. Pearson's. Arthur Pearson is fine anywhere, and Douglas Pearson in most places; but when I saw Amaranth, Mrs. Musters, and others lately at Battersea Park, the colours were lovely; but where was the mass of colour attainable by Lucius, Bonfire, and pre-eminently Waltham Seedling? Where was the effect? A mass of green leaves, and peeping tints! The same thing struck the observer at Kew Gardens in relation to a good many other kinds of new Geraniums. The strong and free kinds are a necessity to most gardeners, and this is why further communications will be very welcome.

Bronzes ought to be discussed. The greenish kinds, Kentish Hero and Beauty of Calderdale, extensively grown for their vigour, want to be replaced by equally vigorous kinds with golden leaf-ground. Bedding whites and blush whites are a matter of uncertainty.

What relations of Madame Vaucher and François Desbois will stand wet weather and bloom well out of doors? Mr. Cannell studies dwarf-growing Geraniums particularly. Will someone write for exposed situations and light soils, where the dwarf kinds are mere pigmies? Violet Hill, Charley Casbon, &c., are failures in such a situation; so I fear Mrs. Upton must prove, though far better than the seed-spikes of the old Christine. Pink May Queen, recommended by Mr. Peach, is unsightly where the wind can reach it, and bears very few trusses anywhere. Vesuvius is scantier yet of flowers upon its manifold trusses when the breeze touches it, and I mean to grow it no more, for it never has trusses fit to gather, and only makes up by quantity for palpable want of quality. A dark scarlet called Chief Justice, of Mr. Paul, is fine here; it is derived from St. George. The double pink Marie Lemoine has been lovely for two months, always dwarf but covered with flowers; old plants doing best, inasmuch as young doubles do not make flowers till July.

Lastly, I should rejoice to see undeserving but much-puffed kinds of Geraniums exploded and puffed out; not from uncharitable feelings, but for the same reason that I find pleasure in seeing a detected bad halfpenny nailed to the counter, that it may go on its road of roguery no further.—C. S. B.

FRUIT TREE MANAGEMENT.

As your correspondent Mr. Pewtress wants a few hints as to the management of his fruit trees, I will endeavour to give him a little assistance. I cannot understand how he can find fault with the situation of his garden. I should think "a warm south aspect on the slope of a hill" is the situation to be desired above all others; and the fact of vegetables coming earlier than elsewhere is a great recommendation, and would tend to show that the soil is a dry one and suitable for fruit trees. I should think the reason of the failure is that the sorts selected are too delicate for standards. Has he tried the Victoria, Orleans, Gisborne's, and Magnum Bonum Plums; the Beurré Diel, Emile d'Heyst, and Bergamotte d'Esperen Pears (as pyramids); the Keswick Codlin, Hawthornden, and Lord Suffield cooking Apples; and Pearson's Plate and Nonpareil Apples for dessert? If not, I should recommend him to try them and other hardy sorts.

Now as to failures. I had a fine standard Easter Beurré Pear, the fruit of which was good for nothing. I have had it cut back and grafted with Beurré Diel. What was the cause of the failure? your correspondent may ask. The answer is that it is a useless Pear here, except as a pyramid on the Quince. I have two Plum trees which are failures as standards, the Cherry Plum and Washington, which I intend to have cut back and grafted with some good cropping Plum. The reason the Cherry Plum does not succeed is that it blossoms so early

(sometimes in February) that the bloom is always cut off by the spring frosts, and Washington I find not satisfactory in that respect. It is a good plan to plant a row of pyramid Pear trees within 7 or 8 feet of a wall, so as to secure a little shelter without being so near as to injure the trees trained against the wall.—AMATEUR, Cirencester.

IN AND OUT OF ABERYSTWITH.—No. 4.

WHAT cottage gardeners can effect is fully illustrated here. The town is well supplied with vegetables entirely from the gardens of the cottagers in the vicinity. Their wives and daughters come into the town bearing one or two baskets containing small parcels—and only small parcels—of whatever their gardens are producing. Two baskets which I saw this morning borne by different women contained samples of our daily supplies. One had in it three Vegetable Marrows, two leaves full of Kidney Beans, and a few Potatoes. The other basket held Apples, Red Magnum Bonum Plums, three Cabbages, and some Potatoes. Both baskets in one of their corners had some small bouquets. Mushrooms are also a specialty just now, and dozens of baskets of them are offered every morning, being the produce of the vast pastures around. Having small parcels and a variety, suits both the buyers and the sellers; the buyers have their vegetables fresh every morning, and the sellers have rarely a surplus to carry home unsold. Chickens, ducklings, and eggs are brought to our door by other cottagers' wives in the same way. All seem to have regular customers, and if one vendor has exhausted her basket of its contents and meets a neighbour who has been less successful, I see she takes some of the latter's commodities, and going in a different direction evidently tries to aid in vending them. There are stalls in the Market House where vegetables and fruits are sold, but they are chiefly supplied from the cottagers' gardens. I say, "chiefly," because there are packages about them containing West India Pine Apples, Spanish and even greenhouse Grapes brought by the railroad.

The cottage gardens have the advantageous peculiarity that, slate and shale composing the surrounding mountains, they are enclosed by thick walls composed of those Silurian formations, and the cottages are constructed of the same materials. These when unwhitewashed, which they very rarely are, have a chequered appearance, each dark block being encompassed by a white line of mortar. Against the walls and houses the Plum trees are trained which supply the baskets of the market women. Manure from the pigstye and collected from the roads are the fertilisers.

I have often replied vaguely to queries about flowers that will thrive close to the sea, but I can now say that the common Nasturtium (Tropaeolum), and Mignonette flourish most luxuriantly and flower abundantly here, within 5 yards of high-water mark, and they are wetted frequently by the sea spray.

This is a vicinity where a Cottagers' Garden Society might be established advantageously, for, as I have stated, the cottagers exert themselves—and their exertions are successful—to supply the town with vegetables and fruits; but the varieties are the oldest mentioned in our gardening books—Charlton Peas, Sugar-loaf Cabbages, inferior Cherries, Plums, Apples, and Pears—of these last there are only a very small green variety, a very small yellow and red variety, and the Windsor. A local society could promote the introduction of superior and more remunerative varieties, and be the means of preventing the intrusion of some large establishment, which would impoverish many a cottage fireside.

Within a few miles of Aberystwith the lead-mine region is reached, and there gardening is at its lowest. I may be mistaken, but my belief is that in that region there is not a really good cottage garden. This is not wonderful, perhaps, for the bread-winners are delving underground and have no surplus time or energy to delve its surface. Let me not be understood as depreciating the miners; they are a race that aid largely to maintain our country among the heads of nations. Never was I more gratified as well as surprised, for it has been to me an unknown region, to find in the parlour of a little inn far-up among the mountains, shelves of books hundreds in number, including scientific works, Shakespeare, Moore, Scott, dictionaries, novels, English and Welsh bibles. The landlady explained that the room was the evening resort of the miners. All honour to them, and let Londoners especially regard this vicinity, for to it they are indebted for their supply of New River water. This is no paradox. Sir Hugh Middleton made

his vast fortune from the Cardiganshire lead mines. From one, that of Cwmsymlog (Coomsymlog), he profited £25,000 annually, and he sacrificed his wealth in obtaining for London its best water-supply.

The little inn alluded to was reached by me on my road to Bedd Taliesin—Taliesin's grave. Is not Bedd the word from which our "bed," a place also of rest, is derived? No one who has a taste for a combination of the grand and the beautiful in mountain scenery will regret proceeding thither from Aberystwith. The deep valleys richly wooded, the precipitous yet wooded mountains, the paths mere shelves on their sides, are each and all sources of gratification. Nor will it be least gratifying to find that the last building, very far distant from but one other at the summit of the mountain, is a place for Divine service. Nor is this association of the lone memorial of the Welsh bard and a lone Christian pulpit incongruous, for one of the Welsh Triads records that Taliesin was one of "the Christian or baptised bards." This is probably a reason that, although he lived fifteen hundred years ago, so many of his poems have been preserved. The monks, the great librarians of the middle ages, would regard more kindly his mental offspring. Eighty poems attributed to him have been preserved, chiefly mystical, theological, historical, and elegiac. I will only give the translation of one extract from his "Mead Song," for that is not foreign to your pages:

"To Him that rules supreme, our sovereign Lord,
Creation's Chief, by all that lives adored,
Who made the waters and sustains the skies,
Who gives and prospers all that's good and wise—
To Him I'll pray that Maedwyn ne'er may need
Exhaustless treasure of the sparkling mead."

Other extracts might be published relating to fitting subjects, and from other bardic and triad pages, before arriving at the era of Hywel Dda—that is, Howell the Good. He was born about the end of the ninth century, and died in the year 948. His code continued in force until Wales was subjugated by Edward I., and its enactments throw much light upon the values of the productions of the garden and field in those days. The value of horses, cows, sheep, and pigs is specified at various ages to be paid by those who killed, or injured, or stole them. Of a cat, "after it could kill mice, 2d." If the cat was killed or stolen from the king's barn "it was to be suspended by the tip of its tail, with its head touching the ground, and to have Wheat poured over it until the tip of the tail was covered." The heap of Wheat was the penalty.

A gander was worth two geese, and a goosie was valued at 2d. A hen was valued at 1d., and a cock at two pence. To constitute a cock it must have crowed, and to constitute a hen it must have laid. A stock of bees was valued at 24d., and a spring swarm at 16d., a second swarm at 8d. The penalty for destroying or stealing an Apple tree was 60d., of a Nut tree 15d., and of a Plum tree 7d.—G.

A STRANGE SUMMER SCENE IN THE SWISS WENGERN ALP.

MONDAY, AUGUST 10TH.—Yesterday morning a more wintry scene was presented than I had experienced all last winter—the ground thickly covered with snow, and snow still falling heavily, with the thermometer nearly down to freezing on the 9th of August. This state of things continued until long after the sun arose, but the weather afterwards partially cleared, when the lower snow was melted, though the surrounding hills retained their whiteness. Some of the parties amused themselves playing snowball with each other. Of course good wood fires were in requisition and much appreciated. It was altogether very strange for this time of the year, though not infrequent at this elevation (6700 feet). One gentleman, an artist, who has been staying here some time, said that on the 30th July the snow was 6 inches deep. We get what we come for—cool weather in the hot season.

Tuesday, August 11th.—The fresh snow much enhanced the beauty of the surrounding scenery, and the sun shining upon it had a very brilliant effect. Went yesterday morning out on the hills in search of wild flowers, and though later in the season than last year, yet was very pleased to meet with many of the old favourites still in blossom. One particular hollow in front of the Monch glacier was a perfect Nature's garden; so much better to my fancy than the stiff formal parterres we see in England prepared at great cost and care. The Asters, Gentians, Androsace, with the fine yellow *Arnica montana*, were quite numerous. The Rhododendrons are very nearly

over. The grazing cattle seemed hardly to know what to make of the snow on their pasturage.—E. COPLAND.

WINDOW GARDENING FOR TOWNSFOLK.

SOMETIMES it is supposed that horticultural publications have no interest in the welfare of towns. We have constantly shown that we think differently. We know that the opportunities are comparatively rare when we can be of the same service to those whose lives are spent entirely away from the country as to the bulk of our readers whose circumstances are much more favourable; but we have always done what in us lay to foster a love for plant-growing in the crowded courts and back streets of our great towns. Our readers will not, then, we think, be surprised that we should reproduce the following article on town window gardening from the columns of our contemporary the *Midland Counties Herald*.

ALMOST every human being has an inborn love of flowers. No one familiar with the habits of "the people" can fail to be aware that even in our most crowded and closest streets there is a constant struggle to gratify this love, and efforts are always being made to grow some plant or other. A Geranium or a Fuchsia, a Musk plant or a Myrtle, is perhaps the object of the loving attentions of these cultivators under difficulties. Not unfrequently a good deal of success rewards the labours thus bestowed, which it may always be assumed are labours of love. In London and elsewhere societies have been formed to encourage such efforts, and wherever the beneficial influence of such societies has been exerted they have done much good. Many a dingy home has been made all the brighter by the plants grown in them under the fostering influence and encouragement of such societies. Nor has it been essential to the happiness of the owners that a high standard of plant-cultivation should have been set up. If only a plant will live, preserve its leaves green, and occasionally gladden its owner's eyes with a flower, then the causes for supreme satisfaction are quite ample. Now and again it is possible to meet with really well-grown plants in the homes of the very poor; and we well remember on one occasion to have seen in the window of a small house in one of our back streets nearly a dozen healthy vigorous trees which would not have been discredit-able in any cottage window in the country. This by way of encouragement.

There are many plants which will thrive excellently well even in the smoke of large towns, provided they receive a few extra attentions. For instance: The soil in which they are planted should be fresh and sweet, and should be renewed at least annually; the dust and dirt which will be certain to accumulate on the leaves day by day should be occasionally removed—the oftener the better—by sponging, or the rougher and readier method of sprinkling, or the more simple one of exposure to gentle rains when they fall; then, again, plants should, on the one hand, never be overwatered, so as to convert the soil into mud, nor kept without water too long, so as to convert the soil into dust. With such means most of the more robust plants which commonly adorn cottage windows will grow and do well in those of towns. Evergreens of many varieties are well adapted for permanent occupancy of such positions, for, owing to the harder and oftentimes glossy surface of the leaves, they are hardier than most softwooded plants. The Cactus family, again, and many of the succulents, will for a long time bear up against rough usage and neglect, and the other adverse circumstances attendant upon town gardening; and their uncommon styles of growth, and flowers quaint and strange in appearance, invariably produce undag-ging interest. Bulbs of many sorts, too, are particularly suitable to fill creditably a prominent place in a town window.

A step in the right direction would be the preparation and general publication of brief accurate directions how to grow plants, stated in such plain everyday language as would be readily understood by all who can read; and to this might be appended a list of such plants as are most likely to flourish in town windows.

We should like to know that window-gardening societies were established in all our populous towns. They would accomplish a really good work, and would encourage many who are now inert to become cultivators. The duties of the committees of management would not be arduous. They might well undertake the printing and distribution of such a code of instructions as we have referred to, and which we shall have pleasure in getting prepared by a competent hand, if such a society is started in Birmingham. They might purchase

and distribute, at the lowest possible price, suitable plants, bulbs, &c., properly potted; and we are authorised to state that a townsman will annually make a present of a large number of Geraniums, &c., to such a society. They should arrange for the holding of two exhibitions every year—one early in spring, when bulbs should be shown; the other some time in the summer, for plants generally. They might also arrange for the occasional delivery of simple, but instructive addresses on plant life and plant-growing in various parts of the town. They would also have to collect funds, in order to cover necessary expenses and provide prizes, which might be in money, plants, books, or useful domestic articles. As a start, we can already promise them subscriptions from several friends interested in the movement.

To make the society as powerful as possible it would, perhaps, be advisable to arrange for the organisation of two bodies—the one central, the other local. The local sub-committees should, perhaps, be as numerous as the ecclesiastical parishes or the municipal wards. They should be chosen by the residents in their respective districts. The central committee might consist of representative members of the local ones, one or two selected from each, with the addition of perhaps a few other persons chosen by these local representatives. The work of the central committee would be to raise the necessary funds, to settle the rules, to fix the exhibition days, and to award the prizes; while the local committees would have to work-up their several districts, diffuse information respecting the objects of the society, put themselves in personal connection with the class in which the exhibitors would be found, and in other ways help on the work of the organisation. By such a dual arrangement an immense amount of work might be done, while no one person's share need be overwhelming. The connection between the localities, each being represented in the central committee, would be mutually helpful, and if well managed the society would prove all-powerful in carrying out its objects.

Here, then, we venture to submit, is a plan capable of yielding admirable results, and which all classes of the community can assist either by subscription or personal work, or both. Cannot such an organisation be started in Birmingham forthwith? No one need be frightened at the labour involved or the amount of money to be raised: £100 per annum would do the work magnificently; half the amount might possibly be sufficient to start with, and to do it fairly well.

The writer of this article was, not very long ago, in some degree instrumental in setting on foot in one of the largest towns in Lancashire a small but successful show of the kind suggested, where the exhibitors were the children attending a Sunday school in a poor district. A teacher in that school applied to him for information as to what could be done to induce the children to attempt plant-growing. He suggested that they should be supplied with bulbs, properly potted in suitable soil, for which they should pay a nominal sum. This was done; a considerable number of the children invested their pence. Simple directions what to do were given to each purchaser, and a few months after the juvenile cultivators were invited to assemble on a stated day, and bring their plants with them. These were then arranged in order of merit, and prizes, consisting chiefly of books, were distributed among the children. Not only did the children bring the plants, but their friends, all poor people, came too; and a happier gathering was, perhaps, never brought together. This effort, commenced quietly and unostentatiously, but carried on with intelligent perseverance, has already yielded good fruits, and its refining influence is growing greater and wider every year. The plan has been tried in many other towns, and nowhere without success. Surely this, and more, may be done in Birmingham.

TWO SIDES TO THE QUESTION.

We folks in the insect world don't read periodicals, yet we do get, in a way that I need not explain, some intelligence about what is going on amongst gardeners, as this often nearly concerns us. I hear with alarm the tidings that there is a movement afoot to promote the plan of planting none but early Potatoes as a precaution against disease, and were this to be carried out universally, I suppose long before August is out the Potatoes would be dug and the fields cleared. Now, only consider for a moment how hard this is upon those who belong like myself to the species called the Death's-head, or the Atropos of entomologists. We as a race come forth in

the winged state some time in July, seldom earlier, and then having deposited eggs, the caterpillars from these feed on the Potato leaves in August and September. Used to do so, I should say; for on this new plan there will be no leaves to be got at the season when they are so important to our progeny. It is true we can eat the Privet, but we don't much care for that shrub; Jasmine is rather to our taste, only on that we are exposed to more perils; and though some caterpillars with eccentric tastes resort to the wild species of Nightshade, yet the Potato has always furnished our staple diet. We feel so safe in a Potato field or plot: birds are less likely to molest us, entomologists seldom look us up, and if a chrysalis is now and then chopped in two by the fork, that is a casualty that can't be avoided; but to rob us of our food altogether, that is serious indeed, and I am afraid as moths who have pursued the same plan many centuries we cannot make a change, and come out two months earlier in the year. Habit has an astonishing power both with moths and men.—AN ANXIOUS ATROPOS.

ROYAL HORTICULTURAL SOCIETY.

AUGUST 19TH.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. Messrs. Dobson & Sons, Isleworth, sent a brace of Cucumbers called Prince of Wales, a white-spined ribbed variety, which was not thought distinct from others in cultivation. Mr. James Chambers, of Springrove, Isleworth, also sent a seedling Cucumber, called Westlake Rival, of which the same opinion was expressed. Mr. A. Henderson, Shrubland, Walthamstow, sent a Kidney Bean, called Lady's Finger, which was considered too similar to the Case-knife to be regarded as distinct. It was recommended to be grown at Chiswick. Mr. Sweeting, gardener to T. G. Venn, Esq., Sneyd Park, Bristol, sent bunches of a seedling Vine, called Sneyd's Seedling. It is a large bunch, well shouldered. The berries are oval; the skin black, with a delicate bloom; the flesh firm, juicy, richly flavoured, and with a distinct Muscat flavour. It was considered a very valuable addition to the varieties of early Muscat-flavoured Grapes from its free-setting and early-bearing properties. It was awarded a first-class certificate. Messrs. Lane & Son, of Berkhamstead, sent a seedling Grape which was thought very favourably of by the Committee, and as it was not quite ripe the Committee desired to see it at a subsequent meeting. Mr. Clark, of Roehampton, sent a dish of Washington and Kirke's Plums.

Mr. Browne, gardener to Earl Howe, Gopsall, sent a box of excellent fruit of Peaches and Nectarines which had been gathered from trees moved last season, to which a cultural commendation was awarded. Mr. James Groom, Henham Gardens, Wangford, Suffolk, sent a Melon of very large size, which had been brought home from Africa by Sir Samuel Baker and presented to the Earl of Stradbroke. The fruit is 18 inches long and 9 inches in diameter, of a deep orange colour, the skin somewhat crumpled. The flesh is white, very tender, juicy, and sweet. The Committee considered it a very well-flavoured fruit for the size. Mr. F. Dancer, of Chiswick, brought fruit of Souvenir du Congrès Pear.

FLORAL COMMITTEE.—Dr. Denny in the chair. First-class certificates were awarded to Messrs. Paul & Son, of Cheshunt, for a very ornamental variety of *Cerasus Mahaleb* called pendula, having a graceful head of pendulous branches, and for a *Cornel* having the leaves edged pure white, and named *Cornus alba marginata*. Messrs. Paul also exhibited *Cerasus semperflorens pendula aurea* with yellowish green variegation, but as shown it was not effective.

From Mr. W. Chater, nurseryman, Saffron Walden, came a collection of Hollyhock blooms; also a number of seedlings, of which Mulberry Gem and Rose Supreme, answering in colour to their names, had first-class certificates. Messrs. Rollisson and Sons, of Tooting, sent a fine collection of cut *Phloxes*; and Mr. R. Dean, Ealing, *Phlox Miss Robertson* (Cocker & Son), with large white flowers, one of the early-flowering section which had been already certificated. Messrs. W. Hender & Son, Bedford Nursery, Plymouth, were commended for their strain of hybrid *Amaranthus*, with leaves exhibiting various shades of crimson, orange, yellow, and green.

A botanical certificate was granted to Mr. J. Croucher, gardener to J. Peacock, Esq., Hammermith, for a flowering plant of *Decabelone elegans*, having a campanulate flower with a yellowish ground nearly covered with purplish red dots and broken streaks. He also sent *Aloe Fraskii*, a South African species, with the base of the leaves clasping the stem like a cup. From Mr. J. W. Blackwood, gardener to F. Collinson, Esq., Herne Hill, came *Bonatea speciosa*, an old Orchid which, though slightly fragrant, has no claim as an ornamental plant. *Cheilanthes Bergiana*, a pretty Fern from the Cape, was sent by the same exhibitor, and had a first-class certificate. *Weigela Lavaliei*, with rather small dark red flowers freely produced,

was shown by Mr. Bull, of Chelsea, as also a cut bloom of a large and very double *Petunia*. Mr. May, gardener to J. S. Brockett, Esq., Muswell Hill, sent specimens of *Cattleya Dowiana* in great beauty; and Mr. J. Chambers, Westlake Nursery, Spring-grove, of the double-flowered *Lobelia pumila grandiflora*, forming dense little masses covered with bloom, together with *Pilea muscosa alba*, a neat little creeper with small light green leaves, and *Diplacus californicus* with ornamental buff and orange flowers. Messrs. Paul & Son contributed several stands of cut Roses.

LITTLE HEATH MELON.

I THINK the Little Heath Melon a very good variety for amateurs like myself. I do not know if there is any difficulty in growing Melons generally; but from the time I sowed the seed (April 24th) in a frame which I made up with dung for Cucumbers until July 31st, when I cut three, I had not a single drawback with them—no fly nor disease of any kind. I put in two plants in a two-light frame heated with dung, and they produced eleven fruit, eight or nine being of a good size, and very good. I should judge that this year was very favourable for flavour. Last year I also grew them without any trouble; but I always give regular attention, and certainly feel well rewarded by the results. Everyone who saw them admired the growth and fruit.—G. C.

DAHLIAS.

As an amateur Dahlia-grower for many years, it has often occurred to me why the flower should be thought so little of by the committees of provincial exhibitions. In many of the schedules the amount of prize is the same for a stand of Asters as a stand of Dahlias. The absurdity is great to those who know anything about the culture of the two flowers. The framers of these schedules cannot be aware of the great difference in the cost of purchase, the quantity of land required, the time and trouble in getting twenty-four good blooms of Dahlias as compared with a stand of Asters. To grow twenty-four Dahlias fit for competition with any chance of success, you must have at least 150 plants of the best new and old varieties: this will require ten or twelve perches of land heavily manured, four or five stakes to each plant, and each to be thoroughly mulched with cow dung; in dry seasons a man employed continually watering, shading, and tying; and continual watchfulness after the buds show colour to keep down grub and earwigs, else the labour is lost. Also, if there are one or two good new seedling flowers every year, you must purchase them at half a guinea a plant to keep pace with your neighbours, besides keeping up the old stock, losses of which will occur every winter with most amateurs. Now contrast the expense in the cultivation of the Aster: 3s. 6d. will purchase a packet of good seed, two or three perches of land will be sufficient room, then give plenty of old manure and attention, and you are one in the competition at the exhibition.

Referring to the prizes offered, here are two examples this season: A schedule sent me from Pontypool specifies, "German Asters, twelve blooms, first prize, 10s." "Dahlias, twelve blooms, first prize, 10s." Another is from one of the late homes of the Dahlia (the more surprising), where the rearing and growth of many a first-class Dahlia can be traced—I refer to Birmingham and the late Mr. Charles Perry. The schedule from Edgbaston, near Birmingham, specifies, "twelve Dahlias, 10s.; twelve Asters, 7s. 6d.; twelve Phlox, 10s., first prizes." This lad encouragement of the Dahlia now that it has arrived at its greatest perfection rather inclines one to give up its cultivation—a bobby I have enjoyed for twenty years.—THOMAS HOBBS, Bristol.

THE KITCHEN GARDEN.—No. 11.

A WELL-MADE walk kept in good condition is an ornament to any garden, and for appearance only I would give the preference to those made of well-coloured and good binding gravel. True, the labour of keeping gravel walks in order is considerable, but there is a satisfaction afterwards which compensates for it. However, in some parts of the country gravel is out of the question, and some other material must be used.

The next best kind of walks, probably, are those made of asphalt or tar, gravel or small stones, coal ashes, and sand. They are made in two ways. The first I shall describe is the preferable one. It involves no great excavation for drainage,

but if the soil is good some of it may be taken out and anything else substituted, covering it over with fine material; beat this down firm and put the walk into shape, making it high enough, but allowing for the thickness of mixture that is to go on. Now collect a quantity of coal ashes and sift them fine, also coarse road or drift sand and lime rubbish. All these should be sifted, and kept under cover and dry. Mix the three together in equal proportions; take a small quantity at a time, say about three barrowfuls, lay it in a heap and make a hole in the middle, into which pour a quantity of boiling tar; add enough, and mix well together till it is as stiff as mortar. Take this to the walk and put it on carefully, not less than 3 inches thick; many put it on 4, and some as much as 6 inches thick. The walk is shaped out properly while it is soft and pliable. Before it hardens a good sprinkling of fine ground stone or sifted gravel of a lightish colour, and some sand with it, should be strewed evenly over the walk, and a light roller passed over it to press it well into the tar. After the surface is a little more hardened, but before it is too much so, a heavier roller should be passed over it several times, which will solidify the whole. This addition of light stone and sand is to improve the appearance of the walk, of which the surface would otherwise be very dark, which I consider an objection. All this work should be done in dry weather, and the ground rendered very firm before commencing. In a few hours the whole mass will be pretty well set and quite waterproof.

The next method is a more expeditious one, though I think less substantial, and will not bear comparison with the former, yet walks done in this way last a considerable time, and the method is therefore convenient to some persons. It is this: First shape out the walk, and put all the material on as described in the former mode, pour the tar on cold over the whole surface, regulate it with a stiff broom, or, what is better, a small board on the end of a pole in the form of a rake. Put on a sufficient quantity of tar to penetrate the whole, and let it soak in, taking care that it is evenly distributed. Add sand and fine gravel as for the first method, and in other respects treat similarly. Whichever mode is adopted no large stones must be permitted on the surface, as they would work out again and leave holes in the walks; and even the fine stones must only be thick enough to allow them to be embedded properly in the tar. Walks made after the last method are liable to break-up in flakes, especially if pressed by heavy loads frequently at one and the same place.

In walks of this description there will be the surface-water to be disposed of more than in those made of gravel, though it is necessary to provide for carrying it off any walk. In a previous article I mentioned about marking the place where the drains run, so that their connections may be made good to take off the surface water; this should be done previous to making the walks; as there is likely to be some washings of soil and other rubbish to dispose of, and which ought not to be allowed to go into the drains, to avoid this it will be necessary to dig-out a small hole, say 15 or 18 inches square at the top, and 2 feet or more in depth, at every junction with the under drain. Let the drain for the water go out at the top of this hole, and as the latter becomes full the water can run off, leaving the sediment behind. Now it is hardly necessary for me to say that after heavy showers, and at other times also, these holes should be cleaned out, and all that would otherwise enter the drains and soon stop them up should be taken away. Gratings of iron should be provided and placed over each hole, set-in firmly in a frame, which may be embedded in the asphalt as the work of making the walk goes on. I prefer the convex form of grating; it is not so liable to get stopped-up by the accumulation of rubbish as the opposite shape.—THOMAS RECORD.

EARLY BEATRICE PEACH.

THE first ripe fruit of this excellent Peach was gathered from a tree on an open wall in the second week of July. The tree is young, and did not yield more than one good dish of fruit, all of which were ready a few days later; then came an interval of nearly three weeks before the first fruit of Rivers' Early York were fit for table. The prevalence of dull showery weather will in some measure account for the tardy ripening of Early York. I hope to form a connecting link between it and Early Beatrice by means of Early Rivers, which will come into bearing next season. Thanks to the coping boards, I hope eventually to have a full supply of Peaches with a tolerable degree of certainty from trees on the open walls, from the

second week in July till the end of September. The list of kinds upon which I depend is—Rivers' Early Beatrice, Early Rivers, Rivers' Early York, Rivers' Dr. Hogg, Grosse Mignonne, Noblesse, Royal George, Barrington, Rivers' Lord Palmerston, Walburton Admirable. These are arranged in the order of ripening, but I am by no means certain that this selection of the kinds I have actually in cultivation might not be improved by the addition of two or three more of the Rivers strain. Early Alfred, for instance, bears an excellent character, notably for flavour; Alexandra Noblesse, too, I am inclined to think good. Can anyone assist me? I invite discussion, because I feel assured that a more general knowledge of Mr. Rivers' numerous seedlings, both of Peaches and other fruits, will prove conducive to the general good. I have several of these among an extensive collection of fruit of all kinds under my care, and can confidently assert that those kinds which have already come into bearing, tend to the conviction that Mr. Rivers' descriptions are most reliable and trustworthy, and they may be depended upon as the calm and honest deductions of a veteran practitioner.—EDWARD LUCKNURST.

STAG'S-HEAD FERN.

Your correspondent "BETA," page 144, mentions that a Fern so called grows on the limestone formations, what is the botanical name of the Fern? Does not "BETA" mean *Lycopodium clavatum*, common Club Moss? This I have met with on the mountain slopes in the Isle of Man, where it grows luxuriantly, trailing on the turf. I brought some fine specimens home; a portion I planted in an outdoor fernery, the remainder in pots in a cool greenhouse (I did not try a Wardian case); but neither existed much longer than about twelve months. If "BETA's" Stag's-head Fern is so hardy and easily cultivated, possibly he has discovered something that novices like myself have not seen or heard of.—F. P.

[The "Stag's-head Fern" cannot be a *Platyserium*. If he will send us a specimen we may be able to identify it.—EDS.]

DESTROYING WASPS.

AMONGST the many modes of destroying wasps' nests described by your contributors, I do not notice a very convenient one that has been adopted at various places with as fair a share of success as any other mode that I have ever seen tried. It is simply a squib composed of dry gunpowder and flowers of sulphur, broken up fine, mixed in the proportion of about three of the latter to one of the former. The squib is made by wrapping a piece of common brown paper round a stick about as thick as the forefinger, the paper being three or four ply thick, when it is tied with string or matting, and being drawn off presents a sort of paper tube. One end is afterwards closely tied up, and the tube is then filled with the mixture, pressing it tightly in with a stick, and then tying the other end. A squib of 3 or 4 inches long is generally sufficient to stifle a wasps' nest for a reasonable length of time. It burns with a searching smoke for at least half a minute, and is easily lighted by holding the end to a candle. Of course, digging out the nest is necessary, and I do not know of any effectual way of destroying wasps without digging out.

Placing offensive-smelling substances at the mouth of the hole is an old-fashioned mode, as I have seen it adopted more than twenty years ago with a ball of loose tow or something of that kind soaked in turpentine, and put into the mouth of the hole, and sometimes the spirit has been poured into the hole, saturating the soil so as to give off deadly fumes to the wasps attempting to pass it; but they sometimes succeed in digging out for themselves another outlet. Other substances, as coal tar and muriatic acid, were recommended before paraffin became common, but I have most faith in some process in which digging-out forms a part, and I have also most confidence in the use of gunpowder as a stupefying agent. I may add that I have seen it often enough used alone in a wetted state, and made up into the form of a cigar; but it is more costly than when mixed with brimstone, and requires some little practice to wet it up into the proper condition to burn as long a time as possible, for if too wet it will not burn at all, and if not wet enough goes off too soon, whereas the squib rarely or never fails, and is in every way convenient.

Although we had quite the average number of queen wasps in the spring, I have since met with one but very rarely up to the time I write (August 10th); this is unusual, for we generally find them more or less abundant as the Gooseberries

ripen, whereas this year this fruit will be all gone ere wasps make an appearance. Another maxim seems also not to apply this season, that a good Plum year is sure to bring plenty of wasps. This season the crop of Plums is tolerably good around here. A near neighbour of mine gathered upwards of three hundred bushels last week—I believe all or nearly so of Early Orleans—and yet I do not hear of a single wasp. That we may have them yet is very probable, but that they are not likely to be so numerous as they sometimes are is equally certain. It is, however, somewhat strange that they are not numerous this season, as it has been unusually dry, and although we have been visited with frequent and sudden changes of temperature, there has been no lack of hot days, yet amongst the many enemies we have had to encounter, wasps have not been one. If they fail to appear at all, the circumstance will cause no regret, for although they, as well as most other things, have a useful mission, there are few amongst us willing to give them credit for anything but mischief, and we never hear of that very useful and praiseworthy Society which is instituted to prevent cruelty to animals ever throwing its shield over wasps and snakes, against which we all wage war.—J. ROBSON.

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 23.

It does not require a large amount of philosophy to make the fact obvious to us, that individuals of the genus *Homo* most remarkable for beauty or for size seldom possess in the like degree either wit or wisdom. The "Admirable Crichtons" of our race are rare; and we look upon it as a matter of course, with a few exceptions, that those who possess certain advantages or excellencies lack others which their neighbours boast of. Thus things are equalised; and though here and there we find a man head and shoulders above those of the race around him, like Saul of old, yet through all human diversity there is generally traceable a weak point or deficiency which prevents, or ought to prevent, each one from unduly exalting himself at his neighbour's expense. Curiously enough, matters are very much the same in the insect world. The handsomest, rarest, largest insects are not at all of necessity the most sagacious and the most active. Look at the Lepidopterous order for instance, comprehending the butterflies and moths. Throughout that division of insects we find the wings clothed with scales, giving bright and varied tints, surpassing what is displayed by most of the species belonging to the other orders, yet that marvellous instinct, almost akin to reason, which has rendered some tribes of insects so memorable, is less noticeable among the butterflies and moths. We must seek it in its potency in the dwellings of the bee and the ant, or study it in the despised gnat or beetle.

I have been particularly struck with this fact in rearing the Hawk Moths, where we have both beauty and size. The caterpillars of several of these seem exceedingly dull and stupid. Should the pod, plant, or twig on which they are feeding wither-up, they do not appear to have always sense enough to quit it and start on an exploration to obtain a fresh supply. In a breeding-cage, though green twigs may be placed almost touching the heads of some of these, such as the Poplar and the Eyed Hawk Moth, they still hold on the dry or well-nigh bare twigs, unless removed from them. Nor is this an easy thing to do, the grip of one of these caterpillars being exceedingly firm, no doubt given as a natural protection against their being wafted away by the wind against their will; but still one would suppose they would have the sense to loosen their hold rather than suffer injury. It is not so, however, and more than once, in attempts to lift a Hawk Moth caterpillar from a twig, I have seen the body torn from the claspers, which remained attached to the object, and the creature thus perished through what might be called a perversion of instinct. Then, again, when a number are kept in the same box, they in their wanderings about, though they may be well supplied with food, are apt to fall to and nibble the curved horns with one of which the back of each individual is adorned. As there is no proof that in such cases the individuals have quarrelled, and, like the Kilkenny cats, resolved not to spare each other's tails, but begin the onslaught by seizing these, it seems rather like a foolish sort of experiment on a new food, scarcely likely to be very palatable. Nor do these caterpillars when adult show the judgment we might suppose they would, in the selection of a place for pupation. The Eyed Hawk caterpillar which often devours the Willow

leaves on trees situate in marshy land, may be seen entering clayey earth, which, becoming hard, leads ultimately to the death of the insect. Smaller species are often to be observed crawling about seeking for earth to their mind, but this does not usually suit a gentleman of the more elevated race of the Hawk-Moths.

Just about this time, on Privet, Lilac, Ash, and occasionally on wild Apple or Plum, feeds the caterpillar of the Privet Hawk Moth, *Sphinx Ligustri* (see figs. 48, 49, and 50), which takes its name from its more common food plant, according to a plan once followed by entomologists, which has caused some confusion. Often as this species has formed a subject for comment, it is yet hardly fair to exclude it from the present series of papers, its beauty being noteworthy both in the larval and imago states. It is frequently found on the borders of the garden domain, if not within its boundaries; and though the caterpillars lay bare a few twigs in the months of August and September, the species cannot be reckoned as a garden foe. I opine it has rather aristocratic tastes, as year by year I have hardly ever failed to find the caterpillars, when I sought them, on the hedges environing the central spaces in our Belgravian squares. Tradesmen's boys occasionally parade one upon the top of a stick, but as a rule, particularly when it is getting large, the Privet Hawk caterpillar keeps itself well concealed in the day, feeding chiefly at night and in the early morning, and then retiring to the thicker places in the tree or bush. Some

tongue with which the head is furnished is kept ready for action as the insect passes from flower to flower. Those caterpillars that have been fed-up on the leaves of the Lilac have no chance when they emerge as moths the following year, of tasting the honey of that tree, since the blossom is over before the Privet Hawk Moth is out of the chrysalis; but about the flowers of the Privet in June and July the moths float with delight, now and then careering-off to visit some flower bed.

The eggs, which are large, yet not easy to find, having much the colour of the Privet leaf, are laid in those months, and the young caterpillars emerge in a few weeks. The seven stripes with which the body is marked are not so obvious to the eye at first, and the skin of the caterpillar has rather a wrinkled appearance, which disappears as it grows older.

After four successive molts during the course of seven or eight weeks, the Privet Hawk caterpillar exhibits itself in its last garb. The surface of the body is now a light green, the head being of the same colour, with a band of black encircling it; the extremity showing the usual horn of the tribe, which is now black above and yellow beneath. The seven stripes on each side are lilac and white, at least the latter colour is not disputed, but the former has also been called blue, or purplish blue, violet, and "mauve" by the ladies. What is known as the "sphinx" attitude is seen to perfection in this caterpillar when it happens to be reposing on a twig—that is, the claspers and part of the body are firmly at rest on the twig, though

Fig. 48.—Privet Hawk Moth (*Sphinx Ligustri*).

Fig. 49.—Privet Hawk Moth, larva.

Fig. 50.—Privet Hawk Moth, pupa.

of its brethren, as for example, the Unicorn Hawk, descend to the earth or even enter it, and come forth to banquet at sunset or soon after. I have not ascertained that this caterpillar has received any special designation from the cockneys, though occurring in various parts of London. In some of the midland counties all large caterpillars of the Hawk Moth are called locusta, or, more exactly, "lokus." How this strange misappropriation of a name arose is not easily explainable.

The Privet Hawk Moth has wings about 4 inches across when stretched-out fully, and the nervures are remarkably strong, enabling the insect to take long and rapid flights, and from the size of the species, moths when on the wing high in air are sometimes mistaken for bats or small birds. The fore wings are grey and brown, with a rich tint of rose at the base; the hind pair of wings have a rosy pink as their ground colour, crossed by three bands of dark brown. The body has very distinctly marked bands of pink and black, and it is stout and heavy. In the dusk of evening the eyes of this moth are seen to sparkle like two balls of fire, while the long proboscis or

the head, legs, and the first segments of the body are raised in the air. Hence, as the story goes, the gardener of Roessel, the German entomologist, was greatly disgusted with these caterpillars, he considering the posture as a proof of self-conceit and vanity! The object is probably the deceiving of birds, which might otherwise carry-off this caterpillar as a large but choice morsel. That they do occasionally pick it up, I have had positive proof. Should anyone touch a caterpillar gently while thus in repose, it will be found to shake itself to and fro as if resenting the affront; should the assault be more violent most generally the creature falls suddenly to the ground. Mr. Wood tells a droll story, not much to the credit of a University man, who asserted that a Privet Hawk caterpillar assaulted a lady and bit a piece of flesh out of her arm! Certainly it is well provided with jaws, but it shows no desire even if irritated to seize the human hand; and, indeed, from the sideway manner in which the jaws of a caterpillar cut, it could not easily do so were it disposed. There are some caterpillars, several of them belonging to the family of Pseudo-Bombyces, which exhibit

such grotesque shapes, that do open the jaws and attempt to bite the skin. This has never been noted as the habit of the species before us.

Having reached maturity, the caterpillars of this moth lose their bright tints, cease to eat, and, becoming of a livid hue, they excavate a chamber in the earth, the interior of which is beautifully smoothed-off so that no rough particles of soil can annoy the chrysalis. The case or shell in which the proboscis is enclosed is distinctly seen folded round on the breast of the chrysalis. In some years, instead of the emergence taking place during the following season, the chrysalis stage lasts on through another summer and winter, the moth coming out in the second year. There have—so some report—been instances where it has been the third year; but even this is surpassed by the small Egger Moth, which has been known to pass six winters in a state of dormancy.

I will end this paper with a few words on a moth of very different size and appearance, which is produced from a caterpillar which feeds on the Hawthorn, and the perfect insect is therefore often seen flying about gardens where the Hawthorn grows in the vicinity. In the day a tap of a stick given at intervals along a Hawthorn hedge during August will bring out one after another of these, each falling like a snowflake amongst the grass. This is popularly known as the Chinese Character (*Cilix spinula*), and the beauty of it lies especially in the silvery scales which are arranged along the wing-rays, and which have been thought to bear a resemblance to Chinese letters or characters. But there is also much elegance in the greyish band and spots as they are set out on the pure white of the wings. All the wings are thickly clad with scales, and when at rest the moth folds these over the body in a roof-like manner. The caterpillar is of a singular shape, having a double row of small humps or warts along the back, and the pointed head is cleft on the crown. At the tail there is a spike or point, which the caterpillar lifts in the air as it crawls, much in the fashion of the caterpillar of the Puss Moth. When it forms the cocoon it usually fastens on the outside a leaf, or a part of one, in such a way as to give concealment, and then weaves behind that a close abode of silk, in which it only continues two or three weeks. The species has been seen in all parts of England.—J. R. S. C.

LEEK CULTURE—CABBAGES CLUBBING.

The following, in answer to "AGRICOLA," may be useful to other readers as well.

To grow Leeks to a full size the highest cultivation must be given. Instead of planting them out on a border of rich soil, as many do, and with good results, for "AGRICOLA'S" special purpose I would advise him to make preparation for them the same as for Celery, and grow either one or two rows in a trench. For one row the trench will do about 15 inches wide, but for two it should be not less than 18 inches in width; and in either case not less than a foot in depth, filled up with good substantial manure, afterwards covered over with about three inches of soil. First of all, however, fully 6 inches of manure ought to be dug-in at the bottom of the trench, as the Leek is a vigorous and deep-rooting plant. It also requires full time to develop itself; therefore the seed ought to be sown by the middle of March on a bed of deeply-worked rich soil. When the plants are 6 or 8 inches high select the best of them and trim back the long weak roots a little, cut the loose leaves off, and dibble into the trench—not deep, but just sufficient to hold the plant in its place; water them every day, if the weather is dry, until they have established themselves, and once or twice a-week afterwards according to the state of the weather. When the soil is dry enough, after every second watering it should be stirred to promote the free growth of the plant, and to keep down weeds. In about a month after planting another 2 inches of soil may be added to the surface, and again once or twice afterwards; and when they have nearly attained their full growth the plants may with advantage be earthed-up a little.

By the above treatment "AGRICOLA" will perceive that the plants will produce enormous leaves as well as large stems; but in order to increase the size of the latter he must keep the large leaves trimmed back to half their length according as new ones are produced, and I doubt not he will realise what he desires.

In reply to "AGRICOLA'S" second question, I think his system is as good as any other, for I have never known any remedy prove effectual for a series of years. For years we have

been little troubled with the disease called clubbing, and this season, so far, I have not seen one plant affected by it. I rely as much upon cultivation as I do on a remedy; and if I had a sandy loamy soil I should apply manure in lieu of salt, but with lime and soot, and that, too, in the bed where the seed is sown, because it is there that the plants are first attacked. The following is my practice: Prepare the seed bed by working the soil fully a spit deep, adding rich half-decomposed manure and lime about 4 inches under the surface, and when raking this down also work-in a quantity of quicklime and soot in equal proportions. Sow the seed and rake it in. The lime and soot act as a preventive to the attack of the insect, and the manure from the time the seeds are up acts as a stimulant for the plants to grow out of the way of its ravages. Again, we see more of this clubbing in dry summers than in wet ones: therefore from the time the seedlings are up do not allow the soil to become too dry: the frequent waterings cause the insect to leave the ground, as it does not thrive in wet places. The next thing I do is to prick-out the plants also in well-prepared soil, and both at this moving and when the plants are transferred to their final quarters each is examined and the warty substance cut off: the plant is none the worse, and is seldom attacked again. Should any affected plants escape notice at the time of planting-out they may soon be discovered by their pallid appearance and by flagging under the sun; then by moving away the soil and cutting off the protuberance the plant recovers if supplied with plenty of water. I ought to say that at every transplanting lime and soot are worked-in with the soil.—THOMAS RECORD.

SEEDLING BRIAR STOCKS.

In reply to "P.," page 138, seedling Briars can be raised from English seed, but the French seeds are much better, and they can be purchased in Paris. Briars are extensively cultivated in France for stocks by the French rosarians. I would recommend "P." to purchase the stocks in the season. I usually get mine over in December. Any amateur requiring either stocks or plants can be supplied with any quantity by a Rose-grower with whom I am acquainted.—JOHN MAYO, *Oxford*.

MELONS SPLITTING.

THE same rational method which "VIRIS" recommends to prevent Grapes cracking, a plan I know to be effectual, is equally useful in arresting the splitting of Melons. In houses it is comparatively easy to prevent Melons flying to pieces by withholding water soon enough, but it is not so easy to do so in the case of ordinary frame and manure-bed culture. Towards the end of the season the roots are apt to pass into the then-decayed manure of the bed, and the result is a splitting of the fruit. This is perhaps more common than the world is aware of, and numbers of Melons are every year thrown away "on the quiet," because they are "not fit to send in." At this season splitting often follows the cutting of a few fruit from each plant, those left having a double influx of sap to deal with, and give way under the pressure. Cut the stem half through, or even the fruitstalk, when there are signs of splitting, and the evil will be averted.—CUCUMIS MELO.

ROSES AT WORCESTER.

I AM going to add an appendix to "D.," of Deal's, interesting account of the Cheshunt Roses by saying a few words with regard to Roses at Mr. Smith's at Worcester, where "D." and I went after the Birmingham Show on the 7th of July, but whence "D." had to depart before we had half gone through the Roses there. I cannot, and do not pretend, to give an adequate description either of the Roses or the nurseries, still less of Mr. Richard Smith's kindness and hospitality. I can only say that meeting Mr. Smith for the first time at Birmingham when the Judges and Committee were luncheon together, he pressed me most hospitably to come on to Worcester that night to stay with him and see his nurseries the next day, and that I was by no means prepared to see the state of perfection to which the whole of the arrangements of the large nursery grounds, propagating pits, vineries, orchard houses, &c., had been carried.

I had not time to make many notes, but I went carefully over about seven or eight acres of Roses; one-third on Briar, about two-thirds on Manetti, at a rough guess. I can quite endorse "D.'s" opinions about the new Roses of 1872; there are none like Etienne Levet or François Michelon of the pre-

vious year. Madame Lacharme seemed to me the best, and I am glad to find that "D." can so confidently state it is a good second bloomer. The best of the 1872 Roses were Pierre Seletsky, Mrs. Veitch and Marius Cote, both of them somewhat alike, of the Antoine Ducher style, and Reine Victoria, a soft pink, but chiefly good for pillars, as it is a Bourbon. I thought Claude Levet, Pierre Seletsky, MacMahon, Madame Moreau (the second, by the way, of this name), all either poor or doubtful; and even after making allowance for the dry season and the hot suns which were scorching Roses at that time, I do not believe any Rose of 1872, except Madame Lacharme, will last long in nursery lists.

Of older kinds—Abbé Brammerel, good as a garden Rose, is far too flat and rough for exhibition; André Dunand was blooming very freely; Baronne Louis Uxkull good, but I think it is too much extolled; Charlotte Corday and Charles Margottin were doing well, so were Henri Pages and Louise Corbet. Many of the whites of the Mdlle. Bonnaire type are very much alike, as Madame Noman, Madame Liabaud, Madame Freeman, and Virginal. The whites, in fact, seem divided into two types: one like Boule de Neige, Baronne de Maynard, and Madame Gustave Bonnet of the Noisette type, and the other of the H.P. type, inclined to a bluish centre, as Virginal. Richard Wallace and President Thiers disappointed me; the first was too hard in the bud, the second not so good as Countess of Oxford, which it somewhat resembles. Marquise de Mortemart was exceedingly pretty, though too flat, but the freshness of the newly-opening buds very beautiful. No Rose seems improving much more than Marquise de Castellane; it is good in habit and constitution, and will be sure to firmly establish itself with such well-known Roses as Charles Lefebvre, Alfred Colomb, Marie Baumann, La France, &c. Among very dark ones, Monsieur de Pontbrian was promising, with a very fiery centre, and Maxime de la Rocheterie would do were it not so flat.

These few remarks on Roses are very desultory, it is to be feared. I am glad "D." speaks so highly of S. Reynolds Hore. I have hitherto been afraid there was not sufficient size or substance for one to be called after the Rose king. Annie Luxton deserves all the praise he has given it; but I doubt if Bessie Johnson is as good as Abel Grand, from which it is a sport, and to which it has a tendency to revert.

The Roses at Mr. Smith's are all pinched back when making their first growth from the bud, so as to secure good and symmetrical heads; and in spite of the adverse season, the plants were looking healthy and well. The old-established sorts, as Gloire de Dijon, Maréchal Niel, Alfred Colomb, John Hopper, &c., were grown in great quantities, and the number of rows of each variety formed a test of public opinion with regard to them.

I cannot understand on what grounds Mr. Radclyffe praises up Edward Morren so much. I know it has occasionally a good bloom, but it is a rare exception; it is generally rough and coarse. Nor, again, why he should in 1866 designate Felix Genero and Madame Margottin first-rate, and call Annie Wood, Black Prince, Monsieur Noman, Princess Mary of Cambridge very good, as though inferior to the other two, whereas any one of the last four is better than the other two. I know he gave his flat once in favour of Felix Genero, and I ventured to doubt it, since which Felix Genero is always brought to the front by Mr. Radclyffe in any list he gives. I see occasionally good blooms, and it is useful in a stand as a contrast to others. What is there, again, to recommend in Madame Masson? Dull in colour, coarse, and flat. Why, again, omit such Roses as La France and Marie Baumann, and put in Madame Creyton and Thyra Hammerick? Well, I suppose opinions about Roses always will differ, but when we have Roses good in form and shape and colour, we do not want to go back to old flat, uneven, and ragged Roses, nor to adopt newer ones like Maxime de la Rocheterie, Vicomtesse de Vezins, and Abbé Brammerel, even though they be good in colour.

While on the subject of Roses, I do not think Mr. Camm need be afraid of quantity ousting quality at our English Rose shows. Masses of Roses shown as at a French show (as I saw last year, brought in tumbled together in hampers and baskets, and put into lumps of wet clay and rows of claret bottles) will not suit the English taste. We want perfection in bloom, and good opportunity to compare the varieties.

I can sympathise with Mr. Camm in the loss of his Peaches. Naturally I think them a good fruit, worth all the pains to cultivate. I recommend him a 2-feet glass coping and Nottingham net strained in front well off the wall, and kept on till the first week in June. The same treatment, with plenty of

guano water at the root, suits Maréchal Niel to perfection, and I hope that his clerical friends may once more pay him their annual visit under the united influence of Peaches and Roses.

I should have liked to have added more about Mr. Smith's nurseries, but they have already been well described in your pages. Suffice it to say that they will well repay a visit by anyone who is interested in almost any branch of horticulture, but more especially, I might say, they excel in fruit trees, there being nearly fifty acres devoted to trained trees, bushes, espaliers, &c., of all the best kinds of Apples, Pears, Plums, Peaches, Neectarines, and houses full of young Vines, &c. Mr. Richard Smith, too, has collected a most interesting variety of Oaks, and has also a wonderful collection of Acers of all forms and colour, including all the newer varieties of Japanese Maples. The nurseries, 150 to 160 acres in extent, are well and fully stocked with young plants from one end to another, and the long centre avenue planted with every variety of evergreen, and dotted with interesting deciduous shrubs, is quite unique in its way. However, it is not my intention, as I said to begin with, to attempt to give any adequate description of the nurseries. I have only written these few notes, being induced to do so by the remarks made on Roses in the last number of your Journal, as, though mine are desultory, I thought they might interest some of your readers. —C. P. P.

MADAME LACHARME ROSE.

I AM delighted to read in "our Journal" this week that my friend "D., Deal," thinks so highly of this Rose. I had determined not to bud a single stock with it this year, but as I have all my Manettis to work, I will give Madame Lacharme another trial. I speak, as my friend does, from what I have seen here and elsewhere. Neither in my own garden nor in the nurseries of Messrs. Cranston, Keynes, and Walters have I seen a good bloom of this variety, nor indeed has it been my good fortune to see one at any Rose show. With regard to Souvenir de John Gould Veitch, I saw some blooms at Salisbury which delighted me. The Rose is rather like Charles Lefebvre, but not of so velvety a texture. It reminded me very much of Mr. Paul's best, in my opinion, novelty—Wilson Saunders. But we require to work a new Rose, which has a good reputation, for a season or two before we can pronounce any judgment worth recording.

I am glad to see that "D., Deal," agrees with me in condemning the remainder of last year's novelties. I am surprised at Mr. Radclyffe's sticking to such Roses as Baronne Prévost, William Griffiths, Alexandrine Bachmeteff, and a host of other utterly useless varieties. Year after year he writes to you recommending Baron Chaurand as one of the very best dark Roses, and yet I can confidently say that I have never seen that Rose exhibited, and I do not know of a single large grower who cultivates it. Allow me to congratulate Mr. Radclyffe on giving up Madame Chirard. I went through his interesting list, each second expecting to meet the Madame, but she appears to have disappeared at last even from the garden of her one-solitary though staunch friend.

If such Roses as I have named above, and some others mentioned in Mr. Radclyffe's letter, as Pierre Seletsky, Madame Louise Carique, Madame Campbell, and Baronne Pelletan de Kinkelin are "the living dogs," then I prefer "the dead lions." There is one thing to be said about these living dogs—I know of no kennels whence they can be purchased. —JOHN B. M. CAMM.

THE FLOR DE ISABEL.—BARKERIA SPECTABILIS.

THIS genus contains but few species, but all of them are beautiful; in general appearance they resemble Epidendrums, and, indeed, saving the broadly-winged column, there is little to separate them from that genus.

The plant in question, as well as the other species which belong to this family, do not, I am sorry to say, receive that amount of attention at the hands of the amateur Orchid-grower which they merit. Not that I would infer that they are troublesome members, and require an extra amount of care, but one sees them really so seldom, even in collections devoted to "cool Orchids," to which Barkerias essentially belong, that it becomes quite a matter of surprise. True, these plants must be grown in a particular manner; again, they are deciduous, which has no doubt led in a great measure to their neglect, for without leaves they are not peculiarly ornamental.

but such reasons should not be sufficient to expel them from the cool Orchid house.

Barkerias should be grown upon pieces of rough wood, or, what is better perhaps, virgin cork, and they should be securely

fastened with copper wire until they fix themselves by their roots. There must not be any moss or peat used to cover the roots, as I have found they thrive much better without it. The roots are thick and fleshy, and whilst some attach them-

Fig. 51.—*BARKERIA SPECTABILIS*.

selves to the wood, others grow straight down, and with their large mouths drink-up ravenously the moisture from the atmosphere. It must, therefore, be well remembered by those who would succeed in their cultivation, that they require during the growing season an abundant supply of moisture in the atmosphere, and that although unattractive during the resting time, they must not be neglected, for if allowed to shrivel they will be sure to break weakly, and probably there will be no bloom to gladden the heart of the possessor. The coolest

house suits them best; indeed, they will melt away if subjected to great heat; and although they like abundance of air, a densely shaded situation is their delight.

The species which our figure is intended to represent deserves a place in every collection however small, whilst those who grow Orchids for exhibition purposes will find a good plant of it by no means a despicable object upon the table or stage when set-up for competition.

It is an erect-growing species, attaining a height of 9 to

12 inches, producing its leaves upon the stem in a distichous manner; scape terminal, erect, bearing from six to ten of its beautiful flowers, which are in the sepals and petals soft pink or lilac; lip of the same colour, but in addition more or less dotted and spotted with reddish crimson. It blooms during June, July, and August, and continues long in beauty if the blooms do not get wetted with water from the syringe. Native of Guatemala.—EXPERTO CREDE.

THE HERBARIUM.

HAVING read with much interest the article on the Herbarium in your Journal of the 30th ult., will you allow me to offer some additional remarks thereon? The eight new bricks proposed to be used as weights would, no doubt, be effective, but very cumbersome and clumsy, as frequent shifting is required; and the old newspapers are not so porous, and consequently do not absorb the moisture from the plants so quickly as the botanical paper commonly sold, and some expressly prepared, for the purpose. I much prefer, after many years' practical experience, two boards not so wide as 12 inches, and when the plants and papers are arranged the whole to be bound round with two leathern straps about the same as are used for travelling cloaks, as by means of the buckles with a little care a good pressure may be secured; and the apparatus altogether is much more portable, which is often a great consideration, and is very easily opened by merely unfastening the straps. If the straps are changed so as to be buckled the reverse of each other, they can, after being fastened, be strained tighter still. When the plants have been changed, the paper should be well dried in the sun or by a fire.—EDWARD COPLAND.

SALE OF THE MEADOWFRANK ORCHIDS.—The third and concluding sale of the Orchids which formed the grand collection of Thomas Dawson, Esq., of Meadowbank, near Glasgow, took place at Mr. Stevens's rooms on the 5th, 6th, and 7th inst., when the following prices were realised—viz., *Odontoglossum Alexandræ niveum*, with seven matured and two young growths, £6; *O. hystrix superbum*, with nine matured and two strong young growths, £6 6s.; *Oncidium cruentum magnificum*, with eleven matured and two young growths, with two flower stems, £8 10s.; *Vanda cærulea superba*, strong plant with twelve leaves, £7 17s. 6d.; *Oncidium cruentum Peleanum*, said to be the only plant in the country of the variety, four matured and one young growth, £6 10s.; *Zygopetalum maxillare Andersonii*, with eight fine pseudobulbs, very rich and brilliant in the violet colour, £6 10s.; *Cattleya speciosissima gigantea*, with seventeen fine pseudobulbs, £6; *Vanda Batemanni gigantea*, said to be the largest and finest specimen of the species in Europe—plant over 10 feet high, with four strong breaks, each a fine plant in itself, £13 13s.; *Angraecum eburneum superbum*, largest and best variety, plant with seventeen leaves and two breaks, each six to seven-leaved, £9 9s.; *Lælia anperbiens*, with fifty matured bulbs and several young growths, £9 19s. 6d.; *Odontoglossum Alexandræ*, nearly pure white variety, with twenty matured and four young growths, £7; *Odontoglossum radiatum majus*, extra fine plant, with eight matured and two young growths, £7 10s.; *Epidendrum vitellinum magnificum*, with thirty pseudobulbs, £6 6s.; *Cypripedium Fairrieanum*, plant with eight growths, fine and vigorous, £6 6s.; *Masdevallia Harryana*, Bull's blood variety of the collectors, £13 2s. 6d.; *Dendrobium cærulescens*, fine specimen, with two hundred pseudobulbs, £7 7s.; *Lælia Tuckeri*, £14 14s.; *Oncidium cruentum superbum*, with twenty matured pseudobulbs and four young growths, £8; *Lælia anceps gigantea*, £7 7s.; *Lælia anceps grandiflora*, £7; *Cattleya Trianae magnifica*, £7 17s. 6d.; *Angraecum eburneum superbum*, £11. In addition to the Orchids, fine plants of *Anthurium Scherzerianum* brought £9 9s., £9 19s. 6d., and £11 11s. The total amount realised was upwards of £1500, that at the previous sale being £3016 6s.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

THE season for gathering the main crops of Apples and Pears is now at hand; and it is not enough that the fruit is brought to perfection on the trees, it must also be carefully gathered and stored. The fruit-cultivator, who takes as much interest in studying the formation and texture of the many varieties of Apples and Pears as the ardent Orchid-lover or the enthusiastic florist in admiring and noting the distinguishing features of their

respective pets, has quite as many cultural difficulties to overcome before success crown his efforts. The insect enemies of the Apple and Pear are numerous, and constant watchfulness is necessary from the time the buds open until the fruit is gathered. A maggot similar to that which feeds upon the Rose buds attacks the fruit buds as they are opening: it must be destroyed by hand-picking. The larvae of the Lackey moth, which congregate together and form a tent-like covering to protect themselves from inclement weather, whence they issue forth to their work of destruction, must be disposed of in the same manner. In hot dry summers in our gravelly soil red spider is very troublesome; it sucks the juices of the leaves, causing them to become brown and to fall off before their time. Another maggot attacks the fruit, and it persistently follows up its attacks from the first formation of the fruit until it is gathered—even further than this, it follows it into the fruit room and burrows into it there. It would be a timely warning to say that no fruit that has been attacked by this pest should be left lying about on the ground, or even left on the trees to fall off. Far better is it to sacrifice all such fruit than to allow it to be a medium of propagating the marander. Then as to gathering and storing. Of the two it is a greater evil to gather Apples under than over-ripe, and the reverse is the case with regard to Pears. The latter fruit should be taken from the trees in different stages of ripeness, although the best-flavoured fruit will be that gathered when the pips have become about half coloured. Gathered earlier than this, the fruit will probably shrivel towards the stalk, and if allowed to hang later it will certainly be wanting in flavour. More especially will this be found to be the case with Pears that ripen after November. Pears that would be in season in December and January may be kept until March by allowing them to hang on the trees a month later than usual; but as to the flavour of such late-ripened fruit, the less said about it the better, although such Pears may be useful to make up dishes if there is other fruit on the table for the use of the guests. It is well that Apples should be ripe before gathering. We have sometimes been tempted to gather the fruit before the pips were brown, to prevent it from being dashed from the trees by wind and rain, but it does not keep so well as that allowed to ripen on the trees. Do not gather Apples unless the fruit parts readily from the trees. When it does so it ought to be gathered, otherwise great loss will result should a high wind arise. All fruit ought to be gathered dry, and handled as a careful poultry-keeper handles eggs for sitting from the choicest strain.

Several questions have arisen lately as to the best place and manner to store Apples. Ours are carried at once to the fruit room, and carefully laid out on shelves; we would not lay them out more than one layer deep if we could help it, but it is sometimes necessary to place three layers one above another. When this is the case there is considerable difficulty in picking-out decaying fruit without moving the sound specimens more than is necessary. Ran the Dutch hoe through the borders, as weeds had grown more than they ought to have done.

FRUIT AND FORCING HOUSES.

Vineries.—Until last week no artificial heat had been applied to the late house of Muscats, Mrs. Pince, &c., since June; and as we like to have the fruit ripe about the first week of September, it has been necessary to warm the hot-water pipes. With ventilation at front and back, the minimum temperature ranges from 65° to 70°, and a nice heat in the pipes causes a good circulation of air in the house, which tends to give flavour to the Grapes. When the houses were built, six or seven years ago, and the borders made, it was intended to widen the space for the roots, which was made up only 6 feet wide inside, and 9 feet outside. All the interior portion has been renewed, and it has now been decided to add 8 feet to the outside. The ordinary garden soil and gravel is being cleared out to the depth of 4 feet, which will allow 1 foot for brickbats and 3 feet for the compost, which will be turfy loam eight parts, rotted manure one part, and to every cartload of this 14 lbs. of crushed bones will be added. Though this alteration is being made, recent experience rather goes to show that the Vine will extend itself, and bear immense crops of fine fruit with a very limited root-space. When the space is confined, annual rich surface-dressings and frequent applications of liquid manure are necessary.

Early houses, from which all the Grapes have been cut, are oftentimes left without any attention to the wants of the Vines. All young growths that are made should be stopped; the border will be dry, and common sense suggests that a thorough good watering will cause the buds, whence comes the crop for next season, to develop themselves. The leaves will be dnaty, and even if red spider is not discerned at a superficial glance, a little investigation will probably show that it is present; whether or not, a good washing from the garden engine will be very beneficial to the Vines.

Cucumber and Melon Houses.—During the last two months very little artificial heat has been required for the Cucumbers, and none at all for Melons. With shortening days and a lower night temperature more attention must be devoted to the heating apparatus. At present the Cucumber house is kept at 70°

though the glass falls to 65° occasionally no harm will be done. Seeds should now be sown for the winter plants. It cannot be expected that plants which have been giving a supply of fruit all the summer, will continue to do so satisfactorily all the winter as well. They will bear all through if overcropping has been avoided, but it is short-sighted policy to trust to them. Our own plants are kept up by cuttings struck twice a year, so that one set of plants will bear a succession of Cucumbers for six months. Melon houses, where the fruit is ripening, require a dry atmosphere, and, as the year goes on, increasing watchfulness is necessary to develop the flavour of the fruit.

PLANT STOVE.

Summer-flowering Cattleyas, such as *C. Mossie* and *C. Warneri*, are now starting into growth. Most of the plants required repotting, and this has been done. The pots are filled nearly three parts full of crocks, using the rougher portion at the bottom and the finer at the top. Equal parts of very fibrous peat, chopped sphagnum, and potsherds are the best material for the roots to work into. Cattleyas and other species of Orchids have been sent to us when the potting material has been peat and decayed sphagnum, firmly compressed into the pot to three parts of its depth, and the result was that all the roots that penetrated into it died; a live root or two may be found at the bottom of the pot amongst the drainage, the life of the plants being sustained by roots rambling over the surface and twining their way down the outer surface of the pot. In fact, no Orchidaceous plant will thrive if potted in a mass of sphagnum and peat in too large a body, and without any admixture of broken pots to keep it open; sooner or later, according to the fibrous nature of the peat, the mass consolidates, owing to the decay of the fibre, and the roots perish.

Potting Ferns and fine-foliated plants. The leaves being kept in health and free from dirt constitutes the beauty of these; they must therefore be kept growing freely, and should the house become crowded it is better to throw some of the plants away than to spoil the beauty of individual specimens. Insect pests also more readily attack root-bound plants than they do those growing more freely. Proper potting material and a moist atmosphere, with a free use of the syringe when necessary, will maintain any plant in good health. Of course there are some Ferns, and fine-foliated plants likewise, that never ought to be syringed, but these the cultivator will soon ascertain for himself. —J. DOUGLAS.

TRADE CATALOGUES RECEIVED.

Dickson & Robinson, 23, Market Place, Manchester.—*Catalogue of Hyacinths, Tulips, Narcissus, Crocus, &c.*

A. M. C. Jongkindt Coninck, Tottenham Nurseries, Dedemsvaart, near Zwolle, Netherlands.—*Wholesale Trade List of Nursery Stock.*

Robert Parker, Exotic Nursery, Tooting, Surrey.—*Catalogue of Alpine and Herbaceous Plants, Bulbous Roots, Fruit Trees, &c.*

James Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, S.W.—*Catalogue of Hyacinths and other Bulbous Roots.*

W. Cutbush & Son, Highgate, London, N.—*Bulb Catalogue.*

B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, London, N.—*General Bulb Catalogue, Fruit Trees, Roses, &c.*

Francis & Arthur Dickson & Sons, 106, Eastgate Street, Chester.—*Catalogue of Dutch and other Flower Roots.*

Lawson Seed & Nursery Company, Southwark Street, London, S.E., and 1, George IV. Bridge, Edinburgh.—*Catalogue of Dutch Flower Roots, &c.*

TO CORRESPONDENTS.

It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

SITUATION (B. T. S. L.).—Write to Mr. Smith, Curator, Botanic Gardens, Kew, and to Mr. Sowerby, Royal Botanic Garden, Regent's Park. They will answer you.

THE WELSH FOR HYACINTH.—"T. G." obligingly writes as follows:—"In your correspondent 'G.'s' interesting paper headed, 'In and Out of Aberystwyth,' No. 3, August 13th, he says that the Hyacinth, *Cerin y brain*, means The Leek of Dignity, or King of Leeks! The proper translation of brain

would be 'Crow's.' King would be *Breun*, an entirely different word. *Cerin y brain* means, therefore, Crow's Leek." In reply, "G." says that in Spurrell's Welsh Dictionary, "braint" is translated "dignity," and "bran" is a "crow." "G." thinks it much more likely that the first title was applied to a flower of beauty.

HAND BOUQUETS.—"Exhibitor" wishes to know at what show a five-guinea cup is offered for the best-arranged bouquet for the hand, and the secretary's address.

ARON'S BEARD (—).—This is a popular name of the Large-flowered Tutsan or St. John's Wort, *Hypericum calycinum*. The Bearded St. John's Wort, *H. barbatum*, is totally different.

IMPROVING A HEATHY PASTURE (A Ten-years Subscriber).—As you do not wish the turf disturbed, and under ordinary circumstances it would not be advisable to do so, we should recommend the heath to be cut off a little below the surface by a sharp spade, or, what is better, a half-mattock hoe made tolerably sharp, taking care to cut away as little of the turf as possible. After removing the heath a few hay seeds may be sown on the bare places, and if a little fine soil can be had cover them with it. We like the beginning of September as well as any time for sowing grass seeds, as they will come up and form a good covering during the autumn, and the whole of the ground might have a good dressing of manure or compost during the autumn or winter. If the turf is mossy, or is of a harsh unpalatable kind, a good harrowing before the compost is put on will do good, as it will break up the tough decayed herbage and encourage fresh. All such dressings should be free of stones, or contain as few as possible; and if of a rough kind the earlier in the autumn they are put on the better, so as to mellow-down by the frost during winter. It is hardly necessary to say that after the compost or dung has been on the ground some time it will require to be more finely broken either with a chain-harrow, or with what is called a brush-harrow, which is a frame of some kind about the size of an ordinary gate, interwoven with suitable pieces of Hawthorn or other hard-wooded tree, and then drawn over the land with a horse. If the land is poor you may apply from thirty to forty one-horse loads of manure to the acre, the latter quantity being as much as turf will bear without destroying it in places, which it is not advisable to do.

POT PLANT (N. B. W. S.).—You could not interpret "a pot of Lilies" as a pot plant, unless the pot contained a single bulb only. "A pot plant" is a single plant in a pot when the term is used in connection with an exhibition schedule, and the same rule ought to be applied to Lilies as to any other plant when this term is used. If it is desired to have as good a show as possible of a Lily in a single pot, then the term "a pot of Lilies" ought to be used in the same way as is done in the case of Lily of the Valley or any other plant which is reproduced by rhizomes and bulbs.

SEEDLING BRIAR (P.).—"I know of no one who sells them. Certainly Mr. Prince cannot spare any of his. I do not know of any other nurseryman who cultivates the seedling Briar. What your correspondent had better do is to save his own Briar seed, and have patience, for it will require a precious lot of this virtue to cultivate the seedling. It never occurred to me that anyone would think of purchasing the seedling Briar stock. What I recommended was the purchase of a certain number of Roses worked on the seedling Briar. Of these your correspondent can obtain any number of Mr. George Prince, Market Street, Oxford.—JOHN B. M. CAMM." [See also what Mr. Mayo says in a previous page.]

MARÉCHAL NIEL OR GLOIRE DE DIJON ROSE FOR STOVE (Marlow).—Neither will succeed in a stove, especially as they would be planted in a wet border and shaded by plants on a stage in front. The best plant for such a position in a stove is *Cissus discolor*, but it requires to have the soil rather dry in winter when it is leafless. An evergreen covering for such a wall would be *Ficus elastica*, the most accommodating plant known.

BOTTLE-BRUSH PLANT NOT FLOWERING (Idem).—Give it a light and airy position in the greenhouse, repotting in spring when it begins to grow, watering copiously when in free growth, and only moderately when the growth is complete, and it will flower when it is sufficiently strong. The pruning should be confined to the removal of irregularities of growth.

CUTTING-DOWN LAVENDER HEDGE (H. G. M.).—If your hedge has become bare of young wood at the bottom, having no young shoots, it is likely if it were cut back to the old brown wood that it would not shoot again, but die. We lost a great many bushes by such a proceeding a few years ago, and we have since cut back only to within an inch or two of the old wood.

SEEDLING CYCLAMEN PERISCIUM TREATMENT (H. N. O.).—Pot them off singly at once in 3-inch pots, and place in a frame, keeping close, moist, and shaded until established, then admit air and light. When the pots become full of roots shift the plants into 4½-inch pots, and remove them to shelves in the greenhouse, keeping moist. They will hardly be sufficiently strong for flowering next spring, though some may do so, and most would were they wintered in a stove or warm greenhouse, so as to keep them in freer growth. Place in a frame after May, and water moderately, only just keeping the soil moist. In August they will again be growing, and should be shifted into 6 or 7-inch pots, and removed to the greenhouse in September. They will flower well in the following winter and spring.

NORTHERN SPY APPLE GRAFTING (Idem).—The trees of this we presume are not on their own roots, but worked on the Crab or Paradise stock. In either case you may graft upon them any kind of Apple you wish, with every prospect of success. The Northern Spy being a late grower will not injuriously affect the growth of the kinds worked upon it.

TACSONIA VAN-VOLKXEM NOT FLOWERING (Idem).—Your plant does not flower because it is not sufficiently advanced in growth. Could you not plant it out, or give it more root space? It would grow more freely; and the shoots being trained out at full length, and about 4 to 6 inches apart, and 9 inches from the glass, ought to flower freely. With us it flowers most of the year, but principally late in summer, autumn, and during the winter.

VIOLA CORNUTA ALBA AND BLUE PERFECTION IN BORDER (T. F. P.).—You may keep the plants where they are for another year, cutting away the flowering parts in autumn, and top-dressing with rich soil. Shoots will come from the base, which should be preserved, but cut off any straggling growths so as to give a neat appearance. We should put in cuttings now, in a shady border of light soil, to be kept moist. The cuttings ought to be of the shoots which come from the base of the plants. They will be used plants for planting by October, and will be available for next spring and summer bloom.

PROPAGATING VARIEGATED ARABIS (Idem).—Now or early next month slip off the shoots, each separately, from the stem it originates from, and insert them about 2 inches apart in rows 3 inches asunder, in light, moderately rich soil, in a shady border, and up to the leaves, keeping moist. They will be well rooted by spring, and may be moved to where they are to remain.

STOVE PLANTS FOR WINTER FLOWERING (D.).—*Echea fulgens*, *Anthurium Scherzerianum*, *Apelandra avaritaca* Roeblii, *Burchellia capensis*, *Ceratopogon* *Lucaeana*, *Conoclinium ianthinum*, *Dalechampia Noebliana* rosea, *Eranthemum pulchellum*, *Euphorbia jacquiniiflora*, *Franciscia calycina* major, *Gardenia citriodora*, *Gesnera exoniensis*, *Ipomoea Horsfallii* (climber), *Madettia bicolor*, *Monochatum ensiferum*, *Plumbago coccinea* superba, *Poinsettia pulcherrima* and vars. *alba* and *major*, and *Thysanotus rutilans*. *Begonia hybrida* multiflora, *Ingramia*, *insignis*, *maicata*, *fuchsoides*, and *nitida* are good free-flowering winter plants. Of Orchids—*Calanthe vestita*, *Barkeria Skinneri*, *Cologyne cristata*, *Lycaste Skinneri*, *Odontoglossum Pescatorei*, *Phajus grandifolius*, *Odontoglossum Alexandrie*, *Dendrobium nobile*, *Epidendrum tigrinum*, *Cypripedium barbatum*, *Miltunia Warscewiczii*, *Zygopetalum erinitum*. The best Roses for forcing are the Tea-scented and Hybrid Perpetuals.

EVERGREEN CLIMBER FOR SHADED WALLS (Terandah).—There is but one plant close-growing and clinging to the wall like Ivy—viz., *Ficus repens*, which would probably succeed, the roots being in the open ground. *Escalonia mucrantha* and *Garrya elliptica* are fine for a south wall, but they would need to be secured to the wall by shreds and nails, or be tied to a trellis.

FIG-TREE CULTURE (A Young Gardener).—Your treatment as described to us is sound, but their having the roots under the path is not good, as they must in summer be deprived of moisture, and this is probably the cause of the fruit falling before ripening. Could you not make holes with a crowbar in the walk, and into these pour water two or three times during summer? It is not good practice to shorten the shoots of trees out of doors; a better practice is to thin-out the long and bare shoots, replacing them with fresh.

STRAWBERRIES IN POTS (Idem).—Do not place them in the house as soon as they have perfected the growth, but pack them in ashes outdoors until January or February, or when you commence forcing, then introduce.

MARROWS OF LORNE CUCUMBERS CROOKED (Tomlin).—It is difficult to account for the fruit being crooked, but they are disposed to be crooked when the bottom heat is deficient and the growth not free. The fruit may be kept straight by placing them whilst young in glass tubes, which are sold by most dealers in horticultural requisites, or could be procured to order. Three pieces of half-inch deal nailed together, so as to form a box without a lid and open at the ends, answer very well; the fruit being laid in them after it begins to swell. They require to be about 3 inches wide and deep.

QUEEN ANNE POCKET MELON (Idem).—Your plants must have been strong when planted, and have done remarkably well, setting the fruit quickly. We have no experience of Melons being planted so late and producing fruit so quickly as yours have done. We agree with you that Queen Anne Melon fully ripe is most beautiful.

MELONS DEFICIENT IN FLAVOUR (A Lady in Cheshire).—There is much in the power of the Melon-grower as regards imparting flavour to Melons. Being grown in a house with Cucumbers is sufficient to account for want of flavour. Melons when ripening require to have the soil and atmosphere drier than for Cucumbers, and on this account it is not desirable to grow both in the same house. The shrub of which you sent us a specimen is *Symphoricarpos racemosus variegatus*. The back numbers of this Journal may probably be disposed of through a bookseller, or an advertisement in our columns.

PINES NOT FRUITING—GLASS GREEN PAINTED (Britannicus).—We do not wonder at the plants becoming drawn and not fruiting in the midst of so much gloom. We should have them potted at once, the paint removed from the glass, and they will probably start for fruit early next year. Slight shade is not amiss for Cucumbers or even Melons when growing, though when ripening they cannot have too much light. The intense gloom caused by the coating of the glass with thick green paint is sufficient to cause them not to do well.

PESTROYING SNAILS AND SLUGS (Willington).—Sprinkle quicklime over the plants and over the ground in the evening just before dark or early in the morning, and this repeated a few times after rain or heavy dew will effectually clear them. It is best done in moist weather after a rainy day, as they are then most active.

SHEEP BARKING ORCHARD TREES (Idem).—Mix equal proportions of cow dung and lime together, with water, to the consistency of paint, and apply to the stems as far as the sheep can reach. It will keep them from barking the trees, but will need to be renewed. There is a composition to prevent hares and rabbits from barking trees, and it would no doubt answer for sheep. It may be had of most nurserymen.

WALCHEREN BROCCOLI HEADING PREMATURELY (A. E. G.).—It is due in a great measure to the plants having remained too long in the seed bed, the check on planting being great, which causes the premature heading. Prick them out when they show the second rough leaf, and plant out when they are stiff sturdy plants, before they become drawn and weak, watering well.

VINES GROWING IN PIT (S. E. T.).—Of the places you name, the greenhouse would be the best suited for Vines, but as you have pits at the sides you could not well provide a suitable border. The span-roofed pit would answer for a couple of Vines, a proper border being made for them outside, the stems introduced through a hole in the wall, the portion outside being protected with a hayband. A Black Hamburgh and Buckland Sweetwater, the one a black and the other a white Grape, would be suitable. Our "Vine Manual" will suit you, price 2s. 6d., or free by post, 2s. 7½d.

STACKING PEA HAY (Sahib).—The haulm of any Pea may be kept for months if thoroughly dried before it is stacked.

WATER IN HEATING APPARATUS (Rus).—It may be not only heated to 170°, but to 212°. We do not know the graduation of a brewer's thermometer, but we presume it is on Fahrenheit's scale, and capable of showing the temperature of boiling water.

THRIPS ON VINES (A County Dublin Reader).—The leaves you sent are attacked by thrips. The remedy is to thoroughly fill the house with tobacco smoke, choosing a calm evening, shutting up the house closely, and having the floor moist. It will be necessary to repeat the fumigation every alternate evening for a week, and in about a week after the last fumigation examine the leaves carefully, and when any of the insects are seen again fumigate.

NAME OF PEA (J. Halstead).—It is impossible to name Peas from the pod only; the plant throughout its growth needs to be seen.

NAME OF FRUIT (S. L. E.).—Lord Suffield.

NAMES OF PLANTS (R. J. S. B.).—1, *Heeria rosea*, Tr.; 2, *Physianthus albus*, Bot. Mag., 3231. (R. J. W.).—*Polypogon monspeliensis*. (Britannicus).

—Many thanks for the last. 1, *Thuopsis borealis*; 3, *Abies Menziesii*. 4, *Abies orientalis*; 5, *Taxus adpressa*; 6, *Abies Nordmanniana*. (A Juvenile).—It seems a *Scirpus*, but we cannot name it unless we see the flower.

POULTRY, BEE, AND PIGEON CHRONICLE.

FRENCH POULTRY IN ENGLAND.

CONSUL HOTHAM, the British representative at Calais, in his last report to the English Foreign Office on the trade of Calais, refers to the attempts which have not unfrequently been made to introduce French poultry into England. This has been done under the impression that with proper care and management these fowls may become a fair source of profit, as far, at least, as eggs are concerned. Mr. Hotham has not yet, however, succeeded in discovering that the French hen, when removed from her native land, has behaved herself with that productive alacrity which distinguishes her in many, though not in all parts of France. The Consul has been informed, and for many reasons he is inclined to believe, that the reason of this is to be found in the following circumstances:—In the neighbourhood of Calais, as well as near Boulogne, there exists a marked quantity of silex in the soil, highly favourable for egg-laying purposes; remove the fowls from this peculiar soil, and their excessive fecundity ceases, and that this is the case is well known. At Amiens, again, this same quality of soil is found, and the poultry from the district are remarkable for their laying qualities; "indeed," continues the Consul, "perhaps they are the most celebrated 'layers' in France." If, therefore, the same breed lay better in one part of France than another, it is not unreasonable to suppose that the change of soil is the principal cause of attempts having hitherto failed to transplant French poultry into England for commercial purposes. Otherwise, Consul Hotham thinks, it surely would be worth our while to turn our attention seriously to the subject, instead of importing hundreds of millions of eggs yearly from France. The reason sometimes given of our climate not being suitable for poultry is, with all due deference to those who advance that theory, more fanciful than real; for, however much our climate may be abused, there are many districts in the south of England which, without a doubt, might compare favourably with the north coast of France, and as to the expense of keeping poultry, the egg-dealers in Calais state that they hardly feed them at all, but let the fowls run about and pick up what they please in the fields and hedgerows. Consul Hotham believes the whole secret to be in the quality of the soil. Whether this could be successfully made up to the French fowls in England by artificial means, is a matter which he is not prepared to discuss. (Land and Water.)

[We think "Consul Hotham," though correct in his facts, is quite wrong in his inferences. Silex is the predominant constituent of all cultivated soils, therefore the French fowls would not lack this aid in England. We do not admit that they are more egg-prolific than many other breeds are in England; but the real reason why so many eggs are imported from France is that its peasantry more generally keep fowls than they do in England, and sell the eggs in quantities too large for home consumption. In England a labourer who keeps fowls eats most of their eggs, and rears chickens from the surplus.—Eds.]

PRODUCTIVE DUCKWING GAME BANTAMS.

I HAVE a pair of Game Duckwing Bantams. The hen began to lay in the middle of last December, and up to the present date (August 13th), she has laid 135 eggs. Is that a usual occurrence? I had a brood hatched on the 14th of last April, three of which were pullets. Two of them have laid this day their first egg; they will be only four months old to-morrow. Is not this also very early for Bantams?—J. STOKES, Ipswich.

[Such laying as you describe is not by any means a common occurrence, but is nevertheless greatly to be desired. The two pullets you mention have begun to lay at the earliest possible period—viz., sixteen weeks. These events are the more to be noted, because they happen to be a sitting breed. Among the non-sitters we not unfrequently hear of large numbers of eggs laid during the year, but we do not hear of their laying so early.—Eds.]

BLACKPOOL POULTRY SHOW.

This was held in connection with the Agricultural Show, on the 12th inst. The awards made by the Judge, Mr. Fisher, of Leeds, were as follows:—

SPANISH.—1 and 2, J. Leeming, Brimington, Preston.
DOBERGERS.—1, J. Robinson, Garstang. 2, W. H. King, Rochdale.
COCHINS CURRA.—1, H. Tomlinson, Birmingham. 2, J. Robinson.
GAYS.—1, C. W. Brierley, Middleton. 2, J. Leeming.
HAMBURGERS.—*Golden-spangled*.—1, J. Robinson. 2, G. & J. Dackworth, Church. *Silver-spangled*.—1 and 2, J. Robinson.
HAMBURGERS.—*Golden-pencilled*.—1, J. Long, Bromley Common. 2, J. Robinson. *Silver-pencilled*.—1, J. Robinson. 2, J. Long.

ANY OTHER VARIETY.—1, T. F. Ansdel, St. Helens. 2, J. Robinson.
 BANTAMS.—1, E. F. Addie, Preston. 2, G. Anderson, Accrington.
 GAME.—Cock.—1, J. Laming. 2, C. W. Brierley.
 DUCKS.—Aylesbury.—1, J. Robinson. Any other variety.—1 and 2, H. B. Smith, Doughton, Preston.
 GEES.—1, G. H. Catterall, Lytham. 2, T. Fare, Skippool.

HEREFORD POULTRY SHOW.

THIS Show proved a most successful one, so much so that the most practical amateurs confessed the competition was much greater than they had anticipated. We can with justice speak very highly of the general arrangements and the attention paid to the specimens, the only drawback being that some of the high-class breeds of Pigeons were placed decidedly too high from the ground for comfortable inspection by either visitors or Judges, a mismanagement that only interfered with the general appearances of the Show. Three tiers are always to be avoided if possible, more particularly if placed upon the poultry pens.

Grey *Dorkings* were very good, Mr. Walker's first-prize-and-cup bird being penned in admirable condition for the time of year, and it also was especially good about the feet for so large a bird. Messrs. Burnell and Darby had an especially close run in hens, as both of the prize pens of *Dorking* hens were so good, we could see but little for choice between them. In *Dorking* cocks of any other variety Mrs. Bailey's very true-feathered cock, a grand Silver-Grey, stood very far ahead of its rivals; for purity of colour it has but very rarely been equalled. The second-prize was also a Silver-Grey, but infinitely inferior. The remainder were White *Dorkings*, but shown in anything but good feather, whilst most of them proved unusually faulty in combs. In the hens a very nice pair of Silver-Greys, exhibited by Mr. Cresswell, took the first prize, and two pens of superior White hens were second and highly commended. The entry of Dark *Brahmas* cocks consisted of only four pens, the first prize being won by a really good one, but the second-prize pen was not of remarkable excellence. In pairs of hens or pullets Mr. Edwin Pritchard had an easy win with a lovely pair of Dark pullets, also securing the silver cup allotted to Dark *Brahmas*. They were one of the chief attractions at Hereford. As might be anticipated in this neighbourhood, the Light *Brahmas* were heavy classes of good well-shown birds, Mr. Dean taking first for cocks, and Mr. William Harris that for hens with a specially fine-plumaged pen of pullets that also secured the cup for the best pen of this fashionable variety. Mr. Henry Tomlinson took both first prizes in the cock class, also for hens in Buff *Cochins*, the hens taking the cup. These latter birds were well shown; the cock, however, was certainly not looking so well as he has done heretofore. Mr. Winwood and Mr. Bloodworth were the respective second-prize winners with very fine pens. White *Cochins* and a pen or two of excellent Partridge-coloured were much admired. The *Game* fowls throughout could not be spoken of highly, the majority of them being in heavy moult. A large entry of first-class *Hamburgs* proved a general attraction, a pen of Golden-spangled taking the cup, the hen being of an extraordinarily clear and rich ground colour. *Spanish* and *Houdans* might easily have been of a better character. Why it was so seems an enigma, with very fair prizes offered; but only two pens of *Game Bantams* were entered, and neither of them really high-class birds. The Black *Bantams* and the Silver-laced *Sabretrons* were unusually perfect. Really good Malays and Black *Hamburgs* were shown in the Selling cock class, and very fine Dark *Brahmas* and White *Cochins* in the hen class. So very indifferent were the entries of Pencilled *Hamburgs* in the Any other variety cock class (a Selling class), that the prizes were withheld altogether; the hens were, however, praiseworthy. Black *Spanish* and Black *Hamburgs* being the prizewinners.

Of *Ducks* of every kind, *Geese* both White and Grey, and *Turkeys*, few, if any, shows could boast of better, and we cannot but specify the cup-winning Turkey hen, she being one which from her large frame was a treasure to any Turkey-breeder. Buenos Ayrean *Ducks* took first position in an exceedingly well-filled class against many capital pens of fine-plumaged Waterfowls of the choicest kinds. Mr. Walker's *Geese*, both Embden and Toulouse, were remarkably well shown.

Pigeons were unusually good, as may be well imagined when we say Mr. Fulton and Mr. Spencer were the most important competitors. Almost every breed of Pigeons was represented by the best birds to be met with, and the generality were sent in excellent condition; but, as may be gathered from what has been before stated, a great portion of the attractiveness of this division of the Show was lost from the pens being placed far above the heads of most of the visitors.

(From a Correspondent.)

THIS Show was held on the 11th, 12th, and 13th of August in a large tent in the grounds of the Agricultural Society, and proved a great success. There was some little delay in penning the birds, but this was caused by the carpenters being behind time with their staging. The birds were well attended to, but we should have preferred to have seen more soft food given them,

and less whole maize and barley. The two most experienced Judges were employed, and as usual, when such is the case, general satisfaction was given to exhibitors. Mr. Birch, the Honorary Secretary, cannot be too "highly commended" for his attention and courtesy.

Coloured *Dorkings* came first. In this, as in the other classes, adult birds and chickens competed together. The prizes were given to two grand adult birds about equal in weight. The first-prize bird was in the best condition, but the second was certainly the better *Dorking*, being short, broad, and deep, while the cup bird was leggy. A forward cockerel was highly commended. In Coloured hens first were old birds, in good condition for the time of year; second, splendid chickens, which we should have liked to have seen put first. Mr. Walker's hens were large, but in dreadful feather. In the Variety *Dorking* class both prizes were given to Silvers. The second was the larger bird, but the first the best colour. A White cock deserved notice. In hens, first were large Silvers, second very good Whites. In Dark *Brahmas* the first prize went to a promising chicken, while the cup Dark *Brahma* pullets we have rarely seen equalled, being good all round; they were claimed at £25, and went to the north of England. The second-prize pullets were rather light in the throat, but far too cheap at £2; they were quickly snapped-up by a "knowing one." Mr. Dean's Light *Brahma* cock again took a first prize, but he was in a woeful state, and sadly requires a new suit. The second-prize bird was in better feather, but rather yellow. Mr. Lingwood showed an enormous cockerel of the American pattern sadly wanting in chest. We liked his second-prize pullets much, quite as much so as those that won. Buff *Cochins* were good, especially the second-prize pullets, which were claimed at seven guineas, and will be cheap if they do not become "mealy-winged." In the Variety *Cochin* cocks first was a White, second Black; while Blacks won first in hens, White chickens second. One of Mr. Feast's White hens was found dead on arrival. Surely, from the way this exhibitor sends his birds about from show to show without anyone to look after them, he must be very deficient in common humanity, to say the least of it; he has had several hints on this subject, but does not seem to be able to take them. We hope no more will be required. *Game* were poor, if we except the cup pen. In *Hamburgs* a local exhibitor won the cup in good competition. The first-prize *Crev-Ceurs* were particularly praiseworthy. In *Dantams* the first-prize Blacks were extra good, particularly in earlobe. Some good Silver-laced chickens were shown, and deservedly won a prize.

Ducks, *Geese*, and *Turkeys* were all good classes. In the Local classes a protest was lodged against the first-prize birds winning, as, though exhibited by a local man, they were found to be borrowed, a plan we do not at all admire.

DORKINGS (Coloured).—Cock.—1 and Cup, J. Walker, Spring Mount, Rochdale. 2, A. Darby, Baschurch. *he*, T. C. Burnell, Micklethorpe. *c*, E. Shaw, Plas Wilford, Oswestry. *Hens*.—1, A. Darby. 2, T. C. Burnell.

DORKINGS (Any other variety).—Cock.—1, Mrs. H. T. Bailey, Tenbury. 2, T. C. Burnell. *Hens*.—1 and *he*, O. E. Cresswell, Earlywood, Bagshot. 2, A. Darby.

BRAHMAS (Dark).—Cock.—1, Hon. Mrs. A. B. Hamilton, Ridgemoor, Woburn. 2, J. Watts, Hazlewell Hall, King's Heath, Birmingham. *Hens*.—1, E. Pritchard, Tettenhall. 2, W. Plummer, Holmer, Hereford. *he*, H. B. Morrell, Cemaaw, Clyn.

BRAHMAS (Light).—Cock.—1, T. A. Dean, Hereford. 2, Mrs. A. Williamson, Leicester. *he*, T. A. Dean; Horace Lingwood; J. Rooke. *c*, M. Leno, Markyate Street. W. H. Mitchell, Moseley, Birmingham. *Hens*.—1 and Special Cup, W. Harris, Bridgend. 2, Horace Lingwood. *he*, T. A. Dean; W. H. Mitchell; Mrs. A. Williamson. *c*, E. Kendrick, Jun.

COCHINS (Cinnamon and Buff).—Cock.—1, H. Tomlinson, Gravelly Hill, Birmingham. 2, E. Winwood, Worcester. *he*, A. Darby; C. Sulzwick; Ryddenden Hall, Keghly. *c*, J. Bloodworth, Cheltenham. *Hens*.—1 and Cup, H. Tomlinson. 2, J. Bloodworth. *c*, C. Bloodworth; H. Feast.

COCHINS (Any other variety).—Cock.—1, Mrs. A. Williamson. 2, H. Feast. *Hens*.—1, A. Darby. 2, C. Bloodworth.

GAME (Black-breasted Red).—1, J. Mason, Worcester. 2, J. J. James, Sketty, Swansea. *he*, W. Jones, Worcester.

GAME (Any other variety).—1 and Cup, C. W. Brierley, Middleton, Manchester. 2, E. Winwood.

HAMPSHIRE (Golden or Silver-spangled).—1 and Cup, Mrs. G. M. Rolls, Hendre Morrhay. 2, J. Long, Bromley Common. *c*, P. Hanson, Wheatonhurst, Stanchouse.

HAMPSHIRE (Golden or Silver-pencilled).—1, P. Hanson. 2, J. Long. *c*, H. Feast.

CREVE-CEURS.—1 and Cup, J. J. Malden, Biggleswade. 2, H. Feast. *Houdans*.—1, G. W. Hibbert, Godley, Hyde, Manchester. 2, D. Lane, Hardwick, Gloucester.

PANISH.—1, E. Winwood. 2, H. Feast.

POLISH.—1, C. Bloodworth. 2, H. Feast.

BANTAMS (Game).—1, A. Darby. 2, H. Feast.

BANTAMS (Black).—1, J. Walker. 2, R. H. Ashton, Mottram. *he*, H. Feast.

BANTAMS (Any other variety).—1, M. Leno. 2, J. Lloyd, Kingston, Herefordshire. *he*, J. Bloodworth; J. Watts.

ANY OTHER VARIETY.—1, C. Sidwick (Black *Hamburgs*). 2, Rev. N. J. Ridley, Hollington, Newbury (Malays). *he*, Rev. A. G. Brooke, Shrawardine; H. Feast; J. Long.

SELLING CLASSES (*Brahmas*, *Cochins*, and *Dorkings*).—Cock.—1, J. Walker (Partridge *Cochin*). 2, T. A. Dean, Marden (Light *Brahmas*). *Hens*.—1, T. A. Dean. 2, C. Bloodworth. *c*, T. A. Dean; J. Bloodworth.

ANY OTHER VARIETY.—Cock.—Prizes withheld. *Hens*.—1, E. Winwood. 2, E. Slake, Bromfield, Salop.

LOCAL CLASS.—1, Mrs. T. A. Dean. 2, Mrs. H. T. Bailey. *c*, C. J. P. Nash, Blakeney, Hereford.

DUCKS (Aylesbury).—1, Cup, and 2, J. Walker. *he*, Mrs. H. J. Bailey; S. R. Harris, Cusgarne; T. Sear, Aylesbury. *c*, H. Feast.

DUCKS (Rouge).—1, J. Walker. 2, T. Wakefield, Golborne.

DUCKS (Cabo).—1 and *he*, Mrs. H. T. Bailey. 2, T. Wakefield.

DUCKS (Any other variety).—1, J. W. Kellaway, Merston, Isle of Wight. 2, M. Leno. *he*, M. Leno (2); C. H. Mayo.

GEES (Grey or Mottled).—1, J. Walker. 2, Mrs. H. T. Bailey.

GEESSE (White).—1 and Cup, J. Walker. 2, Mrs. H. T. Bailey. *hc*, Mrs. W. Berrow, Alconbury; Mrs. A. Dugham, Ross.
 TURKEYS.—Cock.—1, Rev. N. J. Ridley. 2, Mrs. H. T. Bailey. *hc*, A. Armitage, Radnor. *Hen*.—1 and Cup, Rev. N. J. Ridley. 2, E. Kendrick, jun.
 SELLING CLASS.—Ducks.—1, J. Walker. 2, T. Sear.
 LOCAL CLASS.—1, Mrs. H. T. Bailey. 2, C. J. P. Nash.

PIGEONS.

CARRIERS.—1 and Cup, P. R. Spencer, Hereford. 2, S. D. Baddley, Hereford.
hc, R. Fulton, Bruckley Road, New Cross; J. James, Bath (2); P. R. Spencer.
 POUTERS.—1 and 2, H. Pratt, Hampton-in-Arden. *hc*, Rev. W. C. Ballen, Bath; Mrs. Ladd, Calne; P. R. Spencer.
 ANTWERPS.—1, P. R. Spencer. 2 and *hc*, H. Gough, Wolverhampton.
 BARBS.—1, R. Fulton. 2 and *hc*, P. R. Spencer. *hc*, G. H. Gregory.
 FANTAILS.—1, P. R. Spencer. 2, G. Holloway, jun., Stroud. *hc*, R. Fulton; J. F. Loversidge, Newark.

 TRUMPETERS.—1, R. Fulton. 2, P. R. Spencer.
 TUMBLERS.—1, R. Fulton. 2, P. R. Spencer. *hc*, R. Fulton; P. R. Spencer.
 ANY OTHER VARIETY.—1, R. Fulton. 2 and *hc*, P. R. Spencer.

JUDGES.—Mr. Hewitt, Birmingham; Mr. Teebay, Fulwood, Preston.

THE POULTRY-KEEPER.—No. 15.

THE SPANISH HEN.

THE hen has nearly the same characteristics as the cock. She is sprightly, and holds up her head and tail proudly. Her plumage is like that of the cock, but the iridescence is less varied and brilliant.

Weight.—5½ lbs., a little more or less.

Head (fig. 52).—Delicate, sprightly, and of rather small size.

Comb.—Long, finely denticulated, bent near the base, and falling on one side of the head without touching the cheeks.

Wattles.—Long and round.

Ears.—Large and white.

Tuft.—Larger than the cock's.

Cheeks.—White like those of the cock, but without the wrinkles, and scattered over with small black feathers, imperceptible at a distance.

Nostrils.—Ordinary.

Beak.—Like that of the cock.

Eye.—Iris, red; pupil, dark chocolate.

Feet and Toes.—Ordinary, somewhat long.

Laying.—Excellent; eggs white, very large and delicate; non-sitter.

GENERAL OBSERVATIONS.

This variety is of remarkable beauty as a fancy bird, and of great fecundity; it may be added, also, that it is excellent for the table.

The cock is an admirable bird, contrasting with all the other varieties, and the hen lays very many large milky-white-shelled eggs, and of an exquisite flavour. The flesh is very abundant, of a remarkable flavour; the skin white and fine. The comb, by its shape and the contrast of colour, is a very peculiar ornament. The comb is very tender in cold seasons, and may be destroyed by even a slight frost if the birds are not shut-up in time; therefore this fowl is only to be recommended for warm localities. The chickens are covered with a bluish black down, marked with white, which comes off, and often leaves them naked. They are extremely susceptible of cold, and take a long time to feather. It is not till they are five weeks old that they begin to have feathers, which first appear on the back, and the birds are not entirely feathered till about two months and a half old. They decline much when the large tail feathers begin to grow, which takes place at the fourth month. The colour of the skin is fine, and they can be set free at the end of five or six months; a projecting breast and long limbs give the bird a disadvantageous aspect, and but an erroneous idea of the quality and abundance of its flesh.

The old, like the young ones, feel much the moulting, and their productiveness makes them always irritable. The rearing of the chickens must be watched very carefully, and especially during the first six weeks, and they require delicate food, given often and in small quantities. The hen will lay six eggs a week from February to August, and from November to February three eggs a week, smaller than those of the summer. If the poultry-yard is well sheltered they commence laying at five months old, and continue to do so during the winter. The eggs can only be sat on in April. The white on the face appears more with the cock than the hen, and modifies according as the bird is more or less amatory.

The pure black colour is the only one very much esteemed. When one has been imprudently exposed to too low a temperature, and the comb is frozen, which may easily be seen by its black colour, care must be taken before putting it again into a warm place, to directly rub the affected part with snow or ice till it becomes red again.

There are some varieties. The *Minorca*, of which the cheek of neither the cock nor hen is white, though the ear is the same as

Fig. 52.

Spanish Hen's Head.

in the Spanish. It is higher on the feet, and preferable for the table on account of its more rounded form.

The *Ancona* like the *Minorca*, if it were not that the plumage is sometimes white, sometimes black, and sometimes partridge.

The *White Spanish*, which is none other than albino reproducing black.

The *Andalusian*.—Cock from 6½ to 7½ lbs. Hen from 5½ to 6½ lbs. Colour of feathers slate or greyish blue. Feathers of the hackle, back, tail, the upper coverts of the wings and shoulders, vary between slate grey, black, and ringdove. Feathers of the thighs, the throat, the under coverts of the wings, slate or greyish blue. The plumage of the hen is all over bluish grey. The comb of the cock is very high and very large, also that of the hen, which is large and hanging. In both sexes the ears are white, the cheeks red, the eye and beak black.

PADDOCK (NEAR HUDDERSFIELD) POULTRY SHOW.

THIS took place on the 8th inst. The awards were as follow:—

BRAMMAS.—Cup, H. Beldon, Goitstock, Bingley. 2 and *hc*, J. H. Pickles, Southport.
 HAMBURGS.—*Golden-spangled*.—1 and 2, H. Beldon. *hc*, N. Marlor, Denton, Manchester. *Silver-spangled*.—1 and 2, H. Beldon.
 HAMBURGS.—*Golden-pencilled*.—1 and 2, H. Beldon. *Silver-pencilled*.—1 and *hc*, H. Beldon. 2, H. Smith, Keighley.
 HAMBURGS.—*Dark*.—1, H. Beldon. 2, N. Marlor. *hc*, H. Beldon; C. Sidgwick, Keighley; W. Bentley, Holmfirth.
 GAME.—1, J. Fortune, Keighley. 2, R. Walker, Gomersal. *hc*, H. Beldon.
 BANTAMS.—1, G. Noble, Staincliffe. 2, R. H. Ashton, Mettram. *hc*, F. Steel, Halifax.
 SPANISH.—1, J. Thresh, Bradford. 2 and *hc*, H. Beldon.
 POLANDS.—1 and 2, H. Beldon.
 COCHINS-CHINA.—1, W. Harvey, Sheffield. 2, J. Walker, Rochdale. *hc*, H. Beldon; C. Sidgwick; G. Palfryman, Sheffield.
 DORKINGS.—1, J. Walker.
 HOUDANS.—1, J. Healey, Hepworth. 2, G. W. Hibbert, Hyde.
 SELLING CLASS.—1, W. Harvey. 2, H. Beldon.
 GEESSE.—1, J. Walker.
 DUCKS.—*White Aylesbury*.—1 and *hc*, J. Walker. 2, J. Newton, Silsden, Leeds. *Rouen*.—1, J. Walker. 2, J. Newton, Silsden. *hc*, T. Halmshaw, Earsheaton.

PIGEONS.

 ANY OTHER VARIETY.—1, P. R. Spencer. 2, H. Yardley. *hc*, G. Holloway; W. Tomlins; P. R. Spencer.

RABBITS.—*Lop-eared*.—1, Hon. M. Howard, Charlton Park. 2, Mrs. Bailey, Malmesbury. *Himalayan*.—1, R. Barrett, Stroud. *Silver-Gray*.—1, E. Crawford, Cirencester. *Any other variety*.—1, J. Moore, Malmesbury. 2, Dr. Kinnier.

JUDGES.—Mr. J. Martin, Baschurch, Salop.

ROYAL AGRICULTURAL SOCIETY OF IRELAND'S POULTRY SHOW.

The following prizes were awarded at this Exhibition, held at Wexford on August 13th, 14th, and 15th.

DORKINGS.—*Silver-Gray*.—1, S. Mowbray, Monntrath. 2, J. C. Cooper. *hc*, D. A. Milward, New Ross. *Chickens*.—1, D. A. Milward. 2, Withheld.
DORKINGS.—*Coloured*.—1, J. C. Cooper. 2, S. Mowbray.
SPANISH.—1, J. C. Cooper. 2, S. Mowbray. *Chickens*.—1, S. Mowbray. 2, J. Harvey. *hc*, J. C. Cooper.
GAME.—1 and 2, J. C. Cooper. *hc*, F. Carr, New Ross.
COCHIN-CHINAS.—1, J. C. Cooper. 2, No competition. *Chickens*.—1 and 2, Mrs. Harvey, Wexford.
BRAHMAS.—*Dark*.—1, R. W. Boyle, Milltown. 2, J. C. Cooper. *hc*, Mrs. Taaffe; C. H. Peacocke. *Chickens*.—1 and *hc*, J. C. Cooper. 2, R. W. Boyle.
BRAHMAS.—*Light*.—1, J. C. Cooper. 2, No competition. *Chickens*.—1, J. C. Cooper. 2, No competition.
HOUDANS.—1 and 2, J. C. Cooper.
HAMBURGS.—*Pencilled*.—1 and 2, S. Mowbray. *Spangled*.—1, S. Mowbray. 2, H. J. Oliver, Wexford.
ANY VARIETY.—1, J. C. Cooper (La Flèche). 2, J. Harvey (Crève-Cœur). *hc*, J. C. Cooper; S. Mowbray; Hon. Mrs. Keane; E. G. C. Harvey.
COTTAGE CLASS.—*Aylesbury Ducks*.—1 and 2, W. Magrath. *hc*, K. Byrne; M. Magrath.
DUCKS.—*Rouen*.—1, R. W. Boyle. 2, S. Mowbray. *hc*, D. A. Milward (2); J. C. Cooper.
GESE.—*White*.—1, J. C. Cooper. 2, S. Mowbray. *Goslings*.—1, J. C. Cooper. 2, S. Mowbray.
GESE.—*Gray*.—1, S. Mowbray. 2, J. C. Cooper. *hc*, C. H. Peacocke. *Goslings*.—1, J. C. Cooper.
TURKEYS.—1, J. C. Cooper. 2, C. H. Peacocke. *Poult*.—1, Miss H. Craith, Cahur. 2, E. Carr. *hc*, C. H. Peacocke.

JUDGE.—Mr. C. F. Staunton, 81, Strand Road, Sandymount, Dublin.

ALDBOROUGH AND BOROUGHBIDGE POULTRY SHOW.

The fourteenth Exhibition was held on the 7th inst. in a field near the town capitally suited for the purpose. The day was fine, and the attendance very numerous. The number of entries was more than double that of any previous Show, caused, no doubt, by the very beautiful extra prizes given in the shape of teapots, cups, &c. The quality of the poultry and Pigeons was very creditable, and many first-class specimens were shown. The number of entries in poultry was 150; of Pigeons, 122; and of Rabbits, 10.

TURKEYS.—Cup, I. Moorey, Mnlwith, Ripon. 2, Miss Parker, Thirsk. *Poult*. 1 and 2, T. H. Foden, Ripon. *hc*, I. Moorey; F. Parker, Roehiffe, Boroughbridge; Mrs. G. Mangles, Givendale, Ripon.

GESE.—1, J. Nicholson, Littlethorpe, Ripon. 2, J. T. Renton, Ripon. *hc*, Mrs. G. Mangles. *Goslings*.—1, Mrs. G. Mangles. 2, J. T. Renton.

DUCKS.—*Aylesbury*.—1 and 2, T. P. Carver, Langthorpe, Boroughbridge. *Ducklings*.—1 and 2, T. P. Carver.

DUCKS.—*Rouen*.—Cup, C. Graham, Aldborough. 2, T. P. Carver. *Ducklings*.—1, Mrs. G. Mangles. 2, C. Graham.

DUCKS.—*Any other variety*.—1, G. Sadler, Boroughbridge.

FARMYARD CROSS.—1, W. Woodward, Minskip, Boroughbridge. 2, A. C. M. Thompson, York. *Chickens*.—1, T. P. Carver. 2, A. C. M. Thompson. *hc*, T. P. Carver; E. Williams, Sharow, Ripon.

CHINESE FOWLS.—1, W. H. Young, Driffield. 2, J. King, Ripon. *hc*, J. T. Renton.

DORKINGS.—Cup, Lady A. Beresford-Peirse, Bedale Hall. 2, T. P. Carver. *SPANISH*.—1, Pickering & Duggleby, Driffield. 2, Pallister & Hawkins, Topcliffe.

COCHIN-CHINAS.—1, R. J. Raworth, Harrogate. 2, F. Horseman, Boroughbridge.

BRAMA FOOTBALLS.—Cup, Lady A. Beresford-Peirse. 2, Mrs. G. Mangles. *hc*, T. P. Carver.

GAME.—Cup, J. Watson, Knaresborough. 2, Pickering & Duggleby. *hc*, S. Shaw, Langthorpe.

DORKINGS. **SPANISH**. **COCHIN-CHINAS**. **BRAHMAS**. OR **GAME**.—*Chickens*.—1, Lady A. Beresford-Peirse. 2, Pickering & Duggleby. 3, T. P. Carver. *hc*, Mrs. G. Mangles (2); R. R. Farrar, York; Pallister & Hawkins.

HAMBURGS.—*Gold or Silver-spangled*.—1, Pickering & Duggleby. 2, T. P. Carver. *Gold or Silver-pencilled*.—1, Wells & Sherwin, Ripon. 2, J. Robshaw, Whitley, York.

POLANDS.—1 and 2, C. Walker, Boroughbridge.

BANTAMS.—*Game*.—1, Wells & Sherwin. 2, Lady A. Beresford-Peirse. *Any other variety*.—1, Wells & Sherwin. 2, F. Powell, Knaresborough. *hc*, T. P. Carver (2).

ANY OTHER VARIETY.—Cup, T. P. Carver. 2, G. Slater, Ripon. *Chickens*.—1 and *hc*, J. Robshaw. 2, C. Holdsworth, Harrogate. 3, F. Horseman.

SELLING CLASS.—1, T. P. Carver. 2, H. Taylor, Boroughbridge. *hc*, Wells and Sherwin.

PIGEONS.

POUTERS.—1, Wells and Sherwin. 2, R. R. Farrar.

CARRIERS.—1, G. Sadler. 2, A. T. Umpleby, Boroughbridge. *hc*, W. Boddy, Ripon (2); G. Sadler; Miss F. Seignor, Leeds.

TRUMPETERS.—1, A. Walker, Boroughbridge. 2, P. Wilson, Boroughbridge.

JACOBS.—1, T. Dale, Scorton, Catcliffe. 2, Miss F. Seignor.

FANTAILS.—1, J. Wetherill, Northallerton. 2, J. Umpleby, Boroughbridge.

hc, T. Horseman.

TUMSELMAN.—Cup, Miss F. Seignor. 2 and *hc*, Wells & Sherwin.

BABBS.—1 and 2, Miss F. Seignor. *hc*, A. J. Blakeborough, Harrogate; A. Russell, jun., Northallerton.

NUNS.—1 and 2, Miss F. Seignor.

ANTWERPS.—1, Miss F. Seignor. 2, J. Snowden, York. *hc*, B. Watts, Aldborough; E. Bowman, Boroughbridge; T. Horseman.

TURBOTS.—1, T. Dale. 2, W. Umpleby. *hc*, T. P. Carver.

OWLS.—*English*.—1, A. T. Umpleby. 2, G. Sadler. *hc*, G. Sadler; Miss F. Seignor.

ANY OTHER VARIETY.—1, G. F. Umpleby. 2, Wells & Sherwin. *hc*, Miss F. Seignor (2); Wells & Sherwin.

SELLING CLASS.—1, W. Scott, Boroughbridge. 2, Wells & Sherwin. *hc*, W. Boddy; R. R. Farrar.

RABBITS.—*Any breed*.—*Duck*.—1, S. E. Phillips, Ripon. 2, G. Grainger, Northallerton. *Doe*.—1, J. K. Swift, Boroughbridge. 2, S. E. Phillips.

EXTRA STOCK.—*hc*, J. H. King, Boroughbridge; W. Charlton, Ripon; J. & A. Pinkney, Aldborough.

Mr. James Dixon, Bradford, and Mr. Joseph Walker, of Birstwith, acted as Judges.

BISHOP AUCKLAND POULTRY SHOW.

The pens were arranged in double rows stretching from north to east in the most prominent part of the cricket field in which the Show was held, and the wind proving fresh, and the pens (which were Pothergill's, of Sunderland), having by some accident been left unfastened, a number were blown over, and the occupants let loose. These were only secured and repenned after considerable trouble. Most of the varieties were divided into classes for adult and young birds, and though the season is well advanced the old section was well filled, numbering 135 pens, with 173 chickens. The adult *Dorkings* were good for the time of year; the *Cochins* grand, every pen being noticed. The medal for several classes went to a splendid pair of Buffs. *Brahmas* were not good as a class; but in *Spanish* there were some good birds, although the best were sadly out of feather. *Red Game* proved good, the first-prize cock a most excellent bird in hand, but the hen was rather grey in body; the second were fully better in colour, but not so good in hand, many of the pens, mostly Brown Reds, coming in for high commendations. In other colours Duckwings were first, and Pileas second. *Hamburgs* were but poor. If we except the prize-winners and one or two pens, the Gold-spangled proved best as a class; while the winners in Silver-pencilled were of fair quality. The first in the Spangles were very good, while the cock in the very highly-commended pen was the best in the class, but badly matched. *Polands* were very good, the medal in this section being awarded to a nice pen of Golden, which were, however, closely pressed by good Silvers.

In Black Red *Bantams* were some stylish birds, but many were scarcely fit for the show pens, owing to want of feather and condition. The first prize for Any other variety of Game was won by Piles and Duckwings respectively; the first in fair order, and the second out of feather, but very stylish. Rose-combed Blacks won in the following class.

The winning *Rouen Ducks* were very large and good in beak, especially the first. *Aylesbury* were failing in feather, but large and of good quality. The Variety class was interesting, every pen being noticed. The first were Widgeons, second Black, and all the rest White Decoys, very small and neat in form.

In the Variety class capital Crève-Cœur were first, and Houdans second. Single cocks were a really good collection; the first a grand La Flèche, the second a Buff Cochon. Pairs of hens were also well shown, and in this case La Flèche were again first, and Black Red Game second, the La Flèche cock taking the medal also.

Many of the young birds were forward and well shown, this being the case especially in the *Cochins*, where the first of the medals for young was awarded; the *Dorkings* were also very promising birds. *Brahmas* were not forward, if we except the first-prize Dark chickens, which pen contained a well-marked pullet; the second being Light birds, but though large they were rather raw. *Spanish* were moderately good, but *Game* only poor in the Red class, except about three pens, two of which were Brown Reds. In the Other variety class a grand pair of Yellow-legged Piles stood first, good Duckwings second. In *Hamburgs* there were not many good pens, with the exception of the winners; but in the Pencilled, both Gold and Silver, these were very good. The winning *Polands* would have looked quite as well with the fostering care of the old hen. In *Red Game Bantams* the first were in full feather and very stylish Black Reds, the second of that kind also being good. In the class for Any other variety the first prize and medal went to a pair of superb Piles, although young. In the next class Silver Sebrights were first, and Blacks second. *Turkeys* and *Geese* were good, but young, though they were very promising as regards size. In *Ducklings* first were a grand pair of Ayleburys, and second Rouens, two other pens of that variety being very highly commended. In the Variety class the first were Dark Red Malays, and the second Houdans. The two Selling classes contained fifty-four entries; there were many cheap lots, and several extra prizes were awarded in both classes.

PIGEONS.—*Carriers* stood first, and were single birds, the quality being only moderate. The first prize went to a neat Black hen, the second to a young Blue cock. *Pouters* were good, but there were only five entries, the first being a really good White, and second Black Pied, both coming up well in measure.

ment and general properties. *Tumblers* were a mixed class, but two Almond cocks bore off the honours, nothing else approaching them in winning properties. There were some good *Jacobins*; the first prize went to a Red cock, very good in all points, and he won the medal for birds of the parish; second came a Red hen, good in all points but flights, which were a little foul; and highly commended a Red hen, failing a little in hood. *Turbits* were a nice lot, and mostly noticed; first stood a small good Yellow, and second a grand Silver, with rather kitey bars. In *Fantails* Mr. Loversidge was again first and second, but the wind was too strong to show them to advantage. The first in *Owls* was a very good White foreign, and second a moderate Silver. The Variety class was large, and some good specimens were shown, the first being a most perfect Grizzled Frillback, second a Nun, and third a Red Barb.

RABBITS were shown in pairs, the Lops numbering ten entries; the first and second good in length and general properties, but the third, though large and good in other points, was rather short. Fourteen pairs were shown in the Variety class, and some of these were very good; the first an almost perfect pair of Silver-Greys, about half-grown; second Himalayans, good in most points, but a little mousey on the feet; and third two neat Belgian Hare Rabbits; several moderately good pairs coming in for high commendations.

MALTON PIGEON SHOW.

This took place on the 11th inst.

TUMBLERS.—1, Miss Seanoor, Leeds. 2, G. Eash. *che*, C. Anton, York. *hc*, Miss Seanoor.
POUTERS—1 and 2, J. Blanchard, Driffield. *che*, Miss Seanoor.
JACOBIANS.—1, J. Blanchard. 2, Miss Seanoor. *che*, C. Anton (2); Miss Seanoor; J. A. Conly, R. Sedale.
FANTAILS.—1, C. Anton. 2, Miss Seanoor. *che*, C. Anton; Miss Seanoor.
CARRIERS.—1, J. Alconly. 2, Miss Seanoor. *che*, C. Anton; Miss Seanoor.
TRUMPETERS.—1, Miss Seanoor. 2, J. W. Hild. *che*, C. Anton.
SPOTS.—1 and 2, J. Muckle, Malton.
TURBITS.—1, C. Anton. 2, Miss Seanoor. *che*, J. Alconly; J. Blanchard; C. Anton.
NUNS.—1, Miss Seanoor. 2, J. Blanchard.
BARBS.—1 and 2, Miss Seanoor. *che*, C. Anton; J. Alconly.
ANY VARIETY.—1 and 2, Miss Seanoor. *che*, J. Blanchard; C. Anton; Miss Seanoor (3); J. Alconly.
DOVES.—1, T. Elms. 2, Miss Hartley.

RABBITS—Longest ears.—1 and 2, T. Myton, York. Extra 2, R. Addison, Malton. *Any other variety*.—1, Miss H. Taylor, Malton. 2, H. Jones, Malton.

JUDGE.—Mr. Shaw, Newlay, near Leeds.

BIRMINGHAM BIRD SHOW.

This Show, which opened on the 18th inst., and will conclude on Friday, is held in the Exchange Rooms, New Street. The following are the awards of the Judges, Messrs. Barnesby, E. Sandell, jun., and A. Willmore:—

NORWICH.—*Clear Yellow*.—1 and 2, W. Walter. 2, J. Bexson. 3, J. Adams. *hc*, W. Shakespear. *Clear Buff*.—1, W. Walter. 2, J. Adams. 3, J. Bexson. *hc*, W. Smith.
NORWICH.—*Marked or Variegated Yellow*.—1 and 2, W. Smith. *Marked or Variegated*.—1, J. Bexson. 2 and 3, H. Simpson. 3, W. Shakespear.
NORWICH.—*Clear and Ticked, high colour*.—1, Brown & Gayton. 2 and 3, J. Adams. *che*, W. Walter (2). *hc*, R. Simpson. c, Hampton & Chamberlain.
Marked or Variegated, high colour.—1 and 2, J. Adams. 2, Brown & Gayton. 3, Hampton & Chamberlain. c, F. Schweiss.
NORWICH.—*Marked or Variegated Crested Yellow*.—1, C. Hillier. 2, F. Woodward. 3, J. Spencer. *Marked or Variegated Crested Buff*.—1, W. C. Simpson. 2, F. Woodward. 3, W. Shakespear. c, J. Riddam; F. Schweiss.
BECHAN.—*Clear and Ticked Yellow*.—1, J. N. Harrison. *Clear and Ticked Buff*.—1, Withheld. 2, J. N. Harrison.
LIZARD.—*Gold-spangled*.—3, F. Schweiss. *Silver-spangled*.—1 and 3, C. Greenwood. 2, Withheld.
CINNAMON.—*Jouque*.—1 and 2, J. Adams. 3, J. Bexson. c, W. Smith. *Buff*.—1 and 2, J. Adams. 3, R. Simpson. c, J. Bexson.
GOLDFINCH MULE.—*Evenly marked Buff*.—1, Hampton & Chamberlain. 2, J. Adams. 3, J. Bexson. c, F. Schweiss (2).
GOLDFINCH.—*Any other Class of Yellow*.—1, Withheld. 2, J. Bexson. *Any other Class of Buff*.—1, Withheld. 2, J. Gann. 3, F. Schweiss.
GOLDFINCH MULE.—*Dark Jouque*.—1, F. Schweiss. 2, Withheld. 3, Hampton & Chamberlain; J. Bexson. *Dark Mule*.—2, W. Smith. 3 and Equal 3, F. Schweiss.
SIX NORWICH CANARIES, IRRESPECTIVE OF COLOUR.—1, J. Adams. 2, W. Walter. 3, Rev G. Herbert. *hc*, W. Smith; F. Schweiss.
MISCELLANEOUS.—1, F. Schweiss.

BRITISH BIRDS.

GOLDFINCH.—1, W. H. Cane. *hc*, R. Pearson; J. N. Harrison. c, J. Brittain. **LINNET**.—1, J. N. Harrison. *che*, Rev G. Herbert. *hc*, R. Pearson. c, W. W. Elliott.
SKYLARK.—Prize, F. Schweiss.
BLACKBIRD.—Prize, F. Schweiss.
SONG THRUSH.—Prize, Hampton & Chamberlain.
STARLING.—Prize, F. Schweiss.
MAGPIE.—2, — Voigt. Equal 2, F. Schweiss.
JACKDAW.—Prize, Master J. Bell, Bradford.
ANY OTHER VARIETY.—Prize and *che*, J. Mallett (Wood Lark).

FOREIGN BIRDS.

RED-HEADED CARDINAL.—*Single*.—1, Miss M. A. Robinson.
ANY VARIETY.—**WAXILLS**.—*Pairs*.—1 — Voigt. Equal 1, F. Schweiss. *che*, — Voigt; W. Walter.
JAVA SPARROWS.—*Pairs*.—1, — Voigt.
COCKRETAILS.—*Pairs*.—1, Miss M. A. Robinson. c, W. Walter.
PARAKEETS.—*Australian or Broadtail*.—1 and *hc*, M. George. *Ring-necked or Indian*.—1 and *hc*, — Voigt. *che*, — Schweiss.
PARROTS.—*King*.—1, — Schweiss. Special 2, Mrs. Weeks. *Green or any other variety of Large, except Grey*.—1 and 2, — Schweiss. *Grey*.—1, Mrs. D. Staithforth. 2, — Selwicks. *che*, Miss Sprague. c, Miss Johnson.
COCKATOOS.—*Leadbeater or Rose-breasted*.—1 and 2, Miss M. A. Robinson. *hc*, W. H. Wood. *hc*, W. Walter. — Schweiss. c, — Voigt. *Lenon or Orange-*

crested.—1, M. George. 2, Withheld. *Any other variety*.—1, Miss M. A. Robinson. *che*, — Voigt; Miss M. A. Robinson.
FOREIGN BIRDS.—*Any other variety*.—Equal 1, — Voigt (Toucan); P. T. Warren (East Indian Lora). *che*, — Voigt (Glossy Starling and Mynor); W. Walter (Parakeet); — Schweiss; M. Roberts (Flamingo). *hc*, — Voigt (Indian Blue Bird and Australian Lora). c, Miss M. A. Robinson.
NIGHTINGALES.—*Prize*, B. Smith.
MARSH TIT.—2, E. Martin.

POUTERS, ANY OTHER COLOUR OR MARKINGS.

On the first day of January this year, there appeared in the columns of THE JOURNAL OF HORTICULTURE a short paper of mine upon the exclusion of this class of Pouters from some of our shows. Those remarks have led to a lengthened debate, partly conducted in this Journal, and partly in the pages of a contemporary.

The controversy seems now to have attained a definite form. It is self-evident that it is the North British Columbarian Society *versus* the Pouter breeders and fanciers of Scotland.

Mr. Wallace has replied, I presume, so far as he intends, and he is supported by a writer dating from Greenock, unknown to the fancy till his name appeared a few weeks ago. Mr. Stuart and Mr. Ruthven follow in the same "confusion worse confounded" style, each and all condemning me and those who agree with me, for supporting a class for "mis-marked" Pouters; but anyone would have supposed that after reading the early portion of the correspondence the true meaning of the debate would at once have been seen. Indeed, my first paper (see THE JOURNAL OF HORTICULTURE, 1st January, 1874) is so plain that a very young fancier might have understood it from the beginning.

The class in dispute, so far as I am concerned, is "Pouters, any other colour or markings," as headed at the commencement in THE JOURNAL OF HORTICULTURE, not "mis-marked" Pouters, which I neither keep, breed for, nor ever supported. Surely this is plain enough.

To Mr. Stuart's letter I do not reply, because it contains neither argument nor fact, but on the other hand shows a spirit to which I can be no party, and which does not sit gracefully upon a young and ever-changeable fancier, therefore I decline all further correspondence with him. Mr. Ruthven quite surprised me. I thought he would have sided with me out and out, as I have not known him for many years to be possessed of, or to have shown any one specimen that was not other than the standard-coloured birds; indeed, the "off-coloured" birds seemed to be his special favourites. But there is an insinuation in Mr. Ruthven's letter which I must notice. He says, "Mr. Ure and Mr. Huie are very extensive breeders of the Pouter class, and very enthusiastic fanciers I know, and from this very fact they must obtain in experimenting to produce fine standard colours an unusual number of mealies, chequers, and mis-marked birds, consequently there may be a strong desire to have classes to show them off." Now this is an insinuation which neither Mr. Ure nor I deserve; it will not be believed though put in print, and I cannot look upon it in any other light than unworthy of its author. I like all things put to the test, and I shall so treat this matter. From Mr. Ure's loft and my own combined, there are not one tithe of the "off-coloured" and "mis-marked" birds produced which some of the smallest Pouter breeders I know of turn out annually; and one thing is certain, which the show catalogues will prove—neither of us show them as some others do.

I hope I am now done with this controversy, and await the comments of my brethren in the Pouter fancy, not "a host" of those who know nothing about the peculiar class. One thing I am sure of is, that all committees of "first-rate" shows will have one or more classes for "Pouters, any other colour or markings." If not I must repeat that they will "not only be damaging the Pouter fancy, but quarrelling with their 'bread and butter.'"—J. HUIE, Glasgow.

[A letter from Mr. Ure on this subject shall appear next week.—Eds.]

COMING RABBIT SHOWS.

Bury and Cirencester have managed to clash this year, but of the two Bury is the better, having six classes against four of its rivals. Spanish, Angora, Himalayan, Silver-Grey, Any other variety, and Selling classes, with prizes of 10s. and 5s. form the prize list.

Cirencester has a class for the best Lop, Himalayan, Silver-Grey, and Any other distinct variety, with the same prizes as the last-mentioned Show. The Judge is Mr. Tegetmeier, who has all the arbitration to do.

Middleton holds its next Exhibition on September 1st. The classes for Rabbits are six in number, distributed in exactly the same manner as those of Bury, but with prizes of less value.

The Vale of Todmorden Show will take place on Sept. 5th. The classes assigned are similar to those of its two predecessors.

Long Sutton, on September 23rd and 24th, gives seven classes with prizes of £1 and 10s. to each, and an extra prize of two guineas to the best Rabbit in the Show. There is a class for

Lop bucks, and one for Lop does, one for Silver-Greys (buck or doe), and one for the heaviest. Then comes a class for "Any other pure breed (bucks)," and a like one for does follows. I regret to see this arrangement, for where five distinct breeds that are generally allowed a class each, are huddled up in one class, the Judge cannot be expected to do justice to them, particularly if there should be anything like a large entry, and as the prizes are rather higher than usual, such I suspect there will be. A sale class with the price unrestricted finishes this badly-arranged schedule, which I hope will be thoroughly revised before next year's Show.

A glance at any of the above-mentioned prize lists will show that committees are more liberal in the number of classes they give than hitherto; yet, as will be perceived, there is ample room for additions to the number. But though Rabbits may have more classes than they had formerly, are the prizes in these classes of sufficient value to encourage exhibitors to send their stock? I think not. Exhibitors, as a rule, do not care to send valuable Rabbits to a show where, though they may be almost certain of winning, the first prize is about 7s. 6d., well knowing that the entry fees and carriage to and from the show often takes nearly if not all of the prize money.

As an instance of the support given to exhibitions which will give liberal prizes, let me refer to the Leeds Ornithological Show, held in April last, when no less than 120 Rabbits were entered in four classes. Why? Because the prizes were worth the attention of fanciers, being a silver medal for first, and 10s. for second in each class, except the sale class, which had a silver cup for first, a silver medal second, 10s. third, and 5s. fourth. The consequence of this liberality was, that forty Rabbits were shown in this class alone. Here, then, is an instance of a show which, giving good prizes and well-arranged classes, secured itself one of the largest entries of the season.

Exhibitions after September are few and far between, but the Crystal Palace schedule will doubtless require a short notice.—A RABBIT FANCIER.

DRIVING AND UNITING SWARMS.

As "F. C." and others want to know which is "the best time of the day for driving and uniting bees," I shall here state that we have always found the afternoon or evening to be better for this work than the earlier parts of the day. After the labours of the day are over bees are at home, and may be driven hither and thither at will without molestation from the bees of other hives flying about. Of course, if bees are not at work they may be driven as quietly at 12 o'clock noon as at 6 p.m., but for those who have not their evenings to spare, let me say that bees can be easily driven in warm weather at any time of the day. In cold weather, and when they have been nesting for some time amongst the centre combs (and not at work), they are more difficult to drive. They are reluctant to leave their cozy quarters. In cold weather we feed the bees before we begin to drive them, by pouring half a pint of syrup over the combs and bees. In about fifteen or twenty minutes after they have been fed the heat of the hive, together with the gladness and noise of the bees, becomes very great. They are now easily driven. Even in the coldest months of winter bees thus treated may be readily driven into other hives. In very cold weather we carry them into a vinery or a room of a dwelling house when about to drive and unite them. All this is stated that bee-keepers may know and bear in mind that warm weather and warm hives cause bees to run better and faster when driving and artificial swarming are practised. In hot honey weather four minutes' drumming will be ample for an artificial swarm, and from fifteen to twenty minutes' constant drumming will drive nearly all the bees into an empty hive.

As to the best time of the day for uniting swarms I think there can be but one opinion—viz., about sunset. We frequently drive bees in the forenoon, and unite them in the afternoon. By feeding the hive to receive the bees some twenty minutes before the union takes place, fighting is prevented. Feeling thus, we throw the bees of the hive into a state of hilarity and joy. Dr. Cumming has told us that honey to breakfast makes people sweet-tempered. Perhaps this was said by way of banter. We all know that a child with a lump of sugar candy in his mouth is difficult to exasperate, and that bees after being well fed are not disposed to quarrel and fight. This, touching bees, cannot be too widely known and practised. As soils are prepared for the reception of seeds, hives should be prepared for the reception of bees. Inattention to this particular will be frequently followed by failure. As bees know each other by smell, I use and recommend minted syrup when uniting swarms. Success is certain if these conditions are complied with. By feeding bees at sunset, and casting a swarm amongst them twenty minutes after, we have never failed in uniting swarms, and very often without the loss of a bee. If bees united abstain from fighting for fifteen minutes at first, they do not fight at all. A union lasting as life is thus cemented.

Such is our practice and experience; but there are other ways of uniting swarms. Chloroform, a puff-bill, are resorted to in

this work of unions. Both of these when properly used produce prostration and unconsciousness amongst bees. They fall from their combs as dead bees, and may be safely united in their state of unconsciousness and helplessness. The use of chloroform and puff-bill is so hurtful and dangerous to bee life that I follow, and recommend others to follow, a more safe and merciful course.

As the honey hives of "F. C." are at one end of his garden, and his young stocks at the other, he seeks for advice how to proceed. He has not told us whether he wishes his stocks to remain where they are, or whether he wishes them to occupy the place of the old ones. It does not signify. He should drive all the bees from the old stocks into empty hives first, then bring the stocks and bees together at 7 o'clock p.m., and unite them as described above. There is but little risk at this season in changing the positions of hives in a garden, if all be moved at once; the bees could be taken to the stocks, or the stocks to the bees, or both on being united could be placed half way between the two stands, or in any other part of the garden. But let it be understood, if such change of position be contemplated and undertaken, all the hives must go at the same time. One hive left on a stand from which others were removed but a short distance would draw the bees that returned to the stand from their new position. We have known bees removed from one side of a dwelling house and from one side of a garden to the other side without injury, but then all the hives were removed at once.

The hive that gathered 10 lbs. of honey in one day belongs to Mr. Shearer, near Huntly, in the north of Scotland. The case was mentioned to stimulate the apiarians in the south. "They are far behind who cannot follow."—A. PETTIGREW.

THE HONEY SEASON.

It is difficult not to feel envious as one reads the accounts now coming in from many parts of the country telling of glorious harvests of honey, while no such plenty has blessed one's own vicinity. I will not say utter barrenness is our experience *per contra*, but it is as near to that as possible. I left home on the 18th of July for the Lizard district in Cornwall, and was absent three weeks. My bees at home had managed in the splendid comet weather to recover themselves somewhat, and honey was glistening in many cells, but evidently gathered with difficulty. On my return home three weeks later, hearing of abundant rains in many quarters, I hoped to find that my own bees had shared in the good luck reported from other parts of England. Not so, alas! on the contrary, my bees had fallen off unquestionably, breeding had quite ceased in most hives, and all was still as in September, that dreariest of months for bee-keepers. The cause of all this poverty in our country is that which has prevailed throughout this remarkable season—namely, the absence of moisture. Rains have fallen elsewhere in abundance, floods even occurring in some places; here nothing beyond a good shower occasionally from the 14th of April to the 7th of August, showing a drought unparalleled in this west English county. Grass is only just beginning to grow. The curious thing is, that only a few miles from us there has been a fair quantity of rain. Nevertheless, matters are certainly much better than they were last year. Then every hive was impoverished; now half my stock is sufficiently supplied with sealed honeycomb to survive the winter, and the rest will only require partial feeding. Moreover, I have actually harvested from two or three hives several pounds of honey.

Curiosity moved me to carry-off a "turnout" hive into Cornwall, as I did two years ago, the history of which hive was given in this Journal. I wished to see if they would do as well as they did then. They travelled well, and were full of brood all sealed-up at the expiration of my three-weeks holiday; but although the weather was generally fine, and heather was within reach as well as clover, the result was certainly no more increase to their stores than 3 or 4 lbs. of honey at the utmost! and yet I took down rather more bees than I did two years ago. They travelled well thither, but remembering how the heat of the train caused the collapse of the comb two years ago, we thought it advisable to destroy the bees the day before our return, save only the queen and a few workers. These were fortunately saved, as I found one of my hives which had recently swarmed minus a queen. Over these the rescued queen with all the brood was immediately put. I had the pleasure of seeing her majesty well received by her new subjects.

It is to be hoped that further reports may be sent in from other parts of England. I am curious to learn if in the great plains of Berkshire, Lincolnshire, or elsewhere, droughts have prevailed as largely as in our smaller Somersetshire levels.—B. & W.

OUR LETTER BOX.

YOUNG DORKINGS AT BISHOP AUCKLAND SHOW.—Allow me to inform you that I took first and second prizes for young Dorkings.—C. WIDDAS, *Houghton-le-Wear*.

BOOKS (W. B.).—Our "Poultry-keeper's Manual" gives all the essential information you need. If you enclose sixpence stamps with your address you can have it post free. (D. B., *Enfield*).—Our "Bee-keeping for the Many." You can have it free by post if you enclose five postage stamps with your address.

BRIDGEPORT POULTRY SHOW.—The first prize for Polish was awarded to Mr. Bloodworth, and not to Mr. Jones, as stated in the prize list, the birds of these exhibitors having been placed in the wrong pens.

POWLS' LEGS SCURFY (T. H. Hall).—Rub the legs with citrine ointment daily. You can obtain it of any chemist.

RAIN PRODUCTIVE OF FOOD (J. C.).—It is possible to have too much of a good thing, and just as we often long for sunshine in April and May, so we have wished and waited for rain for some weeks past. We are convinced it is as beneficial to the poultry as to the garden. You need only look at the grass run. Ten days since it was plain unrelieved brown; the passage of a chicken raised a dust, and the poor, dead, moulted feathers flew about without hindrance. You might as well look for animal life and food on a London gas-pipe as on the parched surface. Now there is a shade of green, the earth is pleasant to walk upon, and at daybreak the long voyages of discovery undertaken by the chickens will show they know food may be had for the seeking.

POWLS IN CONFINED SPACE.—EATING HOME-FATTED CHICKENS (A. G.).—We are answerable only for our own writing, that is enough for anyone. If you had written to us we could have told you, you could not rear chickens in the space you came. It was large enough only during the first fortnight. We advise you to future to "go in" for eggs. Perhaps you will say as one of our correspondents did lately, that "it is very hard to keep poultry and never to eat a chicken." We are by no means sure those who keep the largest number of fowls eat the most poultry. Provocative wisdom says, "The cobbler's wife is the worst-shod woman." You say there is such a satisfaction in eating that you have had something to do in producing. We will meet that difficulty. Have a small fattening-coop made. ("Fowls," by Bailey, page 96). Buy four or six well-grown, lean, but fleshy chickens, put them up, and fatten them yourself. You can do this at small expense. You have space enough, but mind the fattening chickens must not be in any place used by birds at liberty.

DEFECTIVE FOWLS (G. W.).—Get rid of the faulty birds at once. Every mouthful they eat is waste. "Poor little pets," as they are called, are the plague and bane of the poultry-yard. They eat as much as the best birds, and cannot make any return for it. Where only fancy is concerned, do as you please; but if you want to show a balance, you must forswear sentiment.

KEEPING FOWLS PROFITABLY (Sarah).—You must keep account of the food consumed, and strike an average. With such meagre statistics as you provide, we cannot do it. The condition of the birds, whether recently purchased, the nature of their run, the breed of them, all have to be taken into consideration.

AVOID DEFECTIVE STOCK (J. J.).—Never breed from a cock with a disqualifying fault.

WATERY SWELLING ON HAMBURGH'S EARLOBE (T. L.).—We were not aware any query had escaped us. We are sorry if it is so. The white skin is only the outer sac or covering. The lobe within is perfectly red. If you think it is a watery swelling, puncture it so that it will not show from the outside, and let the contents escape. If it increase much in size, wash it frequently with a strong solution of alum and water. It is very unusual for any hen to lay thirteen eggs in thirteen days. It has not been very uncommon for a Spangled Hamburg to sit. Our experience in Black Hamburgs is not as great. We have, however, known a Pencilled hen sit and rear a brood.

DARK BRAHMAS (Changing).—Do not give up your Brahmas. They and Cochins are the only birds that will suit you, because they are the only breeds that respect fences. The non-sitters—Hamburghs, Crève-Coeurs, Houdans, and Spanish "fly like Pheasants." If you kept any of these you must cut one wing close, and even then we believe they would strangle over the fence.

FOWLS FOR LIMITED SPACE (G. H.).—Some fowls are not fitted for a confined space, and it is probable those you describe as barndoor are of the number. The Game cock has caught the disease from the hens. Do they get the sun? We should prefer the light sandy soil to the ashes for the flooring of the house. We should alter the feeding by giving ground oats or barley meal slacked with water in the morning, house scraps at mid-day, evening same as morning. Give them some lettuce, especially those that are gone to seed, and let them have dust heaps. On these conditions you can choose your breed. Keep twenty-four fowls in your space. They should be Brahmas or Cochins.

BRAHMAS BROODY (Novice).—Light Brahmas are not more prone to sit than any other birds, and you must, as in any other case, consider that the ordinary course of things cannot be altered, even though it should interfere with our wishes or arrangements. Broodiness is their rest. It is the sign of puberty, and their growth ceases; but beauty of form and plumage, excellence of condition, and general merit remain, and cannot fail to be appreciated. If they cannot be winning chickens on account of their precocity, they will be beautiful adults next January and February, because the blush of youth will remain upon them.

PIGEONS NEGLECTING TO FEED ONE OF THEIR YOUNG ONES (G. C.).—Pigeons will frequently do this. There is no cure if the birds be well supplied with food. Perhaps they are aware that one bird is too weak to live, and treat it as the Huddos are said to treat their sick or aged relatives—leave it to die.

WHITE CLOVER (A. J. W.).—Bees prefer the white before any other species of clover. A row of it between rows of peas and beans in your garden would not injure them, but the clover would be productive of very little honey in such a situation.

EMPTY BEE HIVES IN GARDEN.—FOLLOWING A SWARM (Morning Watch).—It is not illegal to have hives with comb in them left in a garden after the bees are dead. No one can legally follow a swarm of his bees on to another person's land. He should go to that person and ask permission to recover the swarm.

UNITING SWARMS (B. B.).—We cannot approve of putting so many swarms into one box in June and July. Probably you would have had more honey to take now, and more stocks for another year, if you had kept your swarms separate. Though you may have failed to find the queens cast out of Taylor's

hive, they were, doubtless, destroyed. We think that the 32 lbs. gained in the time mentioned by you is very good, and that as you are desirous to have some honey your better way will be to remove No. 2 box, and take all the honey you can get from it, then replace it on the hive. If some of the centre combs are filled with brood they could remain undisturbed, by cutting out the honeycomb only. If the weather become fine your bees should gather from the beehive 30 lbs. more. If they do, you may have a second harvest of honeycomb in about a month.

VERMIN ON CANARY (Yais-y-Cum).—Mr. Brent says—"The red mites or cage bugs are a species of Acarus. They live in the cracks and joining of the cages, and at night sallies forth to suck and annoy the birds; they multiply in great numbers about the cage and in the nests, tormenting the poor birds, causing the death of the young, and frequently of the old birds likewise. Some fanciers have recommended the use of the Persian insect-destroying powder; but I have not tried it, finding that by thoroughly cleaning the cages, saturating the cracks with linseed oil, and then filling them with flowers of sulphur, and dusting sulphur among the birds' feathers, also by cleaning the nest and sprinkling powdered sulphur in, that I can get rid of these pests. Wherever any floury or mouldy appearance is noticeable about the joints or crevices of the cage, these tormentors to the birds may be suspected, and no time should be lost in giving them notice to quit."

REMARKS.

12th.—Fine morning, and moderately so till 5 P.M., when it clouded over; rain at 6 P.M., and wet night.

13th.—Showery till 4 P.M., after that time fine.

14th.—Stormy and boisterous all the fore part of the day, the latter part fine and less windy.

15th.—Morning and noon very fine; a very pleasant day, scarce any wind.

16th.—Fair all day, but rather cloudy and dull.

17th.—A very pleasant enjoyable day, and starlit night.

18th.—Another very fine day; much warmer in the after part of the day. The 12th, 13th, and 14th were stormy uncomfortable days, the wind on the 14th being particularly boisterous; the remainder of the week very pleasant. The mean temperature at 9 A.M. about 1° above that of the previous week.—G. J. SIMONS.

COVENT GARDEN MARKET.—AUGUST 19.

A GOOD supply and the fine weather favours the in-getting of a large quantity of Plums and Pears, a considerable portion of which goes to furnish the markets in the north and midland counties. Rough vegetables have much improved under the recent rains. Hot-house Grapes, both Black and Muscats, are plentiful. Peaches and Nectarines from the open walls sell at 3s. to 4s. per dozen.

From observations taken near London during forty-three years, the average day temperature of the week is 72.2°; and its night temperature 48.1°. The greatest heat was 85°, on the 1st, 1843; and the lowest cold 32°, on the 20th, 1859. The greatest fall of rain was 1.59 inch.

COMPARATIVE HARDINESS OF FRUITS.

ALLOW me to call the attention of amateurs and others to the fact that there are among fruits some varieties that are comparatively hardy and productive of their kind. They can scarcely be made to fail in the worst of seasons and with the worst of treatment. Some of them, too, are fruits of good quality; I will mention two or three that are on my memory, and ask others who are experienced to add to their numbers. First and most familiar is Louise Bonne of Jersey Pear. Whoever saw a fair-sized tree of Louise Bonne that did not bear fruit? Last year it was especially conspicuous here. No other Pear of good quality in the garden, excepting those trained on walls, bore half a crop, the bloom being killed by frost; but Louise Bonne stood it bravely in spite of spring and midsummer frosts, and brought its handsome fruit to the greatest perfection amid the drenching autumn rains. Another fruit that was noticeable too amongst the general scarcity was Coc's Golden Drop Plum. It is always the same. Let all other Plums fail, there are always at least a few fruit on Golden Drop, and generally a large quantity. It is the best of all late Plums, and one of the hardiest. It succeeds tolerably well on a north wall, where the sun scarcely ever reaches it. Of course it has not so good a flavour there as when grown on an east or west wall, but it generally bears a quantity of moderately-good fruit that will at least do for kitchen use, and which, after a fine autumn, is not to be despised in November and December for the dessert.

I will name one other fruit, which, perhaps, is not so well known as those already mentioned, but I say the sooner it is the better for those who wish to provide for bad seasons, and they are all bad now-a-days. We get a glimpse of something very like summer weather in March or April, and we begin to count our chickens, but before the hatching season is fairly come we find the mercury in our thermometers nearly congealed, and our eggs are addled. We want fruits that will blossom and set and swell in spite of a few degrees of frost. Such a one, according to my experience, is Crawford's Early Peach. For three successive seasons, when all other kinds have been comparative failures, this has borne a heavy crop. I shall be very glad if others can speak as well of it, for I am inclined to plant it largely. It is a light yellowish-fleshed Peach of good quality, and ripens in the beginning and middle of August. It is, I believe, of American origin. Royal George Peach, on the other hand, I do not consider a desirable kind to plant outside, except in the most favoured localities. Of course it cannot be denied that it is a good Peach where it does well; but it is subject more than any other kind to all the maladies that a Peach is heir to, including mildew, gumming, and loss of limbs from some unknown cause; and besides, I do not think its flowers are so hardy as those of some other kinds.

Where one goes to the expense of covering walls with textile material I am inclined to think *frigi domo* is the

cheapest in the long run; the cost at first is great compared with netting, but with care it will last three times as long, and is certainly much more effectual. A broad temporary coping is a first necessity; mine is 13 inches wide, I wish it had been 3 feet.—WILLIAM TAYLOR.

ROSES.

I, AMONGST thousands, enjoy a weekly treat in reading "our Journal," yet never have a word to offer in return for the many pleasant jottings of others.

The remarks of our friends and real guides, such as Mr. Camm and Mr. Peach in last week's Journal, constrain me to offer a word to prevent misapprehension by many amateurs.

Confusion is often caused by confounding the mere flowers of a Rose tree and the tree itself. Whilst Mr. Radclyffe may be alluding to the tree, our exhibiting friends may dwell solely on the flower, and so mere amateurs get confused. And in like manner our best nurserymen unconsciously lead us astray.

Mr. Camm may buy Baron Chaurand Rose from Mr. W. Paul, or Mr. Cant, or Mr. Charles Turner; so he has not thought of all possible good nurserymen where this may be had; but I am bound to say I have patiently tried this Rose, and found it unable to bloom under the strong winds, wet weather, and cloudy skies of this neighbourhood.

I advise amateurs to well consider the meaning of strong recommendations of exhibiting Rose-growers. For instance, all of these speak highly of such Roses as Etienne Levet, Countess of Oxford, and other seedlings of Victor Verdier Rose, and one of our best Rose-growing nurserymen speaks of the former as taking rank with Alfred Colomb and Charles Lefebvre. Now this is a great mistake in the general sense as applied to amateurs who do not exhibit. Such seedlings, as well as Marquis de Castellane, never will rank with such Roses, for they are scentless, and this is a point of more value in a general sense than exhibitors count on. Of Madame Lacharme I had plants (standards) of Lacharme's own raising, and I am quite satisfied it will never take the rank of many Roses that we have had for years. This will not do as a first-rate Rose in any sense I feel satisfied, and Mr. Camm's first year's verdict will also be his last, I am of opinion. No doubt, in the absence of large whites, or even a large light good blush, it may be used until superseded; but I am clear that Mlle. Bonnaire or Souvenir de Malmaison are better on the whole as blushes, and Boule de Neige, though smaller, much better as a pure white.

My situation and climate are mild in winter, so that Teas need then little or no protection, and I have lost none out of many in winter for the last five years; yet the late spring and summer were most severely trying by strong continuous cold wet winds, and low general temperature arising therefrom. This will give amateurs a general idea of the situation and circumstances here, and prepare them to properly estimate my experience of the best twelve Roses, after patiently trying nearly all in cultivation. They are Madame Victor Verdier, Alfred Colomb, La France, Marie Baumann, Charles Lefebvre, Baronne Rothschild (no

scent), Gloire de Dijon, Prince Canille de Rohan, Abel Grand, Dupuy-Jamain, Louis Van Houtte, Boule de Neige (little scent).—*AMATEUR, Aigburth, Liverpool.*

WHAT ARE GARDEN HOUSES AND PITS?

WITH a view to elicit something like an editorial opinion on a subject in which writers on gardening seem decidedly to differ, I ask, Is it right to call a glass structure divided into compartments one house; or ought it to be named according to the number of its divisions? I ask this question without the least intention of cavilling or finding fault with those who consider a number of vineries, pinneries, or the like as one. My object is simply to obtain something like uniformity, for although I have been in the habit of considering every compartment an individual house in garden phrase, I am not by any means sure that I am right. I may be told that a house of another kind may be divided into any number of rooms and still be only one house, but this definition hardly applies to glass structures devoted to horticulture; and I presume as a body we have the same privileges that other classes have of making laws for ourselves, and consequently of deciding what a certain term implies in garden vernacular. Taking two terms for structures met with in every garden of note, some understanding ought to be come to as to what they respectively mean—houses and pits.

Beginning with pits, I find a great difference of opinion, some calling every glass structure having a fermenting bed in it "a pit," no matter what its size is; others limit the term to a smaller description of building. Perhaps it may appear presumptuous for me to say that I have been in the habit of calling every structure a house which has a legitimate pathway into or through it, and only such smaller enclosures as have no such pathways nor modes of ingress and egress for visitors, I should call pits. At the same time they must not be moveable but fixed on a foundation of brick or stone, or otherwise secured to their position to entitle them to the name of pits; while those of a moveable kind might be termed frames, limiting the latter name to such as are moveable as a whole, but not to include such structures as are prepared to be taken to pieces for removal at the expiration of a tenancy.

Coming now to the houses, assuredly it must be wrong to call a range formed into a number of compartments by divisions one house, even where all the compartments are devoted to the cultivation of one kind of fruit, or one description of plants, as is done in the description of the noble vineries at Longleat, in a recent number of *THE JOURNAL OF HORTICULTURE*, wherein it is stated the fine span-roofed house of 216 feet long by 32 feet wide, is divided into three compartments. Would it not be more fair to say there were three houses? for similarity of build is not enough to entitle all three or more to be called one, otherwise in many places ranges of several hundred feet might claim the same distinction, for outwardly the line of roof and general contour is the same throughout. Perhaps it may be urged that when a number of houses are all devoted to the cultivation of one kind of fruit; for instance, Grapes, the terming them one house is applicable or excusable, but I hardly think it is.

I would also ask some of your many correspondents to inform us where the largest vineries are to be found. If I am not mistaken, some one has described those at Clovenfords (Mr. W. Thomson's), as being even larger than that at Longleat, assuming it may be regarded as one, which I am unwilling to do. I may be wrong as to the size of Mr. Thomson's vineries, as I have not seen them, but I have seen other large houses, and as far back as 1860 described two at Mr. Meredith's, Garston, near Liverpool, one being planted with black Grapes the other with white, and each house was 144 feet long by 32 feet wide without any division. Subsequently, some half dozen years ago or more, I found that Mr. Meredith had erected two more vineries still larger than the first, being, I believe, upwards of 200 feet long and 32 feet wide; these were also without divisions. With the exception of two glass houses near Maidstone, those last mentioned at Mr. Meredith's are the largest houses for fruit-growing that I have ever seen; and in point of area occupied they were, perhaps, larger than the Maidstone houses, one of which was 387 feet long, and the other 377, both being 16 feet wide inside. One of these was occupied entirely with Peaches, the other partly with Peaches and some Grapes. The houses last referred to are what are usually called "half-span;" a short north light being united to a steep front one, gave more roof than is usually the

case with houses of greater width. All these houses are undivided, and consequently cannot be described otherwise than as one house. Larger houses may exist, but I have not seen any devoted to fruit-culture that exceed these; nurserymen, however, sometimes have larger plant houses. Some of the largest and in other respects fine houses of this kind that I have seen, are at Messrs. Smith's nursery, Worcester, but I forget the precise dimensions. They were each devoted to some special purpose, as a Rose house, an orchard house, and a house for hardwooded plants.

What, then, constitutes a house as usually understood when the term is applied to a glass structure? And if every compartment is entitled to that name, might not the distinction of "a series of houses," be applied in some of those cases where the singular number only is used?—*J. ROBINSON.*

NOTES ON LIFTING FRUIT TREES.

ROOT-PRUNING fruit trees dates from a period anterior to that of "lifting" them biennially or triennially, in order to continue them fruitful, but of a manageable size in a small space. The founder of the system was the veteran pomologist and rosarian, Mr. Rivers, of Sawbridgeworth, who in his "Miniature Fruit Garden," seventeenth edition, tells us in the introduction that his "attention was drawn to the benefits fruit trees derive from root-pruning and frequent removal, about the year 1810." This will undoubtedly give us the date of lifting, and, I think, of systematic root-pruning also; for though we have root-pruning alluded to before, so meagre were the details that no one could tell upon what subject to act, nor where to begin and end. The cutting-off a few roots was all that was considered necessary to lessen the growth of wood and induce fruitfulness. Our nurserymen from a remote date have, no doubt, been root-pruners and lifters of fruit and other trees in the course of business, quite as much to keep them with good roots and saleable as for any other purpose, they being unconscious of the effects on the fruitfulness of the trees. Mr. Rivers was the first to reduce root-pruning to a system. McIntosh certainly mentions "a rational mode" as adopted in the gardens of Lord Mansfield in Perthshire, "by cutting the roots of the trees nearly to their stems," but gives no date, and mentions it as an "adoption," not invention. The first notice I remember of seeking fruitfulness by acting on the roots is by Evelyn; but the "paring" of the roots we can only conclude to have acted by the disturbance at their origin tending to the emission of fresh fibres, on the presence of which near the surface depends fruitfulness.

Lifting, which tends to multiply roots by preventing the formation, or at least the continued extension, of the thick and fibreless roots with a tendency to go down into the cold, wet, unameliorated soil, appears the most rational, and, what is better in practice, the most effectual mode of promoting fruitfulness; but we must not practise it without discrimination, for it should not be forgotten that there is diversity of root as well as disposition and form of head or branch. Some trees or stocks have naturally fibrous roots put forth at and near the stem. Such they may have when very young, yet these fibrils soon enlarge, becoming thick and long with the fibres at their extremities; hence these are not fitting subjects for lifting, as from the character of the roots the operation is attended with, if only moderately distantly practised, great retardation of growth and considerable loss of vitality, not unfrequently proving fatal. Instances of these descriptions of tree or stock are the Crab and Apple from pips, the Pear, and the Cherry. Lifting if practised upon them seems not to be attended with any good result. It unquestionably tends to promote their fruitfulness, but the roots would appear not to be multiplied in sufficient numbers to cater for the increased crop so as to permit of their attaining a full size; the fruit for some time after the operation being considerably less in size though greater in quantity than on subjects not having their roots interfered with after planting. Lifting and root-pruning are not, so far as I have experience, nearly so well adapted for them as for the other description of trees, those of a much more decided surface-rooting and fibrous character.

Lifting, however, frequently resorted to, with trees on free stocks—i.e., the Crab, Pear, and Cherry, gives a check to growth greater than is experienced by trees on the "dwarf" stock, the former being longer in recovering from the effects of removal and consequent loss of roots. The trees mostly show the effect of removal by an attempt at fruitfulness; I say

attempt, because the result does not warrant our saying more, the fruit being small, and no sooner are the roots again in possession of the soil than they depart from the fibrous character given by the lifting, and strike out long in quest of nourishment, soon becoming thick and fibrous. At the same time as the roots extend considerably the head commences to make long shoots, which no amount of stopping will restrain. True, the head may be kept in reasonable bounds by pinching or stopping, but the trees will not form fruit buds; on the contrary, they will exhibit the desire to grow by putting out an infinity of spray. It is the nature of the tree, albeit the root, to grow in that way, and who can control Nature? Is it not better with subjects of this kind to allow the branches to extend, suffering no pruning nor disturbance of the balance between the roots and branches beyond what is necessary for the proper disposition of the branches? Should we not secure a greater, finer produce, and earlier than if the trees were subjected to frequent manipulation of the shoots in summer and of the roots in winter, allowing them to grow not restrained of necessity, no pruning whatever being practised but what is absolutely necessary to keep the head open for the due admission of light and air, and to secure the form of tree wished? "Well, the trees will become standards that may not be grown at less than 24 feet apart, giving but seventy-five trees to the acre!" "Think you not that these seventy-five trees, which may yield their twenty bushels per tree, will not afford as good a return as the same kind of trees at half the distance apart, or 12 feet, 302 trees root-pruned and summer-pinched? Yes, that they will, and double, both in quality and quantity." I have seen both Apples and Pears on the "free" stock, dwarfed with a result characterised only by sterility or insignificant fruit.

There are some kinds of Apple and Pear which on the "free" stock are prolific at an early age; they yield as fine or finer fruit, and are as manageable as those on the dwarfing stock. But a majority are so free in growth, their tendency so in unison with that of the stock as to be ill-restrained, the very act of restraining them by pruning causing the head to become thick and stunted, just as if the tree had in the first instance been suffered to become a large tree, and then the branches sawn off to what they are, the spray upon them being the result of the removal of the head. No tree on the free stock makes shoots approaching a yard long, without in the next year from almost every eye starting a short stubby shoot crowned by a tuft of leaves, a spur, and in due course a fruit bud. Shorten such a shoot one or two thirds its length, and it will in the following year put out from a majority of the eyes shoots of considerable strength, scarcely any having the short stubby spur type, and not unfrequently the shoots so monopolise the sap that the eyes below them remain dormant. So convinced am I of the injurious effect of severe pruning upon trees on the free stock, and of root-pruning except under special circumstances, that I feel justified in thus protesting against the practice.

Without pruning the trees would grow wild; this I know. The pruning should be of a kind to prevent this, and no more. Encouragement should be given to the spurs, their formation and maturation, and not to growth for no possible purpose but to be cut away, hoping that spurs may result. Vain hope! The tree is bent upon growth, refuses to be restrained; the more it is cut at the more it will grow. Root-prune it and obtain fertility. Praise this of fruitfulness. In a year or two the roots will have recovered; they will fashion the head again after their kind, the growth in a few years being almost as free as ever. Why, what is it that necessitates pruning? Culture—man making the tree assume a form upon a wall or trellis contrary to its natural habit, training the shoots horizontally when the natural habit is to grow upright or obliquely. This is one reason certainly, and another may be said to be in removing such shoots as interfere with the spurs and fruit by depriving them of light, air, and nutrition. But are there none other? Yes, there is one more, and may be others, one very often lost sight—limiting them to a space altogether inadequate to that which their growth demands. Do we not often see trees that, whilst growing and covering the space allotted to them, progressing in growth and fruitfulness each succeeding year after establishment, no longer to do so when the elongation of the branches ceases? The branches become spray instead of clusters of spurs, two or more crops of the spray requiring to be removed in a season. Think you it would be so were the branches allowed to extend—that barrenness would ensue, root-pruning be necessary, and not rather that this

extension would result in fruitfulness? One-half the ills of fruit trees are due to our not giving them what their nature requires. It is all very well to dwarf a tree. It takes up less space, enables us to have greater variety, but we should discriminate with what and upon which subjects we act. Free stocks mean large trees. The Crab is a tree, and so is the Pear, also the Cherry. Stunted and dwarfed they may be by frequent destruction of the roots, by cramping them, and by growing in a starving soil, but they will give poor small fruit. It cannot be said that making them bear brings quality and size. Nothing of the kind takes place. At the best they are bad rooters, and in consequence are not equal to the support of a mass of growth suddenly converted into spurs for blossom or fruit.

Numerous instances might be quoted as coming under my observation of the utter inutilty of a systematic persistence in lifting and root-pruning young fruit trees on the free stock; but I will content myself by naming two, the one relating to young trees, and the other to aged trees. In the case of young trees I may state that I had for some walls for Pears, which it was desirable to cover as soon as possible, trained trees of large size having a spread of branches of from 12 to 18 feet. They were well-furnished trees, and in a bearing state, and had from frequent removal—every second year, capital roots, and all took well. They gave a sprinkling of fruit the next three seasons, very small the first, a little better the second, and better the third season after planting. They had recovered the last planting, and made shoots characteristic of the roots. The growth was thought to be too free, and lifting being resorted to, opportunity was afforded of noting the runaway nature of the roots, and the absence of fibres near the stem, very few being emitted from the thick roots cut in the late removal, a few only being put out from their extremities, and those had become already comparatively thick and long—wonderfully so in so short a time. Growth the following year was poor, some trees making very small and few leaves, and the blossoming was weak, no flowers setting, or, if any did, they dropped off prematurely.

These trees were ten to twelve years from the graft, had been lifted every alternate year up to seven, and then in the third. If lifting causes fruitfulness, why did it not do so in this case? I admit the want of fruitfulness to be counteracted by the lifting; and though the removal did cause the formation of fruit buds in the season following the lifting, the roots had made such poor progress as to be unable to afford nutriment for and bring to a full size the resulting fruit. It could not be due to any other cause than lifting, for trees on the same stock and of the same age bore plenty of fine fruit. I have noted the like result from Apples and Cherries on the free stock—the year after removal the trees are scarcely able to exist; and notably I may allude to Cherries and some Pears putting out a few leaves, and after a short time drying up. Last autumn we lifted about two hundred, some on the free stock and others on the dwarf stock. They were in both instances large trees, and were lifted because they had been planted too deeply, a not uncommon error in planting. Probably they had been planted eight or nine years—not for a less time than the first. The difference in the rooting of the two stocks was very remarkable. Those on the free stocks it was impossible to move with more than a few thick roots without a particle of soil; those on the dwarf stocks were in every instance moved with balls of earth, and numbers of feeders beautifully fresh and white emanating from the main root-stem at, or a very little below, the surface of the soil. The difference in the growth it is scarcely necessary to note. Those on the free stock are barely alive; three Pears out of about fifty trained trees and the same number of pyramids have not put out a single leaf, the delinquents being a Beurré Giffard and Marie Louise, a Beurré de Capiaumont being now in full blossom, not having put out a leaf until after midsummer. All on this stock (free) are no more than alive: they blossomed, or strove to do so, abundantly, but failed. What a different prospect those on the dwarf stock present! All have made abundant foliage, short stubby shoots, and are carrying fruit; not so much, perhaps, as would have been the case had they not been lifted, but enough to show both in foliage and fruit the advantage of rooting and feeding possessed by the dwarf stock over the free, both in the Apple, Pear, and Cherry.

The best example of the effects of root-pruning a large free stock is a natural one—the Crab itself—blown over by a high wind, the roots being broken off on one side, and on the other partially. This tree the year following had a hard struggle for

life, for not only were the roots upheaved on one side, but they were partially or wholly broken at the other. It managed to blossom and to put forth its leaves, sufficiently so for the conversion of almost every bud into a fruitful state, for the year following, or second after the natural lifting, it bore an immense number of fruit, very small indeed, even for Crabs. No growth of note was made in either of those years; but along the central branches (which were, from the throwing-over of the tree, horizontally placed), some knobs or excrescences appeared, and from some of them a small shoot was noticeable. In the season following, from those knobs issued shoots which in three seasons have made 9 to 12 feet of perpendicular height, some almost at their base as thick as my wrist, and though so strong they are not unfruitful—in fact, large fine Crabs are produced.

This Crab tree is an example of the whole of my observation and experience in root-pruning and lifting Apples on this stock, and all fruit trees on the free stock. Bringing the branches into a horizontal position causes the upright sappy shoots, which are such a plague in all cultivated trees on walls, trellises, &c. Their removal answers only to confine them to a given space; it does not hasten, but renders more distant the bearing, convincing me that trees on the free stock are not for small gardens where they cannot attain their full proportions. The very act of restraining them, though inducing temporary fertility, renders them more barren, and instead of causing spurs to be formed, young strong growths are made, and the tree, on being root-pruned, appears as if resuscitated; fresh roots and new shoots being formed, which monopolise the sap, the old becoming enfeebled, decaying slowly but surely, and fruit shows itself, not on the old, but on the new parts.—G. ABBEY.

THE ROSE ELECTION.

TIME draws on for the calling-in of the voting papers. I should wish to get the returns printed if possible in the last week of September. As there is a large amount of labour in the summing-up, I shall be glad to have the returns from all intending voters as soon as possible. I propose to keep the poll open till Saturday the 5th of September, but I shall be grateful to have the returns as soon as possible. Often they are informal, and necessitate my replying, which delays the whole.

The question I again give: Name what you consider the best fifty Roses in cultivation (this, of course, includes any Rose in commerce of whatever kind), and underline the best twenty of these fifty.—JOSEPH HINTON, *Warminster*.

BEDDING GERANIUMS.

DR. DENNY and myself are anxious to get up some good prizes open to everyone for bedding Geraniums, subject only to the condition that the raiser's name be attached to each plant. Will any of my friends assist us? Any contributions to this object will be gladly received by me, and the names will be published in the papers. We are each prepared to give five guineas, and any assistance will be welcome. Our object is to gather together all the best varieties in the country, so that all may have an opportunity of seeing which are the best worth cultivation.—J. R. PEARSON, *Chilwell*.

I HOPE some one will do as "C. S. B." suggests, and contribute some fuller notes on bedding Geraniums, stating at the same time the soil and treatment under which they succeeded. When Geraniums are not bedded-out, as in many parts of the London parks, till the third week in June, they are not likely to make any growth so as to come into bloom till nearly the end of August. This I can testify, that by the 14th of June many beds of Geraniums, especially in the Green Park, were not planted; and even at the Crystal Palace, when I was at the Rose Show on the 20th of June, there were plenty of empty beds to be found. What chance had Geraniums, especially newer sorts propagated in spring, to succeed when a dry cold June was followed by a hot dry July? Young plants never got any hold of the ground in many cases till rain fell after the 27th of July, and plants must grow before they can flower. I am glad "C. S. B." speaks out about Vesuvius. I grew it one season longer than I otherwise should because it was so much cracked-up, but nothing would induce me to make another bed of it. Though Pink Queen is a shy bloomer till the plants get established, yet it is in very fine bloom

here. Several kinds besides Vesuvius are apt to shed their petals with hot dry sun or wind, notably Darius and Jean Sisley.

I fear none of the true Gold and Bronze section of Geraniums will be as strong as Beauty of Calderdale, Her Majesty, Kentish Hero. The very absence of chlorophyll (the green colouring matter of the leaves) will prevent this. Still Impératrice Eugénie, Crown Prince, Reine Victoria, Earl Rosslyn, and my namesake, Rev. C. P. Peach (which last seems the strongest-growing of all the true Gold and Bronze section), will always repay extra trouble. Mrs. Lowe, Amaranth, Violet Hill, Charley Casben are both growing and blooming well here, but then they were planted out before the end of May, and were good plants when put out.

I despair of getting either a good white of the Madame Vancher type, or a good one of the François Desbois style. Gloire de Corbenay was the best I ever had.

Many Geraniums, as well as double Marie Lemoine, would be better planted out as old plants, for other plants besides doubles do but little good till July is nearly over. Of strong growers, Col. Holden and Dr. Tait would suit many. Chief Justice was far too strong here, and had to be discarded. I hope others may record their opinions.—C. P. PEACH.

LITTLE HEATH MELON.

I CAN bear testimony to the great merit of Monroe's Little Heath Melon. In four lights of an ordinary brick pit I had fourteen good fruit, the largest weighing 5 lbs. They had no bottom or top heat other than sun heat, as the pit was filled with leaves only early in January for Potatoes, the Melons being planted after the Potatoes were taken up. The flavour, however, is not first-rate, although better than that of many varieties I have grown.

I may add that Gilbert's Victory of Bath has proved very good with me this year. It is very early and of good flavour, also an excellent bearer; I cut fifteen of fair size—from 2 to 3 lbs. each—out of two lights.—T. PROSSER, *Gardener, Bridge Hill House, Canterbury*.

UNDOUBTEDLY the Little Heath Melon is the best for amateurs to grow, and for flavour it ranks with first-class Melons. It requires no heat, so that the trouble of a hotbed as for less hardy sorts is dispensed with. All that is required is to raise plants, say two in a 60-pot, and when a cold frame is at liberty throw in a mixture of rather strong turfy soil three parts, and one part thoroughly rotted manure, to the depth of a foot. Level it, but leave a small hill in the centre of each light, in which plant. If the lights are large put two plants in a hill: if small, one. When the plant is in free growth give air on every favourable occasion, so as to secure short-jointed wood, and keep the atmosphere rather dry while the fruit is setting. By no means allow more than five fruit on one plant, for this number is all the plant can well carry. Trim and train the shoots regularly, keeping the main shoots thin, so as to allow space for the laterals on which the fruit will be produced. The soil should be made rather firm, which will tend to prevent over-luxuriant growth, and water should not be given too freely. Great care must be exercised to maintain a sweet healthy atmosphere and to guard against red spider. Dryness at the root and also in the atmosphere when the fruit is ripening will tend to improve the flavour. If "G. C." (see page 161), adopt this plan he will meet with the same success at much less expense and trouble, for this Melon does not require heat.—J. H., *Bickley, Kent*.

STAG'S-HEAD FERN.

IN reply to "F. P.," No. 699, page 165, I beg to enclose you three specimens of fronds taken from three plants in my possession. One is plain, the other two forked. In this part of the country they are commonly called Stag's-head or Stag's-horn Ferns. Botanically this is a misnomer, as the fronds bear no resemblance to the proper stag-horn (a specimen of a plant of mine I also enclose). The botanical name of the Ferns to which I referred in my first communication is *Scelopendrium*, Hart's-tongue. The two forked specimens enclosed may be classed as *crispum* (curl-leaved), or *multifidum* (many-cleft), and the plain-fronded one as *Scelopendrium vulgare*. Some seven years ago I gathered the roots from off a moor near Ulverston, called Birkkrigg. When I first had the forked kind, one frond only was forked, and that with a single fork.

Since then I have had it in a rockery in the open air for two years, and finding that it yearly continued to improve (it has never had a straight frond since the first year), I took it into the house and potted it. The improvement has been annually manifest, and at the present time a single piece of gold coin would not purchase it. On the moor above referred to, the limestone formation crops out to the surface in large boulders of quaint shape, the smaller ones of which are used in rockeries or as a top-dressing for garden walls. In the clefts of these rocks the *Scelopendrium* is found in large numbers, and also in the neighbouring hedges. Of course, the surrounding inhabitants are not insensible to their merits, and the forked ones are sought for, yet there are many still to be found. I have no hesitation in saying that in a day a man would be able to collect an ordinary cartload all in growing condition. Of these twenty per cent. would probably be forked. Some two or three years ago a friend of mine, now resident in Manchester, but a native of this district, wrote to ask me if a specimen of the many-cleft species could be found in its wild state here, and was not a little astonished when I sent him a similar frond to those I enclose to you. I also send you a specimen of the Maidenhair Fern, which grows here in great profusion.

—BETA.

PEACHES.

In conformity with Mr. Luckhurst's request, page 165, I write a line, premising that my experience is from orchard-house culture only. I strongly recommend Early Alfred as one of the best sorts—that is to say, at present, and I put in this proviso because I have found sorts which were excellent for a few years sink below old and tried varieties. This was the case with Dr. Hogg. After it had lost its first excellence I kept it on for two or three years, hoping that it would recover, but with me it never did. Early Rivers and Walburton Admirable I have discarded. As a late Peach take Rivers's Princess of Wales, a noble fruit, and for very late purposes his seedling No. 10, though far inferior to mid-season sorts. A most desirable variety is Pymond, an Exeter seedling, sold by Veitch.

—G. S.

A NEW PRINCIPLE OF GARDEN ARRANGEMENT.

THIS is the title of a little pamphlet by Mr. H. W. Cooper, in which what is termed the "natural style" of gardening is set forth as being altogether superior to "the present artificial style," and an attempt is made to show how improvements are to be effected.

It has so long been customary for many worthy horticulturists to indulge in sweeping invectives against the so-called artificial style, that some inquiry as to what this style really is may perhaps serve to enlighten even those who so stoutly rail against it. To quote Mr. Cooper's words, this is what it is: "For five months we may see our grounds brilliant, indeed resplendent, with Geraniums and a host of other bedding-out plants; but what becomes of those beds for the other seven months in the year? Have we not mostly seen dull gloomy-looking shapes of earth cut out of the grass or gravel, and prized in winter only for their quaint or elegant designs, or in remembrance of their past summer glories?" Thus it is resolved into five months' splendour and seven months' dullness in regular alternations. Spring gardening is indeed mentioned, but it is not advocated, being merely passed over as being "not very generally practised," and the spring-flowering plants are claimed as permanent fixtures under the "natural style."

Now, I have seen many of our finest gardens, and have during the last four years been closely engaged in working out the details of a new place, and do not hesitate to say that our present style of gardening is an excellent combination of nature and art; faulty it certainly may be, and susceptible of improvement in some of its details, but not to the extent or in the manner which theorists assert. Take, for example, a terrace garden replete with such architectural embellishments as noble flights of steps, balustrades, statuary, vases, and fountains attached to a pile of buildings of lofty proportions and stately aspect: is it not an art work of the highest order? and would not any attempt to copy or imitate Nature's wild grace in the planting prove altogether incongruous and out of character? The flower garden is undoubtedly a work of art, and a glorious one it is too; only let the design be pure, well adapted to its position, and the beds well filled—not with gaudy, glaring, overpowering masses of primary colours, but

with some full rich tones skilfully interwoven with various quiet tints and shades, rendering the beds objects full of beauty and unceasing interest, and we have a picture so expressive of poetry, and graceful yet dignified refinement, that we may, and do, claim by it to exemplify not "a flash of colour," but "the real and deeper mode of Nature herself."

Nor do we by any means confine our efforts to the production of a mere summer display, but, as has lately been shown in the papers on spring and winter gardening, the preparation of successive relays of plants for winter and spring immediately follows the summer planting; so that the beds never remain bare, the exhausted plants of each season being removed to give place to those which are adapted to the next. Thus we have for winter Holly, green and variegated, and numerous other very ornamental plants which have frequently been enumerated, such as *Pernettya*, *Cotoneaster*, *Gaultheria*, *Mahonia*, *Berberis*, *Pyracantha*, *Symphoricarpos*, *Skimmia*, *Ruscus*, and *Hedera*; with such dwarf Conifers as the violet red *Retinospora cricoides*, the compact and symmetrical *Retinospora leptoclados*, *R. obtusa nana*, and the golden form *R. obtusa aurea*, *Thuja aurea*, and *T. elegantissima*, the very symmetrical *Arthrotaxus selaginoides*, and the Chilean Yew, *Podocarpus andina*, with a perfect host of other shrubs, for the list affords ample materials wherewith an effect full of richness and warmth may be wrought out.

But it is in spring that the garden appears in fullest beauty; then the deep blue *Scilla*, the lovely *Myosotis*, with *Saponaria*, *Viola*, and all the wealth of vernal beauty which we now possess, burst upon us in such loveliness, that it is no uncommon thing to hear exclamations of genuine admiration from those who at other seasons hardly seem to notice or care for flowers at all. Thus we delight to keep the flower garden always bright, always attractive, with our best treasures. May we not call them "art treasures?" for are not most of them varieties and seedlings resulting from skilful and patient hybridising by masters of that art.

Now, what does Mr. Cooper offer us as a substitute for all this? Insisting upon the use principally of hardy plants, he enumerates *Yucca*, *Tritoma*, *Acanthus*, *Rhubarb*, *Dielytra*, *Asparagus*, *Thrift*, *Daisies*, &c., as worthy to form a "permanent foundation for the ornamentation of our grounds." It is true he is willing to admit a few of our usual summer flowers, but he confidently asserts that "the ribbon beds, and all similar preiseness of colour will soon be reckoned with the past." It is a remarkable fact that most of the really valuable hardy flowers do find a place in very many gardens, but then good taste leads us to form them into bold groups mingled with shrubs; they also most effectively fill many a niche in the rockery, or render mixed borders perennial with their almost continuous succession of bloom. But ornamental as they undoubtedly are, we never should dream of yielding many of them a place in the flower garden. That very much more can and should be done with hardy plants is undoubtedly correct enough, more especially in the formation of striking shrubby groups and beds. Take for example the *Yucca* for a bold effect upon a steep bank or abrupt declivity; the Heath tribe for gentle slopes; the Pampas Grass (*Arundo*), and *Gunnera* for rocky dells or the margin of ornamental waters; and so far as Mr. Cooper's advocacy of this goes, it is useful and praiseworthy. Unfortunately, however, he is so ardent a reformer, and his ideas wander so far out of the beaten track, that his last two or three pages are devoted to showing how, in his opinion, beauty and utility may be combined by associating the Raspberry, Currant, and Gooseberry with Hollies, Box, Yews, &c., and by mixing *Gladioli* and herbs, garnishing beds of flowers with Parsley! and so forth. The absurdity of such teaching must be so evident to all that any refutation is unnecessary.

It is altogether in vain for the advocates of hardy flowers to suppose that they will ever succeed in ousting the bedding system from our gardens. Depend upon it the education of gardeners is progressive, and instead of the adoption of any plan that is so retrogressive in its character, we shall strive rather to perfect and extend the system of which the foundation was so firmly laid by that master of the art, Donald Beaton. Let not anyone suppose that real lovers of gardening are content to remain passive in the matter. The very numerous inquiries that are constantly made, and the tasteful colour-arrangements sent for criticism, would alone afford conclusive evidence of the general prevalence of a lively and growing interest; and as time rolls on, instead of clashing with Nature, we shall, I doubt not, strive with increasing

earnestness and success to copy the lessons which she teaches—not so much when she presents herself in wild and rugged beauty, as in the softer and more pleasing aspect of flowing lines and harmonious tints. The work is a healthy and elevating one, and is far more generally appreciated than many persons appear to be aware of. It never palls upon the mind or grows tame; it appeals to our common nature so forcibly that whenever I see a well-kept and highly-finished flower garden, with the rich yet soft harmonious blending of its colours, the exquisite neatness of its keeping, the pleasing relief which the skilful intermixture of plants of stately or graceful aspect imparts, I invariably recall the exclamation which a bluff old nurseryman made years ago when speaking of such a scene, "Paradise, sir, paradise!"—EDWARD LUCKHURST.

CONSTRUCTING GREENHOUSES.—No. 1.

THIS is the usual season for erecting these structures, and many of our readers are now asking us for suggestions and directions. The late Donald Beaton wrote to us so fully on the subject that we republish his notes, and add some plans that our readers may select one that best suits their places and purposes:—

The best aspect for either a greenhouse or pit is south, but east or west aspects will answer. The angle of the roof is best when low, say about 30°; the width inside from 12 to 14 feet. Greenhouse plants always do best when the roof is pitched low. The usual objection to low roofs is, that the wind will drive in the rain between the glass, but that is easily got over by having the laps of the panes puttied. A higher angle for the roof than 30° is apt to draw the plants too much to one side. You always see nurserymen, who are good judges of what is best for their plants, use flat roofs to their greenhouses. The roof-sashes should be in two lengths, and the top ones one-third shorter than the bottom ones; they will thus be lighter for sliding up and down in giving air to the house. A better plan, however, would be to have all the roof lights or sashes fixed, and in that case they would be better in one length; but that could only be done well when a good dry shed is placed against the wall behind the greenhouse; into this shed large openings might be made at the top of the back wall for giving air. One of the greenhouses at Shrubland Park is thus constructed, and answers very well. This very house and shed may be described as an example of one very economical and useful for an amateur. This house is 12 feet wide inside, the back of it 13 feet high, and the front 6 feet, consisting of 2½ feet of brickwork, and the rest of glass. The front sashes move on hinges, by which they are fastened to the top plate, and when opened for giving air are retained in their position by a thin piece of flat iron 15 inches long fastened to the bottom frame of each sash. This flat handle, as I may call it, is pierced with ten holes along the centre, about an inch apart, and there is an iron pin 1½ inch long fixed in the lower wall-plate, which fits these holes. Now, when you want to give air you take hold of this handle, lift it from the pin, and push out the sash with it, say to the length of six holes; drop down the handle then over the iron pin, and your light stands open 6 or 8 inches wide. No wind or accident can alter it backwards or forwards till the handle is let go off the pin. There is nothing in this contrivance to get out of order, and it is the simplest thing possible. All the front sashes may be opened to 14 inches wide, and, with the door open, the plants are nearly as free as if they were in the open air. The roof sashes are all fixed, and just under the top angle there is an opening into the back shed under each light. These openings are 3 feet long and a foot wide, without any shutters to them; there they are wide open day and night, winter and summer. The shed behind is always dry, being used to hold large Myrtles, Fuchsias, &c., during the winter, and as a painter's shop and lumber-room in summer, so that a current of dry air plays over the plants all the year round. When the shed and greenhouse are closely shut up in frosty weather the current of air goes on nearly as strong as when all is open, by a very simple contrivance. The floor of the shed is 6 inches lower at one end, and here a hole is made through into the greenhouse; this hole is directly over the furnace which heats the greenhouse flue. As the air cools in the shed it rolls down to this opening, and is sucked into the greenhouse by the heat of the furnace; it then ascends over the plants till it escapes into the shed again by the top openings. For the economy of the thing the back wall is only made up of posts and strong boards,

plastered over on the greenhouse side, and whitewashed with lime on the shed side, and being always kept dry, will last a lifetime.

A shelf 30 inches wide runs along the front and one end of this greenhouse, and under this shelf the flue passes all the way. The shelf is 2 feet 3 inches high from the level of the path, the bearers which support it being cross-pieces let into the second course of brickwork next the top; the shelf thus standing one brick lower than the front glass. The path ought to be 2 feet 10 inches wide, or if you give it a yard it will be all the better. Recollect there will be a shelf on each side of it, and when your friends come to see your success in growing plants they have to walk, stand, or turn round in the path; and if there are ladies in the party their dresses are sure to be made so full that a narrow path will not allow them to pass without pulling down your pots and plants on either side of the way, and instead of getting any praise for your plants and for the laying-out of your new greenhouse, you will be told, and very properly too, that "you have made a poking place of it after all." Let us therefore have a wide comfortable path at any rate, though by doing so we encroach a little on the shelves. The front shelf need not be wider than 18 inches, just to cover over the flue, if you are tied for room, as no tall plants could occupy that part for fear of intercepting the light from the rest of the plants. The roof sashes are best made 4 feet wide, or as near to that as the size of the glass will allow; let them be made of the best red deal, primed, and once painted before the glazing is done. The reason for giving

Fig. 53.

two coats of paint is, that after the glass is in there must be no more painting allowed for full three months. Now, if you contract with a builder to erect the house, recollect to enter this clause about the painting in the specification, as he will be sure to urge you to finish it off at once. The reason for the three-months delay is that the putty may get dry throughout before it is fit to be painted. Of course you will be told this is all fancy, and that ninety-nine persons out of a hundred never think of such a thing, and that a little white lead mixed with the putty will make it set hard in a few days; and so it would, but have nothing to do with that sort of putty. Gardeners never allow the use of that old kind of putty in these days, because once it gets dry they can hardly cut it when repairs or alterations are to be made afterwards. We have seen a good glazier break four squares of glass trying to mend one broken one, besides spending an hour and a half at the job, which a mere lad could do in five minutes, and without any breakage, if proper putty had been used in the first instance.

Hothouse putty is made with whiting pounded down and sifted very fine, and boiled linseed oil, making it into dough as the bakers do their bread; the more the dough of putty is worked the better it will be, and it should be at least ten days old before it is used; in that time a large lump of it will "sweat"—that is, slightly ferment, which is necessary to give it the proper adhesive power. When this soft putty, as it is called, is allowed to dry thoroughly before it is painted over, it will last as long as the hardest white-lead putty, and at the end of twenty years be soft enough to be cut away with your knife. If, therefore, you wished to remove your greenhouse at any future time, you could easily take out the glass, pack it in boxes, and the timber-work could then be handled and packed without the risk or annoyance of breaking the glass. We often see very neat well-built greenhouses in all respects, except that

the putty, having been painted over as soon as the lights were glazed, gives way the second season, the paint having blistered, not being able to fix or unite with the putty in a green or damp state. Then the rains drip in between the putty and the glass in all directions. Now, to guard against this everyday occurrence is the reason for my dwelling so long on such minute details. To say that this, that, or the other, should or should not be done, without assigning reasons for what you say, is no proof that the party giving such directions is any judge of what he recommends or condemns.

In making the shelves for the body of the house, the lowest shelf ought to be on a level with the front one, and the others carried up in regular gradations, according to the slope of the roof. If the house is detached from other buildings, both ends should be glazed above the level of the shelves. The door is to be at one end, and the fireplace behind the door, the flue passing under the path within the doorway, and on reaching the front wall, to rise with a gentle slope, and to be carried nearly on a level along the front wall, and within 2 inches of it, and to pass along to the farther end of the house into a chimney in the corner. The size of the flue to be 9 inches wide and 11 inches deep, made with bricks set on edge, and on no account to be plastered inside or out. The top and bottom of the flue to be made with thick tiles, called "foot-pamment," the bottom ones resting on flat bricks to clear them from the ground; the fireplace should be 18 inches long by 14 inches wide, and 14 inches high, with iron bars for a hearth. The door to be a foot square, and the asphalt 9 inches deep, and the same length and width as the fireplace above it. The door of the fireplace would be more effective, and less liable to warp with the heat, if it is made a "double" door—that is, by having a plain square piece of half-inch-thick iron riveted to the inside of it, and 2 inches apart from the inside of the door; this is a simple and very useful contrivance, but often neglected. British sheet glass, 16 ozs. to the foot, is the best kind to use; the width of the panes for the roof sashes should be about 8 or 10 inches, and they should be from 1 to 1½ foot long. For the front sashes the glass may be much larger every way. This kind of glass is sold in boxes, containing 100 feet of glass each, and sold from 2½d. to 3d. per foot. Sashes of the best red deal are generally made by contract at about 6d. per square foot; but the price, no doubt, varies in different parts of the country, but this will be sufficient to form a guess at what the sashes and glass will cost; for nothing of this kind ought to be attempted before every item of the expense is first ascertained. If the house is made by contract, let the contractor be responsible for the efficiency of the whole for the first twelve months.

on the same principle is shown in *fig. 51*; but to save expense the bottom is placed on the ground, and slates or tiles placed diagonally at the sides to prevent the soil coming against it, and thus let the heat ascend from the sides as well as top. This flue may receive a wide-enough cover to form the walk, or may be covered over like the rest of the floor, if tiled.

Supposing the doorway was at one end, or you had a doorway at each end, so that you could go right through the house, then the stovehole should be sunk a little at the side of the doorway, the flue turned a little until it got to the centre beneath the pathway, and then turn a little at the other end so as to avoid the doorway, if there is one, and go into a small chimney there. Such a flue in a length of 30 feet might rise from end to end some 2 or 3 inches, and to draw well the bottom of the flue ought to be from 15 to 18 inches above the firebars, so that for such a small fireplace as would suit this flue, you would have to sink a stovehole from 3 feet to 3 feet 6 inches below the ground level, and the small hole could be covered with a neat wooden flap.

But, now, supposing that your soil is so bothered with springs and swamps that you could not expect such a hole to be made without retaining in winter 6 or 12 inches of water, then all you have to do is to sink all that less, and take your flue along above the ground level, beneath the flower platform, instead of in the middle of the house. This house we would advise for a warm sheltered spot, and we think that in a short time it will prove cheaper than a pit, as though much more glass will be wanted, the fixed roof will otherwise cost much less than the sliding sashes.

Fig. 51.

Fig. 51 is a form of house that we would recommend for an exposed place, and where even a little fuel would be a consideration; width the same, back wall 5½ feet, front wall 2½ to 3 feet, sashbars the same; but if the house were 30 feet long we would have two slight pillars in the middle, 10 feet apart, and an iron bar along the roof. The short-hipped roof at back might be glass, one-third of it moveable; or, if warmth were a great object, it could be wood, and be painted a light colour inside, and a ventilator placed in it all the length. The front ventilator we would secure by openings in the front wall and slides. If the house were to be filled with small plants brackets for shelves could be left in the back walls. The same principle would apply to the flues; and if a little more expense were no object, hot water might be substituted. Such a house with a fixed roof would cost little more than a pit with moveable sashes, and there could be no comparison of the pleasure it would afford, and that, too, ultimately in the most economical manner.

Now for the management of such a house. In summer, unless in boisterous weather, all the ventilators and doors may remain open for months; in winter the tenderest plants could be placed nearest the furnace. If the house were from 30 to 40 feet long it would be better to make two divisions, and place *Calceolarias* at the farther end, then *Petunias*, then *Verbenas*, and so on, keeping fine *Pelargoniums*, &c., at the warmer end. The admission of air will always regulate the temperature. Firing should not be given in frost to raise the temperature more than to 38° to 45°; never above the latter. We have made no allowance for moist heat, because from the soil in the pots, and from the floor, sufficient moisture will, in general, be obtained; but if in continued frosty weather the air should become too dry, that is easily remedied by syringing the plat-

The cheapest of all modes of heating a small house—say 9 feet by 20 feet or 30 feet, remarks the late Mr. Robert Fish, would be an Arnott's brick stove inside the house, or a portable iron stove, which, however, we do not like so well, and a small portable boiler might also be used; but in the case of those great numbers who would rather have the fire outside than inside the house, we would recommend such a house as shown in *fig. 53*.

Width 9 feet, height to apex 7 feet, height of side walls 3 feet, openings in these side walls for air 1 foot by 18 inches every 4 feet, ledge left out in side walls to receive the ends of flooring for pots, the other side being supported by posts at the pathway, and a plank some 4 inches square with a notch in it to receive the other ends of the boards or spars for pit platform. Underneath this platform there will be room for stowing *Dahlias*, *Salvias*, *Fuchsias*, old roots of scarlet *Geraniums*, &c. Roof all fixed, rafter sashbar 3 inches by 1½ inch, placed so as to receive squares 18 inches wide by 12 inches deep, and two squares at top every third row made in a frame, and made to slide or open on pivots. A crossbar every 6 feet across from rafter to rafter, and a shelf in the middle over the pathway if deemed advisable for small plants. The space beneath the platform, and also the sides of the pathway, would hold many things when first potted, before they began to grow, and were thus able to stand the sun on the platform without any shading.

We have represented this house as being heated by a flue sunk in the middle of the house, but free of the earth all round. If the floor were tiled the same tiles could go over the top of the flue, leaving the open spaces at the sides so as to secure more heat; or if the floor were earth or gravel, the top of the flue could form the path, or a sparred gangway could go over it. Either of the first two would be the cheapest. A flue

form, or damping the floor and walls. The same care must be attended to in giving air as in a pit; but here comes the advantage of a place to which heat can be applied: you can give just a little air at the top every day, so as to sweeten the air in the house; and in cold muggy weather you can put on a little fire, which will enable you to give such an amount of air as will make a little breeze in the house, and even cause the cold fogs to disperse, by changing visible clouds into invisible vapour.

CANKER IN TREES.

THERE is as much difference of opinion on this subject as on the Potato disease. It is variously ascribed to bad or wet soil and subsoil; exposure to cold bleak winds, in high situations particularly; black frost in spring checking the circulation of the sap, external injuries of different kinds; insects lodging in the cracks and under the old bark; the infirmities of old age in those varieties long cultivated in England; improper stocks or improper grafting. Though others seem to be of a different opinion, yet I think that no topical application will do any good, and that the disease is not of the bark, but of the wood; and I am inclined to believe that this may frequently be the case, for on removing cankered branches I have often remarked that the very heart was infected and discoloured, and the wood under all the three different barks rotten or diseased. That canker often proceeds from the old age of those varieties long cultivated in England I am also convinced, from its being so very destructive to young trees in new gardens, in many of which it is very prevalent where these old kinds are found.—J. H., *Bickley, Kent*.

TAUNTON DEANE HORTICULTURAL SHOW.

It is not recorded of the illustrious Mr. Mark Tapley that he was ever the secretary, or even the member of a committee, of a horticultural society, and I think it was an oversight of the author not to have put him into that position; for, as in that experience the morning of the exhibition day opening under a gale of wind with heavy rain and a tent blown to tatters is not an unusual thing, to have been jolly under such circumstances would have been more creditable than in any of the positions in which he has been placed. Such was the case at Taunton on the 13th, and things looked gloomy indeed. But yet there was no sign of despair. Hope was the order of the day; and the Secretary and Committee alike seemed to have heard the word of

"Hope is a lover's staff: walk home with that,
And manage it against despairing thoughts."

And their hopefulness was rewarded. The sun broke through; soon the crowds from the neighbouring places thronged in, and the clean comely town were quite a holiday aspect, for the flower-show day is the day of the year. The streets were one huge fair; and as one surveyed the delicacies offered to the strangers, the thought crossed me, Have these people such a thing as digestion? The grounds were soon filled with the *élite* of the neighbourhood, and as I left the multitude was pouring in; and although the attendance could not have equalled that of former years, still it must have been large.

I do not think that it is very interesting to enter into the details of the various exhibits at these provincial exhibitions, but to notice those things which are well done, and from which those who are in the habit of visiting our metropolitan shows might gain a lesson; and some such were to be here. Zonal Pelargoniums are among the plants one very seldom sees "done well" in or about London. The plants are either overgrown, and then they are leggy and sticky, or else they are miserably small. But those exhibited by Mr. Hoskin and Mr. Woodhouse were models of plants—plants of medium size, with about two dozen trusses of bloom standing up well above the foliage, good in quality and sturdy in growth. Then never did I see such Balsams as those exhibited by Mr. Woodhouse. There was one especially, a lilac one, which was more like an enormous Brompton Stock than anything else. I was not singular in my opinion, for Mr. Turner, who was with me, expressed the same opinion. Gladioli were exhibited by Mr. Kelway, and as they were close at home it may well be imagined of what character they were. A more beautiful stand it was impossible to imagine than his twenty-four, and, as usual, nearly all his own seedlings. Two new ones were marked for first-class certificates—Kriemhilda and Mrs. Dombrin, the latter a very lovely light flower. A very good stand was exhibited by Mr. Sampson, of Yeovil; most of them being also Mr. Kelway's seedlings. Mr. Dobree exhibited some very good ones including Ondine and De Miral, two of the new French varieties of this season, the latter a very fine flower. Roses and Dahlias were shown by Mr. Keynes, a sufficient guarantee of their excellence. The latter were especially good for the season, and one, Mrs. Harris, received a first-class

certificate. When I say that Mr. Coleman, gardener to Lord Feversham (whose Grapes have attained so great a character), and Mr. Pragnell, gardener to Mr. Digby, of Sherborne Castle, were amongst the exhibitors of fruit and vegetables, it will be seen that fruit was staged worthy of any exhibition, and certainly the Stirling Castle Peaches, the Muscat and Hamburg Grapes, were grand examples of culture.

I last year commented somewhat severely on the table decorations, and am glad to say that this year two very excellent tables were set up. There were faults in each, and I hope if either of the ladies who exhibited them read my notes they will pardon the freedom with which I criticise them. That which obtained the first prize was too crowded. Had those abominations the shallow trays sprawling about the table been removed it would have been a very excellent example. The faults of the second were that the garniture of the table was too scanty, the "converts" consisting only of a knife and fork—no second fork or spoons. This made it look meagre, while the centrepiece was too heavy and obstructing the view. The flowers on this table were very prettily arranged and good, but these faults counterbalanced its excellencies. I cannot say that the combination of specimen glass and napkin-holder on the first-prize table struck me as anything but vulgar.

It remains but for me to add that the same courtesy and consideration I have ever met with from the good folks of Taunton were freely given this year, and that among the red-letter days of 1874 must be marked in my calendar the day of the annual Show of the Taunton Horticultural Society.—D., *Deal*.

EARLY AND LATE STRAWBERRIES.

UNDER this head "D. F. J. K.," page 143 of "our Journal," asks whether there exist any Strawberries to beat Elton and Oscar for lateness, and Black Prince for earliness. The idea strikes me first that "D. F. J. K." does not possess either Oscar or Cockscumb true to name. Oscar is one of the earliest Strawberries we have, ripening frequently its first berries together with Black Prince if planted near each other, whilst Cockscumb is decidedly one of the largest kinds ever sent out; this latter is mostly of irregular and cockscumb shape, whence its name very properly given. It is quite as late as Elton and Eleanor (both sour), to both of which as regards quality it is greatly superior. The sort sent out many years ago by an Exeter firm under the name of Nimrod, proved to be nothing else than Myatt's Eleanor. I had my plants at the time direct from the advertisers through one of the leading London nurserymen, and can, therefore, speak of it with good authority. Frogmore Late Pine, though ripening the first berries at the medium season, continues in bearing quite as long as Elton and Eleanor, not to speak of its superior flavour.

Now as to early Strawberries. It is quite useless now—a days to propagate such kinds as Black Prince when we possess, thanks to Dr. Roden, the beautiful Early Prolific, which if planted side by side with Black Prince is quite as early. Then we are going to have from the same raiser (Dr. Roden) Alpha, which bids fair to be earlier still; in fact as early as we may expect to gather Strawberries in our northern climate. Here the strong April and May frosts destroyed the better part of the bloom; nevertheless I had Early Prolific, Duke of Edinburgh, Vicomtesse Héricart de Thury, Oscar, Marguerite, &c., ripe simultaneously with Black Prince.

Speaking of Strawberries, I cannot help alluding to another small article on the subject, headed "Notes on Strawberries." This note was signed "A. P., Germany," but I think the author, my friend Mr. Edmund Nebelsieck, the able head gardener at Villa Albertina in my neighbourhood, will not feel hurt in his modesty if I divulge his name. He speaks of my new seedling Unser Fritz in very flattering terms, and he is a good judge, growing at his employer's, the Consul Schön, a large number of the best varieties. I hope that—several parties in England having obtained from me plants of Unser Fritz—it will there likewise become a favourite, which it has become with all who possess it in this country. It begins to ripen at the medium season, and bears plentifully until all the known late sorts are over. The day before yesterday (August 14) I still had some very nice berries. As regards the quality, I leave the parties who have Unser Fritz under cultivation to be the judges.

In conclusion, I may add that there is still a very good late Strawberry "D. F. J. K." does not seem to be aware of—I mean Riddleman, raised at Frogmore. This is likewise decidedly a very late kind, and an enormous bearer.—FERDINAND GLOEDE, *Eppendorf, Hamburg*.

In reply to the queries of "D. F. J. K." (page 143), I beg to

say that in my high and exposed situation in the open, and without any protection whatever, we gathered Black Prince on the 8th of June in quantity, but had some odd berries ripe before that time. I have grown many so-called earliest Strawberries, including Knight's Princess Alexandra and Nicholson's May Queen, but for earliness have given all up in favour of Black Prince, and this year they have been better in quantity and quality than usual. Our last Strawberries in quantity were gathered July 27th, although we continued to get a few good fruit up to August 8th; these last were from Cuthill's Prince of Wales, a most excellent sort for general cultivation, being hardy, and a good grower on light as well as strong land, a handsome fruit, also a good cropper.

Brown's Wonder has again been a real wonder for quantity this year, some of the plants having as much as a hundred ripe and ripening fruit on at one time; the fruit has also been better flavoured and better shaped than usual.—H., *Belper*.

NOVELTIES IN THE ROYAL GARDENS, KEW.

Solanum venustum is a beautiful and little-known climber, flowering in the Palm house. The stems are slender, and with the foliage light green. The leaves are pinnately 3-5 foliolate, though the first produced on the young shoots are usually simple. The flowers are light mauve colour, and are borne in large terminal panicles. They much resemble those of *S. jasminoides*, to which it is nearly allied. It is supposed to be a native of Brazil, and so far as known requires a warm greenhouse or stove. Cuttings root easily. Close at hand a fine plant of *Passiflora macrocarpa* has about a dozen huge fruits. In this country the fruit is not so good as that of *P. quadrangularis*, but in South America it is much valued for the table.

The very rare *Rhexia virginica* is in flower at the Rockwork. It is the only hardy member of the order Melastomaceæ in cultivation. The flowers are rosy purple. It has a neat bushy habit, and grows about 1 foot high. It is difficult to cultivate in pots, and should be planted in a deep bed of peat where there is plenty of moisture. But few of the nurseries have a good stock; Messrs. Osborn, of Fulham, have, perhaps, the largest and in the best condition. *Micromeria piperella* has received but little attention. It is an extremely pretty Thyme-like plant, very suitable for rockwork. The stems are wiry, about 6 inches long, and produced in a tuft. At the extremities are borne numerous pinkish flowers. It grows readily from seed, and may also, doubtless, be increased by means of cuttings. A young plant of *Aeonium heterophyllum* has a few flowers. It was figured in the "Botanical Magazine" for April of this year, and though apparently of not much value for the ornamental border, is of importance for economic collections. "Is a very interesting plant, as being, though a member of a most poisonous genus, in extensive use as a tonic medicine throughout North India, under the name of Atees or Atis."—(Dr. Hooker, *Bot. Mag.*) It is a native of the Western Himalaya.

Cienkowskia Kirkii, a new plant introduced by the Royal Gardens, is flowering in the stove. It much resembles a small *Curema*, to which genus it is allied, but the flower instead of the bract is in this case the chief ornament. The flowers are pink and very pretty, though not sufficiently striking, and of too short duration for general cultivation.

Hemantus eoccineus is a great ornament in the Cape house from the brilliant crimson leaves of the involucre. It is an old plant far too rarely grown. There is no difficulty in its cultivation. Like most other Cape Liliaceæ, it does best when the pots are full of roots. The bulbs should be potted with porous loam, in pots or pans that will but little more than contain them. If carefully done they should remain in good condition, and will not require repotting for several years. When at rest they should be kept dry, a very occasional watering in fine weather excepted. After the flowers are over the leaves appear, and from their massive character the plant is still of value for decoration.

Of the species of *Clematis* in the Herbaceous ground, *C. æthusifolia* is one of the most elegant and graceful. The leaves are light green and delicate in appearance; the flowers are freely produced, they are somewhat tubular and yellowish white, not brilliant in colour. *Lavatera unguiculata* is handsome from its numerous rose-coloured flowers. It grows strongly, reaching a height of about 6 feet, and would be excellent for shrubberies and rough corners. *Trachymene (Didiscus) cærulea* and *Emilia sagittata* are worth the attention of those who

care to grow annuals. The former is of some interest as having showy blue flowers, and belonging to the Umbelliferae. It grows about 18 inches high. The stems are erect, and the leaves three-parted, each division again divided; both clothed with soft hairs. There is no disagreeable smell. *Emilia sagittata* is an Indian Composite with orange-scarlet-flowered capitula, much like those of *Kleinia fulgens*. The leaves are light green and rather succulent. It grows from 1½ to 2 feet high.

DESTROYING WASPS.

In my locality these insects have been the great consumers of my fruit this season, but their destruction I have found anything but difficult. Cyanide of potassium is sold by all druggists at moderate cost. I place a piece of this, about the size of a lump of sugar, in a piece of sponge sufficiently large to fill the hole of the wasps' nest, and thus I close the entrance. I leave it for some hours, and every wasp is killed. I then dig out the nest, and destroy the comb, so as to prevent the hatching of the grub. The remedy is easy and infallible, at small cost.—(GARDENER IN THE SOUTH.)

If instead of the squib or other devices which require preparation, about 12 or 18 inches of the ordinary fuse used by miners for blasting rock, &c., and which may be procured at any ironmonger's at a trifling cost, were introduced into the nest, and a light applied to the outside end and immediately covered with a turf, it would be found to be a much more simple and efficacious way of disposing of these pests. The nest must be dug out after allowing a few minutes for the fuse to exhaust itself. As the fuse will burn under water it does not require any air to complete its combustion. The fumes are more deadly than those of ordinary powder. I have never known this plan fail, and its great advantage is its easy mode of application.—ADMSTON.

Your correspondent Mr. J. Robson has mentioned the most convenient way of destroying wasps, but I think that if nitre in a fair proportion is added to the sulphur and gunpowder the strength of the squib is greater. I have used the above often with great success, and a few years ago I remember destroying eleven nests in the sandy turf banks at Formby Hall, near here, on one evening, and I dug every one out next morning at six o'clock without finding a wasp that could fly. The mixture should only have enough powder to make it burn fiercely, and a little pure powder in the top of the squib to start it well; and directly it is well alight insert it into the hole, and tightly press a turf, previously cut, ready over all. There is no fear of the squib going out if properly mixed, to be sure of which take a very small portion of the whole, make it into the shape of a pistil, and apply a match; if it burns fiercely and slowly it is right, and you can fill your eases made as Mr. Robson describes, putting a little dry powder at the mouth as above stated.—J. W.

THE DROUGHT AND ITS LESSONS.

THE very dry and hot weather we have so lately experienced will no doubt induce many owners of gardens to make provision for a better water supply, for I cannot agree with Mr. Taylor in his conclusions about watering, nor care much to see flower-beds covered with chopped straw. In my case, to keep up the supply of vegetables—they are mostly grown in trenches—all hands were kept at the waterpots, sometimes throughout the day. The flower-beds were watered at night, and next morning the soil was stirred with a fork or hoe. Cauliflowers were the only failure I had; all were indifferent after the first lot. As we have had very little rain in the south, and even now the surface is only dampened without watering, my failure in keeping up a supply of vegetables would have been complete. My plan is to give a soaking if possible; if not, to give what I can, and stir the soil afterwards. Even if the soil is not stirred the water will not all pass into the air, some will be taken up by the plants; and I think that this, though perhaps not sufficient for a healthy growth, is better than none. There is much advantage in growing vegetables in trenches as for Celery, and less water is required.—W. S.

MERCURY.—We are informed, but cannot believe the information, that some of our readers have thought we ignorantly recommended the common Dog Mercury (*Mercurialis*

perennis) as good for cooking as Spinach. If our notes on pages 258 and 441 of our last volume are referred to it will be seen that we especially pointed out that the plant is Good-King-Henry (*Chenopodium Bonus-Henricus*), and that the name of "Mercury" is the common name applied to this in Lincolnshire.

BELFAST INTERNATIONAL FRUIT AND FLOWER SHOW.

THIS was held on the 20th and 21st inst. in the Gardens of the Royal Botanic Society at Belfast, and under the management of the Ulster Horticultural Society. It was entirely successful, and we refrain from minute details, because we cannot afford space for the claims upon our columns made by many other exhibitions in England, Scotland, and Wales. Messrs. Veitch and Mr. B. S. Williams were to the fore among the English exhibitors, but we shall enumerate chiefly the Irish exhibitors. Messrs. Rodger, McClelland, & Co., Newry, exhibited more than a hundred specimen plants, and obtained three first prizes. Mr. R. B. Matthews, Belfast, had a large and meritorious collection. The Roses from the nurseries of Mr. Hugh Dickson, Belmont, and Messrs. Alexander Dickson and Sons, Newtownards, were, as might have been foretold, most successful. Among the fruit we will notice the monster bunches of Black Hamburgh and Calabrian Grapes from Lambton Castle. The Hamburgh bunch weighed 21½ lbs., and the Calabrian 15 lbs. The Queen's gardener at Frogmore, Mr. Jones, was the chief prizewinner for Pine Apples. The prizes offered by Mr. W. Bull, King's Road, Chelsea, went chiefly to Irish amateurs.

THE LADY APPLE.

It has been asserted that this Apple was brought from Peloponessus to Rome by Appian Claudius. Whether this be true or not, there can be no doubt it is of great antiquity, as all the oldest authors regard it as the production of an age prior to their own. Dalechamp and Harduin are of opinion that it is the *Petisia* of Pliny; but J. Baptista Porta considers it to be the *Appiana* of that author, who thus describes it, "*Odor est his cotoneorum magnitudo que Claudianis, color rubens.*" From this description it is evident that two varieties are referred to, the *Appiana* and *Clandiana*. Such being the case, J. Baptista Porta says, "*Quo sunt apud nos Mala, magnitudine et colore paria, et preciosa, quorum unum odorem servat cotoneorum, alterum minimè. Quod odore caret, vulgo dictum Melo rosa. Id roseo colore perfusum est, mira ténertudine et sapore, minimè fugax, pomum magnitudine media, ut facile cum ceteris de principatu certet, nec indignum Clandii nomine. Hoc Claudianum dicerem.*" This *Melo Rosa* may possibly be the *Pomme Rose* or *Gros Api*, and if so, we may infer that the *Api* is the *Appiana*, and the *Gros Api* the *Clandiana* of Pliny. This, however, may be mere conjecture; but as the authority referred to was a native of Naples, and may be supposed to know something of the traditional associations of the Roman fruits, I have deemed it advisable to record his opinion on the subject. According to Merlet the *Api* was first discovered as a wilding in the forest of *Api* in Brittany.

Although mentioned by most of the early continental writers, the *Api* does not appear to have been known in this country till towards the end of the seventeenth century. It is first mentioned by Worlidge, who calls it "*Pomme Appaise*, a curious Apple, lately propagated; the fruit is small and pleasant, which the madames of France carry in their pockets by reason they yield no unpleasant scent." Lister, in his "*Journey to Paris, 1698*," speaking of this as being one of the Apples served up in the dessert, says, "Also the *Pomme d'Apis*, which is served here more for show than for use, being a small flat Apple, very beautiful, and very red on one side, and pale or white on the other, and may serve the ladies at their toilets as a pattern to paint by." De Quintinye calls it "*Une Pomme des Damoiselles et de bonne compagnie.*"

Under the name of *Lady Apple* large quantities of the *Api* are annually imported to this country from the United States, where it is grown to a great extent, and produces a considerable return to the growers, as it always commands the highest price of any other fancy Apple in the market. In the winter months they may be seen encircled with various coloured tinsse papers adorning the windows of the fruiterers in Covent Garden market.

There are other varieties mentioned by J. B. Porta as belong-

ing to the *Api* family: one which ripened in August, in size like the *Clandiana* already mentioned, and commonly called *Melo Appio Rosso* because it retained the scent of the *Api*; this is probably the *Rother Sommer-api* of Diel. There is another, of which he says, "*Assererem tunc esse Melapinum Plinii*," and which was held in such estimation as to give rise to the proverb—

"*Omnem Malum malum præter appium Malum.*"

Fruit small, oblate. Skin thick, smooth, and shining, yellowish green in the shade, changing to pale yellow as it attains maturity, and deep glossy red, approaching to crimson, on the side next the sun. Eye small, set in a rather deep and plaited basin. Stalk short and deeply inserted. Flesh white, crisp, tender, sweet, very juicy, and slightly perfumed.

Fig. 55.—The Lady Apple.

A beautiful little dessert Apple, in use from October to April. It should be eaten with the skin on, as it is there that the perfume is contained. The skin is very sensitive of shade, and any device may be formed upon it by causing pieces of paper, in the form of the design required, to adhere on the side exposed to the sun before it has attained its deep red colour.

The tree is of a pyramidal habit of growth, healthy, and an abundant bearer. It succeeds well in almost any situation provided the soil is rich, loamy, and not too light or dry, and may be grown with equal success either on the *Doucin* or *Crab* stock. When worked on the French *Paradise* it is well adapted for pot culture. The fruit is firmly attached to the spurs, and forcibly resists the effects of high winds.—H.

PEACHES—STRAWBERRIES.

As Mr. Camm asks advice in respect to Peaches, and I suppose Nectarines, I am pleased to give it. He must use Parham's glass copings, which are successful, and which I have seen at Mr. Connop's at Fifehead Neville near here. He must buy Mr. Bréchant's admirable treatise called the "*Modern Peach-Pruner*," which can be had at the office of THE JOURNAL OF HORTICULTURE. He must read and copy, as near as he can, page 89, "*the theory of close pruning*," especially Mr. Knight's advice, beginning with the words "*Instead of taking*," to the words "*Cold and late ones.*" I use sheet copings, and have, on all walls in a most trying situation, a capital crop of Peaches and Nectarines. I practised Mr. Knight's plan long before I saw it brought forward. Mr. Sturt's under gardener has been here from Critchel. He was astonished at the fruit and health of the trees. The trees out of doors of the above fruits, he says, have been much blighted at Critchel. The fruits here have been slow in swelling, but the *Grosse Mignonne* Peaches are splendid, from 8 to 9 inches in circumference. That will be a large size for this year. They are splendid in form. *Noblesse* and *Grosse Mignonne* are, in my judgment, the best two Peaches. I cannot recommend too highly *Early Louise* Peach, ripe here on a severe east wall July 19th.

As regards Strawberries, I recommend "*A. P., Germany*," to have Wonderful. It beat all here this year, and is a capital culinary Strawberry, as it retains its firmness. I recommend "*D. F. J. K.*" to have *Frogmore Late Pine*. He is right in saying that the *Black Prince* is the best early out-of-doors Strawberry. There is one much earlier—*Nicholson's May Queen*, but it requires glass to ripen it, as it flowers in February. Baron Hambro's late gardener at Milton Abbey told me some years ago they forced a great quantity and found it very useful. It has been a bad season here, owing to the drought, scarcity of water, and fierce heat. Wonderful was finely cropped. Its chief fault is that it does not colour well to its

points. It is of fine pine flavour.—W. F. RADCLYFFE, *Okeford Fitzpaine, Dorset.*

THOMAS TUSSER.—No. 5.

THOMAS Tusser did not long continue servitor at Trinity College, or the service was compatible with his residing at Chesterton, about two miles distant from the college. He possessed lands in that parish, though of small extent, for in his will he devised to his wife and to his son Thomas, "those seven acres and a roode of copyholde which I now have, lying in the parish or fields at Chesterton. Also all suche estate and terme of yeares as I have yet to come in a certain close called Lawyer's Close, lyinge and beinge in the parish of Chesterton, which said close I have demised unto one William Mosse, for the terme of one whole yeare, beginninge at the Feast of St. Gregorie last past, yeldinge and payinge for the same xxxvs. rente. Also the residue of all my bonds, goods, and chattells, moveable and immoveable, in Chesterton aforesaid or ells where."

That it was his residence seems clear from the first clause of his will, in which he describes himself, "Thomas Tusser, of Chesterton, in the countye of Cambridge, gent." When or how he became the possessor of the Chesterton property we do not know; and though he might extract from it a subsistence, it could yield him no more, and he evidently looked upon it as only subsidiary, for says—

"Too foud were I, here thus to lie,
Unless that wealth, might further health,
And profit some, should thereby come,
To help withall."

Tusser probably inherited, or had devised to him, the Chesterton property from some collateral relative resident there, for it is certain that some branch or branches of the Tusseres were resident at Cambridge. Evidence of this are the following entries in the Treasurer of the Borough's accounts:—

"1515.—Item, for the ferme of another tent tenement, sett and buyld in the said butterowe, in the tenure of Willelm. Tusser, xxvii. viii."

"1525-6.—Item, of Thoms Tusser for the ferme of another tent buyld in the said butt'rowe, xvii. viii."

"1530-31.—Item, of Thoms Tusser for the ferme of another tent in the butt'rowe, xxvii. viii."

The plague continued devastating London until 1575, and between that year and 1580 Tusser returned to the city. It seems from his own autobiography that he felt "Death drawing near," and in wise preparation he executed his will, as thus stated in its preamble:—"In the name of God, Amen. The xxv. of April, 1580, I, Thomas Tusser, of Chesterton, in the countye of Cambridge, gent., being feble in bodye, but perfecte in memorie, thanks be to God, doe make and ordaine this my last will and testament." It was drawn-up in accustomed legal phraseology by "John Plommer, of Barnard's Inne," and among the witnesses to its execution was "Francis Shackleton, the Parson of St. Myldred's, in the Poulterie," in which parish he seems to have resided, for in its church was this epitaph recorded by the chronicler Stow:—

"Here, Thomas Tusser, clad in earth, doth lie,
Who sometime made the 'Points of Husbandry':
By him, then, learn thou mayst,—here learn we must,
When all is done, we sleep and turn to dust:
And yet, through Christ, to heaven we hope to go,
Who reads his books shall find his faith was so."

The church of St. Mildred was destroyed in the Great Fire of London, and with it perished Tusser's monument.

The original will is not to be found, but there are registered copies at Doctors' Commons, and in the Registry of the Bishop of Ely. The will states that William Tusser, the testator's brother, who we mentioned as being Fellow of King's College, owed him on a recognisance, "three hundrethe and thirtie poundes." Of this sum the testator, Thomas Tusser, directs £50 to be paid to each of his four children, Thomas, John, Edmond, and Mary, on attaining the age of twenty-one, and £5 a year until they attained that age, "for and towards their bringinge-up." Then the testator bequeaths "unto Amye Tusser, my wyfe, the summe of foure score poundes." To his eldest son, Thomas, he also bequeaths "my bookes of musicke and virginnalls;" and after providing for remainders, and that his funeral should not be above the summe of twenty markes " (a mark was 13s. 4d.), he appointed his eldest son his executor, and "Edmund Moon, gent., father of the said Amye my wyfe, and grandfather unto my forenamed children, guardian and tutor unto my forenamed children, and supervisor and

overseer of this my last will and testament." The will was proved by Thomas, the testator's son, on the 8th of August, 1580, in the Prerogative Court of the Archbishop of Canterbury.

We have now recorded all the information we have been able to collect, and it only remains for us, in a final communication, to detail from his published works the information they afford relative to the gardening of the time during which he lived.

MESSRS. HOVEY & CO.'S COLLECTION OF PEARS.

To go into a full account of our entire collection I fear would fill too much space, and be a repetition of what I had in past years written upon the subject; but as your readers may know nothing of that, I gladly give you pretty nearly the information you ask. And here I may say your supposition in regard to the age of the oldest tree was pretty near right—viz., thirty years.

We began our collection of trees in the autumn of 1844, our object being the study of the nomenclature rather than any other purpose, the fruit being altogether of a secondary nature. At that time our ground had just been reclaimed from an old pasture, and we had but a small portion suitably prepared for trees. About one hundred trees were planted in the spring and autumn of 1842, and from one hundred to two hundred every year, as the ground was ready, up to 1855, since which time only few trees had been planted to take the place of those which gave out.

Our grounds are laid out in squares, measuring about 150 feet on the sides, and the walks separating these squares are just 8 feet wide. Upon each side of these walks—though but one part of our grounds—borders were prepared 6 feet wide by simply half-trenching, and the trees were set out in a single file in the centre, just 3 feet from the edge of the walk, and 6 feet from centre to centre of each tree, giving about twenty-five trees to each border. These borders number about seventy, and are planted with about 1800 Pear trees. The entire walks between the trees would extend, in a straight line, a distance of over a mile and a half. Such was the style and formation of our plantation.

Of course our object being to study the trees and test every known variety, they were planted as thickly as possible on account of space, and as many upon the Quince stock as we could get, supposing, at that time, that one Pear would grow as well on the Quince as another. Up to 1844 we had planted every variety to be found in the United States, and many from abroad; but in the autumn of that year we visited the English and French nurseries, and selected every variety that could be obtained. M. Jamin, of Paris, assisted us in securing as many as possible. These were all planted in nursery rows, ready for removal as soon as the ground was prepared; but many of them remained four or five years before removal, subject all the time to pruning and pinching to make them perfect pyramids.

From the commencement of planting, another object was to show the perfection of pyramidal training, and up to 1854 this was kept up, every good tree branching to the ground, perfect in symmetry and form; a magnificent show indeed—but all show—no fruit, except those on the Quince. Ten long years of care and labour gave us but a slight opportunity to test the fruit. In the meantime tree after tree on the Quince had given out, and their places been filled with others. We had then learned that but few varieties of Pears will succeed on the Quince, and we gave up that stock for every variety not already proved or reported to succeed, making the further provision in all future planting to have the Quince stock every alternate tree, so that the rows might be somewhat uniform in appearance. We had, at that time, probably some 1500 varieties of Pears. A year or two more of care and labour we thought would bring about the brilliant prospect of bountiful crops; but alas! they failed to come—more than half of our trees were varieties which would not grow on the ground. Many of the latter had already fruited and died, and their places been filled with duplicates or new kinds. What should be done with the others?

Long reflection and close observation told us the pyramid was too slow and labour too dear for us Americans. If we would have fruit we must stop the constant heading and pinching-in, but rather prune up; and acting upon our corrections, we decided to let the trees "alone." Away they went, apparently as happy as a bird loosed from its cage, and

as if thankful for the brief respite from the knife. Their long branches had scarcely more than a year's growth before they were actually weighed down with fruit. We had a little less of symmetry, but a deal more of satisfaction. Our first real crop was obtained in 1862, since which period it has varied from year to year, constantly increasing, and in 1873 measured 2200 bushels.

As we have stated, we have fruited since 1842 more than 1500 varieties, probably 2000. More than one-half of our trees have been grafted over, so that our collection is reduced to some 300 varieties. Thirty trees of Glou Morcean, Beurré d'Aremberg, Easter Beurré, and others, we regrafted last month.

The trees are slightly enriched every autumn, and the ground lightly dug every spring; every two or three years some of the longest branches are shortened in to prevent them from becoming too thickly crowded, and no other care has been given them the last ten years.—C. M. HOVEY, Boston, Mass.—(*American Gardener's Monthly*.)

GLAZING WITHOUT PUTTY.

THE *Journal* has from time to time contained suggestions and drawings of methods for avoiding the necessity of putty for the glass in greenhouses, and a recent number contained one which, though good, necessitates "packing" with nail-bag strand saturated with white lead. The accompanying drawing avoids this necessity, and all substitutes for putty, as will be seen on reference to it.

Fig. 56.

The left-hand side of the sashbar B (*fig. 56*), is hollowed-out to half the depth to form a channel, c, for the rain; the right-hand side at top, A, is bevelled for the glass to rest upon. On the sashbar is a cap, D, which may be rounded as in the drawing, or triangular, which would be more easily made; this may be permanently nailed on. Place the sheet of glass, G, on the bevelled part of the sashbar, pressing it well under the cap, and fix it by means of two or more pieces of lead clamps, L.

In addition to the usual inclination in the roof, there is also a fall from left to right in the glass, which projects halfway over the channel, the projection on the one hand and the cap on the other entirely preventing the rain from penetrating. A greater fall could be given to the glass by lowering the channel in the sashbar. A broken pane of glass can easily be replaced, or the whole may be removed for the purpose of being painted.—S. B.

NOTES AND GLEANINGS.

It is not generally known that the MAIDENHAIR FERN when cut and placed in water along with other plants speedily withers, but if kept by itself it will last for days. This curious phenomenon is more apparent if Mignonette or Heliotrope is along with it. Can this be owing to the odour emitted by these flowers?

— THE DROMORE HEATING COMPANY, formed for carrying into operation Cowan's system of heating by the aid of lime, is now established, and we are informed that they are erecting the apparatus in many places.

— ACCORDING to experiments lately made at Saint-Gobain, with PULVERISED BONES OF COD, from the fisheries at St. Pierre and Miquelon, it has been recognised that their *débris* could be used with great advantage as fertilising matter; but the quantities procured on the beach, where the fishermen leave them, would not be sufficient to furnish the basis of a large industry. The governing committee of the French permanent Exposition des Colonies is casting about, we learn, for a means of extending the supply. As far back as 1851 M. Demolon founded an establishment in Newfoundland, where the *débris* were boiled, dried, after extraction of the oil, and pulverised. Since then the idea has been taken up in Norway, and there is a growing demand in Germany and elsewhere for the pulverulent fish-manures. The fishermen of St. Pierre and Miquelon throw away the viscera, the middle skeleton, and most of the head of the cod; now they supply annually seven to eight millions of kilogrammes of prepared fish, and it is estimated that 890 kilogrammes of these give 1000 kilogrammes of *débris*; there is thus an enormous waste. The fishermen of the open sea could not probably be induced to keep the *débris*, and all that can be counted on at present is the local fishery, yielding about 2000 tons.

— SOME time ago the Paris authorities set up a large steam-engine at Clichy to supply the sandy plain of Gennevilliers, on the opposite side of the Seine, with SEWAGE WATER. The experiment has proved successful. The "*Journal of the Society of Arts*" says that the market gardeners are now eager for a full supply, and the machinery is not powerful enough for the extension of the service. The complaints of the increasing foulness of the river from the sewage still turned into it have become so loud, that it has been determined to erect another engine at the same place, so as to draw off 1000 to 1200 litres of sewage per second, which is about half the quantity brought by the collector; at the same time large conduits in masonry are to be constructed to carry the sewage to points which it has not yet reached. The cost of this work will be about £40,000.

— THERE are several modes of marking ZINC LABELS, the following are two of them:—Chloride of platinum dissolved in water will produce a permanent black stain on zinc. Use about a drachm to a half-pint of distilled or rain water. A strong solution of either nitrate of silver or sulphate of copper applied with a brush or a silver pen to the plate will have the desired effect. The plate must be well cleaned first.—(*English Mechanic and World of Science*.)

— WE notice with much pleasure that the Society of Arts has issued a prospectus of EXAMINATIONS IN THE TECHNOLOGY OF AGRICULTURE AND RURAL ECONOMY, proposed to be held annually by the Society, as a part of its excellent system of technological examinations in the various industries of the country. We sincerely hope that the proposed examinations will be largely the means of carrying out the object which the Society has in view in instituting them—viz., the promotion of a more extended and intelligent study of agriculture and of the sciences bearing upon it, by those intending to adopt farming as an occupation. The examinations will consist of three parts:—1, General Science, in which a very wide knowledge of the various sciences which lie at the basis of successful agriculture is demanded from the candidates; there are three certificates in this department—the elementary certificate, the advanced certificate, and honours. 2, Technology, in which a knowledge of the many points connected with agriculture and rural economy will be demanded from the candidates proportioned to the class in which they may have passed in the previous examinations; this examination looks very formidable on paper, and to pass creditably in it will demand extensive reading and hard work on the part of the candidates. 3, Practical Knowledge; under this head the candidate must forward to the Society of Arts a certificate, on a form supplied, signed by some agriculturist with whom he may have been practically engaged in farming operations, showing that he has a practical acquaintance with the subject. In order to render these examinations really useful, the Council are making application to the agricultural societies, local and general, for assistance in founding scholarships for successful candidates to undergo a regular course of instruction at an Agricultural College. We

hope the scheme of the Society of Arts will be productive of excellent results on the agriculture of the country.—(*Nature*.)

FLOWERS FOR OUR BORDERS.—No. 38.

BOMAREA ACUTIFOLIA.—POINTED-LEAVED BOMAREA.

THE Bomareas are very closely allied to the *Alströmérias*, and were formerly included with them. They differ, however, from the latter in their twining stems, and several details of their floral structure. In the genus *Alströméria* the two upper segments of the perianth differ generally from the others, either in form or colour, so as to give the flower an unsymmetrical appearance. In *Bomarea* it is destitute of this irregularity, the two series composing the flower, although differing slightly from each other, being composed of segments uniform in shape and colour.

Fig. 57.—*Bomarea acutifolia*.

Bomarea acutifolia is a tuberous-rooted plant, with twining stems, growing in the open ground to the height of 6 feet or more. The leaves are, as the trivial name suggests, long and pointed, smooth and dark green on their upper surface, but paler and strongly nerved on their under side, the nerves being clothed with numerous hairs. A curious feature, common, however, to all the species, as well as to the *Alströmérias*, is, the twisted petiole or leafstalk, by which the position of the leaf is reversed. It would seem as if Nature had, in a careless mood, originally attached the leaves upside down, and afterwards corrected the error by the very simple expedient of twisting the footstalk.

The plant luxuriates in a rich sandy loam, and when the soil is naturally heavy and retentive, a considerable proportion of sand should be mixed with it before planting the roots. In low moist situations it will also be highly desirable to place a few inches of drainage beneath the soil on which the tubers rest. This will give them a much better chance of enduring frost, for it is only in dry soils that they can be considered hardy. The tubers should be planted at least 6 inches deep, in a warm aspect; if at the foot of a south wall the plant will flower finer than in more exposed places.

When grown against a wall the stems of the plant may be secured to a narrow trellis; in other situations a neat stick will be requisite. In those localities in which there may be some risk in leaving the tubers in the ground through the winter, they should be carefully dug up soon after the stems

have died down, and be preserved in pots of sandy loam in a dry place until spring. It is not advisable to remove the soil entirely from them, or they will shrivel, and perhaps decay.

The increase of *B. acutifolia* may be effected by division of the tubers, or by seeds, which are usually ripened freely. Like those of some other endogenous plants, the seeds are apt to become so hard by keeping, especially if in a very dry place, that they will only germinate after a long interment, unless sown as soon as ripe, which is not always practicable or desirable.

This desiccation may be prevented to some extent by burying the seeds in a pot of sandy loam, which should be preserved in a dry cool place. It is usual to sow them on artificial heat in spring, but stronger plants are obtained by sowing in the open borders under a hand-glass about the middle of April. Soil of a light porous nature will be indispensable, and when the plants appear above ground air must be admitted, but they must be covered at night as long as there is any danger of frost. The snails and slugs are very partial to this genus, as well as to the *Alströmérias*, and should be watched for, or they will eat off a batch of seedlings in a single night. Some of the strongest plants may be expected to flower the second year, but generally blossoms are not produced until the third season.

In dividing the tubers, which in this and most of the species which have come under our notice, are small spherical potato-like masses, and suspended from the collar of the plant by a long footstalk, care must be taken to secure with each one of the eyes developed at the collar, the tubers themselves producing none.

Bomarea acutifolia is a native of the temperate parts of Mexico, where several other species are found.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

NOTES ON VILLA AND SUBURBAN GARDENING.

THE time of year has arrived when it will be necessary to set about propagating bedding plants, and, as I imagine, there are very few whose gardens afford the convenience of a greenhouse, or a frame or two, and perhaps a few hand-glasses, who would not like to raise many of their own plants. It is a very pleasant and interesting employment, especially to those whose business calls them away for the greater part of the day, and when taken in time and ordinary judgment is used, the task is not a difficult one. It is reasonable to advise all those whose gardens are situated in or near the smoky atmosphere of large towns, and, perhaps, with scanty convenience, to aim at getting their young plants rooted and well established before the dull days of autumn and winter set in, and to begin to propagate those plants first which take the longest time to establish with limited means. This includes the different varieties of *Verbenas*, the several sorts of *Silver-variegated* and *Golden Tricolor Pelargoniums*. These last are mostly of slower growth than the coarser-growing *Bronze* or *Green Zonal* varieties. Another reason for early propagation is, that when only a frame is used there is a chance of working one batch of cuttings out of the way before others are put in.

In order to promote the quick rooting of *Verbenas* and other softwooded plants, such as *Heliotropes* and *Salvias*, and many other tender-wooded subjects, and likewise to secure a healthy leaf-growth, it is much the best plan to prepare a bed of heating material—such as leaves and manure of sufficient thickness, say 2 or 3 feet, beaten down tightly so as to prevent its heat from becoming strong, a very gentle heat only being required; or if there happens to be an old *Cucumber* or *Melon* bed, which with the addition of a little material would produce the requisite heat, so much the better. Place the frame upon this, fill-up inside to within a foot of the glass and firmly beat down, and if the cuttings are to be rooted in pots, cover the bed with 5 or 6 inches of coal ashes finely sifted. The pots may be plunged in these, which will keep the soil at a uniform heat. If the cuttings are to be rooted in the bed—which plan I think is much the better—instead of covering with coal ashes, 3 inches of finely-sifted leaf-mould and sand should be put evenly over the bed and pressed firmly down when it is in a moderately dry state. When the heat has risen, and there are no signs of its afterwards becoming strong or violent, the cuttings may be put in about an inch apart; make the soil firm about each cutting, and afterwards water moderately. Allow no strong sun to get at them until after they are rooted, neither allow the cuttings to flag. To prevent this, at times a gentle sprinkling overhead should be applied, and a little air given them until they are dry again. The cuttings ought not to be kept in a high temperature; only a mild and moderately moist one is needed. They may have air at times, and sometimes the lights may be thrown off for half an hour in warm mornings and nights.

When the cuttings have made good roots, say an inch or more in length, they will be fit to be transferred to pots or pans, and if more convenient, shallow boxes will answer as well. Whichever vessels are used they should be well drained, and the drainage covered with rough material so as to prevent the finer soil from washing-down and choking-up the outlets. Fill the vessels with a soil composed of two-thirds rich loam and the remainder well-rotted frame manure and sand thoroughly mixed. Put the plants about 2 inches apart and water well, and then take them to a cool frame, and set them on a bed of ashes; keep them a little close for a few days, and after that gradually let them have air, and they will become sturdy, strong plants; but as they grow, the strongest and most uneven growth should be repeatedly stopped, and all bloom-buds picked off.

Now, a word as to the selection of cuttings. Always look out for those shoots that have not flowered, not those even that are nearly approaching that period, for they are generally hard and wiry in the stem, and seldom root freely or ever make a plant worthy of the name under the best of treatment. The young tender-growing shoots are the very ones to seek for, and they are generally to be found about the heart or body of the plant. Each cutting should have at least two joints, and the lower leaves of one should be removed and inserted into the soil as above directed. Most of these softwooded bedding plants will root freely without a joint being left at the end; but if inserted so, the next joint above the end must be placed so that it comes in contact with the surface soil, and it invariably throws-out roots. This system is very useful when cuttings of a plant are scarce, and it is necessary to make every joint tell, but the plants require a little more care to establish, which few of those for whom I write are likely to have the convenience for. Moreover, I believe the plan is most suitable and would prove more successful for spring propagation, when the early spring months induce a more luxuriant growth in the plants that root quickly, and being assisted by increasing light and heat, such as that season would bring, plants would be more successfully reared.

The system of propagation above described would answer for nearly all bedding plants but *Pelargoniums*. Of these the variegated sorts should be propagated first, being more delicate, of weaker growth, and consequently longer in making a plant. They may be rooted either in or out of pots, the same as for Verbenas, but there is no need of making-up a bed for them. Place a few hand-glasses together upon a bed of coal ashes or any other bottom which worms are not likely to penetrate, if they are to be put in pots, otherwise a finely-sifted soil at least from 4 to 6 inches in thickness in the place of it, and the cuttings dibbled into it. I recommend, however, rooting them in pots filled with quite two-thirds coarse sand, such as washes down by the side of a road, adding a sprinkling of leaf mould and loam, to help to sustain a little vigour in the plants when rooted. Press them into the pots firmly and water well, place them under the hand-glasses, and allow them plenty of air at all times, but keep the tops of the lights on so as to shelter them from heavy rains. The sun will not hurt them; there is sufficient sustaining power in a cutting of this sort to carry it successfully through the ordeal of propagation, and it is the better for it, as it is harder and able to stand the winter better. Shading plants that will do without it makes them weakly and tender, more susceptible of injury from the sudden changes of temperature and situation. While cuttings treated in this way are rooting many dead leaves will appear. Now, my plan is to let these remain, for by pulling them off there is a risk of loosening the cuttings in the soil, which endangers them so much as to cause them to die-off in quantities. Touch them not until they are growing, and then the leaves may be picked-off in safety.

The next class I think about is the commoner sorts of Geraniums, such as Tom Thumb and other coarse-growing scarlet-flowering sorts. These will root very readily if dibbled into a bed of prepared soil on a border in the open ground, or under a wall perhaps would be better, where they might have protection afforded them if needed; but by rooting them in this way there is the double work of potting them into convenient pots and establishing them, whereas if they were rooted in pots this work would be spared and the cuttings do just as well. The latter for an amateur would be the more desirable plan, especially as with limited means for winter storing they would go into closer quarters and be moved about more conveniently when found necessary. In selecting cuttings for Geraniums, whether variegated or otherwise, the same rule must guide the propagator in his choice as for those of Verbenas and other tender subjects named above.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

For work in this department twenty-four hours' steady rain would be acceptable, as in the dusty dry soil seeds cannot vegetate freely. Though most of the grain crops have been harvested,

large fields of Potatoes are all around us, and should a wet period occur, the disease, which in many instances has been detected, would doubtless assume a virulent character. It is of no use to come with the advice "Lift and store them;" eighty acres of Potatoes cannot be lifted and stored. A lengthened experience has taught the farmers that whether the market returns are high or low, it is the best policy to continue steadily lifting them, and send to market at once. There is also considerable loss with Potatoes stored in "clamps," or what in some districts are called "pits." What with loss in weight, storing, and weighing them up again, the cost is not less than 20s. per ton. Early Don (white) and the West Lothian Dalmahoy are most liable to the disease, and what is not required of these two sorts for plants next year will soon be all sent to market. Those who grow Potatoes for market would do well to try some of the new American sorts, not the reds, which partake of the character of Sutton's Flourball; these are too large and excessively ugly when grown in good soil. Springfield White, an enormous cropper, also ugly in shape, may do for cattle, but should be avoided as a field, garden, or market Potato. It is yet early to speak of the recent variety Snowflake, as it has only been proved during the present season in England; but Bresee's Climax has all the qualities of a first-rate market variety. In flavour it cannot quite come up to the best of the Regents, but it surpasses them in appearance, being round, and not having such prominent eyes; it is early, and an enormous cropper. Extra Early Vermont is also very early; 1 lb. weight planted in the garden, though the young growths were much checked by the frost, produced 80 lbs., and these contained a very large proportion of "ware."

Lifting the Onions. The surface of the ground is very dry, and no better manner of treatment can be suggested than to pull them up, lay them in rows on the surface of the ground, and when they are sufficiently dried store them away for the winter. An airy loft where they would be kept dry is a good place; there they should be spread out thinly on the floor, and if there is not accommodation of this kind, they may be strung up on ropes. Preparing the ground for the autumn-sown crop. It is well to sow now and also in spring. This year the spring-sown crop was the best; another season, owing to the maggot at the roots, the spring-sown crop may be a failure. Autumn-sown Onions do not suffer from the attack of the maggot; but as a rule the spring-sown stock do not start into growth so early in the spring as the others. Medium sized specimens keep better than very large examples. The Depthord is considered to be the best Onion for present sowing. We should also have made a sowing of Turnips in the garden, but that a large breadth has been sown in the field. A crop of Turnips after Potatoes is considered a paying crop by those who grow for market. Sprouting Broccoli and Coleworts also come in well. Sowed Parsley, and cut off the leaves from a portion of the old plants; these will form a fresh crop before winter, which will be much better for kitchen purposes than those which would be produced from plants not so treated.

FRUIT AND FORCING HOUSES.

Pinerics.—There are few gardeners having the charge of Pine houses who have not also the laudable desire to produce very large fruit. The plants are grown in large pots, and allowed plenty of space to develop, and with judicious treatment and well-directed energy no doubt success would be ensured. On the other hand, if one large plant has occupied the space that would otherwise have accommodated three smaller ones, and produced, after two years' growth, one fruit weighing, say 9 lbs., and the three plants would produce in from twelve to eighteen months three fruits to weigh 4 lbs. each on an average, then if such is the case, as no doubt it is sometimes, the large specimen has been obtained at too great a sacrifice. In most families fruit weighing 1 lbs. are more useful than large ones, while those who grow for market find that medium-sized fruit command the readiest sale, and are also more remunerative. All suckers that were potted six weeks ago should be examined. It is a serious mistake to allow them to become root-bound; when such is the case, the fruit oftentimes starts up prematurely. During the operation of potting it is well to be careful that no check is received; if the roots are in good condition and not matted, the ball ought not to be disturbed, but placed in the centre of the fruiting pot a little deeper than it was before, and the fresh compost rammed-in firmly around it. Old plants, from which the fruit has been cut when no suckers are wanted from them, are carried out to the rubbish heap at once, as if any insect pests are in the house, they are always more likely to be on the oldest plants.

ORCHARD HOUSE.

Nearly all the midseason fruit has been gathered, and upon the whole Peaches and Nectarines have been satisfactory; though the fruit has not been large the flavour has been good, and the latter quality is more important than the other. Plums and Pears grown in pots under glass and well exposed to the sun are fine, but they ought to have a house to themselves, and ought not to be with Peaches and Nectarines. The Peach delights in

a moist East Indian temperature just after stoning, and until the fruit is within ten days of being ripe. The Pear wants more ventilation, a drier atmosphere, and not quite such a high temperature. All the trees from which the fruit has been gathered would be potted at once, but other work is pressing, and that must be in abeyance for a few days. It is our usual practice to pot as soon as the fruit is gathered, nor do we make any scruple about reducing the ball of roots, and repotting in the same sized pot as that in which the trees were previously growing. If the roots are much hacked about, the trees will flag in the sun for a few days, but dousing the leaves over with water from the fine rose of a syringe will prevent them suffering to an injurious extent.

GREENHOUSE AND CONSERVATORY.

The choicer description of flowers are scarce at this season, either in the stove or greenhouse. As it is necessary to keep up a moist growing temperature in the stove, any plants in flower there are removed to the greenhouse. *Eucharis amazonica*, a veritable queen amongst bridal flowers, fades quickly in a stove temperature; either cut and the flowers placed in water indoors, or the whole plant removed to the greenhouse and shaded from the sun, they are much prolonged. Potting all hardwood flowering plants, as well as those grown for foliage; it is time all such work were done, in order that the plants may be well established before the cold weather comes upon them.

Recently the great value of the *Phlox* for decorative purposes in the greenhouse and conservatory was noticed; the plants are now nearly over, and as they go out of flower the stalks are cut down close to the surface of the pot, and the pots plunged in an open position out of doors. A new variety of the early-flowering section, named *Miss Robertson*, is said to be a great acquisition to the pure whites; and it must be a wonder in other respects, as a contemporary gravely informs its readers that if cuttings of this *Phlox* are put in in spring and grown vigorously in a cold frame until autumn, it will supply cut flowers at Christmas, and these are to be of a more lasting character than the usual run of forced flowers. Surely there is some mistake here, or *Miss Robertson* is quite different in character from other early-flowering *Phloxes*. With us cuttings of early-flowering *Phloxes* put in in spring flower in July, the late-flowering section in August; and as for the flowers lasting after they are cut, why, they fade as quickly as *Verbenas*.

FLOWER GARDEN.

We continue to get-in cuttings of all bedding *Pelargoniums*. *Mangles'* Variegated and the *Tricolors* strike root best under glass, the first-named in a close atmosphere, the others in a pit or house freely ventilated. All the more robust green and variegated varieties do well out of doors. We put in pipings of *Pinks*; it is rather late now, but under a north wall and protected by a glass frame they will no doubt form roots. *Pink* pipings should be put in about the end of June, and if they are taken from the plants in a wet day and inserted in the open ground they will do well; not one in fifty will fail.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

TRADE CATALOGUES RECEIVED.

Sutton & Sons, Reading.—*Sutton's Autumn Catalogue of Bulbous Flower Roots, Seeds, &c.*

Dick Radclyffe & Co., 129, High Holborn, London.—*Catalogue of Dutch Bulbs, Sundries, Horticultural Decorations, &c.*

Joseph Schwartz, Rue du Repas, 43, à la Guillotière, Lyons.—*Catalogue et Prix Courant des Rosiers—Autumn, 1874, and Spring, 1875.*

J. Carter & Co., High Holborn, London.—*List of Dutch Flower Roots, Fruit Trees, Roses, &c.*

Hooper & Co., Covent Garden Market, London, W.C.—*Catalogue of Autumn Bulbs, &c.*

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

BOOKS (C. S.).—There is no work published on growing under glass fruit, &c., for market. (A. M. G.).—Hibbert's "Town Gardening."

PLUMBAGO LEAF (W. C.).—We do not think the variegation attractive.

GERANIUMS AND PELARGONIUMS (C. W. F.).—We have repeatedly published the botanical distinctions between these plants, but in the garden the bedding-out varieties are usually called *Geraniums*, and the pot varieties *Pelargoniums*. The French *Pelargoniums* have frilled petals.

ORCHIDS UNDER TREES.—VALLOTA LEAVES CURLING (Flora).—The trees not being very closely planted, though affording shade, the openers spots of ground will be suitable for the following plants of the *Orchid* tribe:—*Cypripedium acaule*, *C. macranthum*, *C. pubescens*, *C. latifolia*, *Gymnadenia conopsea*, *Habenaria hifolia*, *H. chlorantha*, *H. viridis*, *Listera ovata*, *Orchis maculata*, and *O. morio*. You may obtain plants of *Thalictrum minus* of any nurseryman dealing in herbaceous and alpine plants. It is difficult to account for the leaves of *Vallota purpurea* curling up, but we should think it arises from the plants being kept in a room of which the atmosphere is very dry. Place it out of doors from May to the middle of September, keep it well supplied with water, and afford it an open sunny position.

HYDRANGEAS AFTER FLOWERING (C. Cross).—If you have glass, keep them in a light airy position until the leaves fall; but if you have not a greenhouse, place them in front of a south wall, and water so as to keep the foliage fresh, and when the leaves fall plunge the pots in ashes to the rim in a sheltered position. The shoots that have flowered may be cut down to the next lower prominent eye or bud, and when the plants begin to grow repeat them and place in a window with a southern exposure, or give them the warmest position you can command out of doors. When they are growing water abundantly. At the base, or not very high upon rockwork, with good soil, abundant watering in summer, and a warm situation, we have no doubt they would do well, the main thing being to secure the ripening of the wood to make sure of future flowering.

ALPINE STRAWBERRY PLANTING (J. P.).—The Alpine Strawberries do not require different treatment from other kinds, only they need not be planted so far apart. The rows may be 1 foot apart, and the plants 9 inches from each other in the rows if plants from runners are employed, but such do not grow so freely as those raised from seed. We plant in rows 15 inches asunder, and the plants 1 foot apart in the lines. We think they do best on an east border. Now is a good time to plant them. There are but two kinds of note, the Red and White; but the Bush Alpine, which does not produce runners, is by some advised for edgings.

VARIOUS (A. G.).—*Gloxinias* done flowering should be kept drier, water being gradually withheld. The plants should be kept in the pots in a place safe from frost until started in February or March. *Cyclamen persicum* just reported keep in a cold frame on ashes until the end of September, and then place in a light airy position in the greenhouse, watering so as to keep the soil moist. If in small pots, they may be shifted into larger ones early in October. Pot Roses ought not to be pruned until the leaves fall. Pruning may be deferred until they are introduced into the house. They should, however, be kept rather drier. It should have a light airy position in winter, repotting in spring when it begins to grow, watering copiously when in free growth, and affording at that time slight shade.

GARDEN NOT FERTILE (H. L. E.).—We think the barrenness of the soil on the site of the old building is a result of its being kept for a lengthened period from the influence of the atmosphere combined with the dryness, the rains not being sufficient to thoroughly moisten it, and the season having been remarkably dry. All you require is a thorough moistening of the soil, and when this takes place we think you may safely venture Strawberries or any other kind of crop. It is likely the ground will not be in a fit state for cropping until the spring of next year.

SELLING TIMBER TREES (Hetherste Lodge).—The Elm will be worth something, as you surmise, for timber, for the sale of which consult a timber merchant. The *Sycamore*, forking as you describe, is worth very little except for firewood.

MUSA ENSETE FRUITING (J. F.).—It is because this plant is somewhat rare, but from its being largely grown for decorative purposes its flowering and fruiting will be common enough shortly. The *Datura* is undoubtedly a grand one, the largest we have seen noted.

GRAB EATING GRAPES (C. B.).—The depredator received some injury and is scarcely recognisable, but the indications suggest that the mischief is produced by the larva of a small moth, very possibly of *Carpeocapsa funebrana*, which in 1872 deserted its favourite Plum sometimes to attack ripe Grapes. In this instance, therefore, it is important to burn all infected Grapes that are removed, as, if thrown casually away, the moth may still appear to pursue the same course again.

GRAPES MILDEWED (E. O. C.).—As the fruit is "quite worthless," cut it off and throw it away, then syringe the Vines thoroughly with water in which

soft soap and flowers of sulphur have been dissolved, in the proportion of 2 ozs. of soft soap and 4 ozs. of the sulphur to a gallon of water. Take a portion of the mixture and add flowers of sulphur to it until it is of the consistency of thin paint, and with this paint the hot-water pipes or flue. The heating apparatus should then be made so hot that the hand may be held on it, but so that it feels rather uncomfortable. If you do this when you dust the Vines with the sulphur the mildew would have been destroyed. Ventilate freely, but judiciously; draughts check the Vine and predispose it to disease. In winter remove all the loose bark from the old wood after the Vines are pruned, and paint with a mixture of sulphur, soft soap, and a little tobacco water; we also add a little soot to it.

GRAPES DISEASED (*Mrs. C. H. J.*).—We never before saw Grapes so completely destroyed by mildew. Repeated dustings with flowers of sulphur, and when all the leaves are off the Vines painting the whole of the stems and branches and the entire house with lime water in which flowers of sulphur are mixed to a creamy consistency, will be needed to subdue the parasite. Next year dust with sulphur immediately if it reappears.

ARTEMISIA JUDAICA—**EDGING PLANTS** (*J. Kelly*).—*Artemisia judaica* is a silvery-foliaged plant about 1 foot to 15 inches high, of graceful habit and compact growth. It is a hardy shrub, but requires a well-drained sandy soil. *Achyrocline Saundersoni* is a silvery edging plant, attaining a height of 6 to 8 inches. *Veronica incana* is a grey or silvery edging plant, forming a thick edging about 4 inches high. For edgings it is the best of those you name.

CAPE BULBS (*J. Y. H.*).—*Crimia algosensis* and *C. aquaticum* should have liberal treatment during growth. Give abundant waterings and sprinklings overhead morning and evening, afford a light and airy position, and keep rather dry in winter. *C. aquaticum* should have the pots set in saucers of water during summer. They require a warm part of the greenhouse. *Hæmantis filicatus* and *H. coccineus* flower before the leaves are produced. They require to be duly supplied with water while growing, and withhold water gradually after they begin to decay. *Brunsvigia Josephine* requires to be well watered when in growth, and to be kept dry when at rest, with a light and airy position in a greenhouse. *Cyrtanthus obliquus* needs free watering during the period of growth, and should have a light airy position in winter, with just enough water to keep the foliage fresh. They should all be placed deep enough in the soil to cover the bulb to the neck. Report when they are in growth, affording good drainage, with a compost of turfy yellow loam two parts, and one part each leaf soil and sandy peat, and a sixth of sand. The pots need not be more than three times the diameter of the bulbs.

HEATING GREENHOUSE (*C. E. P.*).—Your greenhouse for the wintering in safety of the plants you name will need to have frost excluded. Two 3-inch pipes along the front of the house and one end would give you the required temperature in winter—i.e., 40° to 45° from fire heat. A stove boiler would be most suitable. A dozen good *Fuchsias* are: *Dark* (single)—*Try-me-Oh*, *Crown Prince of Prussia*; *Dark* (double)—*Avalanche*, *King of Doubles*. *Whites* (single)—*Mrs. J. Lye*, *Minnie Banks*, *Arabella Improved*; *White-coralis* (single)—*Delight*, *Gem* (Cannell's); *White-coralis* (double)—*Avalanche*, *Little Alice*, and *Striata Splendour*. The specimen sent us is a curious malformation, one segment of the calyx is winged on each side with half a leaf. The specimen is very vigorous and handsome. Do not alter your treatment.

GAS FOR HEATING (*An Admirer of Nature*).—For a small glazed structure for winter protection it is well known, as you say, that gas is effectual, not expensive, and requires the minimum of attention. It is also well known that the fumes from burning gas are destructive of plant life. Arrangements are always made to prevent it, and those arrangements must vary to meet other requisites.

EBONY FROM SEaweeds (*H. C. S. D.*).—We are informed by "G.," whose Aberystwith notes, page 116, you refer to, that he believes all the Fuci are available for the purpose, and that they should be used dry yet fresh. The far greatest bulk of the Aberystwith Seaweeds is the *Fucus vesiculosus*. "G." was only a visitor at Aberystwith.

DESTROYING WASPS (*G. W. H.*).—We do not know Scott's mixture. It should be advertised. Our correspondent recommends boiling water to be poured into the nest, but the nest and its entrance must be peculiarly situated.

NAMES OF FRUITS (*Viridis*).—The Apple is Sops-in-Wine. We think a good deal of your scolding Grape, and would like to see a well-grown bunch. (*G. Unthank*).—*Caillat Rosat*. (*J. Woodlight*).—1, Early Harvest; 2, this is not Jonanet, and we do not know it; 3, Keswick Codlin. (*G. Diss*).—*Plums*: 1, Diamond; 2, Orleans; 3, Goliah; 4, Victoria.

NAMES OF PLANTS (*J. W.*).—The specimen was very withered; we believe it to be *Diphysa californicus*. (*An Old Subscriber*).—*Pinus macrocarpa*, a native of California. No specimen numbered 2 reached us. 3, *Tamarix indica*. (*Lady Maria*).—1, *Rhus Cotinus*, poisonous; 2, *Clematis lanuginosa*; 3, *Cypripedium macrocarpa*, becomes a large tree, but does not spread out "like a forest tree." (*Minax*).—*Alyssum saxatile variegatum*. (*S. Filpo*).—We cannot name plants from leaves only. (*G. W. L.*).—*Eranthemum Andersoni*. *Mast*. (*Bot. Mag.*, t. 577). *Flora*.—*Epipactis latifolia*. (*B. A.*).—*Spiraea alba*, native of North America. (*B. Veratrum*).—*Salicaria Braunii*, *Baker*, *Clethra arborea*, *Ait.* (*G. B. C.*).—*Veratrum ulmum*, and a *Thalictrum*, probably *T. minus*. (*Mrs. Parry Jones*).—*Cyrtanthera magnifica minor* (*Justicia carnea*, *Bot. Mag.*, t. 3353). (*R. W.*).—*Panicum capillare*.

fowl or chicken can be eaten—juicy, succulent, white, and so tender that it may be carved with fork and spoon. This can only be done by continuous hatching. Perfect table poultry is yet unknown to many an ardent amateur. There exists with them a time when fowls are either out of season or so hard they can scarcely be eaten. For perfect table poultry a pullet that has laid is out of the question. Fowls hatched in the early spring grow a third faster than those hatched in the autumn. The natural time for moulting is when the duty and strain of breeding is over. Fowls do not moult the first year (unless they are very early and have become hens), but they change their feathers. In the same way a young cock Pheasant changes his brown for his beautiful plumage. First one feather appears, then another, then brilliant patches are seen, and at last he shines in lovely plumage. A chicken appears all down, then wing and tail feathers appear; hen plumage covers the body, but it is not hard feather—handled, this plumage feels like cobweb. This also disappears, and then the clothing is that of an adult, lasting till laying, sitting, and the maternal duties are over. The feathers are, however, worn out, the back is naked among the hens and pullets. The combs shrivel and look dead, and the whole remaining strength of the bird seems devoted to the formation of the new plumage. As an average this will begin in July, and be over in October. There may be sports and occasional deviations, but this is the natural season.

EDENBRIDGE POULTRY SHOW.

THIS was held on the 19th inst. The following are the awards:—

DORKINGS.—*Coloured*.—*Cock or Cockerel*.—1, W. J. Russell. 2, R. Cheesman. 3, G. Field. *Hens*.—1, T. C. Burnell. 2, G. Field. 3, C. McNiven; 2, Marsh. **DORKINGS**.—*Silver-Gray*.—*Cock or Cockerel*.—1, T. C. Burnell. 2, C. McNiven. *Hens*.—1, Mrs. Lee. 2, J. Francis. 3, C. McNiven. **SPANISH**.—1, E. Winwood. 2, J. Francis. 3, A. S. Owen. **COCHIN-CHINA**.—*Buff or Cinnamon*.—1, E. Winwood. 2, E. Goodwin. 3, Mrs. A. De H. Christy. *White*.—1, R. S. Woodgate. *Any variety*.—*Cock or Cockerel*.—1, R. S. Woodgate. 2, A. A. Vander Meersch. 3, B. Haines. **BAHMA**.—*Pouter*.—*Dark*.—1, Mrs. Lee. 2, R. Sheppard. *Light*.—1, S. P. Broad. 2, Capt. G. F. Talbot.

GAME.—*Black-breasted or other Reds*.—1, F. Warde. 2 and 3, G. H. Fitz-Herbert. *Any other variety*.—1 and 2, G. H. Fitz-Herbert. 3, B. Mollett. *Any variety*.—*Cock or Cockerel*.—1, F. Warde. 2, B. Mollett. 3, R. A. Boissier.

HAMBURG.—*Gold or Silver-spangled*.—1, J. Long. 2, C. E. L. Lucas. *Gold or Silver-pencilled*.—1, J. Long. 2, Master W. M. Cayaleit. 3, H. Kelsey.

POLISH.—1, J. Long. 2, R. S. Woodgate. **HOUDANS**.—1, W. Dring. 2, R. A. Boissier. *he*, Master W. M. Cayaleit.

BANTAMS.—*Game*.—1, W. S. Marsh. 2, J. Long. *Any other variety*, not *Game*.—1, R. S. Woodgate. 2, Mrs. Lee. *he*, A. A. Vander Meersch. *Any variety*.—*Cock or Cockerel*.—1, W. S. Marsh. 2, Capt. G. F. Talbot.

ANY OTHER VARIETY.—1, R. S. Woodgate (Silkies). 2, J. Long (Black Hamburgs). *he*, Rev. N. J. Ridley (La Fleche). 3, S. P. Broad (White Silkies).

SELLING CLASS.—*Cock or Cockerel*.—1, R. A. Boissier (Houdan). 2, Rev. N. J. Ridley (Cochin). *Hens*.—1, E. Winwood. 2, J. Francis (Spanish). *he*, Miss Morrison (Andalusians); Mrs. A. De H. Christy (Buff Cochins). 3, A. S. Owen (Spanish).

ANY VARIETY.—*Cockerel*.—1, W. Dring (Houdan). 2, F. Haines (Light Brahma). *he*, A. Bentley (Black Spanish); B. Mollett (Duckwing Game). *he*, J. K. Lawther (Dark Brahma); Mrs. A. De H. Christy (Buff Cochins); E. Haywood (Dark Brahma). *Pullets*.—1, R. S. Woodgate (White Cochins). 2, F. Haines (Light Brahma). *he*, R. Cheesman (Coloured Dorkings); B. Mollett (Duckwing Game). *he*, W. Dring (Houdans); Mrs. A. De H. Christy (Buff Cochins); E. Haywood (Dark Brahma). 3, Capt. G. F. Talbot (Light Brahma); Miss Pottley (Game Bantams); W. J. Russell (Dorkings).

DECKS.—*Aylesbury*.—1, C. McNiven. 2, N. Edgill. *he*, Mrs. A. De H. Christy. *Rouen*.—1 and 2, C. Brown. 3 and 4, G. Field. *Any other variety*.—1 and 2, S. P. Broad. 3, T. G. Farmer. *he*, L. G. Morrell. 4, A. Glover.

GEES.—1 and 2, G. Field. 3, Mrs. Lee. 4, C. E. L. Lucas.

TURKEYS.—1, G. Field, Norfolk. *he*, F. Warde, Cambridge.

PIGEONS.

CARRIERS.—1, A. Bentley. 2, J. Francis. **TRUMPERS**.—1, A. Bowman. 2, T. Marsh. **ANY OTHER VARIETY**.—*he*, and *he*, A. A. Vander Meersch. 2, A. Easty. 3, A. S. Owen (Blue-shouldered Turbitts); W. R. Killick (Magpies); A. A. Vander Meersch.

RABBITS.

LOP-EARED.—*Duck*.—1, W. Layton. 2 and 3, — Stedman. *Doc*.—1 and 2, — Stedman. 3, R. A. Boissier. 4, W. M. Hen.

ANY OTHER VARIETY.—1, R. A. Boissier (Himalayas). 2, — Stedman. *he*, Miss M. L. Gower.

SELLING CLASS.—1 and 2, — Stedman (Egyptian). 3, E. J. Rogers. *he*, Capt. G. F. Talbot.

JUDGE.—Mr. Matthew Headley, Claremont, Redhill.

DURHAM POULTRY SHOW.

THE annual Show of the Durham Agricultural Society was held on the racecourse on the 21st inst. The day was very fine and hot, an excellent marquee was provided, and the poultry were well protected in comfortable wire pens. The entries were larger than heretofore, although no alteration had been made in the list of prizes.

Cochins, as may be expected, were an excellent class, grand old Buffs winning the prizes, and an excellent pen of White chickens was very highly commended. Some of the pens of *Brahmas* were empty, though the winners were tolerably good adult birds. *Dorkings* came next. The winners of the Dark variety were very good. Of *Spanish* there were only four pens, all old birds; the first a good pen, but the second almost done, although good in points. *Game* had only one class, and only six entries. The winners, which were Brown Rels, showed great quality, although the first were in deep moult. Gold-spangled

POULTRY, BEE, AND PIGEON CHRONICLE.

MOULTING.

WE believe a few general rules will answer the queries of "E. H. R.," and others. The earlier chickens are hatched the easier they are to rear; but it is altogether wrong to advise none but March or April pullets. Many of the best fowls of the year are hatched in May, and their growth is often marvellous. Not only must those who look to eggs as the principal profit to be derived from poultry, hatch nearly all the year round, but those whose calling it is to supply the London market with its celebrated poultry are compelled to do the same. It involves expense, and therefore it must be dear; but it is a fact that in London, in any weather and at any time of the year, a perfect

Hamburghs were poor, except the winners; but in Silvers the first and second were capital chickens; a commended pen contained a model cock with a very inferior hen. Golden-pencilled had eleven entries, and most of these contained some good birds; the winners being good adult birds and pretty closely run. In Silvers there were but three pens, but these were good. Game *Bantams* were a strong class, and the competition close, the winners being Brown Reds. The first was an old cock with a pullet, and the second both aged. *Bantams*, any other variety, were all Black with the exception of one pen of Grey Japanese, and the first-named breed won.

In the general variety class some good *Crève-Cœurs* were shown, as also *Houdans*; but the great features of the Show were the two classes of *Ducks*, especially the Rouens, which were nearly all noticed, the size, marking, and beaks being as nearly perfect as possible, the Aylesbury losing only in point of numbers. The quality of colour and beak was all that could be wished for.

There was a nice show of eggs and butter under the same tent; the eggs, though not of the largest, were well selected, and uniform in shape, size, and colour.

COCHINS.—1, 2, *etc.*, and *hc.* G. H. Procter, Durham. c, J. Flin O'G, Lesrate, Durham.
BRAMA FOOTRIS.—1, R. Shield, Swatwell. 2, Rev. R. L. Story, Lockington Village, Derby. *hc.* J. Anderson, Setghill, Northumberland; T. Dobson, Kirbymoorside.

DORRINGS.—1, W. Morfitt, Goole. 2, J. White, Warley.
SPANISH.—1, W. Jagger, Blyth. 2, J. F. Walton, Rawtenstall. *hc.* R. Shield; Pallister & Hawkins, Topcliffe, Thirsk.

POLANDS.—1 and *hc.* J. T. Proad, Binschester. 2, W. Bearpark Northallerton. c, R. Parsons, Bedlington.

GAME.—1, Miss M. J. Nelson, Cockshaw. 2, D. Chayne, Morpeth. *hc.* J. Gibson, Stanhope. 3, T. J. Munn, Ebbw Vale. W. F. Pitt, Middleburgh.
HAMBURGHS.—*Golden-spangled*.—1, R. Keenleyside, Aycliffe, Darlington. 2, T. Horne, Tow Law. *Silver-spangled*.—1, R. Keenleyside. 2 and c, G. Stalker, West Sleekburn. *hc.* G. Alderson, West Hartlepool.

JUDGE.—Mr. E. Hutton, Pudsey, Leeds.

HETTON POULTRY SHOW.

CLOSELY following the Show at Bishop Auckland was that at Hetton-le-Hole, held on the 12th inst., and on this account the entries were much better than they otherwise would have been, for though the classes were pretty numerous, the prizes were small. Unlike its predecessor, at this Show an excellent tent was provided, and the whole was well arranged and managed; but we must confess our surprise that the Society, which does not hesitate to go to the expense of one of the best military bands, does not offer a more attractive list, which would pay very much better than the one now presented. Adult birds were good for the time of year. Among them we may note the *Cochins*, *Polands*, and *French* fowls in the Variety class, as well as the *Ducks*, which were of all ages; but the Game *Bantams* were one of the greatest features of the Show; the Red in particular were a grand lot, though some of the best were much out of feather. In the Variety colours, Piles of good points were first, and *Dackwings* second. In young birds, *Spanish* were poor, but the *Dorings* very good, while a large handsome pen of Light *Brahmas* stood first. *Hamburghs* were moderately good, while the *Bantams* were very good, and the Variety class was well filled with good birds of Black *Hamburghs*, *Cochins*, *Malays*, and other varieties.

PIGEONS were not remarkable, although there were some good specimens.

RABBITS.—There were two classes, but the mistake was made of classing them in pairs. The first and second in Lops were the same as at Bishop Auckland, and they were very good, but did not match in colour. The first in the next class were fine Silver-Greys, although very young, the second being Himalayan.

SPANISH.—*Black*.—1, Furness & Sudall. 2, R. Moore. 3, C. Nicholson.
DORRINGS.—1, T. P. Carver. 2, Mrs. Clarke. 3, A. Buglass.
COCHINS.—1 and 2, G. H. Procter.
BRAMA.—1 and 2, E. M. Moore.
HAMBURGHS.—*Golden-spangled*.—1, R. Keenleyside. 2, W. Whitfield. 3, T. P. Carver. *Silver-spangled*.—1, R. Moore. 2, G. Alderson. *Golden-pencilled*.—1, W. Whitfield. 2, Wells & Sherwin. 3, M. Hall. *Silver-pencilled*.—1, J. Ferry. 2, R. Moore. 3, W. Whitfield.

POLANDS.—1 and 2, A. Buglass. 3, J. Ferry.

JUDGE.—Mr. E. Hutton.

WOODSOME POULTRY SHOW.

THE ninth annual Show was held at Woodsome in a large field within about four miles of Huddersfield, on the 19th inst.

Spanish were good, but there were only two pens. *Cochins* were numerous and good in old, while in young two grand pens won, both being Buifs. *Game* were not generally good, the winners even being clumsy and heavy-feathered. In *Hamburghs* Mr. Beldon won all but two prizes, and these he did not show for. In *Bantams*, *Game*, we thought the winners had seen Westfield, but they were certainly very good; and in the Variety class first came a neat pen of *Bouens*. *Ducks* in both classes were very good, especially the Rouens; and in *Geese* the only pair of Toulouse were large and well-shaped.

For the amounts offered the *Pigeons* were very good throughout; Mr. Crofts winning the lion's share of the prizes, Mr. Taylor also doing well.

In *Rabbits*, which had two classes, there was nothing of great merit, and the entries in poultry were but small—in consequence, no doubt, of larger and more attractive shows being on at the same time.

SPANISH.—1 H. Beldon, Goitstock, Bingley. *Chickens*.—1, H. Beldon.

JUDGES.—Mr. W. Cannan, Bradford, and Mr. W. D. Henshall, Highburton.

OXFORD POULTRY AND PIGEON SHOW, which is to be held in October, has one of the richest prize lists we have ever known. There are forty-two silver cups and pieces of plate for various classes of poultry, including one given by Prince Leopold, and two confined to Oxfordshire exhibitors. There are seven cups for Pigeons. There are forty-two extra money prizes for Oxfordshire exhibitors, and the money prizes open to all comers are very liberal. We commend the Exhibition to our readers, and

advise them to apply to the Secretary for a schedule. The Judges are Messrs. Esquilant, Hewitt, Jones, Teebay, and Tegetmeier.

NEATH POULTRY AND PIGEON SHOW.

A most important improvement was effected in the present year as regards this poultry show, it being held entirely under cover; and the Neath Market Place proved most suitable to the requirements, affording plenty of light, an equally good amount of ventilation, and the possibility, if needful, of accommodating twice the number of pens. Of the Committee we cannot speak more highly than they deserved, as they were constantly at their post, and the most efficient care was taken of all specimens confided to them.

Here at Neath, however, a mystery was solved: the poultry pens that should have done duty at the show at Chepstow the previous day, had many days before been sent also to Neath, so that so far from here falling short, they had poultry pens in superabundance; whilst by even more unaccountable neglect, no pens whatever for Pigeons ever came to hand for either the Chepstow or Neath Shows—a want that could only be met by additional and unexpected trouble in both instances. In Grey Dorkings the display was unquestionably a poor one, though an entry of nine pens, the three prizes only being awarded, but nothing more. *Cochins* of all kinds were decidedly above par, particularly the Buff and White-feathered. *Brahmas* of both varieties were shown of good quality, the chickens especially of either feather being as good as have been seen this season. The *Spanish* fowls comprised but two pens, the principal one being right good. The *Hamburgs* of every kind were grand, though mostly getting out of plumage. *Game* fowls were, with the exception of a pen or two, comparatively poor, and *Game Bantams* were also below par. The variety Bantam class was really first-rate. *Crève-Cœurs*, *Sultans*, and *Black Hamburgs* were the respective winners of prizes in the variety class for large breeds.

It is almost impossible to hope for better specimens than filled the two chicken classes, and here the Committee generously permitted extra prizes to be given. *Ducks*, *Geese*, and *Turkeys* were praiseworthy.

A spirited competition prevailed in the division of the Show for *PIGEONS*; in *Carriers*, *Jacobins*, *Short-faced Tumblers*, *Antwerps*, and *Fantails* particularly so. In the variety class for Pigeons a pen of perfect *Brunettes* are worthy of the highest approval. Fine weather and an abundance of visitors marked this Show.

DORKINGS.—1, A. Hamie, Tredegarville, Cardiff. 2, J. Walker, Rochdale. 3, H. Feast, Swansea.
COCHIN-CHINAS.—Buff and Cinnamon.—1 and Cup, C. Bloodworth, Bays Hill, Cheltenham. 2, J. Bloodworth, Cheltenham. 3, E. Winwood, Worcester. 4, H. Feast. Any other variety.—1, C. Bloodworth. 2, J. Bloodworth. 3, J. Walker.

BRAMA POOTRAS.—Dark.—1, T. F. Ansell, Cowley Mount, St. Helen's. 2, H. Feast. 3, W. Bevan, Swansea. Light.—1 and 2, T. A. Dean, Marden. 3, Mrs. H. Studdy, Ashdale, Herefordshire.

SPANISH.—1 and Cup, E. Winwood. 2, H. Feast.
HAMBURGS.—Gold pencilled and Spangled.—1, Mrs. Rolis, Monmouth. 2, H. Feast. 3, P. Hanson, Stonehouse. Silver-pencilled and Spangled.—1, J. Long, Bromley Common. 2, H. Feast. 3, J. Carr, Swansea.

POLANDS.—1 and 2, H. Feast. 3, No competition.

GAME.—1, H. Brown, St. Ansell. 2, H. Feast. 3, H. E. Martin, Sculthorpe. C. E. Winwood; D. W. J. Thomas, Brecon.

GAME BANTAMS.—1, J. Mayo. 2, T. Cropper, Bacup. 3, A. Ashley, Worcester. 4, J. Long; E. Payne, Cardiff. 5, T. Jones, Swansea; A. C. Bradbury, Nuthall, Nottingham.

BANTAMS.—Any other variety.—1 and Cup, J. W. Lloyd, Kingston. 2, R. H. Ashton, Mottram. 3, H. Yardley, Birmingham. 4, G. Holloway, jun., Stroud; T. Cropper; J. Mayo, Gloucester; H. Feast; J. Walker. 5, C. H. Pole, Bridgewater.

ANY OTHER DISTINCT BREED.—1 and 2, H. Feast (*Crève-Cœurs* and *Sultans*). 3, J. Richardson, Swansea (*Black Hamburgs*).

COCHIN-CHINAS, DORKINGS, AND BRAHMAS.—*Chickens*.—1 and Cup, T. A. Dean (*Brahmas*). 2, T. F. Ansell (*Dark Brahma Pootra*). 3, J. J. Bloodworth (*Cochins*). Extra 3, G. Lamb, Compton, Wolverhampton (*Partridge Cochins*). 4, Mrs. H. Studdy; T. A. Dean (*Brahmas*); Mrs. H. Feast (2); H. Feast. 5, A. Hamie; J. Long (*Light Brahma*).

ANY OTHER VARIETY.—*Chickens*.—1, D. W. J. Thomas (*Black Red Game*). 2, A. Bentley, Clements Lane, London (*Brown Red Game*). 3, C. Bloodworth. Extra 3, H. Feast. 4, D. W. J. Thomas (*Game*); J. G. H. Morris, Bridgend (*Brown Red Game*); P. Hanson (*Boudans*); Mrs. H. Feast; E. Payne (*Game Bantams*); C. H. E. Martin (*Game*); E. Winwood (*Game*); A. C. Bradbury (*Golden Schright Bantam*).

DUCKS.—*Rouen*.—1, Rev. J. J. Evans, Cantref Rectory, Brecon. 2, J. H. Hoit, St. Ansell. 3, J. Walker. 4, J. Saviour, Llynrhedol, Neath.

DUCKS.—Any other variety.—1 and Cup, A. C. Bradbury (*Aylesbury*). 2, S. R. Hains, Cusack, St. Day. 3, J. Walker (*Aylesbury*); Mrs. H. Studdy (*Aylesbury*); Mrs. M. H. Knight (*Bridgend Aylesbury*); Mrs. H. Feast. 4, Mrs. Rolis (*Aylesbury*); A. C. Bradbury (*East Indian*).

GESE.—1 and 2, Mrs. A. Studdy. 3, H. Gwyn. 4, J. P. James; A. C. Bradbury.

TURKEYS.—1, G. Llewellyn. 2, Mrs. A. Studdy; H. Cuthbertson.
SELLING CLASS.—*Cock and two Hens*.—1, C. Bloodworth. 2, Mrs. G. M. Rolis. 3, P. Hanson.

SELLING CLASS.—*Drake and two Ducks*.—1, J. Saunders, Corntown, Bridgend (*Rouen*). 2, J. R. Paramore, Neath (*Rouen*). 3, J. Saviour, Neath (*Aylesbury*). 4, J. Saviour (*Aylesbury*); Mrs. G. M. Rolis (*Aylesbury*).

LOCAL CLASS.—1, J. Jones, Neath (*Golden-pencilled Hamburgs*). 3, J. Evans, Neath (*Golden Hamburgs*). 2, Withheld.

PIGEONS.

CARRIERS.—1, P. R. Spencer, Hereford. 2, H. Yardley, Birmingham. 4, J. W. Lloyd, Kingston.

FOUTERS.—1, P. R. Spencer. 2, W. G. Davies, Swansea. 4, H. Yardley. 5, T. A. Dean.

TUMBLERS.—*Short faced*.—1, H. Yardley. 2, W. G. Davies. 4, D. A. Thomas, Aberdare; C. Pugsley, Swansea.

BATES.—1, P. R. Spencer. 2, J. H. Watkins. 4, H. Yardley; W. G. Davies. 5, G. H. Gregory, Taunton.
ANTWERPS.—1, H. Yardley. 2, A. Bentley.
TREBIS OR OWLS.—1, H. Yardley. 2, G. H. Gregory. 4, A. Bentley. 5, W. G. Davies.
TUMBLERS.—1, H. Yardley. 2, No competition.
ANY OTHER VARIETY.—1, H. Yardley. 2, T. Cropper. 4, W. G. Davies. 5, G. Holloway, jun.

Mr. Edward Hewitt, of Sparkbrook, near Birmingham, was the Judge.

THE POULTRY-KEEPER.—No. 16.

THE BREDA—BLACK, WHITE, AND CUCKOO.

The three varieties of this breed are known in Holland under the unique name of "The fowl with a Crow's beak."

BLACK BREDA.

THE COCK—GENERAL CHARACTERISTICS.

Well-shaped and large in size. Body very flat, small tuft of feathers on the head; comb like a goblet; hackle thick; breast large and wide; feathers of the neck lengthened in form of a spur; foot feathered; plumage black.

Weight.—From 7½ to 8½ lbs.

Flesh.—Excellent, very abundant, and readily fattened.

Bones.—Light.

Size.—21½ inches.

Head (fig. 58).—Very strong, length 3½ inches. Aspect peculiar on account of the comb, which is rather a cavity than a pro-

Fig. 58.—Head of Black Breda cock.

minence, and gives to the beak a characteristic depression. This absence of comb is more remarkable, as the gills are of a good length, a contrast not remarkable in any other species. The comb should be in the shape of a small oval cup, rounded and rather projecting at the edge; being at the edge of the beak it covers the nostrils in the direction of the centre of the head, and is not more than 1½ inch in length by ½ inch in width. The colour is blackish, and the substance slightly horny. The comb in some birds is transversal, and has little depressions on the outside edges, which do not always mark degeneracy or mixture of blood. The regularly-formed comb, however, must always be preferred with the little oval cup to the regular edges.

Ears.—Small.

Wattles.—Very open, of remarkable size. Length about 2 inches, nearly as wide as long.

Cheeks.—Very apparent, and forming with the ear a fine red face, continued by the wattles close-up to the black plumage, and with a little black down invisible at a distance.

Tufts.—Black and very visible.

Beak.—Of the ordinary form, black at the base, and greyish at the end.

Eyes.—Deep red; pupil black.

Foot.—Of ordinary length, from 3½ inches to about 4 inches, circumference 2½ inches; furnished with stiff feathers from the top to the bottom, and laid one on the other like tiles. These feathers grow in rows placed above and by the sides of the sole, which they partly surround. They take in the heel and edge the toes without covering them; colour blackish. The top of the foot is covered by the feathers of the leg, forming a sort of spur bent inwards.

The plumage is a very fine pure black, iridescent with me-

tall colours, reflecting green, bronze, and indigo, especially in the covert feathers of the wings and the tail. The feathers of the sides, abdomen, and inside of the thighs are of a dull brownish black, those of the shoulders of an intense velvety black.

The hen of the Black Breda is exactly similar to that of the Cuckoo variety, of which we shall give a description.

The plumage of the Black Breda hen is like that of the cock, extremely brilliant and of a raven black; brilliant black and purplish. The cock and hen should have exactly the same characteristics in all three varieties. The Cuckoo or Flemish variety is the strongest; the White is the most tender, and is considered merely a fancy bird.

ROCHDALE POULTRY SHOW.

The annual Exhibition of the Rochdale Agricultural Society was held in the extensive grounds of C. M. Roys, Esq., on the 19th inst. The day was extremely favourable for the occasion, and the inhabitants of that thriving and populous district made the most of the opportunity and attended in great numbers. The patronage of the Messrs. Roys seems to be the heart and soul of the whole affair, and we feel quite certain the success for once achieved must be a source of high gratification to those gentlemen, for previous wet days had so disheartened the Committee, that had it been so this year we should no doubt have had the unpleasant reflection that this Society was numbered with the things of the past.

The specimens were shown in the open air, and the sun being very powerful, some of the birds suffered from the heat; but the attention was excellent, and nothing was allowed to escape the vigilant eyes of the attendants.

Poultry were young, and the entries numbered about 350. They were judged in sections, Mr. Teebay taking the larger varieties, Mr. Douglas the Game and Game Bantams, and Mr. Fielding the Hamburgs and Polands.

Of *Cochins* there were some very good birds, especially pullets; and though the *Spanish* did not tell up in numbers, yet the winners were very good, notably the first-prize pullet. In *Brahma* cocks Mr. Ansdell's cockerel was a grand bird, some others also showing promising points. Of pullets there were twenty-three, and many of them were very good; the winners large and capital in pencilling, but we preferred the second to the first-prize pullet, for, though smaller and younger, she showed more character. In *Game* cockerels the first was a fine promising Duckwing, and second a Black-breasted Red, a capital yellow-legged Pile receiving a high commendation. We thought it a mistake that some of the Brown Reds were not also noticed. In pullets the first was a good reachy Brown Red, and second Duckwing. In *Polands* the first in both cases were very good Golden. *Hamburgs* were good in most instances, Mr. Lane's cockerel and pullet being as well developed as old birds, and quite fit to hold their own in any section. *Silver-spangles* were very good, but not forward, while the first-prize Golden-pencilled cockerel was a model bird, as also the first-prize pullet, which showed rare quality of pencilling; but the best bird in the *Hamburg* classes was the first-prize *Silver-pencilled* cockerel, which we hesitate not to say is the best we have ever seen of his age. *Black Hamburgs* were very good in both classes, and many of the birds quite up in comb and feather. *Dorkings* were very good, the cup cockerel really good, but a little high in tail. The winning pullets were large, well made up, and good in colour. In the *French* class there was nothing of striking merit, nor in the varieties.

In *Game Bantam* cockerels occurred a mistake in judging. A Brown Red cockerel, such as has never yet been surpassed, was left out for a moderate Pile as first, and a bad one as second. In the next class a Pile in full bloom was first, and a Duckwing second, no commendations being given. In the Variety class of cockerels an old-style *Silver-Sabright*, most exquisitely marked, was first, and a White Rose-combed second; and in the next a pure white-ground *Sabright* pullet stood first, and a *Black* second.

Ducks and *Geese*, any age, were good classes, Mr. Walker taking most of the prizes.

PIGEONS were very numerous and well cared for, all the pens, which were substantially-made wooden ones, being well white-washed, a point we commend to the notice of other committees. Throughout, the quality was very high, as may be gathered by a glance at the prize list, many of the champions of the past season competing together, while numerous classes for birds of 1874 added greatly to the value of the list.

RABBITS.—Among *Lop-eared* bucks there was nothing of striking merit if we except the Sooty Fawn which took the first position; the length of ears was 21½ inches by 4½ in width. Does were grand, and all except one were noticed; the first, a Black-and-white, quite a baby, was 22½ inches by 4½, with such carriage and silkiness of ears as it has not been our lot to adjudicate upon of late. The second position was secured by a splendid Black-and-white, better in marking, size, and develop-

ment, but losing in style and texture of ear, as well as length and breadth (21½ inches by 1½). A nice Fawn was third as extra, being 20½ inches by 4½. This was a grand class. In *Silver-Greys* the first, a doe, won the medal for these and *Himalayans*, the quality of coat, silvering, and evenness being perfect; while the second, though a shade lighter, lost only in size; Miss Mortimer's grand doe being thoroughly beaten in this case, but awarded a third prize, many others running very close. *Himalayans* were not good as a class, but some good young ones were shown; the first two, an old buck and young doe, were far ahead of all the rest. *Angoras* were one of the best classes of the season, and three prizes were awarded; size, quality, and length of fur were very good. In *Dutch*, a *Blue* doe carried off the prize, and these were as nearly perfect as any we have seen; a young *Blue* not larger than a rat received a very high commendation. It was in deep moult, but we venture to predict that it will make one of the best in the fancy. Only two heavy *Rabbits* were shown, but these were of enormous size; the second, shown by Mr. Roys, was large in bone, but not half ma-le-up, and consequently not the heaviest. In the *Selling* class a very good *Silver-Grey* was first, and it was soon claimed; the second was a *Lop*. Other *Silver-Greys* and *Lops* came in for commendations.

SPANISH.—Cockerel.—1, H. Wilkinson, Earby. 2, H. Beldon, Goitlock, Bingley. Pullet.—1, H. Beldon. 2, G. Bentley, Rickmansworth. *he*, T. Blake-man, Tettenhall; H. Wilkinson.

COCHINS.—Cockerel.—1 and 2, C. Sidgwick, Ryddlesden Hall, Keighley. 2 and *he*, W. A. Taylor, Manchester. Pullet.—1 and 2, W. A. Taylor. *he*, J. J. Malden, Bingley; R. P. Percival, Northenden, Manchester (2); G. Palfreyman, jun., Healey, Sheffield; C. Sidgwick (2); W. A. Taylor; J. E. Walker, Rochdale. *c*, T. M. Deery, Gledyay.

BRAHMAS.—Cockerel.—1, T. F. Ansdell, Cowley Mount, St. Helen's. 2, R. P. Percival. *he*, C. Holt, Rochdale; J. H. Pickett, Birkdale, Southport (2). Pullet.—1 and 2, J. E. Waker. *he*, T. F. Ansdell; W. H. Crabtree, Levenshulme; E. Kendrick, jun., Lichfield; J. H. Pickett (2); R. P. Percival; J. Watts, Hazlewell Hall, Birmingham.

GAME.—Cockerel.—1, J. Fletcher, Stoneclough. 2, Capt. Mitchell, Rossendale. *he*, J. E. Walton, Kewstall. Pullet.—1, T. Dyson, Halifax. 2, J. Fletcher. *he*, W. Ormerod, Todmorden.

POLANDS.—Cockerel.—1, T. Dean, Keighley. 2, J. Fearnley. *he*, T. Dean; J. Fearnley; J. Long, Bromley Common. Pullet.—1 and 2, T. Dean. *he*, J. Long.

HAMBURGS.—Golden spangled.—Cockerel.—1 and 2, T. E. Jones, Wolverhampton. *he*, T. May. Pullet.—1, T. E. Jones. 2, T. May, Wolverhampton.

HAMBURGS.—Silver spangled.—Cockerel.—1, H. Beldon. 2, J. Fielding, New-church, Manchester. *he*, J. Robinson, Garstang. Pullet.—1, J. Fielding. 2, H. Beldon. *he*, T. Fawcett, Baidon.

HAMBURGS.—Golden pencilled.—Cockerel.—1, T. Fawcett. 2, W. Speakman, Nantwich. *he*, E. Clayton, Keighley. Pullet.—1, H. Beldon. 2, W. Clayton. *he*, W. Driver, Keighley (2).

HAMBURGS.—Silver pencilled.—Cockerel.—1, H. Beldon. 2, J. Long. *he*, J. Robinson; H. Smith, Keighley. Pullet.—1, J. Long. 2 and *vice*, Rev. — Bracewell, Earby, Skipton.

BLACK.—Cockerel.—1, C. Sidgwick. 2, J. Long. *he*, H. Beldon; T. Holmes. Pullet.—1, N. Marlor, Denton. 2, C. Sidgwick. *he*, H. Robinson; C. Sidgwick.

DORKINGS.—Cockerel.—Cup and 1, G. Fox, Wilmslow. 2 and *he*, S. Brierley, Endring, Rochdale. Pullet.—1 and 2, T. Bridal, Cononley. *he*, S. Brierley.

CREVE-CEUR, HOUDAN, LA FLECHE, or MALAY.—Cockerel.—1, J. J. Malden. 2, G. W. Hibbert, Godley, Hyde. Pullet.—1, G. W. Hibbert. 2, J. J. Malden.

ANY OTHER DISTRICT BREED EXCEPT BANTAMS.—Cockerel.—1, J. Long. 2, O. E. Renswell, Early Wood, Bagshot. Pullet.—1, J. Long. 2, R. S. Woodgate, Penbury, Tunbridge Wells.

GAME BANTAMS.—Cockerel.—1, R. J. Hartley. 2, A. Smith, Northowram. *he*, W. F. Entwistle, Westfield, Bradford (2). Pullet.—1, G. Evans, Worcester. 2, W. F. Entwistle.

BANTAMS.—Any other variety except *Game*.—Cockerel.—1, J. W. Morris, Rochdale. 2, F. Cropper. Pullet.—1, M. Leno, Markyate Street, 2, H. Feast.

DOCKS.—Aylesbury.—1, J. Walker. 2, R. Hutchinson, Rochdale. *he*, J. Wakefield. 2, J. Walker. *he*, P. Unsworth, Lewton (2); J. Walker. Any other variety.—1 and 2, H. B. Smith, Brooklands, Broughton. *he*, M. Leno; H. B. Smith; J. Walker (2).

GEES.—1 and 2, J. Walker. *he*, R. Hutchinson.

TURKEYS.—1, J. Walker. 2, M. Lord, Stead Hey Bottom, Warble.

SELLING CLASS.—Male.—1, W. Ormerod. 2, J. Walker. 3, C. Holt. *he*, J. E. Fletcher. Female.—1, J. Walker. 2, J. H. Pickett. 3, S. Lord, Shawclough (Braham).

PIGEONS.—SINGLE BIRDS.

POUTERS.—Red or Blue.—Cock.—1, R. Fulton, Brockley Road, New Cross. 2, W. Harvey, Sheffield. 3, E. Horner, Harewood. *he*, R. Fulton; W. Harvey. Hen.—1, E. Horner. 2, W. Harvey. 3 and *he*, R. Fulton.

POUTERS.—Any other colour.—Cock.—1 and 2, R. Fulton. 3, E. Heath, Blackburn. Hen.—1 and 2, R. Fulton. 3, Major Cryer, Southport.

CARRIERS.—Black.—Cock.—Medal, 1 and 3, R. Fulton. 2, R. Spencer, Hereford. *he*, T. Crisp, Southall. Hen.—1 and 3, R. Fulton. 2, E. Horner. *he*, G. Bentley; R. P. Spencer.

CARRIERS.—Any other colour.—Cock.—1, R. Fulton. 2 and 3, E. Horner. *he*, T. Crisp; R. Fulton. Hen.—1 and 2, R. Fulton. 3, J. Stanley. *he*, T. Crisp; E. Horner.

CARRIERS.—Young.—1 and 2, W. Bulmer, Spalding. 3, Major Cryer; W. Massey. Extra 3, J. Stanley, Blackburn. *he*, W. Bulmer; T. Crisp (2); R. Fulton; J. H. Ivimy, Basingstoke (2); W. H. A. Miller, Walsall; J. Stanley.

TUMBLERS.—Almond.—1, H. Yardley, Birmingham. 2 and 3, J. Ford, Monkwell Street, London. *he*, R. Fulton; W. Harvey. 3 and 4, J. Ford. *Any other variety*.—1, J. Baker, Kew Bridge. 2, J. Ford. 3, W. Harvey. *he*, R. Munnit, W. W. Garage, Rochdale (2); T. W. Oddie, Bury; A. & W. H. Silvester, Sheffield (2).

BALDS OR BEARDS.—1 and 2, T. W. Woodhouse, Lynn. *he*, J. Nield, Birmingham; W. Woodhouse.

OWLS.—Foreign.—1, T. W. Townson, Bowden. 2, W. Lumb, Rochdale. 3, E. Horner. *he*, J. Baker; T. Charnley, Blackburn; R. Fulton. English.—1, R. Gardner. 2, R. Unsworth, Cheddale. 3, J. W. Townson. *he*, T. Charnley; R. Fulton; R. Unsworth (2); W. Woodhouse.

BARNS.—1, J. Baker; J. Thresh. 2, R. Fulton; H. Yardley. 3, E. Horner. *he*, R. Fulton; J. Stanley (2). Any colour.—Young.—1, Major Cryer. 2, J. H. Ivimy. 3, T. Charnley. *he*, W. Massey, Spalding.

TURBITS.—1, J. Baker. 2, R. Fulton. 3, R. White, Manchester. *he*, O. E. Crosswell; T. W. Eckersley, Stoneclough; R. Fulton; J. Gardner; E. Horner; W. Lumb; S. Lawson, Preston; A. & W. H. Silvester.

JACOBS.—1, 2 and 3, R. Fulton. *he*, J. Baker (2); W. Harvey; E. Horner; W. Woodhouse.

Long-faced.—1, J. Lister, Keighley. 2, C. Hopwood, Rochdale. 3, J. Crossland, jun. *he*, R. Brierley, Fishpool; T. Charnley; C. Hopwood. *Short-faced*.—1, W. Gamon, Chester. 2, E. Horner. 3, A. Bingham, Manchester; J. Stanley. *he*, R. Brierley; H. Cox, Smethwick, Birmingham; W.

L.Lis, Idle; J. Gardner, Preston; J. Lister, Dr. Rothwell, Rochdale; J. Wright, Manchester; H. Yardley, *Any colour*.—*Young*.—1, J. Crookland, 2, S. Adshard, *hc*, R. Brierley; W. Gannon; C. Hopwood; J. Stanley.

FANTAILS.—1, J. E. Spence, Broughty Ferry, 2, E. Horner, 3, Q. Blahm, Higher Broughton; R. Fulton, *hc*, Q. Blahm (2); W. Lumb.

DRAGONS.—1, J. Stanley, 2, W. J. W. Pass, Manchester, 3, J. Holland, *hc*, M. G. Dunn, Ryton, Durham; R. Fulton; J. Holland, Manchester; R. Unsworth (2); W. Smith, Walton-on-the-Hill, Liverpool, *Any other colour*.—1, 2, and 3, F. Graham, Birkenhead, *hc*, R. Fulton (2); W. H. Mitchell, Moseley; L. Unsworth; H. W. Webb, *Any colour*.—*Young*.—1, J. Holland, 2, W. H. Mitchell, *hc*, W. H. A. Miller; J. Royle, Manchester; W. Smith.

TRUMPETERS.—1 and 2, R. Fulton, 3, W. Harvey, *hc*, E. Horner. ANY OTHER VARIETY.—1, R. Fulton, 2, H. Yardley, 3, M. Ord, *hc*, O. E. Crosswell (Egyptian Turbentine); J. Gardner; E. Horner; W. Lamb; T. W. Towson; J. Watts.

SELLING CLASS.—1, E. Horner, 2, W. Brydon, *hc*, W. Harvey; W. Lamb; R. Minnitt; J. Nield; T. & W. Oddie.

ANY VARIETY.—1, E. Horner, 2, W. Harvey, *hc*, W. Markland, Dean, Bolton.

RABBITS (SINGLE).

LOP-EARED.—*Buck*.—1, W. Miller & S. Adams, Bradford, 2, T. Schofield, jun., Cheetham, Manchester, *hc*, L. Lamb, Rochdale, *Doc*.—1, J. Boyle, Blackburn, 2, J. Hume, York, 3, S. A. Garside, Ormskirk, *hc*, J. Irving, Blackburn; T. Schofield; W. Whippam, Alford, *c*, J. Armstrong, Leeds; T. Hargreaves, jun., Westhoughton, Bolton.

SILVER-GREY.—*Medal*, S. Ball, Bradford, 2, E. E. M. Royds, Rochdale, 3, Miss Mortimer, Rudhal, Ross, *hc*, J. H. Brand; T. Schofield, jun.; A. W. Whitehouse, Northampton, *hc*, J. Boyle; H. Hinks, Humberstone, Leicester; Miss Walton, Raynestall, *c*, C. G. Mason.

HIMALAYAN.—1 and *hc*, J. Butterworth, Rochdale, 2, Miss Walton, *hc*, S. Ball; H. C. Bowman, Higher Broughton; Legatt & Earwood, Thorne; T. & R. Mills, Accrington; C. G. Mason (2).

ANGORA.—1 and *hc*, H. Sweetman, Fulford, 2, S. Ball, 3, S. Buckley, Healey, *hc*, T. Garner; Miss Walton, *c*, T. Garner, D. Oldfield.

DUTCH.—1, T. Garner, 2 and *hc*, J. Irving, *hc*, J. Boyle; S. Butterworth; H. E. Gilbert, Rugby; A. Lund, York.

HEAVIEST.—1, M. Marsland, Goole, 2, E. E. M. Royds.

SELLING CLASS.—1, E. E. M. Royds, 2, S. Butterworth, Rochdale, *hc*, S. A. Clegg, Rochdale (Fawn Lops), *hc*, G. Feather, Keighley; E. E. M. Royds, *c*, B. Conderme, Littleborough.

The Judges were—for Poultry: Messrs. Teebay, Douglas, and Fieeling; for Pigeons: Messrs. Esquilant and Charlton; and for Rabbits: Mr. E. Hutton.

HOLMFIRTH POULTRY SHOW.

TWENTY years ago the district of Holmfirth provided more of the Birmingham winners in Gold and Silver-spangled Hamburgs, Polands, &c., than any other part of the country; but since then times have altered, some of the old fanciers being dead, though we were happy to meet some of the old hands at their annual competition, when the familiar names of Carter, Broadhead, Moody, Bamford, Battye, Haigh, Hepper, and Caldwell, and the doings of other days, were discussed over an entry of about 250 in all classes. Holmfirth is not one of the most accessible of places, but if the Committee would venture upon a really good schedule there is little doubt that theirs would become one of the most popular of shows, and again stir-up the latent and high-bred tastes of the inhabitants of the district.

As may be expected, the large varieties of poultry were not of high merit, if we except the cup pen of *Spanish*. Silver-spangled Hamburgs, as well as the Golden, both adult and young, were good, the young of the latter variety being very good. Game were of fair quality, and the Game Bantams were also very good.

PIGEONS were not numerous, but some were very good; and it is here was the most original type of Pigeons, shown under the name of Common Dovecot.

RABBITS.—The Belgian Hare in the mixed class was not good in fur, but size and shape were correct. The second was Angora, but the Lops were poor.

CATS.—The great feature of the Show was, however, the Cats, which had but one class, in which there were thirty-one entries; but double prizes were allowed. The first award was made to a Silver-Grey Tabby, the second to a Tortoiseshell-and-white, of which there were not less than twenty, and mostly good, and the third to a Red Tabby. The rest of the awards went, first to a Tortoiseshell-and-white, second to an Angora, and third to a Tortoiseshell-and-white.

DORINGS.—1, W. Buttery, Carr, Upperthong, 2, R. Stringer, *Chickens*.—1, J. Battye, Hillhouse.

SPANISH.—*Black*.—1 and 2, J. Battye, *Chickens*.—1 and 2, J. Battye.

COCHIN-CHINAS.—*Cinnamon and Buff*.—1, W. Wright, Holmfirth, 2, Moore and Cartwright, Holmfirth, *c*, J. Hey, Hunsley, *Chickens*.—1, W. Wright, 2, J. Hey.

COCHIN-CHINAS.—*Any other variety*.—*Chickens*.—1, W. Cartwright, 2, Moore and Cartwright, *hc*, T. Heywood; D. Clough, Holme.

FRAMMA POOTRAS.—1, J. Battye, 2, Moore & Cartwright, *Chickens*.—1, J. P. Floyd, Holmfirth.

HAMBURGERS.—*Golden-spangled*.—1, J. H. Booth, Bartholomew, Upperthong, 2, G. Haigh, Hough, *hc*, Moore & Cartwright (2); M. H. Broadhead, Holmfirth, *Chickens*.—1, M. H. Broadhead, 2, G. Haigh, *hc*, J. H. Booth, *c*, G. Hinchliff; J. Charlesworth (2).

HAMBURGERS.—*Silver-spangled*.—1 and 2, J. H. Booth, *Chickens*.—1, J. H. Booth, 2 and *hc*, J. P. Floyd.

HAMBURGERS.—*Golden-pencilled*.—1, M. H. Broadhead, 2, W. Bentley, Upperthong, *Chickens*.—1, W. Bentley, 2, Moore & Cartwright, *c*, J. A. Brook, Burnley.

HAMBURGERS.—*Silver-pencilled*.—2, J. Lee, Holmfirth.

HAMBURGERS.—*Black*.—1, Moore & Cartwright, 2 and *c*, W. Bentley, *Chickens*.—1 and 2, W. Bentley, 3, Moore & Cartwright.

POLANDS.—1 and 2, J. Battye.

ANY OTHER VARIETY.—1, R. Beighton, Clough, Thurstonland.

SELLING CLASS.—1, W. Bentley, 2, Moore & Cartwright, *c*, W. H. Peace, Shepley.

GAME.—*Any colour*.—*Cock*.—1, W. H. Peace, 2, J. Barber, Hollinbriag, *Any variety except Game*.—*Cock*.—1 and *hc*, Moore & Cartwright, 2, J. Hey, *c*, J. Charlesworth.

ANY BREED.—*Hen*.—1, J. Charlesworth, 2, W. Wright, *hc*, W. Cartwright, *hc*, R. Tolson & Co., Holmfirth; Moore & Cartwright, *c*, J. A. Brook; J. Hey; W. Goldwell.

GAME.—*Black-breasted and other Reds*.—1, J. A. Brook, 2, J. Brook; W. H. Peace, *Chickens*.—1, W. H. Peace, 2, J. A. Brook.

GAME.—*Duckings and any other variety*.—1, W. H. Peace, 2, J. Woodhead, Wooddale, *Chickens*.—1 and 2, J. A. Brook, *hc*, W. H. Peace; R. Beighton, Clough, Thurstonland.

BANTAMS.—*Black-breasted Game or any other Red*.—1 and *c*, R. Tolson & Co., J. E. H. Roberts, Scholes Moor, *hc*, R. Beighton, *Chickens*.—1 and 2, R. Tolson and Co., *hc*, R. Stringer.

BANTAMS.—*Duckling Game or any other variety*.—1, W. Goldwell, 2, J. Lee, *Chickens*.—1, W. Goldwell, 2, J. Lee.

BANTAMS.—*Any other variety*.—1, R. Stringer, 2, A. Thewlis.

DUCKS.—*White-Iglesbury*.—1, J. Hey, 2, J. P. Floyd, *hc*, T. Heywood; W. Bentley, *Rouen*.—1 and 2, G. H. Hirst, Meltham, *Any other variety*.—1, A. Thewlis, 2, J. Barber, *hc*, A. Thewlis; M. H. Bower, Holmfirth.

TURKEYS.—1 and 2, J. Hesp, Holmfirth.

GUINEA FOWLS.—1, J. Barber.

PIGEONS.

CARRIERS.—1, A. Thewlis, 2, W. Kaye, Shepley.

CROPPERS OR POUTERS.—1, W. Kaye, 2, A. Thewlis.

TUMBLERS.—1, A. Thewlis, 2, W. Wright, *hc*, A. Thewlis; E. Morton; FANTAILS.—1 and 2, A. Thewlis.

JACOBINS.—1, T. Hinchliff.

RABBS.—1, G. Beaumont, Meltham.

OWLS.—*English*.—1, E. H. Himes, Hunsley, 2, W. Kaye, *hc*, G. A. Thewlis.

DOVECOTE.—*Common*.—1, D. Clough, Holme, 2 and 3, G. H. Roberts, Scholes, *hc*, J. Wilson, Netherthong; G. H. Roberts.

ANY OTHER VARIETY.—1, W. Bentley, 2, W. Wright.

RABBITS.

SPANISH.—*Buck or Doc*.—1 and 2, W. Wright.

COMMON.—*Buck or Doc*.—1 and 3, Ramsden & Baxter, Underbank, 2, T. Blakey, Holmfirth, *hc*, G. E. Ratcliffe; E. Westerby, *hc*, H. Booth; W. Berry, Holmfirth (2), *c*, C. Goldwell; W. Berry.

CATS.—*Any variety*.—1, D. Ratcliffe, 2, J. J. Ellis, Boothhouse; W. H. Holmes, 3, J. Brook, Prize, T. Roberts, Holme, *hc*, E. Goldwell, Wasphit, *hc*, C. Whitely, Hinchliff; T. Brooks, Modd, *c*, J. Battye; J. J. Firth, Upperbridge; H. M. Cartwright, Ryecroft; W. Reifearn; T. Battye, Norridge; H. Mettrick, Underbank.

JUDGES.—Mr. W. Cannan, Bradford; Mr. E. Hutton, Pudsey.

RYHOPE POULTRY SHOW.

THIS took place on the 25th inst., and was in general a good Show, much better than before. The class for Malays proved quite a success, there being more entries in it than in any but the Selling class. First came a good pen, worthy of its position; the second excellent in style and quality although young.

DOAKINGS.—1, J. White, Wallaby, Northallerton, 2, H. Smith, Malton, York, *hc*, Lady A. Beresford-Peirse, Bedale, *Chickens*.—1, S. Stoddart, Millfield, 2, Lady A. Beresford-Peirse.

COCHINS.—1 and 2, G. H. Procter, Durham, *hc*, H. Tomlinson, Birmingham, *Chickens*.—1 and 2, G. H. Procter.

SPANISH.—1, Lady A. Beresford-Peirse, 2, R. Moore, East Rainton, *Chickens*.—1 and 2, C. Venables, Castle Eden, 3, R. Moore.

SPANISH.—1 and Cup, W. Jaggs, Blyth, 2, H. Smith, *Chickens*.—1, W. Jaggs, 2, Willocky & Carriss, Hexham.

POLISH.—1, A. Bugglass, Carville, Durham, *Chickens*.—1, A. Bugglass, MALAYS.—1, S. Elliott, Liskeard, 2, R. Hawkins, Seaham, *hc*, R. Hawkins; Rev. A. G. Brooke, Shrewsbury.

GAME.—*Any variety*.—1, W. Linsley, Morpeth, 2, D. Cheyne, Morpeth, *hc*, W. Ellis, Seaham, G. Holmes, Great Driffield.

GAME.—*Black-breasted and other Reds*.—1 and Cup, Miss M. J. Nelson, Cockshaw, Hexham, 2, H. Smith, *hc*, D. Nichol, Morpeth, *Chickens*.—1 and 2, G. Watson, Holhearside, *hc*, J. & I. Pounder; G. Watson.

GAME.—*Any other variety*.—1, G. Holmes, 2, J. Gibson, Stanhope, *hc*, A. Bugglass.

HAMBURGERS.—*Golden-spangled*.—1, R. Keenleyside, Aycliffe, Darlington, 2, W. Hinchliff, Helton Station, Penehouses, *c*, A. Bugglass, *Chickens*.—1, R. Keenleyside.

HAMBURGERS.—*Silver-spangled*.—2, G. Alderson, West Hartlepool, *Chickens*.—1, R. Keenleyside.

HAMBURGERS.—*Golden-pencilled*.—1, G. Holmes, 2, G. Alderson, *hc*, J. W. Gibb, Sunderland, *Chickens*.—1, J. G. Walker, Hendon, 2, R. Moore.

HAMBURGERS.—*Silver-pencilled*.—1, G. Holmes, 2, W. Whitfield, *Chickens*.—1, R. Keenleyside.

BANTAMS.—*Game, Black-breasted and other Reds*.—1 and Cup, G. Hall, Kendal, 2, R. Youll, Sunderland, *hc*, Miss M. J. Nelson; T. Clark, Sunderland (2), *c*, D. Hunter, Sunderland, *Chickens*.—1, G. Hall, 2, J. Earlow, Monkwearmouth, *hc*, J. Barlow; H. H. Thompson, Sunderland.

BANTAMS.—*Game, any other variety*.—1, Miss M. J. Nelson, 2, R. Youll, *Chickens*.—1, W. Rodgers, Sunderland, 2, D. Hunter.

BANTAMS.—*Any variety except Game*.—1, W. Laing, Sunderland, 2, H. A. Cave, Sunderland, *hc*, W. Whitfield, *Chickens*.—1, J. H. Cartwright, Welington.

DUCKS.—*Iglesbury*.—1, T. P. Carver, Langthorpe, Boroughbridge, 2, W. Laing, *Rouen*.—1, Miss M. J. Nelson, 2, W. Canney, Bishop Auckland, *hc*, S. Stoddart, Millfield, *Any other variety*.—1 and *hc*, Rev. J. G. Milner, Hamsterley, 2, W. Laing.

SELLING CLASS.—*Cock and Hen or Drake and Duck*.—1, J. N. Lawson, Ryhope, 2, C. Venables.

LOCAL CLASS.—*Barn-door Fowls*.—1, J. N. Lawson, 2, J. Weightman, Ryhope.

RABBIT.—1, J. Davidson, Ryhope.

The Judge was Mr. R. Teebay.

STOKESTOWN POULTRY SHOW, IRELAND.

THE following prizes were awarded at this Exhibition, held August 18th:—

DORINGS.—1, Lord Crofton, 2, P. Creighton, *Chickens*.—1, Mrs. Balfe, 2, Lord Crofton.

FRAMMA POOTRA.—1, Mrs. Traffie, 2 and Cup, Lord Crofton, *Chickens*.—1 and 3, Mrs. Traffie, 2, C. Graham.

COCHINS.—1, Mrs. Traffie (Black), 2, Lord Crofton, 3, Miss C. Chichester, *Chickens*.—1 and 2, Mrs. Traffie (Black), 3, Lord Crofton (White).

ANY VARIETY.—1 and 2, Mrs. Balfe, 3, parish and Homan, *hc*, Lord Crofton, Miss C. Chichester, J. Burke, P. Creighton, *Chickens*.—1, Miss Chichester, 2, Lord Crofton, 3, P. Creighton, *hc*, Miss Lloyd, J. S. Thompson, Miss Convery.

PHEASANTS.—3 and *hc*, J. Burke.

TURKEYS.—1, Lord Crofton, 2, Miss Chichester.

GESE.—1 and 2, Lord Crofton, 3, Miss C. Chichester.

Ducks.—1 and 3, Mrs. Taaffe. 2, Mrs. Balfe. *he*, Lord Crofton, Miss Chichester (2), Mrs. Lynch (2). *c*, Mrs. Balfe, P. Croighton, J. Burke, and K. E. Conrevere. *Drakes*.—1, Mrs. Taaffe. 2 and 3, Mrs. Balfe. *he*, Mrs. Barker, c, Miss Chichester (2); P. Croighton.
SMALL FARMERS' CLASS (Ducks).—1 and 2, P. Croighton.
SELLING CLASS.—1 and 3, Mrs. Taaffe. 2, P. Croighton. *che*, H. Owens (3).
JUDGE.—Mr. C. F. Staanton, Sandymount, Dublin.

CLITHEROE POULTRY SHOW.

This was held on the 21st inst. in a field about one mile from the station. The pens used were of a very primitive character; the management very bad, as birds sent alone were neither fed nor watered; and many of the Pigeons arriving a little late were not penned till after most of the awards were made, although there was ample time for that purpose before the judging commenced.

Single *Game* cocks were pretty good, the winners being Brown Reds of style and quality, but not good in colour. In the large varieties there was nothing of note, Mr. Aspden's Partridge *Cochins* being about the best. In *Hamburgs* Mr. Long won the majority of the prizes with some excellent birds. Messrs. Duckworth's Gold-spangled were also very good and well-shown. In single *Game Bantam* cocks the first was a Black Red of last year, the second being the Brown Red cockerel referred to in the notes on Rochdale. In the next class *Piles* were first and Black Reds second, all the class being birds of this year.

For *Turkeys* there was no competition, but some good Embden *Geese* were shown. In *Ducks* Mr. Walker took the first prize in each class, while White-throated Whistlers stood first in the next class.

In the class for chickens the first were good Spanish and second White *Cochins*, but we preferred pen 625, Brown Red *Game*, for second.

PIGEONS.—The birds were not numerous, nor can we congratulate the Judge upon his awards in the majority of the classes, as we considered only Tumblers (one pen), Owls (three pens), Turbits (two pens), and Dragoons, where there were twelve entries, and these latter well placed.

GAME.—*Cock*.—1, C. W. Brierley, Middleton. 2, J. Leeming, Bronghton, Preston. *Black and Brown Reds*.—1, C. W. Brierley. 2, R. Lonsdale, Worston, Clitheroe. *Any other variety*.—1, J. Greenhalgh, Hancoc, Accrington. 2, Huttall & Anderson, Earnoldswick.

DORRINGS.—1, J. Walker, Rochdale. 2, J. Robinson, Garstang.
COCHINS.—*Buff and Cinnamon*.—1, J. Walker. 2, T. Aspden, Church. *Any other variety*.—1, T. Aspden. 2, J. Walker.

SPANISH.—1, J. Leeming. 2, H. Wilkinson, Earby, Skipton.

BRAMAS.—1, H. Colbow, Clitheroe. 2, T. Ingburn, Whalley.

HAMBURGAS.—*Golden pencilled*.—1, J. Long, Bromley Common. 2, G. & J. Duckworth. *Silver pencilled*.—1, J. Long. 2, J. Robinson. *Golden-spangled*.

—1 and 2, G. & J. Duckworth, Church. *Silver-spangled*.—1, J. Robinson. *Black*.

—1, J. Long. 2, J. Robinson.

POLANDS.—1, J. Robinson. 2, T. Dean.

SELLING CLASS.—1, H. Wilkinson, Earby, Skipton. 2, T. Aspden, Church, Accrington. *Cochins*.

GAME BANTAMS.—1 and 2, W. F. Entwistle, Westfield, Bradford. *Cock*.—1, W. F. Addie, Fulwood. 2, W. F. Entwistle.

GEES.—1, J. Walker. 2, Capt. L. Anyon, Whittle-le-Woods.

DUCKS.—*Aylesbury*.—1 and 2, J. Walker. *Rouen*.—1, J. Walker. 2, S. H. Stott, Preston. *Any other variety*.—1 and 2, H. B. Smith.

ANY BREED.—*Chickens*.—1 and 2, H. Wilkinson.

PIGEONS.

CARRIERS.—1, W. Sefton, Blackburn. 2, J. Stanley, Blackburn.

TUMBLERS.—1, T. & W. Oddie, Brierfield, Burnley.

BARBS.—1, J. Stanley. 2, T. Charley, Salford, Blackburn.

OWLS.—1, T. & W. Oddie. 2, J. Richmond, Oswaldtwistle.

POUTERS OR CROPPERS.—1, J. Richmond. 2, T. Charley.

FANTAILS.—1, J. F. Lovelace, Newark. 2, T. Charley.

TURBITS.—1 and 2, J. B. Bowden, Blackburn.

DRAGOONS.—1, J. Stanley. 2, W. Sefton.

ANTWERPS.—1 and 2, J. Stanley.

NUNS.—1, J. B. Bowden. 2, T. Marples, Blackburn.

MAGPIES.—1 and 2, J. B. Bowden.

ANY OTHER VARIETY.—1, T. Marples (Red Jacobins). 2, W. Sefton.

The Judge was Mr. R. Teebay.

CHEPSTOW POULTRY SHOW.

This Show was held in the Castle grounds, which are all the most fastidious amateurs could desire for the purposes of any similar meeting, the views being of a most impressive character, whilst the interior is highly suggestive of the march of progress now attained, whether of attack or defence, over those existent when the massive walls of the Castle were originally erected. The day was indeed a lovely one for any kind of out-of-doors pursuit, but, as though misfortunes were always twin-born, the Committee, who strove to the utmost to please and satisfy all parties, met with a succession of disappointments, sufficient to damp the enthusiasm of the most persevering. Still they bravely strove on, and no one could for a moment but approve of their self-denial and perseverance. The greatest possible drawback arose from the fact that the exhibition pens (though the party had arrived to put them up) never came to hand, consequently all the fowls had to be shown in their respective travelling baskets, and the Pigeons in pens such as could be most speedily put together at the last moment. Again, the tent, arranged for by contract, arrived safely and in due course, but after the erection of the framework it was found at the most anxious moment that the contractor had by "mistake, brought the

canvas for the end of a very large tent," consequently a second serious pull-back ensued, causing much uncalculated labour and vexation. Still, by dint of unbroken sheer hard labour, the Committee pulled through; and although travelling baskets (open and closed) formed the only exhibition pens, the Show when finished in so picturesque a spot was anything but a bad one; neither was it without considerable attraction, and the attendance was satisfactory. Under these manifold drawbacks, and there being no printed catalogue, we cannot enter into details, except the admission that the majority of the poultry shown were very superior, though the judging was of necessity carried out under circumstances of great difficulty.

The Judge was Mr. Edward Hewitt, of Sparkbrook, near Birmingham.

POCKLINGTON PIGEON AND CAGE BIRD SHOW.

This was held on the 20th inst. *Pigeons* were few and inferior to what we have seen in previous years. *Rabbits* also were not numerous, but Mr. Myton, who obtained quite the lion's share of prizes, showed some good pens. The *Cage Bird* classes had some good entries, and included some capital birds.

PIGEONS.

DRAGOONS.—1, R. W. Richardson, Beverley. 2, C. Auton, York.

ANTWERPS.—1, C. Auton.

POUTERS OR CROPPERS.—1, R. W. Richardson. 2, Mrs. Jackson, Pocklington.

TUMBLERS.—1, C. Auton.

BARBS.—1 and *he*, R. W. Richardson.

JACOBINS.—1, R. G. Sanders, Leven. 2, C. Auton.

FANTAILS.—1, C. Auton, York. 2, T. S. Stephenson, Beverley. c, R. W. Richardson.

TRUMPETERS.—1, R. G. Sanders.

TURBITS.—1, R. W. Richardson. 2, C. Auton.

CARRIERS.—1, C. Auton.

ANY OTHER VARIETY.—1, C. H. Blanchard. 2, C. Auton.

RABBITS.

LOP-EARED.—*Duck*.—1 and 2, T. Myton, York. *Doe*.—1 and 2, T. Myton.

HIMALAYAN.—1, T. Myton. 2, W. Swetnam, Palford.

SILVER-GREYS.—1, T. Myton.

ANY OTHER VARIETY.—1, T. Myton. 2, Miss Cundale, Pocklington.

SELLING CLASS.—1, T. Myton. 2, Miss Jefferson, Pocklington.

CAGE BIRDS.

RELIGIAN.—1, W. Forth, Pocklington. 2, W. G. Wright, Beverley. *Half-bred Belgian*.—1, — Sykes, Beverley. 2, — Downs, Beverley.

NORWICH.—*Clear or Ticked Yellow*.—1, C. Burton, York. 2, W. Forth. *Clear or Ticked Bay*.—1 and 2, W. Forth.

YORKSHIRE.—*Clear Yellow or Bay*.—1, M. Fairburn, Pocklington. 2, H. Curtis, Pocklington.

NORWICH OR YORKSHIRE.—*Even-marked*.—1, Mrs. Downs, Beverley. 2, C. Burton, York. *Ticked or Uneven-marked*.—1, W. Forth. 2, J. Calvert, York.

CRESTED.—*Any variety*.—1, Petty & Cuss, York. 2, C. Burton.

LIZARDS.—*Gold or Silver-spangled*.—1, W. Forth.

JOQUE.—*Buff or Cinnamon*.—1, W. Forth.

CANARIES.—*Young.*—*Any variety*.—1, Mrs. Downs. 2, T. Neill, Beverley.

MICE.—*Parroted Goldfinch and Canary*.—2, W. Lister, Malton. *Dark Goldfinch and Canary*.—1, J. Boulton, Pocklington. 2, W. Lister.

GOLDFINCH.—1, J. Higglet, Pocklington. 2, J. Calvert.

LINNET.—1, W. Lister. 2, G. Eyre, Pocklington.

BULLFINCH.—1, J. Whitehead, York. 2, W. Lister.

THRUSH.—1, W. Forth. 2, J. Boulton.

PARROT OR PARAKEET.—1, T. Grant, Pocklington. 2, J. Calvert.

ANY OTHER VARIETY.—1, Hon. W. Dundas, Waplington (Waxbill). 2, Mrs. Calvert, Pocklington (Green Cardinal). c, J. Calvert (Golden Oriole).

CAGE OF SIX CANARIES, IN VARIETY.—1, W. Forth. 2, Petty & Cuss.

CAGE OF FOREIGN BIRDS.—Extra, W. Lister.

JUDGE.—Mr. Morton, Hull.

BIRMINGHAM SUMMER POULTRY AND PIGEON SHOW.—At this, which the advertisement states will be held in the last week of September, thirty-three extra prizes are offered for poultry, and the same number for Pigeons. In addition, there are three liberal prizes in each class. Altogether the prizes amount to £400. As the Show days include those of the Michaelmas Fair there will most probably be a large attendance, and anyone wishing to sell or purchase birds will act judiciously by being there.

MALTON PIGEON SHOW.

(From a Correspondent.)

The above Show was held on the 11th inst. in connection with the Floral Society. The Secretary and Committee deserve great praise for the manner in which they managed the Show. Next year we hope they will publish a catalogue of entries, arrange their schedule on the single-bird system, and make a few additional classes. In *Tumblers*, any variety, first were a pair of good Almonds, second Black Kites; a pair of good short Reds received a high commendation. Of *Pouters* both winners were capital Whites, good in feather and limb. *Jacobins* were a large class, and both prizes fell to decent Reds. In *Fantails* the winners were excellent. *Carriers* were also a good class. *Trumpeters* contained some very fair birds; both the winners were of the old type. *Spots* were wretched, and we are surprised that the Committee make a class for them and ignore such varieties as Antwerps, English Owls, Dragoons, and many other varieties, as any of these would bring thrice the number of entries that *Spots* do. *Turbits* were a large class, and contained some really good Filled birds, both Shells and Peaks; the winners were first-class headed birds, and able to take their own part in good company. *Nuns*, with the exception of the

first birds, were very ragged in moult, and many of them looked frightful. *Barbs* were a good class, the first-prize Reds being as promising as anything we have seen for some years. A capital pair of *Yellows*, very evenly matched, were second. This class contained some good *Blacks*. The *Auy* variety class was a show of itself, consisting of upwards of twenty-eight pens, including *Owls*, *Dragoons*, *Isabels*, *Archangels*, *Spangled* and *Plain Ice*, *Swallows*, *Antwerps*, *Magpies* three colours, and a pair of small *Runts*. The first-prize went to *Spangled*, and the second to a good pair of *Owls*, one of which had an extraordinary gullet. The *Jndgea* should have had about six extra prizes to give in this class, as many of the birds not mentioned in the prize list were good enough to win anywhere. The awards were published last week.

POUTERS, ANY OTHER COLOUR OR MARKINGS.

On reading Mr. M. Stuart's article in one of your contemporaries, my first impulse was, that as it showed such a want of the proper spirit in which this discussion should be carried on, that I would write no more on the subject; but, on second thoughts, I have to ask you to give me space for a few short remarks. It is an article that will neither help his views nor damage those of his opponents. It wanders from the point; it assumes an insolent tone towards those who differ from him; it is boastful; it makes reckless assertions; it contradicts itself; in a word, it shows an utter want of good feeling, and a degree of ignorance of the subject on which it professes to decide. These may seem heavy charges, but I think they can be easily made good.

In the first place he starts with that unhappy word "mis-marked," though he knows very well that no one advocates classes for these birds. He then says that "every good Pouter fancier" has been convinced by "Mr. Wallace's clear and forcible statements," the meaning of which can only be that those who cannot agree with what Mr. Wallace says are no fanciers, yet he then admits that the off-coloured birds might have a class, which is just about all we are striving for. He then states that he knows more than our "first-class Pouter fanciers" that gave them up because they could not breed them to their mind. What proof is there that those who gave up in disgust were "first-class fanciers"? Is it that they took up a breed and failed to improve it or to keep it up? There is no other proof given, but apparently it is ample in Mr. Stuart's opinion. But he immediately adds, after saying that Pouters have been ruined beyond the energies of "first-class fanciers" to redeem, that the birds of the present day are far superior to the birds of the old school. Here is contradiction and ignorance besides, for I remember the birds of the old school, and a few other fanciers do so also, and I maintain that in all the best points of a Pouter they could beat us. We could, I daresay, beat them by the tape line, but in nothing else. They bred for elegance of style, and managed colour and marking better than is now done. If Mr. Stuart had said that the birds of the present day were the best he had seen, there could have been nothing to say; but he makes them out to be the best and the worst at the same time. His misuse of the word "mongrel" is quite in keeping. He also boasts that "we can and will do without *Mealies*, *Chequers*, &c." Time only will show; but a prudent man, in attempting to do what has never before been done, will delay the boasting until he has done it, and then, if he is "to boasting inclined," one might forgive him. He also boasts of a loft where there is only one chequer, and every bird well marked. It may be so, a little judicious "Pie selection," which he confessed to at one time would do this for any loft; but a loft may boast of this and yet be a poor one after all. Colour and marking do not make a Pouter, they only finish one. This wonderful loft adds also to the surprise and regret one feels on hearing of first-class fanciers leaving off "in disgust." Could they not have got what they so sorely required from such a fountain of pure blood? or were they fond of change, which a certain class of people are said to be, and perhaps had a mind to try their great powers on, perhaps flying *Antwerps*? It is to be hoped they will succeed better in their new sphere, as they are not missed in the one they left. Mr. Stuart assures us that "he is in downright earnest." Are we to infer from this that he is not usually so in what he writes? If not, why so strongly assert it in the present instance? His attack on Mr. Haie as a breeder I only refer to as a further proof of ignorance, and of a total disregard for the feelings of others.

Before closing I would feel obliged by some of the members of the North British Columbarian Society explaining a thing I cannot understand. At their last show they had a class for Short-faced Tumblers "any other colour or marking," comprising *Kites*, *Agates*, *Whole-feathers*, *Splashes*, &c. By this time they had become enlightened on the Pouter question, and there was no class for off-coloured birds. Now, as Pouters of this description serve the breeder precisely in the same way as the "any other colour" Short-faces do, how were the latter not excluded also? Mr. Stuart might have told the Almond breeders

that they could and ought to breed their Almonds from Almonds, and that "no good fancier" would have anything to do with such trash. This, at least, would have had the merit of consistency. As I said before, I would be happy to hear any of the members explain this (but not in Mr. Stuart's style), as it has puzzled not a few. I am sorry the discussion has taken this disagreeable turn, when it might have gone on pleasantly and perhaps usefully.—GEORGE URE, *Dundee*.

P.S.—To show that Mr. Stuart does a thing thoroughly when about it (his change of opinion on this matter), I give some extracts from a letter of his that appeared in *THE JOURNAL OF HORTICULTURE* in March, 1868, during the controversy the Scotch fanciers had with Mr. Volckman on the same subject. He says, "Mr. Volckman tells us that by the use of *Mealies*, *Chequers*, and *Splashes* we have destroyed the colours and markings in our Pouters, and that for the present they must be 'vigorously discarded.' On the other hand, Mr. Tegetmeier says, 'The Pouter fancier has a slavish fear of breeding away from some one particular colour.' Now this is an awkward position for a young fancier to be placed in. Whom is he to believe? and what is he to do? My advice would be, as we have no printed guide, to adopt neither theory, but use *Mealies*, *Chequers*, and *Splashes* in their proper places, and he will find to his own satisfaction, as I have done, that practical experience is safer than theory." Very good.

Again he says, "As far as my own experience goes, and from observation in the lofts of our best Scotch breeders, I believe that the *Chequers* bred from *Blacks* should be crossed with *Blacks* only, and by following this method a *Chequered Pouter* will be quite as good for stock purposes as a *Black*, and the produce will be 'Blacks of raven brilliancy.'" Very good also.

He next says, "I approve of occasionally crossing the *White Pouter* with the *Blue*. The *White Pouter* being constitutionally a weak bird, the produce is improved in strength by this cross, and the *Blues* gain in colour, as the *White Pouter* helps to clean out the foul feathers so often found in the limbs, &c., of the *Blue-pied Pouters*. It was from a cross of this description that I produced the progenitors of the *White* and *Blue Pouters* that stood first at Glasgow for more than one season." Very good still.

But Mr. Stuart has now veered round as far as it is possible to go. Of course change of opinion is an everyday affair, but when one does it so decidedly as Mr. Stuart has done, and not content with this, but derides those who will not follow him, and parades his views in public, fanciers are surely entitled to look for a good reason for such a change. Has he given one? I say he has completely failed in his attempt; in fact, it is all the other way, if we are to be guided by his experience, the only sure guide in these matters, so that his desertion from the good cause must arise from something foreign to the fancy, as facts and theory are all against him.—G. U.

MOTTLES.

THERE are numerous birds among the varieties of Pigeons that are called Mottles, and yet not one in ten approaches the standard by which alone birds answering to that name should be judged. The Mottles of one person are the *Splashes* of another, or the *Speckles* of some other. So it turns out that B is dissatisfied with the birds C sends him, or D thinks E does not know what a Mottle is because E rejects *Splashes*, &c. There need be no difficulty about all this, for it has long been settled as to what a Mottle should be. A Speckle is a spot of one colour upon another. For instance, upon a sheet of paper you drop some ink; it spots or specks it, and if you shake out a number of drops the paper becomes speckled all over. And so it is with a class of Pigeons; the colour of the bird (black, red, or yellow, &c.) is spotted all over with specks of white, whence comes the name of *Speckles*, or *Speckled Tumblers*, &c.

A splash is a different thing. A boy will stand in the gutter, and splash mud over you as you walk by. In this instance a large quantity of mud falls upon one or two places (the little spots count for nothing here), and your white suit is said to be splashed. Therefore among birds, a black (red, blue, &c.) one with large spots of white occurring here and there on its plumage is called a *Splash*; thus two or three white feathers will give a bird a splashed tail, or when the white extends across the back it is a splashed back, as some call it a handkerchief back.

A Mottle bears a definite meaning with it. It has not come by chance, such as a speck or splash; on the contrary, it denotes that something has been carefully done. There is no sense in saying I am mottled with mud, splashed is the word for that; but when you look at a work of art, you say, How carefully that mottling is done! With birds a Mottle means a black (red, blue, yellow, &c.) bird with a rose consisting of about twenty-four, rather less than more, white feathers upon the shoulder of each wing. If these feathers are arranged in a perfect circle, with a black feather alternating between every two of the white ones, it gives a brilliancy and beauty to the bird that will set any

fancier wild. Some fanciers allow a few white feathers scattered about the head and neck of the bird, but methinks it is because they cannot always attain the highest perfection in breeding Mottles, and are therefore inclined to be liberally lax in their ideas in order to accommodate the name to the speckled birds, and not the birds to the name. That is not true fancying; it is but a make-believe, and is always accompanied by an unpleasant sensation of conscience that is very disagreeable to have about one when one's ideas are formed to a high standard. Eaton, in his edition of plates, gives a beautiful illustration of a Mottle, and the only objection to it is the speckling of the back of the neck; but then Eaton was not so strict in his ideas of the meaning of the word as he ought to have been, for he gives us also a plate of a Mottled Trumpeter, and by comparing the pictures it is conclusively shown he attached different degrees of latitude to the word as used in speaking of Mottled Tumblers or Speckled Trumpeters.

What makes a mottled bird valuable is the purity of the mottling and the rareness with which such mottling is reached. It is easy to breed speckled birds; it is hard to breed birds mottled on the wings, and moderately speckled about the head; but hardest of all is it to breed that pure white mottling on the wings alone. It takes time and the most careful selection to produce anything of moment among Pigeons, and the most experienced fanciers have not yet succeeded in fixing those few white feathers indelibly upon the shoulders of the birds, but the time will come when it will be done; meantime, do not let us be dragging down a high standard and prostituting our energies by resting content to call Splashes, Speckles, and even Griggles by the name of Mottles.

Mottled Tumblers are exceedingly scarce, whether Short or Long-faced. There is but one Short-faced nearly approaching perfection in colouring in the circle of our acquaintance; it is a beautiful Black, in the possession of Mr. M—, a fancier of refined taste and liberal ideas, residing in our city. It was considered cheap at \$50, and is now unpriced. The Long-faced are sometimes called Rose-winged, and are occasionally well bred, but in most instances they deserve the name of White-winged or Splashes, more truly than Rose-winged; many of these last are fine tumbling birds, and some of elegant beauty. Mottled Trumpeters are far from being fit exemplars of the word mottle. It would be better to call them Speckled but for the fact that, yielding to the invisible influence of the word mottle, the fanciers are gradually excluding more and more of the white from the standard of markings for the Trumpeters, and the time is not far distant when the mottling of the perfect bird will be ruled by a standard for colours common to both varieties.—Dr. W. P. M.—(*American Poultry Bulletin*.)

[Dr. Morgan gives a good guide here to the young fancier as to what is a properly-mottled Tumbler, except that some of the English admirers of the bird prefer a slight mottling on the back. It is, however, fair to say that all do not agree to the handkerchief back. Eaton in his book gives an admirable portrait of this bird, the best yet produced, and rightly gives no white on the neck; the picture is indeed the gem of the book. A properly-mottled Short-faced Tumbler is the most beautiful of all Tumblers; in my opinion to be preferred even to the Almond, and has this advantage, that while non-fanciers never admire the Almond at a show, everyone, even the most ignorant, delights in the Mottle. We sadly need more of these exquisite birds. It would be well if fanciers went in more vigorously for breeding this class. I would give something to see a good exhibition of Black, Red, and Yellow Mottles. Alas! we only read of them, but never or scarcely ever see them.—WILTSHIRE RECTOR.]

TRAINING THE EARS OF PET RABBITS.

I cut from a piece of leather a strip in shape like this illustration (fig. 59); the places x, x, are cut so as to act like a flap.

Fig. 59.

This must be made of such size as will fit the Rabbit's head. Put the ears through from the under side, and draw the two ends under the throat, and tie them there. These "flaps" press the ear down, and after being kept on a week usually effect a cure. In Rabbits half-grown or over it will take a longer time. The best age to apply it is immediately they are weaned. The leather should be the thickness of ordinary boot-leather.—A. M. HALSTED.—(*Philadelphia Fanciers' Journal*.)

JUDGING BY POINTS.

This subject has no doubt been the means of giving a great deal of labour to some of our friends, particularly in America, and amongst others has caused much interest. I do not think

it is a matter requiring much debate, because it seems to me almost impossible to judge by measure, and, without measuring, all the points cannot be correctly ascertained. Still, I allow that specimens in some departments of the fancy may be judged in this manner. I know something of Canaries, Belgians particularly, and believe that neither they nor Pouter Pigeons can be properly judged in this way. It is only where a close tie is come upon that I think the measure should be applied at all.

There is enveloping the Belgian Canary in particular, and the Pouter Pigeon, a peculiar grace—an elegance which cannot be put on paper either in language or figures, and which only a good judge will at once detect; and as that grace is developed differently in different individuals, and in so many various ways, no printed standard would result in giving satisfaction either to judge or exhibitor. I have instanced only two birds, but there are many others.

The great want, in my opinion, is not a tabulated scale of points for the subject of our various pastimes, but really good judges.

As points seem at present to be fashionable in many matters, allow me to give you my points of a good judge—

True fancy knowledge	35
Good eye, with or without spectacles	20
Manly independence	35
Poetics	10

100

N.B.—Weight or age no object.

It seems to me that we would sooner gain our end if the debate—if debate at all—turned upon and settled the points of judges. That being settled, we may then look after testimonials.—JAMES HUIE.

BEE-KEEPING FOR 1874.

SINCE my letter to the Journal about my visit to Mr. Pettigrew's apiary in March last, I have had ample opportunities of trying what I was then shown, and I have succeeded a great deal better than I expected to do.

I commenced bee-keeping in June last year with a very poor first swarm that I bought of a person who had found it on a brookside, and had it put into a common round-topped hive; about a week after I bought another hive, and sent it to a neighbour's to put a swarm in, and he put a small second swarm in it on July 1st. Both of the swarms were so small that the first one only half filled its hive with combs, and the second one did not fill its hive more than a quarter full; however, I fed them until they gave over taking any more food, and wrapped hay-bands round the hives to keep them warm; but I never expected the second one to live through the winter, it was so small; but it did, and bred a good stock of bees afterwards. I knew of about forty-five hives of bees within two miles round here before winter, and in March this year there were three lots out of the forty-five living, and two of them were mine, so it shows what a little attention will do. I obtained one of Mr. Pettigrew's bee books, and I agreed with what he said, that large hives were more likely to do well than the common small ones, so I purchased an 18-inch stock hive in March. I had then two common hives only partly filled with combs, and one good 18-inch hive to start with this year.

The weather here up to the commencement of June was as bad as it could be for bees. I examined them now and then to see how they were getting on, but they increased in numbers very slowly. I had a pair of gloves and a bee dress ready, so that I could swarm my bees as soon as they were ready without the risk of being stung, and they have paid for themselves once or twice over already. When examining a hive they are not wanted, but when swarming, &c., it is better for a beginner to have something on. I had never seen a hive artificially swarmed, and the first one I had to do I was afraid I should make a mess of it, but I was determined to try and do my best, for I knew if I did not I should lose very nearly all my bees, there were so many hives with combs in waiting for swarms to come to them.

It was the 3rd of July before I had a hive ready for swarming, and about 7 p.m. I smoked the hive, turned it up, and placed an empty hive on the top, wrapped a cloth round the junction, drummed the bottom hive four minutes, then took the top hive off, looked for the queen, and shook the bees out into an 18-inch hive that I had ready for them, put the swarm on the old stand and the old hive about 2 feet off, and they were all right. Three days afterwards I treated the 18-inch hive in the same way, and put the swarm into another 18-inch hive; three days after that the other was ready, and I treated it also in the same way, and put it into a 16-inch hive. The swarms all did first-rate while the weather continued good.

I wanted to have a better class of hives in place of the common ones, so on the twenty-first day after swarming the first common hive I drove all the bees out into a 16-inch hive, and took the honey, 15 lbs., on the third day after a second swarm came out of the other common hive, and settled on to an old stump in the

garden hedge. I was away at work, so a friend of mine covered them over until I got home, when I put them into an empty hive, and in the evening I joined them to my first swarm in the 18-inch hive. This I managed the same evening without any fighting, it being three weeks since I swarmed the large hive. I drove all the bees into a 16-inch hive, and took the honey, 24 lbs. Three days afterwards I took the other common hive, joined the bees to the first turnout, and secured 9 lbs. more honey. I had now my bees all in good "Pettigrew" hives. If it had been a good May I should have done better still. This is but a poor locality, so I consider that I have done very fairly for a beginner. I sold all the honey I had to spare at 1s. 6d. per pound. Twelve months since I was as frightened of bees as any one. If all beginners, and I think there are plenty, will only try the same methods that I have done, and follow Mr. Pettigrew's instructions in the Journal, they will succeed a great deal better than they expect.

The weather here has been very unfavourable for bees since about July 24th. My swarms were gaining weight rapidly; one gained 9 lbs. weight in four days, and then the weather changed, and they have lost 3 or 4 lbs. since instead of gaining, and the others have lost more still. The turnouts I am feeding well, so that they may make as many combs as possible before winter comes on. Artificial swarming is a good plan, especially for any one who works any distance from home.—P. RAINFORD, *Wigan*.

NADIRING.

Your correspondent "E. H. R.," at page 111, draws attention to the value of nadirs "in good years." Of this there can be no question; but then at such times—i.e., when honey is very plentiful, bees will build comb and store honey anywhere. They have been known to do it outside the hives, even below the floorboard. I have known them do it between the general covering of the hive and a super, thus building within and without the super at the same moment. Still I cannot say in ordinary years I have found the nadir principle a good one; certainly in every way a well-managed super is preferable. The objection against the nadir, arising from the difficulty of the bees in finding their way out in the upward direction, has perhaps created a prejudice against it unnecessarily, because a few narrow slits in the top board, sufficient to allow the bees a free passage up the sides of the nadir into the main hive above, would at once obviate this difficulty if these slits, say half an inch wide and 2 or 3 inches long, were made in the middle of each side. There are other objections to the nadir which make it awkward of management, arising from the necessity of elevating the hive over it, which in my own case in my bee house and elsewhere would be very troublesome. The quasi-nadir, or rather super placed nadirwise *pro tem*, is all I can conveniently use. It is used simply to induce the bees to commence building combs earlier than they sometimes will do in a super proper. I also have put a large empty hive below, in order that it may be treated as a stock hive another year.—B. & W.

OUR LETTER BOX.

PIRATING OUR ILLUSTRATIONS.—We have received the following—"Gentlemen,—Referring to the editorial footnote on page 89 of your JOURNAL OF HORTICULTURE, it is proper that I should say that the illustration of the Fantail Pigeon which appeared in our July issue was purchased from the proprietor of the 'Rural New-Yorker,' and the writer had no knowledge that the same had ever appeared in your paper. It seems proper that I should make this explanation.—A. B. ESTES, *Editor of Pet-Stock Bulletin, New York*."

[The "Rural New-Yorker" systematically copies our illustrations without acknowledgment.]

HEREFORD POULTRY SHOW.—Mr. Feast writes to us that he seldom exhibits White Cochins, and that the bird which died went to Hereford direct from his yard at Swausea, and that he has too many good birds in his hundred pens to require them to be overworked. He thinks our correspondent's observations were malicious and libellous, but we are sure that they were only intended for the safety and better chance of success of valuable birds.

PRIZE GOLDEN POLISH HEN AT EARLSHEATON.—"In your report of the Earlsheaton Show you mention a Golden Poland hen whose crest had the appearance of having been operated on by a barber. I have seen the hen in question two or three times during the summer, and although she certainly has that look, yet I do not think she has been trimmed. She has, I believe, chafed it away with rubbing it against exhibition pens. The hen seems to be of a restless disposition, and I have no doubt that that is the cause of her present appearance. She is a fine one, has a good crest, and should not be shown until she has moulted.—G. W. BOOTHBY."

CHEAP RABBITRY.—"On page 65 of No. 694 I see you have taken an article, headed 'Cheap Rabbitry,' from the *Chautauqua Farmer*, and credited it to Dr. Pond of Cassadaga, N.Y. If you will refer to 'Pet-Stock, Pigeon, and Poultry Bulletin' for March, 1874, page 225, you will find the article entire as it originally appeared over my own signature.—A. M. HALSTED, *Pet-Stock Bulletin, New York*."

LOUGHAN BEES (E.S.).—We have had these bees for many years, either pure or hybrid, but we cannot say we find them less irascible than the common English. In point of temper we find "much of a muchness" between them. They are pretty bees to look at, good honey-gatherers, famous breeders, and the fashion, which is saying a great deal for them. Messrs. Neighbour and Sons, Holborn, supply hives of them. The best time to commence keeping bees is the spring.

SMALL BLACK BEES (Midland Counties Bee-keeper).—The bees enclosed in your envelope did not appear to differ from ordinary bees, but they changed so rapidly after death that it is difficult to report upon them. We infer that your bees are Italians, because you ask if they are "the offspring of a pure English queen;" but if not, "small black bees" are referred to in Bevan on the "Honey Bee," and have been noticed by other writers. They occur at times in larger numbers than at others, but so far as we recollect have never been satisfactorily accounted for.

PREVENTING SWARMING (P. R.).—Placing an eke under a hive after it has swarmed once will not prevent it from sending off a second swarm. Driving all the bees out of a hive when the young queens are piping, cutting out all its royal cells, then casting back the bees, will prevent swarming. Throwing back second swarms a few hours after they have issued will, in almost all cases, prevent their coming again.

SAVING BEES (D. B., Enfield).—We gather from your letter that your hive to be plundered, and that to which you would join your bees to be saved, are identical in shape and size; also the hive beneath the first, which is empty, save a little comb. Nothing can be easier under the circumstances. First smoke, then drive the bees out of the hive which is to be plundered into the last-named hive which has a little comb. Next drive the bees in the same manner out of the hive which you intend to keep along with the other bees, or you may drive them separately into different hives. In either case knock them out together in front of the hive which is to be kept. There will be no fighting. You will find full instructions for driving in "Bee-keeping for the Many," which can be had from this office for 5d., postage paid.

REMARKS.

19th.—Fine day, much warmer in the evening.

20th.—Very bright and fine all day and night.

21st.—Rather dull early, but a very pleasant day; quite as bright, but cooler than yesterday.

22nd.—A most beautiful day, cool evening, and starlit night.

23rd.—Fine morning and afternoon, rather cloudy and stormlike between 6 and 7 P.M., but a fine night.

24th.—A very pleasant day, but again stormlike about 7 P.M.

25th.—A little rain in the early morning, and rather thick at 9 A.M.; bright before 11 A.M., and continuing so till 3 P.M.; but then clouding over, and looking stormlike, with puffs of wind at times; fine night.

A week of most agreeable weather, bright and fine, and though the temperature has been about 3° in excess of that of last week, it has rarely been oppressive or felt stormlike, though it has frequently looked so. Heavy dews, but no rain, except on morning of 25th.—G. J. SYMONS.

COVENT GARDEN MARKET.—AUGUST 26.

VERY little alteration to be noticed here. Peaches and Nectarines are coming in freely from open walls; Hothouse Grapes more than sufficient for the demand.

From observations taken near London during forty-three years, the average day temperature of the week is 70.3°; and its night temperature 47.4°. The greatest heat was 91°, on the 7th, 1868; and the lowest cold 28°, on the 7th, 1856. The greatest fall of rain was 1.09 inch.

AUBRIETIAS, AND THEIR CULTURE.

AMONGST flowers for spring and early summer—flowers of the simplest, easiest, hardest culture, flowers dense and telling in colour, and flowers that will grow in any sort of soil in anybody's garden—few deserve higher rank, if few are more lowly in habit, than the Aubrietias. Was it "WILTSHIRE REC-TOR" who some time ago detected some special virtue in men of low stature, and quoted M. Thiers, Nelson, Disraeli, Lord John Russell, &c., as examples? What, if the notion had any kernel in it, would become of literary men if represented by Samuel Johnson and statesmen by Prince Bismarck? No; there is nothing in it. But yet we often find little men the most fierce—no, energetic; little women the—well, the most manly; little dogs the most snappish; little bantams the most pugnacious. Suppose we admit that, and also that a little good-humoured banter is refreshing, then it will not matter whether or not I am a great gardener or our genial friend a little parson, or whether, as is far more likely, just the reverse is the case, and that I am the "little 'un" after all. We will decide to let each one have it as he will; but—to come to business—don't forget the Aubrietias and the little ones in the ascendant.

Actually the little *Omphalodes verna* has cropped up, and Mr. Record has exactly hit its culture. For places partially shaded by trees, and used in conjunction with the variegated Daisy (*Bellis aeneo-lobata*), it makes charming little beds arranged according to taste. Years ago I used it with great satisfaction. A broad border of it round the white Spring Woodroof is chaste and pretty partly under trees. It is very adaptable, used in the circles at the base of single trees or Conifers, where it grows well, and has a chaste and agreeable effect without doing any harm. Thus much in response to Mr. Record. The Aubrietias, however, are not like it, except in humble stature. They rejoice in sun, shade and extreme moisture being contrary to their nature. They are rock plants *par excellence*, only put them in a suitable spot. For covering miniature knolls, or little elevations in sunny corners such as one often sees in urban, suburban, and rural villa gardens, they rank amongst the best of all Nature's gifts. They are admirable for window boxes, and the various little schemes adopted to make a window-sill inviting. For vases of home construction, as the hollow stem of a tree stuck up here and there, they fit to perfection, or a sanitary pipe stuck in the ground socket uppermost affords a fitting receptacle for them, and if jutting out of or contiguous to a rustic pile it is not to be despised.

Does the sanitary idea provoke a smile? Well, I am fortified, having, in fact, royal patronage for a shield. No long time ago, unless I am very much mistaken, I saw a pair of these sanitary vases within the precincts of Windsor Castle, and not a stone's throw from St. George's Chapel. There! give over laughing if you are loyal,

as all are who read these pages. They can be used now without compunction and with a conscience void of reproach; and if any fashionable floral critic, who can tolerate nothing but the "latest out," should give you to understand they are an outrage on the taste of the times, tell him seriously that the "Queen has them in her garden," and you are safe at once. Ten to one he will be converted there and then, and in the exuberance of his feelings reply with, "Bless the Queen, how homely she is!"

But the Aubrietias are useful for other and more general purposes of garden decoration. For marginal lines or clumps in the front of beds and borders they have a great deal to recommend them. Their profusion of bloom, compact dense habit, and firm and decisive colour, summon them to the front as amongst the very best of spring and early summer flowers. In their colour and habit they have no equal at their season—say March to June, both inclusive—and in fact at any season but few things can be found to surpass them. Given an instance. Plant a front row of Aubrietia, next *Iberis corifolia*, next, again, scarlet Lothian Stocks; or fill a circular bed on the same principle, and then say what can be finer and more attractive, more gay and yet more quiet, at any period of the year. But then comes the cry of fear—the old bugbear again—of "What can we have after them?" I recollect some years ago centering a bed with *Campanula pentagonia* (rich blue), edging with an old *Iberis*, and margining with an Aubrietia. It gave such pleasure to the owner that when, in July, I essayed to remove and refill with *Perilla* and white Asters (both sown in the open in May, and pricked-out on a layer of manure), he said, "No. Let it alone; I will respect that bed for what it has been." That was a true respect for flowers. It would be none the worse, and enjoyment none the less, if such a feeling were more general. There is any amount of respect for an empty bed for the sake of the future. Why not respect the past? It is well to look forward with pleasurable feelings, but make the present right, and is there not solid enduring enjoyment to be derived from the past? On reflection everyone will admit that it must be so, and that it is the royal road to attain the fulfilment of any cherished aspiration. But a plan like that would not do in a uniform geometric garden, where a break in the design would be fatal. It is not suggested for where it will not do, only for where it is adaptable. The name of such places is legion, and those who cannot find one may make one, and grow and enjoy these old flowers. Enjoy them and respect them, and so make the pleasure lasting.

Besides being used in continuous lines and margins, the Aubrietias are excellent plants for the fronts of mixed beds—none better, and no places better for them. There, too, they will be respected as well as admired, as I have ever observed that those who prefer this enjoyable style of gardening have an innate love for flowers and plants individually. Used in this simple manner in richly-coloured circular clumps a foot across, more or less, according to taste, in alternation with Golden Feather, *Iberis*,

yellow Pansies, &c., they will contribute no mean share to the general display. After flowering they can be clipped to any size required. They will then take up but little room, and look anything but untidy, or they can be removed altogether to a reserve plot.

The *Aubrietias* are easily increased by root-divisions if plentiful, and good-sized blooming plants are reared at once by slips under hand-lights in summer, or quicker by cuttings of young shoots in a gentle heat in spring, but they must not remain close and warm a moment longer than is absolutely necessary. The easiest way, however, of all to get stout, healthy plants in large numbers is to sow seed. It germinates freely if kept regularly moist. In this way thousands may soon be had. If sown in heat in spring, hardened-off, and subsequently pricked-off in the open, they make useful flowering plants in a year from the day of sowing, and will then flower a lifetime with reasonable treatment. Sown in June in the open border they make nice tufts the same season if cared for, and the following year are splendid clumps. It is thus a very simple and inexpensive matter to raise any amount of stock.

As to species and varieties, there are new ones said to be fine. I have not proved them, therefore am unable to speak practically, and my path is clear to say nothing on hearsay. There are old ones, as *deltoidea*, *purpurea*, *hesperidiflora*, &c., which are all pretty for the purposes named; but one neither new nor old is better than these—*græca*. I am able to speak of *Aubrietia græca* raised from seed as one of the very best amongst compact-growing spring flowers. Isolated—yet not too much so—clumps in a mixed border, or in continuous lines as edgings to walks and beds, it will surely attract the eye. For four months out of the twelve the plants are clothed with flowers, and the remaining eight they are not ugly, not unsightly. That is as much, yea, more, than can be said of many a plant of greater fame and popularity. The variegated forms of this plant are amongst the most chaste and lovely of our hardy gems. They must be perpetuated by slips or cuttings, and not be planted in damp shaded places. This tribe of plants suffered by the extreme wet of 1872. I observed plants on the north sides of beds and shady spots all killed, while on the south and drier side they did not greatly suffer, yet a few sustained injury.

If at this season of the year I were commencing to get up a stock for final planting next autumn, I should sow seed at once in free sandy soil in places that I could cover with hand-lights or spare sashes in winter to keep off heavy falls of snow or extreme wet. I would sow thinly, let the plants remain in the seed bed until spring, and then prick out in nursery beds. By the autumn they would be nice compact plants in the best condition for removal. By sowing in heat in spring the same end is attained, but then many who would like *Aubrietias* have not the heat and means of raising them under glass. Or, assuming the presence of a few old plants, I would slip them into little tufts, and plant in beds which contained an intermixture of sand or road grit in September, not under a north wall but in the open. At that season they would probably require little or no shading. I would not use short cuttings, but long slips put in slanting with the dibber, leaving only the tip of green above the surface—that is, there might be 3 or 4 inches of root-stem—it may be doubled or coiled—in the ground, and an inch of top growth above to make the plant. Cuttings will also strike at this season in sand under hand-lights after the manner of Pansies or *Calceolarias*.

For vigour of plant and fine bloom, however, my experience induces me to recommend *Aubrietia græca* raised from seed as the most certain and satisfactory mode of securing a healthy stock. When planted in their blooming quarters, if a dense carpet is required they must be put in closely in the autumn, leaving as little space as possible between the foliage of one plant and that of the other, as they have not much time to spread before blooming, and unless they are well rooted a portion may perish from the winter's wet. Therefore the more closely they are put in the better to make safe against blanks which mar the general effect.—J. WRIGHT.

SPRING LETTUCES.

As this is the season for preparing for what I consider quite a necessary adjunct to one's supply of vegetables—good, clean, and crisp Lettuces in the early spring, may I just give my experience in the matter? I sowed last August some seed of Cabbage and Cos Lettuces, choosing for the former Sutton's

Commodore Nutt (an admirable Lettuce of the Tom Thumb type), and the old Hammersmith, and for the latter a Black-seeded Bath Cos. They were sown in slightly raised beds, and afterwards transplanted into Looker's Acme frames, and from these I had an abundant supply of good crisp Lettuces all through the early spring. I know that some run down these frames, extol wood in preference, and speak of breakages, &c. Let me say that I have tried both the wood frames and these Acemes, and that I vastly prefer the latter. Care must be taken in placing them down that the ground is made firm where they are put, so that in the case of either wet or frost they may not be altered from their position. I had no breakages last winter save from carelessness. The Cos Lettuce did not answer so well, and I am this winter depending on Commodore Nutt and Hammersmith.

I had all my Potatoes (about a quarter of an acre) lifted and housed by the 15th. They are of very fair size and perfectly free from disease, with only a few instances of super-tuberation. The quality seems to be excellent. More of this anon.—D., Deal.

NOTES ON LIFTING AND ROOT-PRUNING FRUIT TREES.—No. 2.

As already remarked, trees on the free stock are not adapted for being lifted, for the results are a temporary increase of fruit with great loss of quality, as lifting and root-pruning arrest for a time the free growth, only for this to be renewed with the emission of fresh roots, the old parts falling into decay, or producing fruit inferior in size and quality. Lifting, then, when distantly practised being attended with risk of life, and root-pruning with a diminution of vigour, it follows that these modes of inducing fruitfulness in trees on the free stock are not desirable. Judicious root-pruning may in some cases be attended with satisfactory results; but as I can see it, and as I have seen it practised, the operation is best left alone, the cultivator in the first instance freeing the subsoil of water by draining, loosening the soil by trenching, enriching it with manure, and planting the trees high on a mound in fact, for who ever saw a tree in nature in a hole? On the contrary, trees have their roots, as it were, upon a hillock. The planter should give them plenty of room fully to develop the head, and no pruning beyond what is required for the proper disposition of the branches, removing irregularities of growth for the due admission of light and air. Trees so treated, according to my experience, will bear infinitely heavier crops of finer quality than those frequently lifted or periodically root-pruned. A refractory subject may sometimes appear a fitting one for root-pruning, but do not practise this operation; instead, cut off the tree's head, and put on as many grafts as will form a large head in two or three years with as much fruit as, and finer, than will be produced in a generation by root-pruning. This practice is very much older than any living pomologist, and of far greater service in bringing sterile trees into a state of fruitfulness than all the root-pruning extant. The free stock means free growth, large trees, and fruit by the cartload. It is those affording fruit for the million, whilst the dwarfs go in for and win with the often ill-to-please, capricious consumer. Measure them by their usefulness. Appearance, quality, are everything to the latter, but the general consumer requires bulk as well, and that, he knows, requires a bulky thing to produce it, or the dwarfs to be vastly multiplied.

I have a suggestion to offer, after observing that we have in the many dells, valleys, and on mountain sides, spots of good soil unsuited for tillage, now growing nothing but a jungle of indigenous scrub, not unfrequently the Sloe and Crab, which are conspicuous objects in the landscape at their flowering period; and these would be still more so were such unprofitable spots planted with Apple, Pear, and Plum trees on the free stock, the Plums forming the marginal lines, and the Apples and Pears in alternate lines, with Filberts and Cob Nuts between. The nature of the ground would seem to be especially suited to the runaway character of the Pear and Crab. A pretty cottage would give a charm to the landscape, and there would be a profitable return to the proprietor, and a competence to an industrious and enterprising man. Thousands of orchards and as many homes might be formed in our land; there is no need to resort to clearing the aboriginal forest of some distant country when there are such opportunities of improvement at home. The result would benefit the proprietor, the occupier, and the fruit-consumer, especially as it would be obtained from what had in all time

been wanting, the efforts of the cultivating mind and hand. We may go on covering the best of ground with acre upon acre of bush and pyramid fruit trees; never shall we be able to feed the million with fruit in such a way as to meet the demand at a suitable price until we start out on a new track, leaving those who possess gardens, which the many do not, to indulge in their hobby to the full.

But some will say I am wandering from the subject. Not at all, for I want it to be understood that the Crab and Pear usually grow well, and when man has put upon the one the Apple, or on the other the improved Pear, each bears annually, or at furthest every alternate year, bushels of fruit, which are sweetened with sugar, an easier thing now more duty is off, infinitely better for the stomach than millions of gallons of liquor containing the poison alcohol. Cider, even, is far better than malt liquor or spirit.

Now for the dwarf stock. It is undoubtedly the stock of the age—the age of luxury. It is not suited for planting in orchards, or on ground kept clear and left to cater for itself, having no more feeding than that of the soil, and that brought down by dew and rain. In equal conditions to those in which we usually find trees on the free stock, those on the dwarf are not nearly so productive, nor in any way so satisfactory; whilst trees on the free stock succeed with almost any treatment and anywhere, those on the dwarf stock require, if not good soil, at least very liberal culture, and such being the case, they are wisely recommended for gardens, the soil of which, if not good, is made so by fertilising agents. It is only just to the dwarf stock, and to those possessing trees thereon, to state this; many have trees all aglow in spring with blossom, and are disappointed at the meagre quantity and inferior quality of the fruit. Quantity and quality of fruit are results from the means employed to secure them. The planter may begrudge every shovelful of manure for his fruit trees, and expect them to bear full and fine crops. It is a parallel case with that of a proprietor who was particularly partial to fine, solid, crisp, nutty Celery, and denied his gardener access to the manure heap. To expect is one thing; to adopt and afford means calculated to realise, another. Those who cannot be liberal to their fruit trees in the way of manure will be acting wisely to plant none but those on the free stock.

Trees on the dwarf stock are only for a liberal cultivating hand, for they are great rooters; they commence to put out from the stem fresh roots in autumn, and continue to produce them in mild weather through the winter. This I know from having moved them almost every day of the months from September to April. I have even lifted them in the middle of summer, in July and August, in full foliage under a broiling sun, and always found fresh white roots issuing from the root-stem. These roots are rather thick, and at first white; they extend considerably, and become a mass of fibres, ramifying in all directions. Owing to the existence of these roots, which I believe to be of annual, or certainly not great longevity, the lifting or transplanting of trees on the dwarf stock is at no time attended with nearly the same risk as in the case of trees upon the free stock. This I have had ample opportunity of observing, for it has fallen to my share to plant and make alterations in gardens to an extent which, for a gardener, was far from enviable. Not a single failure from transplantation have I known with fruit trees on the dwarf stock. Deaths I have known, but they have arisen from want of transplantation rather than in consequence of it. I remember once, three years ago, moving a trained Plum tree from a south to a west wall in the middle of June, its branches covering a space of 20 feet by 10 feet, and at the same time some Peach trees of not much less size were removed, and they, the Plums, are now in full crop, and the Peaches have borne a heavy crop, they having been forced the last three seasons. I mention this to show that the Plum, if not a dwarfing stock, is equally safe for moving as those known as such—*i.e.*, the Paradise for the Apple, the Quince for the Pear, and the Mahaleb for the Cherry. From the fact also of the Plum being employed as a stock for the Peach, Nectarine, and Apricot, the above observations are made on its free transplanting nature, and it must be admitted to be the best rooted subject of the whole.—G. ABLEY.

THE POTATO CROP.—I agree with "H. G. M." (page 148), that the early frost has done much towards injuring the early crops he named. In respect to the Early Rose, I have grown it three seasons, and it has not produced more than one-third that it did the other two seasons. In regard to the Early

Vermont, I must state that my crop far exceeds his. I planted half a pound, which were three seed-sized Potatoes, and when dug-up the tubers weighed 30 lbs., and are all good and equal-sized Potatoes; twelve of them weigh 5 lbs.—T. M. A. C., *Kemsdale, Faversham*.

NOTES ON ROSES—SEEDLING BRIARS.

WITH regard to the letter signed "AMATEUR, *Liverpool*," I beg to say that I did not include Baron Chaurand in the number of those Roses that had gone out of cultivation. If "AMATEUR" will refer to my letter he will see that those I spoke of are in quite a different paragraph. I know that most of our best rosarians sell this Rose, but I do not think one of them would recommend it as an exhibition variety. There is a great difference between a mere garden Rose and an exhibition Rose.

With regard to the seedling Briar, I am most happy to inform "MIDLAND COUNTIES" that he can procure any number from Mr. Prince, of Oxford, at the extraordinarily low price of 1s. 6d. per hundred. At least so Mr. Prince writes me word, though when I read his letter I could hardly believe my eyes. He adds also the gratifying news, "I have nearly half a million that I can spare." As the best news that I have received for a very long time, I am anxious to let other people besides myself benefit by the most liberal offer I have ever met with. As Briars even in this neighbourhood cost 8s. a hundred, seedling Briars at 1s. 6d. are indeed wonderfully cheap. If Prince has made a mistake it is his, not my fault, if your readers are misled.

With regard to Madame Lacharme, since my article appeared I have received a letter from Mr. Cant, of Colchester, in which he states that he entirely agrees with all I said as to the worthlessness of this variety, and no less rosarians than Mr. Baker of Heavitree, and Mr. Beachey of Torquay, and Mr. Robert Veitch of Exeter, have all commended my condemnation of this Rose. As a pot Rose I am told it may do, and certainly the only decent blooms I have seen this year were on a pot Rose: and as exhibitors in June and July cut their blooms, not from conservatories but from the open ground, I do not see that this is much of a recommendation.

And now allow me to say a few words about the comparatively new Tea Marie Van Houtte. This is a most beautiful Rose, a constant bloomer, and possessing a good constitution. Since Catherine Mermet we have had no Tea Rose which can take the first rank except this beautiful variety. I showed a treble of her at Crewkerne, and the young *débütante* created something like a furor. Numbers of people asked me for buds, and I feel sure that no nurserymen will have a difficulty in meeting the demand for her this autumn. I do not think it is possible to over-rate or over-praise these two varieties and Souvenir d'Elise. I wish I had a thousand of each of them, and I will soon. I put in every bud I can find; I wait till the bloom is expanded, and then put the buds which are under the bloom into shoots which are low down on the Briar.—JOHN B. M. CAMM.

WINTERING GLADIOLUS CORMS.

I HAVE a tolerably good collection of Gladioli, which, thanks to the instructions contained in the Rev. H. Dombrain's book on that flower, have done extra well this year. The great difficulty to contend with here, however, is the harvesting of the corms. It is all very well for Mr. Dombrain to leave his bulbs in the ground until the end of November, but here (Renfrew) the most severe frosts we have are sometimes at that period of the year. Do you think that it would facilitate the ripening without being detrimental to the bulbs if the stalks, immediately after blooming, were bent down about an inch above the ground, as is done with thick-necked Onions?—RENFREW.

[If "RENFREW" will again refer to my book he will find that I name towards the end of October, not November, as the best period for taking up the corms (page 27). We rarely have any frosts at that period, and even were there any it would not injure them. The plan proposed of bending the stems for the purpose of advancing the ripening, would not be desirable. I should much prefer doing what I have sometimes done with Ranunculus—take a hand-fork and gently lift the bulb, not taking it out altogether, but loosening the root-hold. I should think, however, if "RENFREW" watch the weather he will find in the third or fourth week of October opportunities for har-

vesting. Let him not mind their being green, they will harvest well notwithstanding.—D., *Deal*.

THE TURNIP FLEA.

Will you give some information in the Journal about the small black beetle—I believe it is a beetle—which often, and this year greatly, infests gardens in the neighbourhood of fields of brown Mustard? With me they are devouring Turnips and Cabbages, Stocks and Nasturtiums. I would send some specimens, but as they leap like the liveliest of fleas, the catching would take more time than I have to spare.—A. B. G.

[We sympathise with you whilst we laugh over your letter. No insect is more insidious or more sweeping in the destruction it brings upon some of the farmers' and gardeners' crops than the Turnip Flea (*Haltica nemorum*). Turnips of all kinds, Beetroot, Mangold Wurtzel, Radishes, and Flax are all liable to be destroyed by this insect; and it is only one instance of many of the weakness of man when opposed to the apparently insignificant natural agents with which God works, that, despite the indefatigably-applied skill and labour of the cultivator, this minute insect will often rob him of £100,000 worth of Turnips in a single county in one year. It is a singular misapplication of terms that this insect is known among cultivators of the soil as the Black Fly and the Turnip Fly, but none of them ever call it a beetle, which it really is; and the most descriptive name is the Turnip Flea beetle, for this describes not only its real nature, but its favourite food, and its extraordinary power of skipping or leaping like the common flea. This insect is represented in fig. 60. of its natural size and magnified. The body, one-eighth of an inch long, is rather flattened, and of a brassy-black colour, thickly dotted; the wing-cases are greenish black, with a pale yellow broad line on each; the base of the feelers (antennæ) and the legs are pale clay-coloured. The eggs are laid on the under side of the rough leaf of the Turnip from April to September; they hatch in two days. Their maggots live between the two skins or cuticles of the rough leaf, and arrive at maturity in sixteen days. The chrysalis is buried just beneath the surface of the earth, where it remains about a fortnight. The beetles are torpid through the winter, and revive in the spring, when they destroy the two first or seed leaves of the young Turnip. There are five or six broods in a season. These insects are most to be feared in fine seasons. Heavy rains, cold springs, and long droughts destroy them. Their scent is very perfect: the beetles fly against the wind, and are attracted from a distance. The rapid growth of the plant is the best security against them: to secure which, sow plenty of seed all of the same age. Burning the surface of the land is beneficial, by destroying the chrysalids. Deep digging is an excellent practice when the chrysalids are in the soil. Drilling is a far superior practice to sowing the seed broadcast. Destroy Charlock, it affords support to the beetles before the Turnips come up. The most effectual banishment of the Turnip Fleas, we think, is secured by sowing the surface of the soil with gas-lime two or three mornings after the Turnip seed has been sown. This is so offensive to the insect as to drive it away just at the time the young plants are appearing above ground.—Ems.]

Fig. 60.—Turnip Flea.

commend to all rosarians to try the plan, and not to be obliged to France or any other country when we can be better supplied at home.

Take out to the hedgerows your sécateur (a grand instrument for the prickly Briar), and whenever one of the right sort is met with lop-off its branches (farmers will not be displeased at this), take it home, and get it into the ground previously dug for the purpose. Then, in the course of two or three years, you will be delighted with your Briars—tall, clean, and handsome. Whenever one of the old stocks sends out a sucker I am not at all displeased. I either work it on the spot, or transplant it to the little nursery of cuttings. When I find a branch of a Rose I have been in search of containing, say, six good buds, I work three of these on the Briar and the other three on the Manetti, and if the Rose prove worthy, in future years propagate it on its favourite stock accordingly. Always insert the bud on the north side of the branch, where neither summer nor winter suns can shine upon it.

There is little fear of failure just now with good buds and excellent stocks, but the spring is a dangerous period. Just as the Rose bud is beginning to shoot forth, that abominable pest the weevil in one night has the bud eaten out and destroyed. I lost fully five-sixths of my buds last spring in this manner. Remembering that neither men, women, nor children relish castor oil, as a remedy late in the season I went over every bud and bedaubed it with that liquid. I thought of train oil, but was afraid of injuring the bud. If I can hear of no enre from your Rose friends, I shall, early next March, go over every bud with the castor oil, and thus prove whether it be efficacious or not. Any hint in the Journal from your enthusiastic growers will be highly esteemed.—DAVID DODDS, *Kelso*.

CONSTRUCTING GREENHOUSES.—No. 2.

A VERY useful structure is shown in fig. 61:—There are four shelves for plants, each about 10 inches wide, except the top one, which is 2 feet wide. Of course they become gradually shorter as they rise to the central or top one. The shelves, as well as the lower portion for Ferns, are made of strong deal laths instead of boards. Besides the water usually required by Ferns, they of necessity receive additional water when the plants above are watered; but for common Ferns this is rather a benefit than otherwise.

Fig. 61.

1. Four-inch hot-water pipes.
2. Glazed drain-pipe for blue round or under Fern-frame.
3. Fern-platform.
4. Flower-stand.
5. Strawberry-shelf.
6. Vines.
7. Glass rises from here.
8. Flagged path, 30 inches wide.

The conservatory is built on arches, and the Vine roots run both outside and inside.

The house is lofty, being 11 feet to the springing of the span roof, which, to the apex, again rises 4 feet 6 inches. It is placed with one end to the south-west, the other end opening by the glazed folding-doors into a library, and it has the sun on it from 9 A.M. for the rest of the day.

There are Vines trained on the roof which answer well, and afford a good shade for flowers and Ferns. In cold weather the house is heated both by hot-water pipes and by a 12-inch flue of glazed drain pipes.

It is 20 feet square, has a flagged walk round the plant-stand,

BRIAR STOCKS.

I OBSERVE your correspondents are again discussing Briar stocks for Roses, and extolling the seedling Briars so much that they recommend their friends to send to France for a cargo, since they cannot grow them in England. Why not try cuttings, as I recommended last November? Now and next month is the proper time. I put in forty yesterday, and will continue to add more all next month whenever I fall in with a favourite Briar.

I shape my cuttings exactly like those of Gooseberries, and make them as firm in the ground as possible. I take off everyone by the heel. I am confident these will grow, as I have for ten or twelve years proved the fact. I therefore strongly re-

and round the sides, at 2 feet high, a zinc trough 20 inches wide and 4 inches deep, to hold sand, in which plants for propagation and planting-out are placed; and at 7 feet from the ground a shelf 12 inches wide runs round for Strawberries or other plants.

A smaller house and gas-heated is this:—The length of the house (figs. 62 and 63) is 17 feet 6 inches, breadth 7 feet 6 inches, divided into three compartments by brickwork, the end one just large enough to hold a small open hot-water tank about 18 inches

of gas in twenty-four hours (value 3*d.*) the temperature under the platform and also that of the soil is 80° and 75° in the two divisions respectively, and the use of a larger burner raises these figures to 110° and 100°.

Bunsen's burner (fig. 61) is simply a contrivance by which the gas is mixed with an excess of air before it is burned, so as to insure perfect combustion. It gives only a pale blue flame, but intense heat. Were the heat applied directly by a flue or pipe instead of by hot water the economy would be far

Fig. 62.

square, from which a single set of 3-inch pipes runs round the whole length of the frame.

The tank is set on a little brick chamber containing the gas-burner attached by an india-rubber tube, and a zinc pipe serves to carry off the products of combustion.

The pipes are boarded over with rough 2-inch boards, on which there is from 9 inches to 1 foot of soil, so that the heat is almost entirely confined to the bottom. Each compartment

greater. For an amateur the convenience of turning on the gas in a winter's night and feeling safe till morning is valuable.

NOVELTIES IN THE ROYAL GARDENS, KEW.

On the Rockwork there is a nice patch of the charming *Nertera depressa*. It is thickly studded with berries like those of *Solanum Capsicastrum* reduced to the size of small peas. Though cultivated for the last five years, it seems only now to be receiving the favour it deserves. It is a native of bleak antarctic mountains, and, notwithstanding, grows rapidly and well in a forcing pit during the spring of the year, and may then be increased to any extent by means of the creeping rooting stems. In summer it does well in cold frames. It is known to some as *N. scapanioides*, which name was given by Lange in his seed catalogue of 1868. *N. depressa* is the oldest, and should therefore be upheld. It is found on the Andes from Cape Horn to New Grenada, on the island of Tristan d'Aunha, and in New Zealand and Tasmania. *Gaura Lindheimeri* is very pretty. It has a light appearance, grows about 2 feet high; the stems are slender, and terminate in racemes of white flowers. *Euphorbia amygdaloides variegata* appears to be of some value; it has several branches, forming a neat tuft of prettily-variegated foliage. *Pentstemon antirrhinoides* is very distinct from other cultivated species; its habit is shrubby, of stiff twigs with small glossy leaves, and it has yellow flowers.

Zygopetalum maxillare is in flower in the Orchid house; its chief beauty resides in the rich blue lip. The new *Cypripedium Roezli* is showing flower.

A variegated form of *Azara integrifolia*, which originated at Kew, is planted on the wall of the new range. It is of much beauty when growing freely, and appears likely to stand mild winters with wall protection. The leaves are orbicular or obovate, and the variegation is pale yellow disposed in a similar way to *Euonymus*. *A. integrifolia* is "native in groves at Concepcion in Chili."

Enothera serrulata is a new annual, flowering in the Herbaceous ground. It has wiry stems and lanceolate leaves. The flowers are yellow, and freely produced; they remain open for several days. It grows about a foot high, and appears worth cultivation. *Cleome heptaphylla* is very showy; it has viscid digitate leaves, and large purple flowers in terminal racemes. *Datura meteloides* is one of the best of the annual members of the genus. The flowers are large, and tinged with violet.

In the Temperate house are a few plants of *Solanum racemigerum*. It is, perhaps, a form of the Tomato, and is of considerable value cultivated in pots for conservatory decoration. In habit it is not coarse. It bears a quantity of fruit in racemes like Red Currants, but much larger. The treatment should be liberal, as the leaves are likely to turn yellow if the roots are much confined.

A plant of *Erythrina Crista-galli* is very ornamental in one of the octagons. It is of great value for greenhouse decoration at this season from its fine racemes of large scarlet flowers.

Fig. 64.—BUNSEN'S BURNER. HEIGHT 6 INCHES.

A, Gas-pipe, the jet issuing at E.
B, Holes to admit excess of air.
C, Apertures in the circular rim at which the gas is lighted.
F, Circular lid or plate, which is slid on one side when it is preferred to light the gas at the top.

When the plate F closes the aperture at the top the flame issues from the holes C in a crown, as beneath. When it is left open the flame rises in a straight jet of pale blue.

is provided, however, with two wooden tubes, 6 inches square, communicating between the space below the boards and the air above the soil, these being covered by wooden caps, by the

Fig. 65.

removal of which more or less heat may be allowed to rise up to the surface. With a small burner consuming about 80 feet

When going to rest the shoots should be cut back to near the base, and the plant must be kept dry for the winter. Young short shoots taken off with a heel in spring strike readily. Several Eucalypti are in flower or bud; *E. corymbosa*, *E. calophylla* in the former, and *E. globulus* and *E. cordata* in the latter condition.

ROYAL HORTICULTURAL SOCIETY.

SEPTEMBER 2ND.

THE Show was held on this occasion in the western conservatory arcade, and though in the floral department the number of exhibits was not large, the quality was generally very good. The Dahlias in particular were of extraordinary size; the Gladioli were not so good, owing to the earliness of the season; while the Hollyhocks, from a cause too well known to the growers of that noble autumn flower, were scarcely represented. Asters were well shown, and in the vegetable division there was a strong muster.

The first class in the schedule was for thirty-six Dahlias (open). Here Mr. Keynes, of Salisbury, was first with very large finely-built flowers of Earl Radnor, W. Keynes, Herbert Turner, Harriet Tetterell, Arbitrator, Lady Jane Ellis, Victory, John Standish, Flora Wyatt, Queen's Messenger, Mrs. Henshaw, Mrs. Harris, Thomas Goodwin, Picotee, Willie Eckford, George Goodhall, splendid colour; Pauline, Mrs. Eckford, and Flag of Truce. Mr. C. Turner was second, also with fine blooms; and Mr. Walker, of Thame, third.

In the nurserymen's class for twenty-four blooms Mr. Keynes was again first with, among others, fine examples of J. N. Keynes, Lord Derby, James Cocker, Arbitrator, Flag of Truce, John Standish, John Downie, Annie Neville, W. Keynes, yellow seedling, margined with purple; Mrs. Harris, Flora Wyatt, Queen's Messenger, and Herbert Purchase. Second came Mr. Turner, and third Mr. Walker.

In the amateurs' class for twelve Mr. H. Glascock, Rye Street, Bishop's Stortford, was first with a good stand; Mr. Miller, gardener to J. T. Friend, Esq., Northdown, Margate, being second; and Mr. T. Anstiss, Brill, Bucks, third.

For twelve Fancies Mr. Keynes took the lead with very fine examples of Majestic, Rose Flake (Keynes), Flora Wyatt, Mrs. Saunders, Fanny Sturt, Richard Dean, Letty Collis, Motley, and Laura Haslam. The second prize went to Mr. Turner, of Slough, and equal third prizes to Mr. J. Seale, Vine Nursery, Sevenoaks, and Mr. Walker of Thame. For six Mr. Glascock was first, Mr. Anstiss second; and Mr. Harris, gardener to G. A. Ashby, Esq., Naseby Wooleys, Rugby, third.

The Gladioli, though not making so large a display as we expected—owing, no doubt, to the forwardness of the bloom this year—was still a great feature. Messrs. Kelway, of Langport, exhibited an admirable stand of twenty-four, taking the first prize in the class for that number. Among these were Lady Birdport, Dr. Lynn, Racilia, Dai, Algidum, Mr. Tucker, Norma, Sparkler, Salamander, Salmoneus, Colonus, all with splendid spikes. Some others were taken away to be submitted to the Committee. Second came Mr. Douglas, whose stand chiefly consisted of seedlings. The spikes were not so large as Messrs. Kelway's, but some of the seedlings were extremely fine in colour, especially 117. Third came Mr. Seale, of Sevenoaks. For twelve the Rev. Lord Hawke, Willingham, Gainsborough, was first with Lulli, Lacépède, Horace Vernet, De Mirbel, Murillo, M. Legouvé, Madame Krelage, Madame Verlot, Horace, Sir John Franklin, and Eugène Scribe. Mr. Douglas was second, and the Rev. H. H. Dombrain, Westwell, third. For six the Rev. Lord Hawke was again first with fine spikes of Murillo, Lacépède, M. Legouvé, Lulli, Eugène Scribe, and Psyche. Second came the Rev. H. H. Dombrain with excellent spikes of Madame Desportes, Beatrix, Schiller, Sir John Franklin, and Meyerbeer. These ran closely on Lord Hawke's. Mr. Douglas was a capital third.

Of Hollyhocks very few were shown, and these were of no great merit. No doubt the disease has been the cause of this. Mr. Chater and Lord Hawke took first prizes in the nurserymen's and amateurs' classes respectively.

For twenty-four French Asters, Mr. Lakin, Chipping Norton, was first with a very good stand well varied in colour; Mr. W. Parrott, St. Winfred's, Reigate, being second; and Mr. Walker, Thame, third. For German Asters, Mr. Benham, Bagnor, Newbury, was first with beautifully quilled examples, Mr. Betteridge, Chipping Norton, being second, and Mr. Lakin third, all with very good blooms.

The only pot Asters shown came from Mr. R. Dean, Ealing, who had a first prize.

Double Zinnias of great excellence came from Mr. Lakin, the second and third prizes going to Mr. Chater, Safron Walden, and Mr. Betteridge respectively.

A group of Asters came from Messrs. Carter & Co., of Ifigh Holborn, and one of Croton majesticum from Mr. Bull, of Chelsea.

Of early dessert Apples there were eight dishes. The first

prize went to Mr. B. Porter, gardener to Mrs. Benham, Isleworth, who had a nice-looking dessert Apple named Duchess. Mr. T. Benham, Bagnor, Newbury, was second with highly-coloured Red Astrachan. Mr. H. Harris, gardener to G. A. Ashby, Esq., Naseby Wooleys, was third.

The Pears exhibited were mostly Williams's Bon Chrétien. Mr. Porter was first with that sort, and Mr. Moorman, gardener to the Misses Christy, Coombe Bank, Kingston-on-Thames, second. Mr. D. Lumsden, Bloxholm Hall, Sleaford, was third with Jargonelle. There was only one dish of Tomatoes exhibited, a very good one, from Mr. T. Miller, gardener to J. Friend, Esq., Northdown, Margate; to it the first prize was awarded.

Baskets of salads in variety were sent from Mr. W. G. Pragnell, gardener to G. D. W. Digby, Esq., Sherborne Castle, Dorset; and Mr. E. Clarke, gardener to Mrs. J. K. Hall, Sutton, Surrey. The former, who showed the best, had Rollinson's Telegraph Cucumber, excellent white Celery, and other small salads.

The best twelve Onions were sent by Mr. J. Betteridge, The Common Hill, Chipping Norton; Mr. A. Parsons, The Gardens, Danesbury Park, Welwyn, second; and Mr. Walker, nurseryman, Thame, third. Immense specimens of the Giant Rocca were sent by Mr. Pragnell.

For twelve dishes of vegetables, distinct, Mr. Pragnell was first with a fine dish of Model Potatoes, White Spanish Onions, Tomatoes, Williams's Matchless Celery, Carrots, Leeks, &c. Mr. G. Bloxham, gardener to Sir P. D. P. Duncombe, Bart., Great Brickhill Manor, Bletchley, had a splendid dish of Early Coldstream Potatoes and large Red Tomatoes, but his brace of Cucumbers were coarse. Mr. G. T. Miles, gardener to Lord Carington, Wycombe Abbey, Bucks, was third.

For twenty dishes of Potatoes, ten round and ten kidney, Mr. R. Dean, Ealing, was first with very fine, even-sized specimens. Model, Early Market, Rector of Woodstock, whites, and Red Emperor, were the best rounds; Lapstone, Mr. W. F. Radelyffe, Bountiful, and Fillbasket, the best kidneys. Mr. C. Ross, gardener to C. Eyre, Esq., Welford Park, Newbury, was second. He, however, only exhibited eighteen sorts, as the two dishes named Early Goodrich and Goodrich Kidney are both Early Goodrich, and Oxfordshire and Cambridgeshire Kidney were the same sort. For ten dishes, Mr. G. T. Miles, gardener to Lord Carington, Wycombe Abbey, was first with very large and fine specimens of Bresee's Peerless, Dalmahoy, Early Goodrich, Pioneer, Rivers' Ashleaf, Myatt's Prolific, Prince of Wales, Mona's Pride, Red Regent, and Early Emperor, respecting the last two of which some doubt was expressed whether they were not the same. Mr. D. Lumsden and Mr. F. B. Baker, Aylesbury, took the other awards.

FRUIT COMMITTEE.—Alfred Smee, Esq., F.R.S., in the chair. Messrs. Carter & Co. contributed a collection of forty sorts of herbs, which received a unanimous vote of thanks; also fifteen sorts of Kale. A brace of very fine-looking Cucumbers was sent by Mr. Bloxham, gardener to Sir P. Duncombe, Bart., which were passed as not of sufficient merit. From Mr. R. Dean, Ealing, came a couple of Marrows, called the Boston Squash, which were passed. Mr. Bennett, gardener to the Marquis of Salisbury, Hatfield, sent a fine dish of Keye's Early Prolific Tomato, which is a very useful early sort. A vote of thanks was awarded. He also sent a dish of Lord Palmerston Peach, which was passed. Mr. Cox, of Redleaf, brought two dishes of a fine-looking Potato, which were referred to Chiswick for trial.

From Mr. Melville, The Royal Vineyard, St. Laurence, Jersey, came a seedling white Grape, called Duke of Edinburgh, which could not be adjudicated upon in the bad condition in which it came before the Committee. Another seedling Grape of large size came from Mr. E. Clarke, The Grange, Sutton, Surrey, and proved of no merit.

Mr. Smith, of Worcester, sent a dish of highly-coloured Apples, which were passed as being handsome but devoid of flavour; also a large Plum, called Dr. Hogg, similar to Pond's Seedling, but it was not thought so good as that variety. Messrs. Bunyard & Sons, of Maidstone, sent a dish of Alexandra Nonpareil Apples, a very small Russet looking sort, but of no particular merit. Another dish of Apples was sent by Messrs. Johnson & Sons, of Boston, Lincolnshire, but the variety was not considered worthy of any award, being very deficient in flavour.

Mr. Dancer, of Little Sutton, Chiswick, sent three dishes of very fine Pears. From the Society's Gardens at Chiswick came Beurré de l'Assomption Pear, which was of fine flavour, and received a first-class certificate. Mr. James Groom, of Henham Gardens, Wangford, sent another specimen of his African Melon, for which he received a vote of thanks from the Committee. Two other Melons were sent, one by Mr. Button, gardener, Cornham Court, Chippingham; and another by Mr. Bayman, gardener to the Hon. F. L. Gower, Holmesbury, near Dorking, neither of which was of any merit.

FLORAL COMMITTEE.—Mr. J. Fraser in the chair. Messrs. Veitch had first-class certificates for Solanum quitoense, with

noble *Wigandia*-like leaves measuring some 16 inches by 11 inches, and having purplish midribs—a fine subject for sub-tropical gardening; and for *Begonia* Model, producing an abundance of large, very deep rose-coloured flowers. They sent in addition a nice collection of *Strobilium* and other Orchids. Mr. Shields, gardener to the Rev. J. B. Norman, exhibited *Odontoglossum maxillare*, white, yellow at the base of the lip, spotted at the base of the sepals and petals with brown. A first-class certificate was awarded. Botanical certificates were given to Mr. Bull, of Chelsea, for *Drosera Menziesii* and *D. glanduligera*, the latter a pretty little white-flowered species.

From Messrs. E. G. Henderson & Son, St. John's Wood, came the true Resurrection Plant, *Salpiglossis lepidophylla*, for which a first-class certificate was granted, and a like award was made to the same firm for an extremely pretty deep rose-coloured Oleander called New Red Nerium. With this were white and pale yellow varieties. Mr. Bull had likewise a first-class certificate for *Cleocladia guineensis*, a rosy purple Orchid of tolerably showy appearance.

Mr. A. Barr, 10, New Road, Lower Tooting, contributed a group of cut Lilies, chiefly of the speciosum and tigrinum varieties. From Messrs. Veitch came a group of Boltze's Dwarf Bouquet Asters, a first-rate strain. Mr. Keynes, of Salisbury, had first-class certificates for Dahlias Countess of Pembroke, large pale yellow, delicately tipped in the centre with lilac purple; and for John McPherson, rich crimson purple self. Messrs. Kelway, of Langport, had a first-class certificate for *Gladiolus* Duchess of Edinburgh, rosy lilac, lower divisions pure white with violet stripes; also for James Kelway, scarlet, lip white with a violet stripe, and a white line in each petal. Anticles is also a fine red with a purple tinge, maroon flake, and a violet stripe in the lower divisions.

DESTROYING WASPS.

In the answers to correspondents in your last, you inform us that "G. W. H." recommends boiling water to be poured into the nest; "but," you add, "the nest and its entrance must be peculiarly situated." Not so, I can assure you: I have now practised this method for upwards of forty years, sometimes destroying several nests the same season, and the only peculiarity of situation I have ever met with was one into which I could not pour water, being in a hollow tree, and the entrance quite at the bottom. Some boys, however, more clever than I, lighted a fire in the entrance, and destroyed both the nest and the tree.—OCTOGENARIUS.

[Your statement corroborates our observation, and boiling water is not readily obtainable when the nest is far from a house. We have published so many efficient and portable remedies that they meet all contingencies.—EDS.]

CALIFORNIAN FRUIT.

Any industrious person who has the right kind of Grapes can make raisins; and raisin-making, which in 1871 had still a very uncertain future in this State, may now safely be called one of the established and most promising industries here.

In 1872 I ate excellent raisins in Los Angeles, and tolerable ones in Visalia; but they sell very commonly in the shops what they call "dried Grapes," which are not raisins at all, but damp, sticky, disagreeable things, not good even in puddings. This year, however, I have seen in several places good native raisins; and the head of the largest fruit-importing house in San Francisco told me that one raisin-maker last fall sold the whole of his crop there at \$2 per box of 25 lbs., Malagas of the same quality bringing at the same time but \$2.37½. There is a market for all well-made raisins that can be produced in the State, he said, and they are preferred to the foreign product.

At Folsom, Mr. Bugby told me he had made last year 1700 boxes of raisins, and he was satisfied with the pecuniary return; and I judge from the testimony of different persons that at 7 cents per pound raisins will pay the farmer very well. The Malaga and the White Muscat are the Grapes which appear here to make the best raisins. Nobody has yet tried the Seedless Sultan, which, however, bears well here, and would make, I should think, an excellent cooking raisin.

For making raisins they wait until the Grape is fully ripe, and then carefully cut off the bunches, and lay them either on a hard clay floor, formed in the open air, or on brown paper laid between the Vine rows. They do not trim out poor Grapes from the bunches, because, as they assert, there are none; but I expect this will have to be done for the very finest raisins, such as would tempt a reluctant buyer. The bunches

require from eighteen to twenty-four days of exposure in the sun to be cured. During that time they are gently turned from time to time, and such as are earliest cured are at once removed to a raisin house.

This is fitted with shelves, on which the raisins are laid about a foot thick, and here they are allowed to sweat a little. If they sweat too much the sugar candies on the outside, and this deteriorates the quality of the raisin. It is an object to keep the bloom on the berries. They are kept in the raisin house, I was told, five or six weeks, when they are dry enough to box. It is as yet customary to put them in 25-lb. boxes, but, no doubt, as more experience is gained, farmers will contrive other parcels. Chinese do all the work in raisin-making, and are paid \$1 a-day, they supplying themselves with food. There is no rain during the raisin-making season, and, consequently, the whole outdoor work may be done securely as well as cheaply.

Enormous quantities of fruit are now put up in tin cans in this State; and you will be surprised, perhaps—as I was the other day—to hear of an orchard of Peaches and Apricot trees, which bears this year (1873) its first full crop, and for one hundred acres of which the owners have received \$10,000 cash, gold, selling the fruit on the trees without risk of ripening or trouble of picking.

Yet Peaches and Apricots are not the most profitable fruits in this State, for the Cherry—the most delicious Cherries in the world grow here—is worth even more; and I suspect that the few farmers who have orchards of Plums, and carefully dry the fruit, make as much money as the Cherry owners. There has sprung up a very lively demand for Californian dried Plums. They bring from 20 to 22 cents per pound at wholesale in San Francisco, and even as high as 30 cents for the best quality.

The Plum bears heavily and constantly north of Sacramento, and does not suffer from the Curculio, and the dried fruit is delicious and wholesome.

Some day the farmers, who are now experimenting with Figs, will, I do not doubt, produce also a marketable dried Fig in large quantities. At San Francisco in October, 1873, I found in the shops delicious dried Figs, but not in great quantities, nor so thoroughly dried as to bear shipment to a distance. The tree flourishes in almost all parts of the State. Usually it bears two, and often three crops a-year, and it grows into a noble and stately tree.

I am told that when Smyrna Figs sell for 20 to 30 cents per pound, Californian Figs bring but from 5 to 10 cents. The tree comes into full bearing, where its location is favourable, in its third or fourth year; and ought to yield then about 60 lbs. of dried Figs. I suspect the cost of labour will control the drying of Figs, for they must be picked by hand. If they fall to the ground they are easily bruised, and the bruised parts turn sour.

They are dried in the shade, and on straw, which lets the air get to every part. Irrigation is not good after the tree bears, as the Figs do not dry so readily. Birds and ants are fond of the fruit; and in one place I was told the birds took almost the whole of the first crop. There are many varieties of the Fig grown in this state, but the White Smyrna is, I believe, thought to be the best for market.—(Nordhoff's Northern California.)

GINGER (ZINGIBER OFFICINALE).

This popular aromatic, Ginger, is a native of the East Indies, and was described by Gerard in his "Herbal," in 1597. His notice of it deserves to be published without abridgement.

"Ginger is most impatient of the coldness of these our northerne regions, as my selfe have found by proofe, for that there have bene brought unto me at severall times sundry plants thereof, fresh, Greene, and full of juyce, as well from the West Indies, as from Barbary and other places; which have sprouted and budded forth Greene leaves in my garden in the heate of summer, but as soone as it hath bene but touched with the first sharp blast of winter, it hath presently perished both blade and root. The true forme or picture hath not before this time bene set forth by any that hath written; but the world hath bene deceived by a counterfeit figure, which the reuerend and learned herbarist Matthias Lobell did set forth in his observations. The forme whereof notwithstanding I have here expressed, with the true and vnderbitten picture also, which I received from Lobelius his owne hands at the impression hereof. The cause of whose former error, as also the meanes

whereby he got his knowledge of the true Ginger, may appeare by his owne words sent vnto me in Latine, which I haue here inserted. His words are these:

“How hard and vncertaine it is to describe in words the true proportion of plants (hauing no other guide than skilfull, but yet deceitfull formes of them, sent from friends or other meanes), they best do know who haue deepest waded in this sea of simples. About thirty yeares past or more, an honest and expert Apothecarie William Dries, to satisfie my desire, sent me from Antwerpe to London the picture of Ginger, which he held to be truly and liuely drawn: I my selfe gaue him credit easily, because I was not ignorant, that there had bin often Ginger roots brought greene, new, and full of juice, from the Indies to Antwerpe; and further, that the same had budded and growne in the said Dries garden. But not many yeares after, I perceiued that the picture which was sent me by my friend was a counterfeit, and before that time had been drawne and set forth by an old Dutch Herbarist. Therefore not suffering this error any further to spread abroad, (which I discoered not many yeares past at Flushing in Zeeland, in the garden of William of Nassau Prince of Orange, of famous memorie, through the means of a worthy person, if my memorie faile me not, called Vander Mill; at what time he opened, and loosed his first young buds and shoots about the end of sommer, resembling in leanes, and stalkes of a foot high, the young and tendershoots of the common Reed, called *Harundo vallatoria*), I thought it convenient to impart thus much vnto Master John Gerard, an expert Herbarist, and Master of happy successe in surgerie, to the end he might let posteritie know thus much, in the painefull and long laboured

trauels which now he hath in hand, to the great good and benefit of his countrey. The plant it selfe brought me to Middleborough, and set in my garden, perished through the hardnesse of the winter. Thus much haue I set downe, truly translated out of his owne words in Latine; though too fauourably by him done to the commendation of my meane skill.”

The spice was known, however, more than two centuries before Gerard's time, for in Rymer's "*Fœdera*" there is a notice of a Genoese ship being wrecked at Dunster, in Somersetshire, some time during 1380, freighted with Green Ginger—that is, Ginger preserved in lemon juice.

It was first successfully cultivated in this country by Mr. Miller in 1731.

It may be easily cultivated two ways, either in pots or in a deep pit. If in pots the plants should be procured in February, or even July if you have a stove to keep them in through the winter; take the plants, shake them out of the pots when at rest in February, divide them, and pot each piece into a pot 6 ins. across; plunge them, as soon as the heat is temperate, in a bark pit, or a frame heated with dung like a Cucumber bed, the surface being covered with tan deep enough for the pots. As soon as the plants come up give a small supply of water, gradually increasing the quantity as the plants advance in growth. By August they will be fit to take up and preserve.

If a large quantity is required a deep pit of two or three lights will be necessary, the bottom to be filled with rich soil to the depth of a foot; plant the roots in this soil and line the pit with hot dung, renewing it as the heat declines. The time for planting in the pit is February or March. Water whilst growing, give air in hot weather, and in September you will have a large supply of fine Ginger roots, equal to foreign.

Fig. 66.—GINGER (*ZINGIBER OFFICINALE*).

Mr. Fish grew it in a greenhouse as he described to us as follows:—"The roots, in winter, may be kept anywhere dry, where they will be free from frost. When started in spring, by the roots being divided into as many small pieces as they have buds, they must be excited into growth by heat; water freely given as the shoots lengthen and flourish; and the heat of a hotbed, or a plant stove, given until towards autumn; when, as the shoots begin to change from green, less and less water must be given until the shoots ripen; and shortly after, the roots will be fit for preserving, or for keeping dry over the winter, where no frost will reach them."

To preserve the roots as a confection, put some of the youngest and most tender races of ginger, which should also be free from knots, into a china bowl, cover them with water, and let them soak twelve days, stirring them two or three times a-day during that time, and then boiling them until tender. Let a syrup be made of a pound of sifted loaf sugar to every pint of water, to which some lemon-peel and cinnamon should be added. Boil this syrup, skim, and when it has boiled half an hour put in the ginger, and boil all together for another half an hour. Pour the ginger and syrup together into a china bowl or vessel, and let it stand closely covered until the next day, when it should be boiled another half hour, and the same be repeated daily until the syrup is clear, and remains attached to the spoon, when it may be put into a jar, and when cold be tied closely down. Some use equal parts of raisin wine and vinegar, instead of water, for soaking and boiling the ginger.

ROSE-GROWING AND ROSE-SHOWING.

Now that the season of removal is drawing near, many will, no doubt, be thinking about adding to or replenishing their collections of the queen of flowers. To such it is a matter worth considering whether they draw their supplies from a stock in the cultivation of which the chief object aimed at has been the production of large flowers—calculated to carry off at various Rose shows so many first prizes and "astonish the natives"—with the usual concomitant of coarse and unripened wood, brought about by the excessive stimulation attendant on the system of cultivation; or, on the other hand, whether they invest in good sound plants of healthy and moderate growth, and well-ripened wood, likely to produce a pleasing feature by their forms and flowers. Truly a collection of Roses in good health and in their floral array is a "thing of beauty and a joy for ever." It behoves Rose-growers to be on their guard, and studiously to avoid overgrown and overdone plants as may have been cultivated principally with the object of producing bloom for exhibition. Such never succeed so well, when removed, as plants of moderate growth. Their constitution has been undermined, probably, for them to make headway in a new, and in all probability, rougher sphere of life; for ninety-nine people out of a hundred have neither the inclination nor power to pet and pamper their favourites to such an extreme.

In the matter of varieties the same argument holds good. In an establishment where showing for competition is the ruling passion, what can be expected but that the varieties suited for exhibition purposes are grown in larger quantities than, and to the partial neglect of, such as will not reach that standard of supposed excellence? And it must be remembered that many of the best exhibition varieties are very unlikely to further the general objects in view in Rose-growing—namely, abundance and continuation of beautiful Roses. Such varieties, for example, as Etienne Levet, Louis Van Houtte, Marquise de Mortemart, Monsieur Noman, &c., although first-class exhibition varieties, would almost invariably give dissatisfaction to the general Rose lover, producing, it is true, beautiful blooms, but few in number and far between.

However, it is not my wish to depreciate Rose-showing, and industry and perseverance—qualities absolutely indispensable to the Rose exhibitor—must and always will have their due recognition and reward. But to suppose that a man who takes more first prizes than his colleagues must necessarily be able to surpass them in the quality and quantity of his plants is fallacious. What are the small quantities of Roses exhibited at even our largest shows? No one can judge from them concerning the resources of the exhibitors. One merely sees evidence of skill in the production of a few choice blooms. Were our Rose shows conducted on a different principle, large breadths and masses of flowers being substituted for the small collections we are now accustomed to see, the inferences drawn

from them would be different, although not entirely changed. This, however, brings me to the subject of "Rose-show reform," on which I have no desire to enter at present. My object is to warn purchasers that, for the general purposes of Rose-growing, visits to the Rose shows for selecting varieties mislead, because the specimens there seen have been grown by a costly and troublesome system to an unusual pitch of size, which the general cultivator, without special knowledge and a large expenditure of money, will in vain strive to emulate, and disappointment ensues. Let him see his varieties in bloom in their natural state, and in procuring plants let him be careful to avoid such as have been overgrown.—ARTHUR W. PAUL, *Paul's Nurseries, Waltham Cross, Herts.*

NOTES AND GLEANINGS.

DR. HOOKER, at the meeting of the British Association, made the following notice of the CARNIVOROUS POWERS OF THE VENUS'S FLY-TRAP (*Dionæa muscipula*):—"About 1769 a well-known English naturalist sent to Linnæus a drawing of a plant, to which he gave the poetical name of *Dionæa*. He said, 'The plant shows that Nature may have some views towards its nourishment in forming the upper joint of its leaf like a machine to catch food. Upon the middle of this lies the bait for the unhappy insect that becomes its prey. Many minute red glands that cover the surface, and which perhaps discharge sweet liquor, tempt the poor animal to taste them, and the instant these tender parts are irritated by the feet the two lobes rise up, grasp it fast, lock the rows of spines together, and squeeze it to death.' Linnæus only saw in these wonderful actions an extreme case of sensitiveness in the leaves, which caused them to fold up when irritated, just as the Sensitive Plant does, and he consequently regarded the capture of the disturbing insect as something merely accidental, and of no importance to the plant. He was, however, too sagacious to accept Ellis's sensational account of the *coup de grace* which the insect received from the three stiff hairs in the centre of each lobe of the leaf. For another generation the history of this wonderful plant stood still; but in 1868 an American botanist (Mr. Cranby), who is still happily engaged in botanical research, was staying in the *Dionæa* district, studying the habits of the plant pretty carefully, especially the points which Dr. Curtis had made out. His first idea was that the leaf had the power of dissolving animal matter, which was then allowed to flow along the somewhat trough-like petiole to the root, thus furnishing the plant with highly nitrogenous food. By feeding the leaves with small pieces of beef he found, however, that these were completely dissolved and absorbed, the leaf opening again with a dry surface, and ready for another meal, though with an appetite somewhat jaded. He found that cheese disagreed horribly with the leaves, turning them black, and finally killing them. Finally, he details the useless struggles of curculio to escape, as thoroughly establishing the fact that the fluid already mentioned is actually secreted, and is not the result of the decomposition of the substance which the leaf has seized."

—NOTWITHSTANDING the favourable report recently made by M. Dumas on the efficacy of some of the means employed for the destruction of THE PHYLOXERA of the vineyards of France, its ravages continue so alarming that the National Assembly has voted the sum of £12,000 as a prize for the inventor of an effectual destructive procedure.

—THE *New York Tribune* says that few of those who enjoy the flavour of THE PEACH are aware of the labour and excitement attending the work of bringing the fruit to the New York market. As it is necessary that the supply for the wholesale dealers should be on hand in time for the grocers and other retailers to purchase them with the usual market produce, a large portion of the night has to be employed; otherwise, when the fruit reaches the hands of the consignees it will be left on hand, at the risk of suffering great damage through the rot, and thereby becoming a total loss. The Peach trucks are fitted up with rails along the sides, and after one layer of baskets has been placed on the bottom of the waggon moveable boards form a second floor, upon which are deposited another layer; while a third row gives flooring for the upper tier. In this manner from 150 to 180 baskets are loaded on a long two-horse truck without damage to the fruit.

The cars for Peaches are usually chartered for the season, and are specially fitted-up for the business. Racks are made

and fitted so as to support moveable shelves, and the baskets are thus placed in four tiers. A grated door on either side admits the air, and keeps the fruit cool. A carload is generally consigned, as a whole, to one person, and on its arrival at Jersey City is taken possession of by the representative of the firm, who relieves the railroad company of any further responsibility. A few market cars, called "pot cheese," are made up by the railroad company to carry small lots, and the consignees in these cases always give receipts for the fruit on delivery, a clerk taking charge of the cars when they reach the destination. None of the railroad officials are required to unload the chartered cars, consequently the work has to be done by *employés* of the consignees, and the number of men required for the transportation of the fruit from the railroad to market is therefore very large. A train of twenty-four cars arrived; and as each carload averages 500 baskets, and the largest two-horse trucks would only carry from 150 to 180 baskets, and the one-horse trucks less than 100, the large number of waggons necessary for the removal of the 27,000 baskets and crates may be easily calculated. Each basket contains about 200 Peaches, making the arrival by one train of over 5,000,000 of Peaches.

— We are pleased to find that the ULVERSTON HORTICULTURAL SHOW, on the 25th ult., was very successful in every respect.

FLOWERS FOR OUR BORDERS.—No. 39.

GENTIANA BAVARICA.—BAVARIAN GENTIAN.

THE Gentians are impatient of stagnant moisture, especially in winter, and they suffer from full exposure to the mid-day sun during the hottest months of the year; it is probable that inattention to these points is the chief cause of failure in their cultivation, and of their consequent rarity in our gardens.

Fig. 67.—*Gentiana bavarica*.

With regard to soil they are by no means so particular as is commonly supposed. They will thrive in peat; in a mixture of peat and loam; and also in friable loam containing a little sand. Rich highly-manured soil is objectionable, and in wet adhesive loams they will live but a short time; but in either case it will only be necessary to supply a small quantity of the compost of peat and sandy loam, with drainage beneath it, in order to place the plants in the condition requisite to ensure success.

The plants should be screened from the sun during the

hottest part of the day, only the morning and evening rays being allowed to reach them, especially in dry arid soils; but the situation should be as light and airy as possible—they will neither bear to be smothered by other plants, nor endure the drip of trees. During long-continued rains in autumn and winter it will be a good plan to cover the clumps with a large pot, as they are more impatient of wet than cold; but they should not be kept covered longer than is necessary.—(W. Thompson's *English Flower Garden*, Revised by the Author.)

BEDDING PLANTS IN THE LONDON PARKS.

HYDE PARK.—No. 1.

THE public are now pretty generally aware that Mr. Gibson, the much-respected Superintendent of Hyde Park, has been suffering for some months from paralysis, which has prevented his continuing this summer that direct personal supervision of the bedding arrangements which was his wont. Fortunately his son, Mr. John Gibson, jun., well known as a skilful and rising landscape gardener, was at hand to give the active and efficient help in carrying on the work which the nature of his father's illness rendered necessary, and in this he was ably seconded by Mr. Cole and Mr. Chamberlain in their respective departments. The planting-out of 300,000 bedding plants is a heavy task of itself, not to speak of the forethought required to arrange them tastefully and effectively in manifold combinations, all of which, however, are the subjects of anxious consideration long beforehand; but excellently the bedding has been carried out, and grand is its effect, especially the long stretch of beds between the Marble Arch and Hyde Park Corner.

Starting from the former point we come to a series of circles all margined with Golden Chickweed and edged with *Alternanthera amœna*, the centre being filled up with *Geraniums*, many of which, however, are seen to better advantage further on, where the beds are less shaded by trees. The best here are Fire King (Lee), a fine magenta crimson Nosegay, which is also good everywhere else; Waltham Seedling (W. Paul), dark crimson, and Bonfire (W. Paul), crimson scarlet, forming a splendid mass of bloom. It has been largely used this year in the parks, and it has proved itself throughout brilliant in colour, profuse in blooming, one of the best of bedding zonals. Rose Bradwardine (Pearson), though better further on, is nevertheless notable for its beautiful shade of rose. Daybreak *Geranium*, white-edged, interspersed with Purple Queen Verbena, and *Atalanta* similarly mixed, form elegant circles; and two others of Beauty of Calderdale are also noteworthy.

We now reach Green Street Gate, from which point *Geraniums* and *Ageratums* mixed fringe the shrubbery border at the back. The beds in this series are oblongs and circles, the margin and edging of these on the right-hand side being respectively *Mesembryanthemum cordifolium variegatum* and, for the most part, *Lobelia Mazarine Gem*, a deep blue variety with a profusion of small flowers; while on the left the margin is *Gnaphalium lanatum*, with an edging of *Alternanthera magnifica*. Among the *Geraniums* filling the centres of the beds *Lacius* still holds its place as one of the best large-trussing rose scarlets; Mrs. Mellows, crimson, one of Mr. Pearson's raising, forms a very good bed; but Corsair, which we owe to the same source, is still more striking, the bed of this being the finest in the series. Madame D. Bertrand, cherry pink, is free-flowering and of dwarf habit; while Cleopatra, although here not so good as elsewhere in consequence of the trees, throws Christine entirely into the shade, being of a deeper colour, and the flowers while lacking the white eye of Christine, also seem to be more persistent. Mrs. Saunders deserves notice as one of the best of crimsons, and the Rev. J. Dix as a scarlet. The oval at the end of this series of beds is effectively filled with Mrs. Pollock *Geranium*, intermixed with Blue Stone *Lobelia*, a beautiful dark blue, with a very small white eye.

Proceeding on from Brook Street Gate we find a series of oblongs and circles margined with alternate plants of *Alyssum variegatum* and *Lobelia Mazarine Gem*, whilst the edging is *Alternanthera paronychioides major*. Fire King *Geranium* is here very fine, also beds of Golden Fleece, Queen of Queens, Sportsman Verbena, with *Centaurea candidissima* and *Coleus Verschaffelti* dotted with *Abutilon Thompsoni*. F. Bradley *Geranium* is noticeable as a fine crimson, but the bed presented far too much foliage in proportion to the amount of bloom. Briton is also good.

From Grosvenor Gate, which we now arrive at, extends a splendid series of beds in a single row next Park Lane, and in

FIG. 68.—CARPET BEDDING IN FRONT OF MR. CHAMBERLAIN'S LODGE.

a double row on the turf between the walk and the park. The oblong beds on the left have a margin of *Veronica incana*, within which is an edging of *Alternanthera magnifica*, with an inner row of *Sportsman Verbena*, rosy purple. We must not, however, before going further, omit noticing a magnificent scroll bed of *Bonfire Geranium*. Other very effective beds are *Coleus Verschaffelti* dotted with *Abutilon niveum aureum marmoratum*, more beautifully marbled than *Thompsoni*, and with a richer golden tinge; *Geranium Perilla* surrounded with *Golden Fleecy*; *Murillo*, small-flowered, but a fine bedder; and *Florence Duraud* (Pearson), lilac pink, a splendid bed. Having now reached Mount Street Gate it is necessary to turn backwards towards the Marble Arch to examine the beds on the park side, and which are all oblongs, with the exception of the heart-shaped beds at the ends, and four of a smaller shape surrounding the *Rhododendron* clump in the centre. The heart beds are margined with *Achillea umbellata*, a very neat little plant for the purpose, edged with *Alternanthera amena*, and filled with *Daybreak* silver-edged *Geranium*. The oblongs, which are in match pairs, present a margin of *Echeveria secunda glauca*, with an edging of *Mesembryanthemum cordifolium variegatum*, and an inner row of *Iresine Lindeni*, which has an excellent effect. The interior of the blocks is variously filled with *Geraniums* with white, pink, and scarlet flowers, or variegated foliage, and the whole arrangement harmonises well, and is brilliant without being glaring. The silver-edged and golden *Geraniums* give a soft tone which is very pleasing. Beds of *Geraniums* *Bonfire*, *Fire King*, and *William Thompson* are remarkable for the splendid mass of bloom which they offer to the eye. The last is a very fine rosy crimson with a magenta tinge. *Pink Nosegay* is worthless here; and *Jean Sisley*, beautiful as it is in form and colour, drops its petals so fast that another year it will not be used. *Vesuvius* is still good, but will have to give way before newer kinds for bedding display; still it can scarcely be surpassed for continuity of flowering. *La Vestale*, white, appears to be more free-blooming than *Madame Vaucher*; and we must not forget *Pioneer*, which is a splendid purplish magenta crimson, which must become popular, and it is stated to be a free bloomer in winter as well as in summer, and that it is the latter there can be no doubt. The heart beds in the centre are filled with *Daybreak Geranium* mixed with *Lobelia Charming*, and that at the end with *Little Golden Christine Geranium*.

From Mount Street to South Street Gate the beds next Park Lane have a margin of *Santolina incana*, and an edging of *Lantana Sellowii*. The best of the beds are those of *Geraniums* *Lucius*; *Cybiaster*, too tall, but in fine bloom; *Perilla*; *Gaines' Dwarf Calceolaria*, which would have been very good had not many of the plants been stolen; and *Coleus refulgens* dotted with *Abutilon*. Turning backwards, the large oblongs as far as the Elm tree are all margined with *Echeveria secunda glauca*, and edged with *Lobelia Blue King* and *Dactylis glomerata* variegata alternately. The *Lobelia* gives colour, the *Grass* elegance, and the combination of the two is peculiarly pleasing. There is, besides, an inner row of *Alternanthera amabilis latifolia*, which, though strong-growing, is not sufficiently so for the edging. *Waltham Seedling Geranium*, two beds of *Lady Plymouth Geranium* surrounded with *Purple Queen Verbena*, and *Coleus Verschaffelti* dotted with *Abutilon* and surrounded with *Centaurea*, are the chief of this series. The circles round the Oak trees are filled with variegated and bronze-leaved *Geraniums*. From the Elm tree to Mount Street Gate there are eight oblongs in pairs, with two heart-shaped beds at the ends, the margin in all cases being *Mesembryanthemum in-claudens*, and the edging *Alternanthera magnifica*, with an inner row of *Robert Fish* golden-leaved *Geranium*. The centres of the oblongs are filled with *Coleus Verschaffelti Improved*, dotted with *Abutilon*; *Cleopatra* and *White Clipper Geraniums*, &c.

From South Street to Stanhope Gate, on the right the circles round the trees are filled with *Alternanthera amabilis latifolia* surrounded with *Blue King Lobelia*; while the oblongs are margined with *Echeveria secunda glauca*, and have an edging of *Blue King Lobelia* and *Dactylis glomerata* planted alternately, with an inner row of *Alternanthera*. The beds on the left-hand side of the walk next Park Lane are surrounded with *Golden Feather Pyrethrum*, within which is a row of *Iresine Lindeni*. In the central portions of the beds are *Geraniums* *Lord Palmerston* and bronze *Mrs. John Lee*, very effective; *Glow*, fine; *Queen of Queens* mixed with *Viola cornuta*; *Wellington*, fine dark crimson; *Lucius*; *Warrior*, good bright

scarlet, but of very strong growth; *Bonfire*; *Amaranth* (Pearson), beautiful purplish rose, magnificent; *Mrs. Pollock* mixed with *Viola Perfection*, *Duchess of Sutherland* (this is the bed that was pillaged some time ago), and *Stella variegata* mixed with *Lobelia Blue King*, forming a beautiful combination. In other beds are *Coleus Verschaffelti* and *Abutilon* mixed, *Calceolarias*, *Heliotrope Jean d'Amour*, and bronze *Geraniums*.

Instead of turning along Rotten Row, where the bedding is of the subtropical character, we will now cross the park to Mr. Chamberlain's lodge, where there is one of the grandest examples of carpet bedding we have ever seen carried out. Upwards of ten thousand plants are employed; they are as a whole exquisitely arranged, and the effect is superb. The accompanying engraving (fig. 68), represents the disposition of the beds, of which the planting is as follows:—

Bed 1.—*a*, *Scarlet Geranium Shakespeare*; *b*, *Golden and brown-leaved Geranium Luna*; *c*, *Alternanthera amena*, dark crimson; *d*, *Lobelia Erinus speciosa*, dark blue with white eye; *e*, *Stellaria graminea aurea*, yellow leaves; *f*, *Echeveria secunda glauca*.

Bed 2.—*a*, *Pink Geranium Rose Bradwardine*, mixed with *Viola Perfection*, bluish purple; *b*, *Silver-edged Geranium Daybreak*; *c*, *d*, *e*, and *f* as in 1.

Bed 3.—*a*, *Silver-edged Geranium Queen of Queens*, mixed with *Viola Perfection*; *b*, *Golden-leaved Geranium Golden Fleecy*; *c*, *d*, *e*, and *f* as in 1.

Bed 4.—*a*, *Coleus Verschaffelti splendens*, brighter crimson than *C. Verschaffelti*; *b*, *Centaurea ragusina*; *c*, *d*, *e*, and *f* like 1.

Bed 5.—Same as 3.

Bed 6.—*a*, *Pink Geranium Master Christine*, mixed with *Viola Perfection*; *b*, *c*, *d*, *e*, and *f* like 2.

Bed 7.—*a*, *Golden Tricolor Geranium Jetty Lacy*, mixed with *Lobelia White Perfection*; *b*, *Alternanthera versicolor*; *c*, *Lobelia pumila grandiflora*, light blue; *d*, *Lysimachia Nummularia*, golden-leaved; *e*, *Echeveria secunda glauca*.

Beds 8 and 9.—*a*, *Silver Tricolor Geranium Lass o'Gowrie*, mixed with *Lobelia pumila flore-pleno*; *b*, *c*, *d*, and *e* like 7.

Bed 10.—*a*, *Golden Tricolor Geranium Sophia Dmuresque*, mixed with *Lobelia White Perfection*; *b*, *c*, *d*, and *e* like 7.

Bed 11.—*a*, A single plant of *Centaurea ragusina* on a bottom of *Kleinia repens*; *b* and *h*, *Lobelia Lustrous*, dark blue with white eye; *c*, *Leucophyton Brownii*, silvery-foliaged; *d* and *f*, *Alternanthera amena*; *e* and *i*, *Pyrethrum Golden Feather*; *g*, *Cineraria maritima compacta*; *j*, *Cotyledon bracteatum*, silvery-leaved succulent plant; *k* and *n*, *Alternanthera paronychioides* major, with salmon-coloured leaves; *l*, *Mesembryanthemum cordifolium variegatum*; *m*, *Santolina incana*, silvery-foliaged; *o*, *Echeveria secunda glauca*; *p*, *Mixed foliage plants*, amongst them three *Dracena australis*.

The single ornamental plants are *g*, *Dracena australis*; the others, denoted by the circles, are young *Palms* of various species.

N.B.—The engraver has omitted the references to the rings in beds 2, 3, 7, and 9, but they follow in the same order as in the other central beds.

MAIDENHAIR FERN WITH FLOWERS.—“A SUBSCRIBER” seeing it mentioned in page 190 of the Journal that Maidenhair Fern does not live well in water with flowers, thinks it may not be generally known if, directly the fronds are cut, they are submerged for an hour in water they last a long time. “A SUBSCRIBER” has made them in this way live for four nights on a dinner-table when the flowers arranged with them have had to be renewed.

NOTES ON VILLA AND SUBURBAN GARDENING.

THE CONSERVATORY AND GREENHOUSE.—The fact that there are thousands of little structures of this kind attached to the gardens of town residences in almost all parts of the country and perhaps as many others springing-up, shows how deeply rooted is the love for gardening in the minds of the well-to-do class of the community. To many their greenhouse is the only source of pleasure, and the work attached to the growing of plants for its decoration is a chosen means of recreation to most of those who are closely confined to business during the day. With a view, therefore, of giving a little assistance where it is needed, I will devote this paper to a few remarks on the cultivation of many of the most suitable plants for the decoration of the greenhouse and conservatory during the approaching winter months.

The successful flowering of most plants in winter depends upon the preparation they receive, and I shall presume that in

most cases this has been begun. I allude to such plants as *Cinerarias*, *Primulas*, and *Mignonette*, the seed of which should have been sown in June and July, and the plants well a-head. The first-named will thrive when potted in two-thirds light fibrous loam and one-third leaf mould and silver sand, and if it is to be obtained, a double-handful of finely-sifted cow manure well rotted may be supplied in addition, but this must not be used with the soil for plants in a very young state, but only for those which are strong and healthy. For the present these plants may stand out of doors in a shady corner and be carefully watered—that is, no plant must be watered without first proving that it is in want of moisture, either by tapping the pot with the finger or by weighing it in the hand. In potting a few dozens of plants it will be observed that some are already wet enough and others not sufficiently so; now these ought to be watered before potting, because the operation, performed as skilfully as it may be, is a check upon the plant for a time, and if it is watered before potting, water should not be applied immediately afterwards, but the test-rule as above described should be adopted. This applies to nearly all softwooded plants, and therefore in the present paper need not be again mentioned.

The *Cineraria* has its enemies; the chief of these is green fly, which may be destroyed by removing the plants affected to a frame and fumigating with tobacco smoke. The *Primula* does well in a very similar soil to that needful for the *Cineraria*, except that there should be the addition of one-fourth peat. These plants will require the protection of a cool frame for their growth, and should not be shaded if strong and healthy, but if weak only slightly so. As to *Mignonette*, it is generally sown in pots where it is to flower, and when up the plants are thinned-out to from five to ten in a pot, and afterwards top-dressed with decayed manure, and the pots plunged in ashes or tan out of doors where no violent winds can reach them. No other protection need be given just now. As the plants grow it will be seen that their inclination is to ramble over the sides of the pot, which entirely spoils them for in-door or window decoration. This may be prevented by placing four small sticks round the inside of the pot, and connecting them by a piece of matting, which keeps the plants in their places. All side shoots should be pinched off, allowing only one—the largest shoot, to remain, which will in turn form a grand spike of bloom. If it should be necessary to remove them to a frame, they must be placed near the glass and have a free circulation of air at all times.

The next most useful plant is the herbaceous *Calceolaria*, and although it is a spring-flowering plant, yet it is indispensable for the conservatory, and at present I will only refer to it, as it is time the seed were sown, and the mode of doing this I will refer to in detail. First select a shady corner, and place a hand-light there on a few inches of coal ashes, also place inside 3 or 4 inches thick of ashes mixed with lime in order to kill any small slugs. Now procure a pot or a pan of small size, drain it well, at least one-third full; cover this with moss, or, what is better, rough pieces of turf, and fill to within an inch of the rim with finely-sifted sandy soil, composed of loam and leaf mould well rotted; press this down firmly and evenly, water the whole so as to soak through the soil, then sow the seeds evenly over the surface; as they are so very small this must be done with great care. Over them give a very slight sprinkling of silver sand, and again press the soil with some smooth surface, which fastens them in the soil, and place a pane of glass over the pot. Now take a pan which holds water and fill it half full, place it in the hand-light, turn a small pot bottom upwards on it, stand the seed-pan upon this, and put on the top of the light, keeping it close till the seedlings are up. They should not require water in this position until germination has taken place. When the little plants appear place a stone under the glass over the pot to give them air, and the same with the top of the light; as they get larger remove the glass on the pot altogether, and admit more air into the hand-light. Prick the plants off into pans or pots when large enough to handle comfortably, using the same sort of soil as for the seeds. Having now started the cultivator on the method of growing these lovely flowers, I will leave the subject, with the intention of again referring to it in subsequent papers.

The double as well as the Nosegay section of *Pelargoniums* are excellent autumn-blooming plants in the greenhouse. They ought to be potted-on from June in a good substantial loam and manure with a little sand added, and may be grown out of doors up to the middle or end of September. The ordinary treatment will prove successful. They must have all attention to watering and potting when they require it, receiving their last shift at the beginning of this month. All bloom buds to be kept picked off, and the plant framed-out by staking, and the shoots stopped when they need it to make them dwarf. The double sorts will not need stopping more than once, or if excessively vigorous not more than twice during the summer; but the others, which are faster-growing sorts, may need it once or twice more, the last stopping not later than the middle of

August. When the weather becomes cold they may be placed in a frame for a fortnight, and then removed to the greenhouse or conservatory, where they may be allowed to flower, and if the house is free from damp and moderately warm they will last in bloom a long time.

The *Fuchsia*, too, is an excellent autumn and early winter-blooming plant when grown in young and small plants. Strike them in April, and pot them on as for *Pelargoniums*, but they must be grown in the greenhouse or a frame; the latter structure is the better for the summer growth. The pyramid form is the best to show off these plants to advantage; therefore, as soon as they begin to grow after the first potting they must be staked, and as they advance in growth the shoots must be regularly stopped at every two or three joints by taking-out the point of the shoot; the centre one as well, but not so severely as to prevent the plant forming a leader. The plants thrive in a soil of two parts loam, one part well-rotted manure, and one of leaf mould. Give them their final shift in August, and transfer them to the greenhouse. During their season of growth they ought to be frequently sprinkled or syringed overhead with water; this, with an intermediate temperature in almost any structure, will grow them well. All bloom buds must be picked off as soon as they are discovered, but they must not be stopped after the first week in September. During their growth turn the plants round at different times to prevent them becoming one-sided. They will bloom well until November. After this is over stand the plants away where they have the light, but protected from frost for a time, and in the winter they may be put into a shed, but where it is dry and airy. If they are taken care of, the plants will lay the foundation for some good specimens for summer flowering the next year. The above is a system only for autumn and winter blooming, as I have concluded that the greenhouse would not be at liberty to grow these plants till after the bulk of the bedding subjects are out of the way and spring-flowering plants done with.

The next plant to notice is the *Chrysanthemum*, which is purely autumn and winter-blooming; some of the Japanese varieties continuing to flower up to Christmas. The cuttings should be put in not later than March, and for a time grown-on as described for the *Fuchsia*—that is, in a cool frame until June comes in, when they may be hardened-off gradually, so as to be able to complete the rest of their growth outdoors. The same mixture of soil as for *Fuchsias* will suit the *Chrysanthemum*. For ordinary decoration they must be shifted frequently before they become pot-bound; this should not be allowed at any stage of their growth, as it hardens the wood and causes the leaves to fall off the bottom of the plant, which then looks badly. Stop the shoots at every two or three joints; determine the size of pot you intend to flower them in, and after a dwarf well-formed plant is secured put them into their pots, fill-up with soil, and peg the shoots down; and as they grow stop them again until about the middle of July, which must be the last time. As the shoots become long commence staking and tying, but always allow the shoots full liberty to grow. Plunge the pots after the last shift into old leaves, tan, or any other rubbish that will keep the pots moist and the sun from scorching the roots, which it will do if allowed to play upon the pots uninterruptedly. When established in the flowering-pots liquid manure must be given them twice a-week, about a pint to a gallon of water, and in the evenings of hot days sprinkle the foliage with water. This will greatly assist to keep a healthy foliage on the plants down to the edge of the pot. After they have set their flower buds they should be taken under cover and treated in an exactly similar manner, affording plenty of light and air, and thinning-out the smallest buds if too numerous; if every attention be paid to them I feel sure the plants will reward the grower with an abundance of finely-shaped flowers. I ought to mention that the Pompon varieties will not need so much stopping as the large-flowered sorts, being naturally of weaker growth and dwarfer in habit. As the system above described will grow the plants into large specimens, I would advise that only a few plants of each sort should be kept, and if these be managed well there will be much more pleasure derived from them than if many were grown and none of them well. In places with limited space the above rule will apply to everything grown for their decoration.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

Strawberries and *Raspberries* have required attention. Before planting-out the *Strawberry* plants, which had been layered in small pots, the leaves were washed in water in which soft soap and tobacco were dissolved; about 2 ozs. of soap and the same quantity of good tobacco will be sufficient for a gallon of water. If no red spider is to be found on the leaves, it is as well to dip them in this mixture as a precaution. On light soil especially this minute parasite is the desperate enemy of the *Strawberry*, and in all cases when dealing with the insect precautionary measures are infinitely better than any attempt to destroy the

pest after it has gained a foothold. The continued dry weather has been very favourable to its further development, and a few have been perceived on the young plants. Syringing them with soot water is beneficial to the plants and destructive to red spider. Hoed between the rows to destroy weeds. Stirring the surface is also beneficial to the plants in the earlier stages of their growth, causing them to grow freely; afterwards when they are well established, have grown to a considerable size, and the ground is consequently full of roots, these would be injured by hoeing or digging amongst them, so that it is better not to interfere with the surface, and any weeds that may have escaped the earlier operations of the Dutch hoe can be pulled out by hand. There seems to be considerable difference of opinion as to the best sorts to grow. The varieties raised by Dr. Roden—Early Prolific and Duke of Edinburgh, have been grown here; they had every justice done to them, but failing to give satisfaction were discarded. Black Prince is unquestionably the best early variety, and it is excellent for forcing. Next to it comes Keens' Seedling—this variety has often been condemned because those who disparaged it had not the true sort. Then President, Sir J. Paxton, British Queen, or, where the last-named fails, Mr. Radclyffe; Dr. Hogg, Cockscorn, which is very large, but bears a good crop of fine-flavoured fruit; La Constante; and for late use there is no better sort than Frogmore Late Pine. Let good healthy runners of the above sorts true to name be planted, and the result will be satisfactory. A new bed is planted every year and the old plants destroyed.

Hoeing the quarters of *Raspberries*, and tying up the young canes loosely in a position where the sun and air can act upon them. Raspberry plants do not require so much sunlight or air as most other fruit trees and bushes. In a wild state this fruit is found in damp ground and under the shade of trees; and perhaps the best-cultivated specimens we ever saw were of the Fastolf variety, which continued to bear enormously for successive seasons; the canes were planted in moist, rich, unctuous loam under a north wall, and not only had they the shade of a 12 or 14-foot wall, but Apple trees to a certain extent shaded them from the afternoon sun. As it is getting towards the season for planting, those interested should make a note of this, and plant in a shady part of the garden, trench deeply, and manure richly. Excellent varieties to plant are Fastolf, Carter's Prolific Yellow, and Red Antwerp.

FRUIT AND FORCING HOUSES.

Vineries.—It is better that the fruit be ripe before the month of August is over. Ours will not be so this year. Little or no artificial heat was applied after the Grapes were thinned, and as we ventilated freely, thinking to keep the red spider out of the houses, this accounts for the late ripening. The Muscat house is kept at 70°, and the Black Hamburg and Lady Downe's at 65° by night, with a proportionate rise in the day; the weather is also extremely favourable for the ripening of all sorts of fruit. Lateral growths had made much progress, and have been cut quite back where the houses were sufficiently shaded with leaves. Looked over the bunches, and cut out any shanked or small stoneless berries. Many persons find Royal Vineyard a bad setting variety; treated as we have previously recommended when the Vines are in flower, almost every berry sets. We never had it better than it is this year. The bunches are very large and the berries of fair size; if the house is kept dry the berries will also keep well.

Mushroom House.—Preparations should now be made to get a bed ready. Horse droppings should be gathered every morning until a sufficient quantity is obtained. Some persons are careful to remove nearly all the straw from the dung, but this is not desirable; a little straw with it is an improvement. The manure should be thrown up in a heap, and turned over once a day until the rank steam has been evolved, when it is ready to be made up into the beds. Recent experience would lead us to recommend that a third part of the manure for the bed be fresh cow dung. Tread the material in firmly, and allow it to remain until the heat has sufficiently subsided to allow of the bed being spawned. No bed ought to be without a thermometer to test the bottom heat; those with large experience may thrust a stick into the bed and be able to test it by hand, but this is at best very uncertain, as the hand is in itself much warmer at one time than it is at another. It is also as well to note that there is more danger to the spawn by over than by under heating. The spawn will not be injured if the temperature of the bed is not over 85°, and when the thermometer falls to this point the spawn may be inserted, and the surface of the bed covered to the depth of 2 inches with loam. Let the temperature of the house range as steadily as possible at from 55° to 60°. There ought also to be a moist atmosphere; in a parching atmosphere there will be neither quantity nor quality.

STOVE AND ORCHID HOUSES.

Climbers on the roof of the stove trained to trelliswork may be allowed to grow freely in summer and to shade the roof. Now we cut out all unnecessary wood, so that what is allowed to remain may ripen well from exposure, and most plants underneath are benefited by getting more light and air to fit them to stand

more sturdily the short dull days which are now rapidly approaching.

We have brought to a close all potting, with a few exceptions, and these only small plants which will be carefully potted, so that they may make all the growth possible during winter. There is, however, a certain risk in pushing plants forward during the winter months; growths formed at that time are seldom satisfactory, and it ought only to be done with small plants, and that in exceptional cases. Potted *Goodyera* and *Anacochilus*. These plants are unsurpassed for the beautiful markings on the neat, glossy, velvet-like leaves, and under proper management they are very easily grown. Anyone possessing an ordinary plant stove may grow them. Ours are grown in hand-lights under the Cucumbers, the broad leaves of which afford a little shade, but not enough in very hot sunshine; it is then necessary to throw some light shade over the plants, in addition to that afforded by the leaves overhead. The pots used must not be large, as the plants do not make much root. Begin by having in readiness a quantity of clean crocks of two sorts, a large size for the bottom, filling up the pot to three parts of its depth with finer drainage free from dust; over this place a little clean sphagnum, then the compost, which consists of equal parts of turfy peat, clean potsherds, and sphagnum chopped-up fine; in this place the plants. *Goodyera* should merely be pegged-down to the surface of the pot; the other species may be planted, but very shallow. Some moss encouraged to grow on the surface of the pot has a neat appearance, and if it is kept healthy by frequent dewings with the syringe the plants will do well. *Goodyera Dawsoniana* should be grown not only for its beautiful foliage, but it also flowers freely in winter; the flowers are borne on spikes, and are waxy white. *G. Ordiana* is very similar in habit, but the ground colour of the leaves is light green instead of reddish brown, as in *Dawsoniana*.

FLOWER GARDEN.

Tying and sticking the *Gladiolus*; removing all spikes from which the flowers have faded. Looking over beds of Zonal *Pelargoniums*, and picking withered trusses from the plants. *Centaureas* were put in a cold frame, and have been shaded from the sun. With very little air admitted they root freely.—J. DOUGLAS.

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

PROPAGATING AUBRIETIAS (Spring Garden).—No advantage will be gained by taking slips of *Aubrietias* now, as they will not have time to establish themselves sufficiently for autumn planting. If old plants are plentiful let them alone, and at planting time use good-sized root-divisions, not mere slips, and cover the ground at once when planting. Small slips put-in in quantity now, and remaining over next summer, will give an abundance for planting in the autumn of 1875 of nice, tufty, well-conditioned plants. For raising plants by the thousand there is no better plan than sowing seed in heat early in spring, the seedlings to be hardened-off and pricked-out, or sowing in the open ground in May and transplanting in nursery beds, there to remain until large enough for final planting.

PLANTING OUT STOCKS (Idem).—For a rich and massive bed of *Stocks*, stout and sturdy plants, made so by having been planted thinly in nursery beds in an open place, should be planted, as soon as the beds are cleared, just closely enough that the foliage of one plant touches that of its neighbour, but without any serious jostling or crowding. Whether the plants are large or small the rule equally applies. If there are surplus plants, they had better be lifted at the same time and planted in a more sheltered and especially in a drier place than where the bed may happen to be situated—that is, assuming there are not pits to winter a portion in pots plunged in ashes. A portion in the flowering beds may die off from inclement weather, especially if frost and melting snow alternate, and a reserve to draw from makes all right again. If there are no failures the close planting allows the singles to be drawn out as soon as they can be detected, leaving sufficient doubles to form a full bed. If towards autumn the plants grow very luxuriantly, it is advisable to give them a check by half lifting each with a spade three weeks before the time of final removal. The severing the main roots will check luxuriance and cause the emission of feeders ready to take hold of the soil at once in their permanent quarters. If the plants are only of moderate growth this semi-preparatory lifting is not necessary.

DIVIDING POLYANTHUS ROOTS (E. L.).—They and those of *Primroses* may be divided now.

FORCING LILY OF THE VALLEY (A Subscriber).—Take up the roots carefully, those with plump round crowns, and place them in pans or boxes, filling in the interstices with rich turfy loam made fine. Place them on a bed of leaves or dung with a bottom heat of 65°, let them remain there a fortnight

or three weeks, then put on the lights of the frame, keep covered with mats until the dower-stems are an inch above the soil with their lower flower-buds, then expose them fully to light, and the leaves will soon become green and the flowers expand. The temperature of the frame should range from 55° to 65°. After the turn of the year bottom heat is not essential. We place our roots on the wooden stage that rests with the laths on the pipes, so that the plants in the pans and boxes receive some warmth. The temperature is 55° to 60°, 70° or more by day with sun heat and plenty of air. When the plants open the plants are placed in a house with a temperature of 45° to 50°. We force about a dozen pans or boxes of this lovely flower fortnightly from November to April.

ANTHRINUMS (R. H. P.).—It is not unusual for them or any other cross-bred plant to produce flowers varying in colours according to those of their parents.

THE COCOA NUT (A Store Planter).—We advise you to cultivate only the dwarf Palms. *Cocos nucifera*, the Cocoa Nut Palm, attains to the height of 50 feet, and we have seen it higher in Bengal. The following extract answers more than your other queries:—"The three holes in the shell of a Cocoa Nut, which give it such a conical resemblance to a monkey's head, are for the purpose of allowing the young tree to issue from the shell when the nut is planted. The shell with which the core or nuts are covered is extremely hard. When steeped in water it may be beaten out into a substance resembling flax, from which a coarse material may be woven. Cocoa Nut nutting and similar articles are also manufactured from these shells. Inside the hard shell is a layer of white substance, which is both eaten and also much employed in the manufacture of cheap confectionery. When this substance is exposed to the action of a powerful press an oil is obtained, which may be employed in lamps, and burns with a bright clear flame, without producing any smoke or disagreeable smell. A quantity of milk-like fluid is also contained in the interior of the nut, and which, when the nut is young, is much esteemed, but as the fruit grows older the milk becomes more acid and more cooling. A sweet oil may also be obtained from the milk by boiling it at a gentle heat. The milk obtained from the cocoa nut may also be employed instead of ordinary milk for rice puddings, custards, and similar preparations. The nut itself is also used for puddings, cheesecakes, puffs, &c."—(*Cassell's Household Guide*.)

LILIUM AURATUM.—"H. G. S." wishes to be informed the largest number of *Lilium auratum* flowers grown on one stem.

CARNATIONS NOT FLOWERING.—**PLANTING CLEMATIS JACKMANI.**—**WINTERING LATE-SOWN CARNATIONS (Dublin).**—The strong plants of Carnations struck early last year have not flowered from their not being sufficiently strong. The soil being probably rich has induced them to grow vigorously, and this has retarded the flowering. They will no doubt bloom well another season. Now is a good time to plant-out Clematis Jackmanii from pots, for the plants will form good roots before winter, and start strongly next spring. Carnations from seed sown a few days ago will need to have the protection of a frame in winter, with air at every favourable opportunity, and mats over the lights in severe weather.

IRENE HERBERT CULTURE (T. N. R.).—The preceding is the name of the plant you sent us a spray of. It is used in flower-gardening, being planted-out at the end of May or early in June. Cuttings are taken off in August and struck in sandy soil in a cold frame, or in September in a gentle hotbed, wintered in the cutting-pots or pans, and grown-on in spring. If you preserve the old plants they should be kept rather dry in winter, receiving no more water than enough to keep them fresh. To form bushy plants stop frequently, but not after this time, repot in spring, and encourage growth with an increase of moisture. To winter the plants with good foliage they require a warm greenhouse. Three parts sandy loam, half a part each leaf soil and sandy peat, with a sixth of sand and good drainage, will grow them well.

DATURA NOT FLOWERING (Idem).—The want of flowers this year is probably a consequence of the wood of last year not having been well ripened. Afford the plants the lightest and most airy position in the greenhouse, and water only to keep the leaves from falling off prematurely. After the leaves have fallen water only to keep the wood from shrivelling, and in February cut each shoot to within from four to six eyes of last year's wood, cutting-back the weak shoots most and the strongest least; repot when commencing growth, and shift into larger pots when the shoots are a few inches long, watering abundantly when in free growth, and syringing morning and evening until the flowers expand. A light and airy position only is suitable.

MUSHROOM BED FAILING (W. Y.).—From the Mushrooms having appeared in six weeks after spawning, it is evident the spawn was good and that the bed has suited the spawn, though it does not seem to have spread well, as the Mushrooms appeared only around the spawn holes. We presume the bed was covered with 2 inches of soil beaten firm and the surface made smooth. We think you have destroyed the spawn as well as the Mushrooms first appearing by the syringing once a-day, which in a house without ventilation would cause the surface to become too moist. In such a house, where we have now an abundant crop, we find watering, which we do with a syringe, not required of more than twice a week after the bed has been brought into a sufficiently moist state for the production of Mushrooms.

MUSHROOMS ON LAWS (Flycatcher).—It would not answer to take-up the turf in a shady and rather damp part of the lawn, and drop in holes small pieces of spawn. Your chances would be greater if in a dry period you put in pieces of spawn and cover with the piece of turf taken from the lawn, treading it firmly, in fact level. The spawn should be buried about 2 inches. If this were done in early summer it is likely you would have Mushrooms late in summer.

REPOTTING AZALEAS AND CAMELLIAS (Idem).—They may be potted now, but potting is best performed after they have flowered and are commencing to form fresh growths, in March or early April for Camellias, and April or May for Azaleas, as the time of flowering may be, or if not flowering, when commencing to grow.

GARDEN MANURE (R. S.).—Use guano in preference to any you name. If you live near gasworks you may compound an excellent fertiliser by pouring the ammoniacal liquor from the works upon the weeds and other garden rubbish.

ONION SPORT (G. S.).—Though uncommon, the combined inflorescence and bulb-bearing occasionally occur in the Tree Onion. We should thoroughly cleanse the flea-infested onionhouse and then syringe roofs, sides, and floors with diluted carbolic acid.

ROSES (E. B., Berkhamsstead).—*Maréchal Niel* and *Souvenir d'un Ami* would do well in a greenhouse. If a white were wanted *Madame Willermoz* might

be added. (*P. H.*).—We should not recommend either *Anna de Diesbach* or *Louisa Wood* for the purpose for which you require them. *John Hopper* or *Dupuy-Jamain* would suit you.

REMOVING THE SOIL ABOUT GOOSEBERRY BUSHES (Mrs. Henderson).—The earth should be removed down to the roots in November when the leaves have fallen, also for about 18 inches from the stem all round. It may remain out for a month or six weeks, and may then be filled-up with manure and rich soil. To prevent the attacks of the catyrrillar the ground around the stems of the bushes for a distance of 18 inches to 2 feet should be covered 2 or 3 inches deep with tan from the tan yard, leaving it until autumn. The tan should be fresh from the pits after having been used for tanning.

LATE STRAWBERRIES.—CUTTING-BACK PEAR GRAFTS.—APRICOTS UNDER GLASS (Idem).—*Frogmore Late Pine*, *Elton Pine Improved*, and *Elberta* are good late kinds of Strawberries. The Pear grafts should be headed-back to 13 inches, just above a bud. Apricots would succeed under glass trained to a back wall and in front as espaliers, but the front trees must not shade those on the back wall. They do better than when grown in pots, and require considerably less labour in watering.

HOTHOUSE WITH IRON SASHES (Norfolk).—In iron houses, as far as we have experience, there is no very great difference in the breakage of glass as compared with those of wood, nor greater leakage from the pitting parting from the iron. Well painted, we have the impression that iron houses answer as well as those of wood. We should be glad if those having experience of iron houses would give us particulars.

ERECTING A GREENHOUSE (S. H.).—The cost varies according to too many circumstances for us to state the expense. Write to some of the builders who advertise in our columns, and ask them to send estimates.

GROUND VINERY (F. J.).—You must buy Rivers's "Miniature Fruit Garden." The price is 3s. To answer your queries fully would occupy a day. You must send only one question at a time; a letter from you full of questions was put on one side and is lost.

ELTON STRAWBERRY PLANTS (R. P. H. B.).—It is enumerated in the majority of fruit catalogues. We cannot recommend dealers. Write to one of the principal nurserymen advertising in our columns. It is not too late to plant, but the sooner the better.

KEEPING CURRANTS ON THE BUSHES (Idem).—There is no mode equal to matting the bushes after the fruit becomes ripe; gun-lin and hexagon netting answer well, but it is useless in either case to cover the bushes partially; they must be entirely enveloped, and made secure against the incursions of wasps and birds. Mats are the best, because they throw off the rains, and they ought to be new and of large size. Archangel mats are the best. No wonder your fruit does not keep when the material is so badly put on as to admit thrushes. It is of no use if it do not exclude them.

GRAPES WANTING BLOOM (A. F.).—The syringing of the Grapes until half grown would be likely to leave a sediment upon the berries, which when the Grapes were ripe would give the appearance of having been "syringed with dirty water;" but if the water employed were soft clear rain water no such sediment would be deposited, and it would not interfere with the bloom. The injury to this, we imagine, has been caused by the want of ventilation in dull days, and at nights the berries being covered with a dew-like moisture, which has run on them and left the bad appearance, which is not "scalding," and destroyed the bloom. When Grapes are ripening they should have a little air in dull days and at night, in order to keep up a circulation, and allow of any vapour passing off, and so preventing the deposition of moisture on the Grapes.

DALECHAMPIA ROEZLIANA ROSEA FOR EXHIBITION (E. P.).—Your plant is certainly a good specimen, but it would not stand up in good stead at an exhibition where no plant would be much thought of unless twice the size. It might, however, stand well at a local exhibition, but it is not a telling plant at the best for shows, though a very useful one for home decoration.

HONEYUCKLE AND CLEMATIS PLANTING (R. F. H.).—October or early November is probably the best time, but it may be done at any time during the winter in mild weather up to March inclusive. If the plants are to be taken from a wood or hedgerow they should be taken up carefully when the leaves have fallen, choosing plants which have shoots or branches near the base, and not very strong, a small plant being transplanted more safely than a large one, and growing more freely afterwards. Good rich light loam, with leaf soil intermixed, will grow it well, as also the Clematis, which requires similar treatment; but the plants will probably have to be turned out of pots, and should have the ball broken, and the roots spread out. Do not plant deeper than they were before, but keep them rather elevated on a flattened cone, covering the roots about 3 inches deep, and giving a good watering, so as to settle the soil. The shoots should be secured to the wall, training them on the lower part, so as to cover it first. Beyond watering in dry weather, and regulating the shoots, they will not require further attention. The hardiest and freest-growing Clematis is *C. Viridula*, or *Traveller's Joy*.

VINES MILDEWED (W. M. S.).—The leaves sent us are attacked by mildew, which may result from a close moist atmosphere, and want of water at the roots. Dust the leaves and all the parts affected with flowers of sulphur, especially the under surface of the leaves; see that the border is in a proper state as to moisture, and attend to the proper ventilation of the house. The Vines appear to us to be weak, and in the reverse of a rich wet border. It is the atmosphere which is at fault.

CAMELLIA LEAVES BROWNED (T. C. F.).—The Camellia leaves are browned, their tissues disorganised and destroyed by the sun's rays, which, falling upon them powerfully whilst wet, causes them to spot, especially where water is lodging upon them. A shading of tiffany or other material is necessary, there being no Vines or climbers trained to the roof to afford the shade requisite in summer. The top-dressing with the loam, peat, and sheep droppings is good, but will not restore the leaves to their proper state. The shading is necessary from April to the close of September.

CUCUMBERS AND MELONS IN VINERY (Somerset).—The pit will be more useful for plants than for growing other Cucumbers or Melons, the latter not doing much if any good, and the Cucumbers would not be equal to those grown in frames where the plants will have more light. Leaves would be the most suitable material for bottom heat, and should be put in about a fortnight before the Vines are started; and as the Vine border is outside, it ought to be covered with from 18 inches to 2 feet of fermenting materials, such as stable dung and leaves, putting them on about a fortnight before the Vines are started, and renewing up to March. The Cucumbers in the vinery pit would be best grown in pots or boxes, and the shoots trained to a trellis. The Vines we should not start until February, which will give you ripe Grapes in July. The floor of the late house would answer for the wintering of Gra-

niums, but *Verbenas* would be better in an airy position near the glass. The *Calceolarias* would be best wintered in a frame. The stage over the flue will answer for the herbaceous *Calceolarias*, *Cinerarias*, &c. You will need to accommodate them in the early house until the Grapes are cut from this house, as from the moisture the Grapes would not hang long in good condition where the plants are. There are no annuals or perennials that would do well under the trees you describe, and those that are doing pretty well have, we presume, been planted when the trees were young. Cowslip, Primrose, Polyanthus, *Campanula carpatia*, *Hypericum calycinum*, Periwinkles, and *Stachys lanata*, with Winter Aconite and Snowdrops, would give a cheerful appearance.

PEARS RIPENING (Ignoramus).—Beurre Sterckmans in January and February, and Princes Albert in February and March. The knob you enclosed is an excrescence formed by a grub wounding the root to which it is attached.
